The graphs of $y = \sin\left(x - \frac{\pi}{3}\right)$ and $y = -\frac{\sqrt{2}}{2}$ are shown in Figure 6-15.

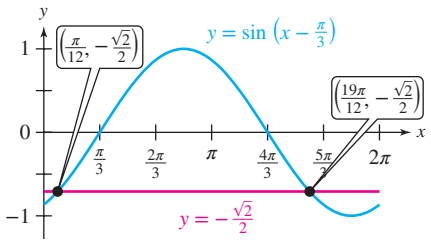

Figure 6-15

The x-coordinates of the points of intersection of the graphs make up the solution set to the equation $\sin\left(x - \frac{\pi}{3}\right) = -\frac{\sqrt{2}}{2}$.

Skill Practice 4 Solve the equation $\cot\left(x - \frac{\pi}{4}\right) = -1$.

a. Write the solution set for the general solution.
b. Write the solution set on the interval $[0, 2\pi)$.

3. Solve Higher-Degree Trigonometric Equations

In Examples 5 and 6, we solve trigonometric equations that are quadratic in $\sin x$, $\cos x$, or $\tan x$. As with standard algebraic quadratic equations, we set one side equal to zero and factor the other side. If the nonzero side is not factorable, we can use the square root property or apply the quadratic formula.

EXAMPLE 5 Solving a Quadratic Trigonometric Equation

Solve the equation on the interval $[0, 2\pi)$. $2\sin^2 x + 7\sin x - 4 = 0$

Solution:

$2\sin^2 x + 7\sin x - 4 = 0$

This equation is quadratic in form. $2u^2 + 7u - 4 = 0$, where $u = \sin x$.

$(2\sin x - 1)(\sin x + 4) = 0$

Factor as $(2u - 1)(u + 4) = 0$.

$2\sin x - 1 = 0$ or $\sin x + 4 = 0$

Set each factor equal to zero and solve the resulting equation.

$\sin x = \frac{1}{2}$ or $\sin x = -4$

The only solutions are those for which $\sin x = \frac{1}{2}$.

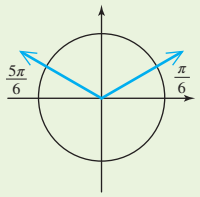
$x = \frac{\pi}{6}, x = \frac{5\pi}{6}$

No solution here because $-1 \le \sin x \le 1$.

From the unit circle, recognize that $\sin x = \frac{1}{2}$ for $x = \frac{\pi}{6}$ and $x = \frac{5\pi}{6}$ on the interval $[0, 2\pi)$.

The solution set is $\left\{\frac{\pi}{6}, \frac{5\pi}{6}\right\}$.

TIP In Example 5, if we were asked to find the general solution, it would consist of $x = \frac{\pi}{6} + 2n\pi$ and $x = \frac{5\pi}{6} + 2n\pi$.



Skill Practice 5 Solve the equation on the interval $[0, 2\pi)$.
$2\cos^2 x - \cos x - 3 = 0$

In Example 6, we apply the square root property to solve a trigonometric equation of the form $u^2 = k$.

Answers
4. a. $\{x | x = n\pi\}$ **b.** $\{0, \pi\}$
5. $\{\pi\}$

ISTUDY

EXAMPLE 6 Solving a Quadratic Trigonometric Equation

Solve the equation on the interval $[0, 2\pi)$. $\cot^2 x - 3 = 0$

Solution:

$$\cot^2 x - 3 = 0$$
$$\cot^2 x = 3$$
$$\cot x = \pm\sqrt{3}$$

Isolate $\cot^2 x$ to write the equation in the form $u^2 = k$.
Apply the square root property.

$\cot x = \sqrt{3}$ $\qquad$ $\cot x = -\sqrt{3}$

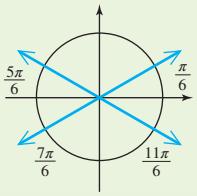
$x = \frac{\pi}{6}, x = \frac{7\pi}{6}$ $\qquad$ $x = \frac{5\pi}{6}, x = \frac{11\pi}{6}$

From the unit circle, recognize that $\cot x = \sqrt{3}$ for $x = \frac{\pi}{6}$ and $x = \frac{7\pi}{6}$ and that $\cot x = -\sqrt{3}$ for $x = \frac{5\pi}{6}$ and $x = \frac{11\pi}{6}$.

The solution set is $\left\{\frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}\right\}$.

Skill Practice 6 Solve the equation on the interval $[0, 2\pi)$.
$4\cos^2 x - 3 = 0$

TIP In Example 6, if we were asked to find the general solution, notice that each pair of solutions differs by π radians (180°). The general solution consists of $x = \frac{\pi}{6} + n\pi$ and $x = \frac{5\pi}{6} + n\pi$.



For trigonometric equations containing more than one trigonometric function, sometimes we can set one side equal to zero and factor the other side to separate factors.

EXAMPLE 7 Solving a Trigonometric Equation by Factoring

Solve the equation on the interval $[0, 2\pi)$. $\tan x \sin^2 x = \tan x$

Solution:

$$\tan x \sin^2 x = \tan x$$
$$\tan x \sin^2 x - \tan x = 0$$

Set one side equal to zero.

$$\tan x(\sin^2 x - 1) = 0$$

Factor the left side.

$\tan x = 0$ or $\sin^2 x - 1 = 0$

Set each factor equal to zero.

$x = 0, x = \pi$ $\qquad$ $\sin^2 x = 1$

The equation $\sin^2 x - 1 = 0$ is quadratic.

$$\sin x = \pm 1$$

Isolate $\sin^2 x$ and apply the square root property.

$$x = \frac{\pi}{2}, x = \frac{3\pi}{2}$$

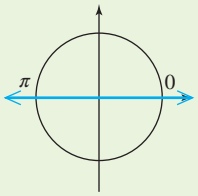
At this point, particular care must be taken before stating the solution set. Recall that the tangent function is undefined at odd multiples of $\frac{\pi}{2}$. Therefore, the values $\frac{\pi}{2}$ and $\frac{3\pi}{2}$ do not check in the original equation and must be excluded from the solution set.

The solution set is $\{0, \pi\}$.

Skill Practice 7 Solve the equation on the interval $[0, 2\pi)$.
$\cot x \cos^2 x = \cot x$

TIP In Example 7, notice that the solutions differ by π. Therefore, we can generate the general solution with one statement.

$x = n\pi$



Answers

6. $\left\{\frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}\right\}$
7. $\left\{\frac{\pi}{2}, \frac{3\pi}{2}\right\}$

ISTUDY

4. Use Identities to Solve Trigonometric Equations

The identities studied earlier in this chapter can be of great service when solving a trigonometric equation as shown in Examples 8–10.

EXAMPLE 8 Using Identities to Solve an Equation

Solve the equation on the interval $[0, 2\pi)$. $\sec^2 x - \tan x = 1$

Solution:

$\sec^2 x - \tan x = 1$

Use the Pythagorean identity $\tan^2 x + 1 = \sec^2 x$ and substitute $\tan^2 x + 1$ for $\sec^2 x$. The left side is now quadratic in the variable $\tan x$.

$(\tan^2 x + 1) - \tan x = 1$

$\tan^2 x - \tan x = 0$

Set one side of the equation equal to zero.

$\tan x(\tan x - 1) = 0$

Factor.

$\tan x = 0$ or $\tan x - 1 = 0$

Set each factor equal to zero.

$x = 0, x = \pi$ $\tan x = 1$

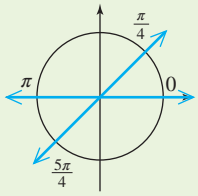
$x = \frac{\pi}{4}, x = \frac{5\pi}{4}$

From the unit circle, recognize that $\tan x = 0$ for $x = 0$ and $x = \pi$, and that $\tan x = 1$ for $x = \frac{\pi}{4}$ and $x = \frac{5\pi}{4}$.

The solution set is $\left\{0, \frac{\pi}{4}, \pi, \frac{5\pi}{4}\right\}$.

Skill Practice 8 Solve the equation on the interval $[0, 2\pi)$.
$\csc^2 x - 1 = \cot x$

TIP In Example 8, if we were asked to find the general solution, notice that the pairs of solutions differ by π radians (180°) and can be combined into one statement. The general solution consists of $x = n\pi$ and $x = \frac{\pi}{4} + n\pi$.



EXAMPLE 9 Using Identities to Solve an Equation

Solve the equation on the interval $[0, 2\pi)$. $\cos 3x + \cos x = 0$

Solution:

$\cos 3x + \cos x = 0$

Apply the sum-to-product formula $\cos x + \cos y = 2\cos\frac{x+y}{2}\cos\frac{x-y}{2}$.

$2\cos\frac{3x + x}{2}\cos\frac{3x - x}{2} = 0$

$2\cos 2x \cos x = 0$

$\cos 2x = 0$ or $\cos x = 0$

Set each trigonometric factor equal to zero.

$2x = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}, \frac{7\pi}{2}, \ldots$ or $x = \frac{\pi}{2}, \frac{3\pi}{2}, \ldots$

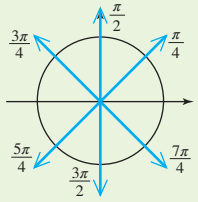
From the unit circle, recognize that $\cos 2x = 0$ for $2x$ equal to odd multiples of $\frac{\pi}{2}$, and that $\cos x = 0$ for x equal to odd multiples of $\frac{\pi}{2}$.

$x = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}, \ldots$ or $x = \frac{\pi}{2}, \frac{3\pi}{2}, \ldots$

The solution set on the interval $[0, 2\pi)$ is $\left\{\frac{\pi}{4}, \frac{\pi}{2}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{3\pi}{2}, \frac{7\pi}{4}\right\}$.

Skill Practice 9 Solve the equation on the interval $[0, 2\pi)$.
$\sin 3x + \sin x = 0$

TIP In Example 9, notice that the odd multiples of $\frac{\pi}{4}$ differ by $\frac{\pi}{2}$. The odd multiples of $\frac{\pi}{2}$ differ by π. Therefore, the general solution consists of $x = \frac{\pi}{4} + \frac{n\pi}{2}$ and $x = \frac{\pi}{2} + n\pi$.



Answers

8. $\left\{\frac{\pi}{4}, \frac{\pi}{2}, \frac{5\pi}{4}, \frac{3\pi}{2}\right\}$
9. $\left\{0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}\right\}$

ISTUDY

In Example 10, we encounter a situation where squaring both sides of an equation results in a quadratic equation that is easily factored and solved. However, we must remember to check all potential solutions to eliminate any extraneous solutions.

EXAMPLE 10 Squaring Both Sides of a Trigonometric Equation

Solve the equation on the interval $[0, 2\pi)$. $\sin x + 1 = \cos x$

Solution:

$$\sin x + 1 = \cos x$$

$$(\sin x + 1)^2 = (\cos x)^2$$ Squaring both sides of the equation will result in $\sin^2 x$ and $\cos^2 x$ terms.

$$\sin^2 x + 2\sin x + 1 = \cos^2 x$$

$$\sin^2 x + 2\sin x + 1 = 1 - \sin^2 x$$ Replacing $\cos^2 x$ by $1 - \sin^2 x$ results in a quadratic equation in the variable $\sin x$.

$$2\sin^2 x + 2\sin x = 0$$

$$2\sin x(\sin x + 1) = 0$$ Set one side equal to zero and factor the other side.

$\sin x = 0$ or $\sin x + 1 = 0$ Set each factor equal to zero.

$x = 0, x = \pi$ $\sin x = -1$ From the unit circle, $\sin x = 0$ for $x = 0, x = \pi$. $\sin x = -1$ for $x = \frac{3\pi}{2}$.

$$x = \frac{3\pi}{2}$$

After squaring both sides of an equation, we must check all potential solutions to eliminate any extraneous solutions.

Check: $x = 0$

$\sin(0) + 1 \stackrel{?}{=} \cos(0)$

$0 + 1 \stackrel{?}{=} 1$ ✓ (True)

Check: $x = \pi$

$\sin(\pi) + 1 \stackrel{?}{=} \cos(\pi)$

$0 + 1 \stackrel{?}{=} -1$ (False)

Check: $x = \frac{3\pi}{2}$

$\sin\left(\frac{3\pi}{2}\right) + 1 \stackrel{?}{=} \cos\left(\frac{3\pi}{2}\right)$

$-1 + 1 \stackrel{?}{=} 0$ ✓ (True)

The solution set is $\left\{0, \frac{3\pi}{2}\right\}$.

The graphs of $y = \sin x + 1$ and $y = \cos x$ are shown in Figure 6-16. The solutions to the equation $\sin x + 1 = \cos x$ are the x-coordinates of the points of intersection.

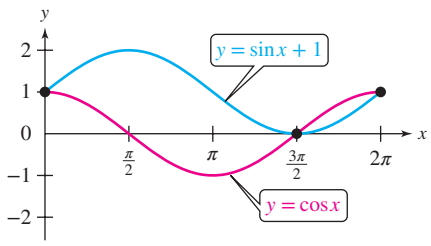


Figure 6-16

Skill Practice 10 Solve the equation on the interval $[0, 2\pi)$.
$\tan x + 1 = \sec x$

In Example 10, we could have taken an alternative approach to solving $\sin x + 1 = \cos x$ by first writing the equation as $\sin x - \cos x = -1$. The left side of the equation can then be written as a single term of the form $k\sin(x + \alpha)$ by using the technique offered on page 659. This approach is examined in Exercise 119, on page 695.

Answer
10. {0}

5. Use Inverse Functions to Express Solutions to Trigonometric Equations

In Example 11, we encounter equations in which the solutions are not "special" angles (multiples of $\frac{\pi}{6}$ or $\frac{\pi}{4}$). Therefore, we will use inverse functions to express the exact values of the solutions.

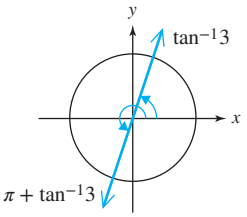
EXAMPLE 11 Using Inverse Functions to Solve Trigonometric Equations

Solve the equation on the interval $[0, 2\pi)$. Give the exact solutions in radians and give approximations in degrees rounded to 1 decimal place.

a. $\tan x = 3$ **b.** $\sin x = -0.8$

Solution:

a. No multiples of the "special" angles $\left(\frac{\pi}{6}, \frac{\pi}{4}, \frac{\pi}{3}, \frac{\pi}{2}, \ldots\right)$ have a tangent value equal to 3. Therefore, our strategy is to find one solution to the equation by using the inverse tangent function. Then use the periodicity of the tangent function to find other solutions.



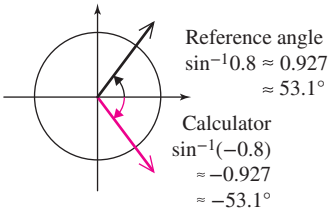
Given $\tan x = 3$, two solutions are

$x = \tan^{-1} 3 \approx 1.249$ $(\approx 71.6°)$ The value $\tan^{-1}3$ is a first quadrant angle.

$x = \pi + \tan^{-1} 3 \approx 4.391$ $(\approx 251.6°)$ The corresponding angle in Quadrant III is $\pi + \tan^{-1}3$.

The solution set is $\{\tan^{-1} 3, \pi + \tan^{-1} 3\}$ or approximately $\{71.6°, 251.6°\}$.

b. Given $\sin x = -0.8$, one solution is $x = \sin^{-1}(-0.8) \approx -0.927$ $(\approx -53.1°)$.

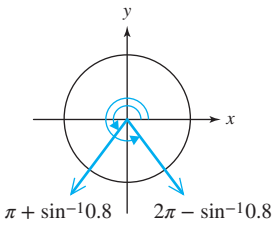


Notice that $x = \sin^{-1}(-0.8) \approx -0.927$ is a negative fourth quadrant angle. The reference angle is $|\sin^{-1}(-0.8)| = \sin^{-1} 0.8 \approx 0.927$. Therefore, the solutions on the interval $[0, 2\pi)$ are

$\pi + \sin^{-1} 0.8 \approx 4.069$ $(\approx 233.1°)$

$2\pi - \sin^{-1} 0.8 \approx 5.356$ $(\approx 306.9°)$

The solution set is $\{\pi + \sin^{-1} 0.8, 2\pi - \sin^{-1} 0.8\}$ or approximately $\{233.1°, 306.9°\}$.



Skill Practice 11 Solve the equation on the interval $[0, 2\pi)$. Give the exact solutions in radians and give approximations in degrees rounded to 1 decimal place.

a. $\cos x = 0.6$ **b.** $\tan x = -5$

6. Approximate the Solutions to Trigonometric Equations on a Calculator

Sometimes finding the solutions to a trigonometric equation is not possible using analytical methods. In particular, this happens when there is a combination of trigonometric expressions and variable algebraic expressions within the equation.

Answers

11. a. $\{\cos^{-1} 0.6, 2\pi - \cos^{-1} 0.6\}$ or approximately $\{53.1°, 306.9°\}$

b. $\{\pi - \tan^{-1} 5, 2\pi - \tan^{-1} 5\}$ or approximately $\{101.3°, 281.3°\}$

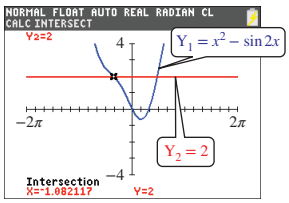
In Example 12, we will solve the equation $x^2 - \sin 2x = 2$ by graphing $Y_1 = x^2 - \sin 2x$ and $Y_2 = 2$. The x-coordinates of the points of intersection represent solutions to the equation.

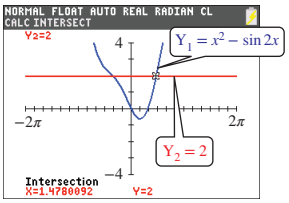
EXAMPLE 12 Using a Graphing Utility to Solve an Equation

Use a graphing utility to solve the equation $x^2 - \sin 2x = 2$. Round the solutions to 4 decimal places.

Solution:

Graph $Y_1 = x^2 - \sin 2x$ and $Y_2 = 2$.





The x-coordinates of the points of intersection are approximately -1.0821, and 1.4780. Since $-1 \le \sin 2x \le 1$, the end behavior of the graph of $Y_1 = x^2 - \sin 2x$ is dictated by the term x^2. Furthermore, the graph of $y = x^2$ does not cross the line $y = 2$ more than two times, so we know that these are the only solutions.

The solution set is $\{-1.0821, 1.4780\}$.

Skill Practice 12 Use a graphing utility to solve the equation $\cos 3x = 0.6x$. Round the solutions to 4 decimal places.

TIP As an alternative method to solve the equation in Example 12, set one side of the equation equal to zero.

$x^2 - \sin 2x - 2 = 0$

Then set Y_1 equal to the nonzero expression on the left.

$Y_1 = x^2 - \sin 2x - 2$

Use the ZERO function on a graphing utility to find the zeros of the function Y_1. These are the solutions to the equation.

Answer

12. {−1.2792, −0.6591, 0.4355}

SECTION 6.5 Practice Exercises

Prerequisite Review

R.1. Factor by grouping. $15tx + 10t + 12x + 8$

R.2. Factor the trinomial. $39x + 10x^2 + 35$

For Exercises R.3–R.6, solve the equation.

R.3. $4v^2 - 3v - 7 = 0$

R.4. $p^3 = 9p$

R.5. $36x^3 + 9x^2 - 16x - 4 = 0$

R.6. $4y^4 - 29y^2 + 7 = 0$

Concept Connections

1. How many solutions to the equation $\cos x = \dfrac{\sqrt{3}}{2}$ exist? How many solutions exist on the interval $[0, 2\pi)$?

2. The solutions to the equation $\tan^2 x = 1$ on the interval $[0, 2\pi)$ are _____. The formula $x =$ _____ can be used to generate *all* solutions to the equation over the set of real numbers.

3. Given $\sin 2x = \dfrac{\sqrt{2}}{2}$, the general solution consists of $\dfrac{\pi}{8} + n\pi$ and $\dfrac{3\pi}{8} + n\pi$. What are the solutions on the interval $[0, 2\pi)$?

4. Given the equation $\sin x = 0.2$, one solution is $x = \sin^{-1}(0.2)$. What is the other solution on the interval $[0, 2\pi)$?

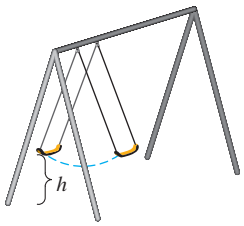
87. $\sin(\cos x) = 0$ **88.** $\cos(\sin x) = 0$

89. The height $h(t)$ (in feet) of the seat of a child's swing above ground level is given by

$$h(t) = -1.1\cos\left(\frac{2\pi}{3}t\right) + 3.1$$

where t is the time in seconds after the swing is set in motion.



a. Find the maximum and minimum height of the swing.

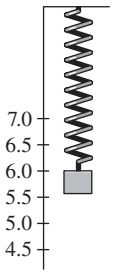
b. When is the first time after $t = 0$ that the swing is at a height of 3 ft? Round to 1 decimal place.

c. When is the second time after $t = 0$ that the swing is at a height of 3 ft? Round to 1 decimal place.

90. A vertical spring is attached to the ceiling. The height h of a block attached to the spring relative to ground level is given by

$$h(t) = -0.8\cos\left(\frac{10\pi}{3}t\right) + 5.8$$

where t is the time in seconds and $h(t)$ is in feet.



a. Find the maximum and minimum height of the block.

b. When is the first time after $t = 0$ that the block is at a height of 6 ft? Round to 3 decimal places.

c. When is the second time after $t = 0$ that the block is at a height of 6 ft? Round to 3 decimal places.

ISTUDY

91. The monthly sales of winter coats follow a periodic cycle with sales peaking late in the year and before the winter holidays. The monthly sales total S (in \$1000) is given by

$$S(t) = 350\cos\left(\frac{\pi}{6}t + \frac{\pi}{6}\right) + 500$$

where t is the month number ($t = 1$ corresponds to January).

a. Write the range of this function in interval notation.

b. During which months ($0 \le t \le 12$) are sales at their maximum?

c. During which months ($0 \le t \le 12$) are sales at their minimum?

d. In which months, between 1 and 12 inclusive, are the sales \$675,000?

92. With each heartbeat, blood pressure increases as the heart contracts, then decreases as the heart rests between beats. The maximum blood pressure is called the systolic pressure and the minimum blood pressure is called the diastolic pressure. When a doctor records an individual's blood pressure such as "120 over 80," it is understood as "systolic over diastolic." Suppose that the blood pressure for a certain individual is approximated by $p(t) = 90 + 20\sin(140\pi t)$ where p is the blood pressure in mmHg (millimeters of mercury) and t is the time in minutes after recording begins.

a. Find the period of the function and interpret the results.

b. Find the maximum and minimum values and interpret this as a blood pressure reading.

c. Find the times at which the blood pressure is at its maximum.

The refractive index n of a substance is a dimensionless measure of how much light bends (refracts) when passing from one medium to another.

$$n = \frac{c}{v}$$

where c is the speed of light in a vacuum (a constant) and v is the speed of light in the medium. For example, the refractive index of diamond is 2.42, which means that light travels 2.42 times as fast in a vacuum as it does in a diamond.

Snell's law is an equation that relates the indices of refraction of two different mediums to the angle of incidence θ_1 and angle of refraction θ_2. Angles θ_1 and θ_2 are measured from a line perpendicular to the boundary between the two mediums. Use this relationship and the table of refraction indices to complete Exercises 93–94.

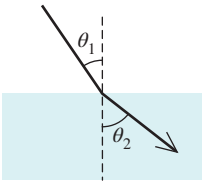
$$n_1 \sin\theta_1 = n_2 \sin\theta_2$$

Index of Refraction	
Medium	Index
Air	1.00029
Water	1.33
Acetone	1.36
Human cornea	1.38
Glycerin	1.47
Sodium chloride	1.54
Sapphire	1.77
Cubic zirconia	2.15
Diamond	2.42

93. Assume that a beam of light travels from air into water.

a. If the incidence angle θ_1 is 40°, what is the angle of refraction θ_2? Round to the nearest tenth of a degree.

b. Alina stands on the deck of a boat and tries to spear a lobster by aiming the spear directly at the lobster. Will Alina hit the lobster? Explain your answer.



94. If a beam of light traveling through air enters a sapphire at an angle of incidence of 23°, what is the angle of refraction? Round to the nearest tenth of a degree.

Write About It

95. Explain why $\cos^2 x - \cos x - 12 = 0$ has no solution.

96. Explain why $x = \sin^{-1}(-0.4)$ is not a solution to the equation $\sin x = -0.4$ on the interval $[0, 2\pi)$.

97. What is the difference between the general solution to a trigonometric equation and the solution over the interval $[0, 2\pi)$?

98. Explain two different methods to solve the equation $\sin 3x + x = 1$ by using a graphing utility.

Expanding Your Skills

For Exercises 99–104, simplify the expression on the left to a single trigonometric function, then solve the equation on $[0, 2\pi)$.

99. $\dfrac{1 - \cos^2 x}{\sin x \cos x} = -\sqrt{3}$

100. $\dfrac{\sin x \cot x}{\cos x \tan x} = -1$

101. $\dfrac{\sec x - \cos x}{\tan x} = \dfrac{\sqrt{3}}{2}$

102. $\dfrac{\csc x}{\cot x + \tan x} = -\dfrac{1}{2}$

103. $\cos^4 x - \sin^4 x = -1$

104. $\dfrac{2\cos 2x}{\cot x - \tan x} = \dfrac{1}{\sqrt{2}}$

ISTUDY

For Exercises 105–118, solve the equation on the interval $[0, 2\pi)$.

105. $\sqrt{3}\tan^2 x - 2\tan x - \sqrt{3} = 0$

106. $\sqrt{2}\sin^2 x + \sin x - \sqrt{2} = 0$

107. $4\sin^2 x\cos x - 2\cos x + 2\sin^2 x - 1 = 0$

108. $\tan^2 x\sec x - 2\tan^2 x - 3\sec x + 6 = 0$

109. $4\sin^4 x - 7\sin^2 x + 3 = 0$

110. $8\cos^4 x - 6\cos^2 x + 1 = 0$

111. $2\sin^3 x + 7\sin^2 x + 2\sin x - 3 = 0$

112. $6\sec^3 x - 7\sec^2 x - 11\sec x + 2 = 0$

113. $\sqrt{\sin x + 1} + \sqrt{2\sin x + 3} = 1$

114. $\sqrt{5\cos x + 4} - 2 = \sqrt{\cos x}$

115. $4\sin^{-1}(x - 2) + \pi = 2\pi$

116. $\frac{3}{2}\cos^{-1}(x + 1) = \frac{\pi}{2}$

117. $2\sin\left(2x - \frac{\pi}{2}\right) - \sqrt{2} = 0$

118. $2\cos(2x - \pi) - \sqrt{3} = 0$

119. Consider the equation $\sin x + 1 = \cos x$ from Example 10.

a. Write the equation in the form $\sin x - \cos x = -1$. Then write the equation with the left side of the equation in the form $k\sin(x + \alpha)$. (*Hint*: See page 659.)

b. Solve the equation over the interval $[0, 2\pi)$ using the form from part (a).

For Exercises 120–122, use the technique from Exercise 119 to solve the equation over the interval $[0, 2\pi)$.

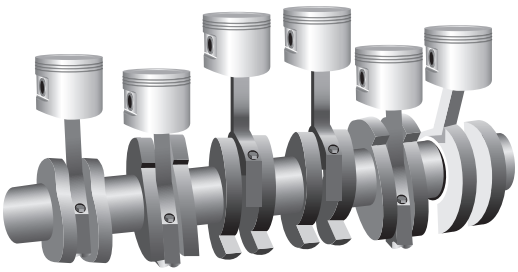
120. $\sqrt{3}\sin x + \cos x = 1$

121. $\sqrt{2}\sin x - \sqrt{2}\cos x = -1$

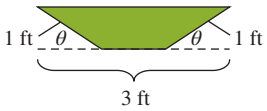
122. $-\frac{1}{2}\sin x + \frac{\sqrt{3}}{2}\cos x = 1$

123. In a six-cylinder engine, the height of the pistons above the crankshaft can be modeled by sine or cosine functions. There are three piston pairs, and the firing sequence is 1, 5, 3, 2, 6, 4. Therefore the height of the piston pairs differs by a phase shift. Suppose that the height of piston 1 is given by $h_1 = 3.5\sin(100t) + 7$ and the height of piston 2 is given by $h_2 = 3.5\sin\left(100t + \frac{4000\pi}{3}\right) + 7$. The values of h_1 and h_2 are measured in inches and t is measured in seconds.

Determine the times for which pistons 1 and 2 are at the same height. (*Hint*: Set $h_1 = h_2$. Then use the sum formula for the sine function to expand the right side of the equation.)



124. From Exercise 87 in Section 6.3, the cross-sectional area of a feeding trough in the figure is given by $A = \frac{1}{2}\sin 2\theta + \sin\theta$.



In calculus, you will learn that to find the value of θ to maximize the area, we need to solve the equation $\cos 2\theta + \cos\theta = 0$ for $0 < \theta < \frac{\pi}{2}$.

a. Find the value of θ to maximize the area.

b. Find the maximum area.

c. If the trough is 20 ft long, what is the maximum volume that it can hold?

125. Consider an isosceles triangle with two sides of length x and angle θ included between them. We have already shown that the area of the triangle is given by $A = \frac{1}{2}x^2\sin\theta$. If an isosceles triangle has two 6-in. sides, what angle is required to make the area 10 in.^{2}? Give the exact value and approximate to the nearest one-hundredth of a degree.

For Exercises 126–127, consider a projectile launched from ground level at an angle of elevation θ with an initial velocity v_0. The maximum horizontal range is given by $x_{\max} = \frac{{v_0}^2\sin 2\theta}{g}$, where g is the acceleration due to gravity ($g = 32$ ft/sec^2 or $g = 9.8$ m/sec^2).

126. If a soccer ball is kicked from ground level with an initial velocity of 28 m/sec, what is the smallest positive angle at which the player should kick the ball to reach a teammate 48 m down the field? Assume that the ball reaches the teammate at ground level on the fly. Round to the nearest tenth of a degree.

127. A quarterback throws a football with an initial velocity of 62 ft/sec to a receiver 40 yd (120 ft) down the field. At what angle could the ball be released so that it hits the receiver's hands at the same height that it left the quarterback's hand? Round to the nearest tenth of a degree.

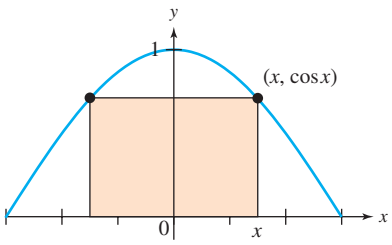
Technology Connections

128. Suppose that a rectangle is bounded by the x-axis and the graph of $y = \cos x$.

a. Write a function that represents the area $A(x)$ of the rectangle for $0 < x < \frac{\pi}{2}$.

b. Complete the table.

x	$A(x)$
0.2	
0.4	
0.6	
0.8	
1.0	
1.2	
1.4	



c. Graph the function from part (a) on the viewing window: $\left[0, \frac{\pi}{2}, \frac{\pi}{6}\right]$ by $[-3, 3, 1]$ and approximate the values of x for which the area is 1 square unit. Round to 2 decimal places.

d. In calculus, we can show that the maximum value of the area of the rectangle will occur at values of x for which $2\cos x - 2x\sin x = 0$. Confirm this result by graphing $y = 2\cos x - 2x\sin x$ and the function from part (a) on the same viewing window. What do you notice?

PROBLEM RECOGNITION EXERCISES

Trigonometric Identities and Trigonometric Equations

For Exercises 1–6, prove the identity in part (a), and solve the equation in part (b) on the interval $[0, 2\pi)$.

1. a. Prove that $\sin^4 x - \cos^4 x = -\cos 2x$.

b. Solve $\sin^4 x - \cos^4 x = 1$.

2. a. Prove that $\tan x \sin x + \cos x = \sec x$.

b. Solve $\tan x \sin x + \cos x = 2$.

3. a. Prove that $\cot x - \sec x \csc x \cos 2x = \tan x$.

b. Solve $\cot x - \sec x \csc x \cos 2x = 1$.

4. a. Prove that $\dfrac{\sec x + \tan x}{\cos x + \cot x} = \sec x \tan x$.

b. Solve $\dfrac{\sec x + \tan x}{\cos x + \cot x} = 0$.

5. a. Prove that $\dfrac{2\cot x}{1 + \cot^2 x} = \sin 2x$.

b. Solve $\dfrac{2\cot x}{1 + \cot^2 x} = 0$.

6. a. Prove that $\cos 2x - \cos 4x = 2\sin 3x \sin x$.

b. Solve $\cos 2x - \cos 4x = 0$.

7. a. Compute $\sin 75°$ by using $\sin(u + v) = \sin u \cos v + \cos u \sin v$.

b. Compute $\sin 75°$ by using the half-angle formula $\sin\frac{\alpha}{2} = \pm\sqrt{\dfrac{1 - \cos\alpha}{2}}$.

c. Show that the results for parts (a) and (b) are equivalent.

8. a. Compute $\cos\frac{\pi}{12}$ by applying a sum or difference formula for cosine.

b. Use the result of part (a) to find $\sin\frac{\pi}{24}$ and $\cos\frac{\pi}{24}$.

ISTUDY

CHAPTER 6 KEY CONCEPTS

SECTION 6.1 Fundamental Trigonometric Identities

Reference

The fundamental trigonometric identities are used to simplify trigonometric expressions and to prove other trigonometric relationships. p. 642

Reciprocal and Quotient Identities:

$$\csc x = \frac{1}{\sin x} \qquad \sec x = \frac{1}{\cos x} \qquad \cot x = \frac{1}{\tan x} \qquad \tan x = \frac{\sin x}{\cos x}$$

$$\sin x = \frac{1}{\csc x} \qquad \cos x = \frac{1}{\sec x} \qquad \tan x = \frac{1}{\cot x} \qquad \cot x = \frac{\cos x}{\sin x}$$

Even and Odd Identities: p. 642

$$\sin(-x) = -\sin x \qquad \csc(-x) = -\csc x \qquad \tan(-x) = -\tan x$$

$$\cos(-x) = \cos x \qquad \sec(-x) = \sec x \qquad \cot(-x) = -\cot x$$

The Pythagorean Identities can be used in several forms. p. 646

$$\sin^2 x + \cos^2 x = 1 \qquad \tan^2 x + 1 = \sec^2 x \qquad 1 + \cot^2 x = \csc^2 x$$

$$1 - \cos^2 x = \sin^2 x \qquad \sec^2 x - 1 = \tan^2 x \qquad \csc^2 x - 1 = \cot^2 x$$

$$1 - \sin^2 x = \cos^2 x \qquad \sec^2 x - \tan^2 x = 1 \qquad \csc^2 x - \cot^2 x = 1$$

To verify a trigonometric identity, work on one side of the equation (usually the more complicated side) until it matches the other side of the equation. Although there is no explicit procedure that works for every identity, helpful guidelines are offered on page 644. p. 644

SECTION 6.2 Sum and Difference Formulas

Reference

The sine, cosine, or tangent of a sum or difference of angles can be expressed in terms of the sine, cosine, or tangent of the individual angles. p. 654

Sum and Difference Formulas:

$$\sin(u+v) = \sin u \cos v + \cos u \sin v \qquad \cos(u+v) = \cos u \cos v - \sin u \sin v$$

$$\sin(u-v) = \sin u \cos v - \cos u \sin v \qquad \cos(u-v) = \cos u \cos v + \sin u \sin v$$

$$\tan(u+v) = \frac{\tan u + \tan v}{1 - \tan u \tan v} \qquad \tan(u-v) = \frac{\tan u - \tan v}{1 + \tan u \tan v}$$

The cofunction and periodic properties were first introduced in Chapter 5 and can be verified using the sum and difference formulas. p. 658

Cofunction Identities:

$$\sin\theta = \cos\left(\frac{\pi}{2} - \theta\right) \qquad \cos\theta = \sin\left(\frac{\pi}{2} - \theta\right) \qquad \tan\theta = \cot\left(\frac{\pi}{2} - \theta\right)$$

$$\sec\theta = \csc\left(\frac{\pi}{2} - \theta\right) \qquad \csc\theta = \sec\left(\frac{\pi}{2} - \theta\right) \qquad \cot\theta = \tan\left(\frac{\pi}{2} - \theta\right)$$

Periodic Identities: p. 658

$$\sin(\theta + 2\pi) = \sin\theta \qquad \cos(\theta + 2\pi) = \cos\theta \qquad \tan(\theta + \pi) = \tan\theta$$

$$\csc(\theta + 2\pi) = \csc\theta \qquad \sec(\theta + 2\pi) = \sec\theta \qquad \cot(\theta + \pi) = \cot\theta$$

A linear combination of $\sin x$ and $\cos x$ can be written as a sine function involving a phase shift. For the real numbers A, B, and x, p. 659

$$A\sin x + B\cos x = k\sin(x + \alpha) \text{ where } k = \sqrt{A^2 + B^2} \text{ and } \alpha \text{ satisfies}$$

$$\cos\alpha = \frac{A}{\sqrt{A^2 + B^2}} \text{ and } \sin\alpha = \frac{B}{\sqrt{A^2 + B^2}}.$$

ISTUDY

SECTION 6.3 Double-Angle, Power-Reducing, and Half-Angle Formulas

Reference

The sine, cosine, or tangent of a double angle follows directly from the sum and difference formulas.

p. 665

Double-Angle Formulas:

$$\sin 2\theta = 2\sin\theta\cos\theta$$

$$\tan 2\theta = \frac{2\tan\theta}{1-\tan^2\theta}$$

$$\cos 2\theta = \cos^2\theta - \sin^2\theta = 1 - 2\sin^2\theta = 2\cos^2\theta - 1$$

The double-angle cosine formulas are used to derive the power-reducing formulas. These convert the square of a sine or cosine term to a first power of a cosine term.

p. 667

Power-Reducing Formulas:

$$\sin^2\theta = \frac{1-\cos 2\theta}{2} \qquad \cos^2\theta = \frac{1+\cos 2\theta}{2} \qquad \tan^2\theta = \frac{1-\cos 2\theta}{1+\cos 2\theta}$$

Substituting $\frac{\alpha}{2}$ for θ in the power-reducing formulas results in the half-angle formulas.

p. 668

Half-Angle Formulas:

$$\sin\frac{\alpha}{2} = \pm\sqrt{\frac{1-\cos\alpha}{2}} \qquad \cos\frac{\alpha}{2} = \pm\sqrt{\frac{1+\cos\alpha}{2}}$$

The + or − sign is determined by the quadrant of angle $\frac{\alpha}{2}$.

$$\tan\frac{\alpha}{2} = \pm\sqrt{\frac{1-\cos\alpha}{1+\cos\alpha}} = \frac{1-\cos\alpha}{\sin\alpha} = \frac{\sin\alpha}{1+\cos\alpha}$$

SECTION 6.4 Product-to-Sum and Sum-to-Product Formulas

Reference

pp. 675–676

Product-to-Sum Formulas:

$$\sin u\sin v = \frac{1}{2}[\cos(u-v) - \cos(u+v)]$$

$$\cos u\cos v = \frac{1}{2}[\cos(u-v) + \cos(u+v)]$$

$$\sin u\cos v = \frac{1}{2}[\sin(u+v) + \sin(u-v)]$$

$$\cos u\sin v = \frac{1}{2}[\sin(u+v) - \sin(u-v)]$$

Sum-to-Product Formulas:

$$\cos x - \cos y = -2\sin\frac{x+y}{2}\sin\frac{x-y}{2}$$

$$\cos x + \cos y = 2\cos\frac{x+y}{2}\cos\frac{x-y}{2}$$

$$\sin x + \sin y = 2\sin\frac{x+y}{2}\cos\frac{x-y}{2}$$

$$\sin x - \sin y = 2\cos\frac{x+y}{2}\sin\frac{x-y}{2}$$

SECTION 6.5 Trigonometric Equations

Reference

To solve a conditional trigonometric equation, we manipulate both sides of the equation into a simpler form to find the values of the variable that make the equation true. For example, this equation is linear in the variable $\sin x$.

p. 682

$$2\sin x + 1 = 0$$

$\sin x = -\frac{1}{2}$ is an equivalent equation.

The solution set on the interval $[0, 2\pi)$ is $\left\{\frac{7\pi}{6}, \frac{11\pi}{6}\right\}$.

The general solution is $\left\{x \middle| x = \frac{7\pi}{6} + 2n\pi, x = \frac{11\pi}{6} + 2n\pi \text{ for integers } n\right\}$.

This equation is quadratic in the variable $\cos x$.

p. 686

$$2\cos^2 x + 5\cos x - 3 = 0$$

$$(2\cos x - 1)(\cos x + 3) = 0$$

$$\cos x = \frac{1}{2} \text{ or } \cos x = -3$$

Setting each factor equal to zero results in two linear equations in the variable $\cos x$. The second of the two equations, $\cos x = -3$, has no solution because -3 is not in the range of the cosine function.

The solution set over the interval $[0, 2\pi)$ is $\left\{\frac{\pi}{3}, \frac{5\pi}{3}\right\}$.

An equation involving a multiple angle may have numerous solutions on the interval $[0, 2\pi)$. $\tan 3x = 1$ The solution set over $[0, 2\pi)$ is $\left\{\frac{\pi}{12}, \frac{5\pi}{12}, \frac{3\pi}{4}, \frac{13\pi}{12}, \frac{17\pi}{12}, \frac{7\pi}{4}\right\}$.	p. 683
Trigonometric identities are also used to manipulate an equation into a more manageable form. $\sin^2 x = 2\cos x + 2$ $1 - \cos^2 x = 2\cos x + 2$ Use the Pythagorean identity $\sin^2 x = 1 - \cos^2 x$. $\cos^2 x + 2\cos x + 1 = 0$ Combine like terms. $(\cos x + 1)^2 = 0$ Factor. $\cos x + 1 = 0$ Set each factor equal to zero. $\cos x = -1$ The solution set over $[0, 2\pi)$ is $\{\pi\}$.	p. 688
Other algebraic techniques such as factoring, squaring both sides of the equation (being sure to check the potential solutions), applying the square root property, and applying the quadratic formula may also be used.	p. 689
Often the solutions to a trigonometric equation are not multiples of the special angles 0, $\frac{\pi}{6}$, $\frac{\pi}{4}$, $\frac{\pi}{3}$, or $\frac{\pi}{2}$. In such a case, use the inverse trigonometric functions to find the exact value. $\tan x = 5$ The solution set over $[0, 2\pi)$ is $\{\tan^{-1} 5, \pi + \tan^{-1} 5\}$.	p. 690

Detailed Chapter Summaries are available with the online resources.

CHAPTER 6 Review Exercises

SECTION 6.1

For Exercises 1–2, factor the expression completely.

1. $\sin^4 x - \sin^2 x \cos^2 x$

2. $12\tan^2 x + 11\tan x - 15$

For Exercises 3–4, find the LCD of the expressions.

3. $\frac{\sin x}{\tan x - 1}; \frac{\cos x}{\tan x + 1}$

4. $\frac{\sin x}{\cos x}; \frac{1}{\cos^2 x}; \frac{\cos x}{\sin x}$

For Exercises 5–6, simplify the expression.

5. $\sin x(\cot x - \csc x) + 1$

6. $\sec^2 x(1 - \sin^2 x)$

For Exercises 7–14, verify the identity.

7. $\frac{\sin x \tan^2 x - \sin x}{\cos x \tan x + \cos x} = \tan x(\tan x - 1)$

8. $\frac{3\sin^2 x - \sin x - 2}{\cos x \sin x - \cos x} = 3\tan x + 2\sec x$

9. $\frac{1}{\csc x - 1} + \frac{1}{\csc x + 1} = 2\tan x \sec x$

10. $\frac{1 - \sin x}{\cos x} = \frac{\cos x}{1 + \sin x}$

11. $\ln|\csc x| + \ln|\tan x| = \ln|\sec x|$

12. $\ln|\tan x| - \ln|\sin x| + \ln|\cos x| = 0$

13. $\cos x + \sin(-x)\tan(-x) = \sec x$

14. $[\csc(-x) + 1](\csc x + 1) = -\cot^2 x$

15. Write $\sqrt{16 - x^2}$ as a function of θ by making the substitution $x = 4\cos\theta$ for $0 < \theta < \frac{\pi}{2}$.

16. Write $\sqrt{(x+1)^2 + 49}$ as a function of θ by making the substitution $x = 7\tan\theta - 1$ for $0 < \theta < \frac{\pi}{2}$.

SECTION 6.2

In Exercises 17–26, use an addition or subtraction formula to find the exact value.

17. $\sin\frac{7\pi}{12}$

18. $\cos 105°$

19. $\tan(-15°)$

20. $\sin(-195°)$

21. $\cos\frac{13\pi}{12}$

22. $\tan\frac{17\pi}{12}$

23. $\cos 40°\cos 80° - \sin 40°\sin 80°$

24. $\dfrac{\tan\frac{29\pi}{18} + \tan\frac{5\pi}{36}}{1 - \tan\frac{29\pi}{18}\tan\frac{5\pi}{36}}$

25. $\tan\left[\sin^{-1}\left(\frac{28}{53}\right) + \cos^{-1}\left(-\frac{5}{13}\right)\right]$

26. $\sin\left[\arccos\left(\frac{3}{4}\right) + \arcsin\left(\frac{1}{2}\right)\right]$

27. Find the exact value for $\sin(\alpha - \beta)$ given $\sin\alpha = \frac{8}{17}$ for α in Quadrant II and $\cos\beta = \frac{6}{7}$ for β in Quadrant IV.

28. Find the exact value for $\cos(\alpha - \beta)$ given $\sin\alpha = \frac{21}{29}$ for α in Quadrant I and $\cos\beta = -\frac{24}{25}$ for β in Quadrant III.

For Exercises 29–32, verify the identity.

29. $\frac{\cos(x - y)}{\cos x \sin y} = \cot y + \tan x$

ISTUDY

30. $\dfrac{\sin(x-y)}{\cos x \cos y} = \tan x - \tan y$

31. $\dfrac{\tan\left(x-\frac{3\pi}{4}\right)}{\tan\left(x+\frac{\pi}{4}\right)} = 1$

32. $\sin\left(x+\frac{\pi}{4}\right) - \cos\left(x+\frac{\pi}{4}\right) = \sqrt{2}\sin x$

33. Write $\sqrt{3}\sin x - \cos x$ in the form $k\sin(x+\alpha)$ for $0 \le \alpha < 2\pi$.

34. Write $3\cos x - 4\sin x$ in the form $k\sin(x+\alpha)$ for $0 \le \alpha < 2\pi$. Round α to 3 decimal places.

SECTION 6.3

For Exercises 35–38, verify the identity.

35. $\dfrac{2\tan x}{1+\tan^2 x} = \sin 2x$

36. $\dfrac{\cos 2x}{\sin x} = \csc x - 2\sin x$

37. $\sin^2\frac{x}{2} - \cos^2\frac{x}{2} = -\cos x$

38. $\tan x \tan\frac{x}{2} = \sec x - 1$

39. Write $16\cos^4 x$ in terms of first powers of cosine.

40. Write $\sin^4 x + 2\cos^2 x$ in terms of first powers of cosine.

For Exercises 41–44, use the given information to find the exact value of each expression.

a. $\sin 2\theta$ **b.** $\cos 2\theta$ **c.** $\sin\frac{\theta}{2}$ **d.** $\cos\frac{\theta}{2}$

41. $\sin\theta = \frac{5}{13}, \frac{\pi}{2} < \theta < \pi$

42. $\cos\theta = -\frac{4}{5}, \pi < \theta < \frac{3\pi}{2}$

43. $\tan\theta = -2, \sin\theta > 0$

44. $\tan\theta = -3, \cos\theta > 0$

For Exercises 45–46, use the given information to find the exact value of each expression.

a. $\tan 2\theta$ **b.** $\tan\frac{\theta}{2}$

45. $\cos\theta = \frac{3}{5}, \frac{3\pi}{2} < \theta < 2\pi$

46. $\sin\theta = -\frac{3}{8}, \cos\theta < 0$

SECTION 6.4

For Exercises 47–50, write the product as a sum or difference.

47. $\sin 6x \sin 4x$

48. $\cos(-2x)\sin 6x$

49. $\sin(-3x)\cos 6x$

50. $\cos 10x \cos 5x$

For Exercises 51–54, write each expression as a product.

51. $\cos 2x + \cos 8x$

52. $\sin 10x + \sin 2x$

53. $\sin 6x - \sin 2x$

54. $\cos 5x - \cos 2x$

For Exercises 55–56, use a product-to-sum formula to find the exact value.

55. $\sin 37.5^\circ \cos 7.5^\circ$

56. $\cos\frac{5\pi}{4}\cos\frac{5\pi}{12}$

For Exercises 57–58, use a sum-to-product formula to find the exact value.

57. $\sin\frac{31\pi}{12} - \sin\frac{13\pi}{12}$

58. $\cos 345^\circ + \cos 105^\circ$

For Exercises 59–60, use the sum-to-product formulas to verify the identity.

59. $\cos\left(\frac{\pi}{4}+t\right) - \cos\left(\frac{\pi}{4}-t\right) = -\sqrt{2}\sin t$

60. $\sin\left(\theta-\frac{\pi}{4}\right) + \sin\left(\theta+\frac{\pi}{4}\right) = \sqrt{2}\sin\theta$

For Exercises 61–62, verify the identity.

61. $\dfrac{\sin 4x - \sin 2x}{\cos 4x - \cos 2x} = -\cot 3x$

62. $\sin 3x + \sin 5x + \sin 8x = 4\sin 4x \cos\frac{5x}{2}\cos\frac{3x}{2}$

SECTION 6.5

For Exercises 63–70,

a. Write the solution set for the general solution.

b. Write the solution set on the interval $[0, 2\pi)$.

63. $4\sin x + 2\sqrt{3} = 0$

64. $4\sqrt{2} = 2\cos x + 3\sqrt{2}$

65. $3\sec^2 x = 4$

66. $3\cot^2 x - 1 = 0$

67. $7\sin 2x + 10 = 3$

68. $\cos 3x = -\frac{1}{2}$

69. $\tan\frac{x}{2} = 1$

70. $\sin\frac{x}{2} = \frac{\sqrt{3}}{2}$

For Exercises 71–88, solve the equations on the interval $[0, 2\pi)$.

71. $\cos\left(x+\frac{\pi}{4}\right) = -1$

72. $\tan\left(x-\frac{\pi}{2}\right) = \frac{\sqrt{3}}{3}$

73. $\sin\theta = \frac{1}{5}$

74. $\cos\theta = \frac{3}{4}$

75. $8\tan x + 3 = 0$

76. $4\cos x = -7$

77. $6\cos^2 x + 7\cos x - 5 = 0$

78. $6\csc^2 x + 11\csc x - 2 = 0$

79. $17\cos^2 x + 4\cos x - 1 = 0$

80. $10\sin^2 x - 3\sin x - 4 = 0$

81. $2\cos^2 x - 5\sin x + 1 = 0$

82. $\tan^2 x - 4\sec x + 5 = 0$

83. $\sin 2x + \cos x = 0$

84. $\sin x = \cos 2x$

85. $\cos\theta - \cos 3\theta = 0$

86. $\sin 2x + \sin 4x = 0$

87. $\cos x + 1 = \sin x$

88. $\cot x = \csc x + 1$

89. Use a graphing utility to solve the equation $\cos 3x = x^4$. Round the solutions to 4 decimal places.

ISTUDY

90. Use a graphing utility to solve the equation $\sin^2 x - x = 3$. Round the solution to 4 decimal places.

91. A beam of light traveling through air enters a diamond at an angle of incidence of 35°. Use Snell's law $n_1 \sin\theta_1 = n_2 \sin\theta_2$ to find the angle of refraction if the index of refraction of air is 1.00029 and the index of refraction of the diamond is 2.42. Round to the nearest tenth of a degree. (*Hint*: See Section 6.5, Exercises 93–94 on page 694.)

92. A researcher uses Snell's law $n_1 \sin\theta_1 = n_2 \sin\theta_2$ to determine if a large clear stone is a diamond, with a refractive index of 2.42, or a quartz crystal, with a refractive index of 1.54. If the angle of incidence of a laser beam is 75° and the angle of refraction is 23.5°, is the stone more likely to be diamond or quartz? Take the refraction index of air to be 1.00029.

93. The monthly sales of a math textbook follow a periodic cycle with sales peaking in January and September. The monthly sales total S (in \$100) is given by

$$S(t) = 30 \sin\left(\frac{\pi}{4}t + \frac{\pi}{4}\right) + 75$$

where t is the month number ($t = 1$ corresponds to January).

a. Write the range of this function in interval notation.

b. In which months, between 1 and 12 inclusive, are the sales \$7500?

CHAPTER 6 Test

For Exercises 1–2, simplify the expression.

1. $\dfrac{1}{\cot^2\theta + 1} + \dfrac{1}{\tan^2\theta + 1}$

2. $\cos\left(x + \dfrac{\pi}{6}\right) + \cos\left(x - \dfrac{\pi}{6}\right)$

For Exercises 3–8, verify the identity.

3. $(\sin\theta - \cos\theta)(\sec\theta + \csc\theta) = \tan\theta - \cot\theta$

4. $\dfrac{\cot x - \tan x}{\cot x + \tan x} = \cos 2x$

5. $\dfrac{\sin 7x - \sin 5x}{\cos 7x + \cos 5x} = \tan x$

6. $\dfrac{\sin^3 x - \cos^3 x}{\sin x - \cos x} = \dfrac{1}{2}\sin 2x + 1$

7. $4\cos^2\dfrac{x}{2} + 2\sin^2\dfrac{x}{2} - 3 = \cos x$

8. $\dfrac{1 - \cos x}{1 + \cos x} = (\csc x - \cot x)^2$

9. Write $\sqrt{144 - x^2}$ as a function of θ by making the substitution $x = 12\sin\theta$ for $0 < \theta < \dfrac{\pi}{2}$.

10. Write $8\cos x - 15\sin x$ in the form $k\sin(x + \alpha)$ for $0 \le \alpha < 2\pi$. Round α to 3 decimal places.

11. Write $\cos^2 x + 3\sin^4 x$ in terms of first powers of cosine.

For Exercises 12–17, find the exact value.

12. $\sin 250° \cos 10° - \cos 250° \sin 10°$

13. $\tan\dfrac{\pi}{12}$

14. $\cos\left(\arctan 3 + \arcsin\dfrac{4}{5}\right)$

15. $\cos 105°$

16. $\sin\dfrac{17\pi}{24}\sin\dfrac{\pi}{24}$

17. $\sin 555° + \sin 105°$

18. Find the exact value for $\tan(\alpha + \beta)$ given $\sin\alpha = \dfrac{24}{25}$ for α in Quadrant II and $\cos\beta = \dfrac{3\sqrt{73}}{73}$ for β in Quadrant IV.

19. Given $\sin\theta = \dfrac{2\sqrt{5}}{5}$ and θ in Quadrant II, find the exact function values.

a. $\sin 2\theta$ **b.** $\cos 2\theta$ **c.** $\tan 2\theta$

20. Given $\tan\theta = \dfrac{15}{8}$ and $\pi < \theta < \dfrac{3\pi}{2}$, find the exact function values.

a. $\sin\dfrac{\theta}{2}$ **b.** $\cos\dfrac{\theta}{2}$ **c.** $\tan\dfrac{\theta}{2}$

For Exercises 21–22,

a. Write the solution set for the general solution.

b. Write the solution set on the interval $[0, 2\pi)$.

21. $\sqrt{3}\tan x + 5 = 6$ **22.** $2\cos 2x = \sqrt{2}$

For Exercises 23–30, solve the equation on the interval $[0, 2\pi)$.

23. $2\cos^3 x - \cos x = 0$

24. $6\csc^2 x - 17\csc x + 10 = 0$

25. $6\sin^2 x - 5\cos x - 2 = 0$

26. $2\sin^2 2x - \sin 2x - 1 = 0$

27. $18\cos^2 x + 3\cos x - 4 = 0$

28. $\cot\left(x - \dfrac{\pi}{4}\right) = \sqrt{3}$

29. $8\sin x + 5 = 0$

30. $\sin x + \sin 3x - \sin 2x = 0$

31. Use a graphing utility to solve $\sin 2x = 3x^3$. Round the solutions to 4 decimal places.

ISTUDY

32. For a projectile launched from ground level at an angle of elevation θ with an initial velocity v_0, the maximum horizontal range is given by $x_{\max} = \dfrac{{v_0}^2 \sin 2\theta}{g}$, where g is the acceleration due to gravity ($g = 32$ ft/sec^2 or $g = 9.8$ m/sec^2). If a toy rocket is launched from the ground with an initial velocity of 50 ft/sec and lands 73 ft from the launch point, find the angle of elevation of the rocket at launch. Round to the nearest tenth of a degree.

CHAPTER 6 Cumulative Review Exercises

For Exercises 1–8, solve the equations and inequalities. Write the solution set to inequalities in interval notation. Solve trigonometric equations on the interval $[0, 2\pi)$.

1. $5 + 3|2x - 1| = 6$

2. $4x^4 + 3x^2 - 1 = 0$

3. $4\sin^4 x + 3\sin^2 x - 1 = 0$

4. $4x^2 + 3x - 1 \geq 0$

5. $4x^2 + 3x - 1 < 0$

6. $\sqrt{x + 2} - 2x = 1$

7. $16^{x^2 - 1} = \left(\frac{1}{8}\right)^{x + 1}$

8. $\ln 2x + \ln(2x + 1) - \ln(1 - x) = 0$

9. Given $P(x) = 4x^4 + 3x^3 + 15x^2 + 12x - 4$

a. Use synthetic division to show that $x = 2i$ is a zero of the polynomial.

b. Use the result from part (a) to factor the polynomial completely.

10. Given $L(x) = -\frac{2}{3}x + 5$

a. Find the equation of a line perpendicular to L that passes through the point $(-1, 3)$

b. Find the equation of a line parallel to L that has an undefined slope.

11. Determine if the function is even, odd, or neither.

a. $f(x) = 6x^4 + 7|x|$

b. $g(x) = 6x^4 + 7x$

c. $h(x) = 6x^3 + 7x$

d. $r(x) = \cos x + \sec x$

e. $t(x) = x^2 \sin x$

For Exercises 12–15, write the domain and range of each function in interval notation.

12. $f(x) = (x - 2)^2(x + 2)^2$

13. $g(x) = -2\sin 4x$

14. $h(x) = 3 + \sqrt{x - 2}$

15. $r(x) = \sin^{-1} x$

16. Given $y = \dfrac{2x^2}{2x^2 - x - 3}$

a. Identify the asymptotes.

b. Determine if the graph crosses the horizontal asymptote.

17. Given $f(x) = \log_3 x$,

a. Write the domain and range in interval notation.

b. Write an equation of the asymptote.

c. Find the intercepts.

d. Determine the intervals over which f is increasing, decreasing, and constant.

For Exercises 18–19, verify the identity.

18. $\cot^2\theta - \cos^2\theta = \cot^2\theta\cos^2\theta$

19. $\sin 2x \cos x - \cos 2x \sin x = \sin x$

20. Given the right triangle, find a and b.

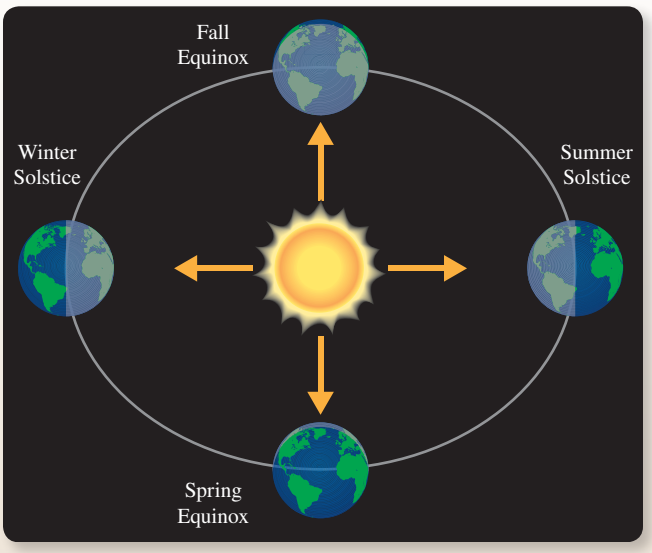
7.3 The Law of Cosines 731

Problem Recognition Exercises: Solving Triangles Using a Variety of Tools 742

7.4 Harmonic Motion 743

The study of trigonometry helps us understand the cycles in many naturally occurring phenomena. One such example is the sinusoidal change in the angle of the Sun at different times during the year.

The Earth's axis is tilted 23.5° relative to the plane of its orbit around the Sun. This combined with the Earth's revolution around the Sun causes the seasons. At the summer solstice, the Earth is at a position in its orbit where the tilt of the Earth results in the greatest amount of sunlight in the northern hemisphere. The Sun appears higher in the sky on this day than on any other day of the year. At the winter solstice, the reverse is true. The Earth is positioned so that the least amount of sunlight hits the northern hemisphere, and the path of the Sun in the sky is at its lowest. This is the first day of winter and the shortest day of the year.



For a point on the Earth at a given latitude α, the angle of elevation of the Sun at noon in the northern hemisphere varies sinusoidally between $90° - \alpha - 23.5°$ (winter low) and $90° - \alpha + 23.5°$ (summer high). For this reason, a sine or cosine model can be used to track the angle of elevation of the Sun in the sky and the length of daylight for any point on the Earth (Exercises 59–60 in Section 7.4).

SECTION 7.1 Applications of Right Triangles

OBJECTIVES

1. Solve a Right Triangle
2. Solve Applications of Right Triangles
3. Compute the Bearing of an Object

1. Solve a Right Triangle

In Section 5.2, we introduced the trigonometric functions as functions of acute angles of a right triangle. We saw immediate applications in finding the measures of the angles and sides of a right triangle when two sides or a side and an angle are known. This is called **solving a right triangle.** In this section, we revisit this concept. Then in Sections 7.2 and 7.3, we expand our study to solve *oblique* triangles (triangles that do not contain a right angle).

As a labeling convention, we will use capital letters to label the vertices of a triangle. The same letters in lowercase will be used to denote the lengths of the sides opposite the corresponding vertices. Thus, ΔABC has sides of length a, b, and c, opposite angles A, B, and C, respectively (Figure 7-1).

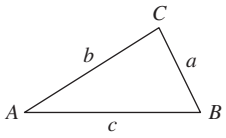


Figure 7-1

EXAMPLE 1 Solving a Right Triangle

Solve the right triangle given in Figure 7-2. Round the lengths of the sides to 1 decimal place.

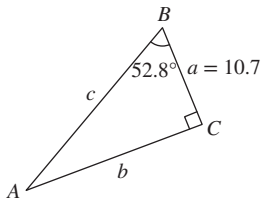

Figure 7-2

Solution:

We begin by noting that $B = 52.8°$, $C = 90°$, and $A + B + C = 180°$.

Therefore, $A + 52.8° + 90° = 180°$

$$A = 37.2°$$

To find b, we need to establish a relationship between a known angle and the known side a.

$$\tan 52.8° = \frac{b}{10.7} \Rightarrow b = 10.7 \tan 52.8° \approx 14.1$$

To find c, we establish a relationship between a known angle and side a.

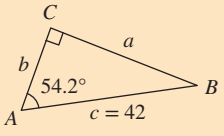
$$\cos 52.8° = \frac{10.7}{c} \Rightarrow c = \frac{10.7}{\cos 52.8°} \approx 17.7$$

Since ΔABC is a right triangle, its sides must satisfy the Pythagorean theorem. Therefore to double-check, we have

$$a^2 + b^2 = c^2$$
$$(10.7)^2 + (14.1)^2 \stackrel{?}{=} (17.7)^2$$
$$313.3 \approx 313.29 \checkmark$$

In summary, $A = 37.2°$, $B = 52.8°$, $C = 90°$, $a = 10.7$, $b \approx 14.1$, and $c \approx 17.7$.

Skill Practice 1 Solve the right triangle. Round the lengths of the sides to 1 decimal place.



Avoiding Mistakes

In Example 1, after finding the length of side b, you can use it to find the length of c by applying the relationship $\sin 52.8° = \frac{14.1}{c}$. However, the length of side b was rounded. Using a rounded value in further calculations potentially compounds the error. Therefore, we recommend using relationships involving the given information (in this case, angle B and side a) rather than the computed information.

Answer

1. $A = 54.2°$, $B = 35.8°$, $C = 90°$, $a \approx 34.1$, $b \approx 24.6$, $c = 42$

2. Solve Applications of Right Triangles

Historically, trigonometry was developed to measure distances that were difficult or impossible to measure directly. We examine such scenarios in Examples 2 and 3.

EXAMPLE 2 Computing Distances in an Application

A beachgoer flies a kite on a windy day. When the spool of string is held at a height of 4 ft above the ground, the string makes an angle of 42° from the horizontal. If 120 ft of string is out and the sag in the string is negligible, find the height of the kite to the nearest foot.

Solution:

A sketch of this scenario is given in Figure 7-3. ΔABC is a right triangle, and the height of the kite is 4 ft + a. To solve for a, notice that a is the side opposite the given angle, and that $c = 120$ ft is the length of the hypotenuse. Therefore,

$$\sin 42° = \frac{a}{120} \Rightarrow a = 120 \sin 42° \approx 80$$

The height of the kite is 4 ft + 80 ft = 84 ft.

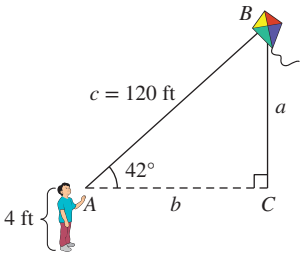


Figure 7-3

Skill Practice 2 A 40-ft ladder on a fire truck leans against a burning building such that the top of the ladder makes an angle of 20° with the building. If the bottom of the ladder is anchored to the top of the fire truck 6 ft off the ground, how far above ground does the ladder reach? Round to the nearest tenth of a foot.

EXAMPLE 3 Computing Distances in an Application

A mathematics enthusiast visiting London wants to know the diameter of the clock face on Big Ben. She stands 200 ft down the road from the tower. Then from an eye level of 5 ft, she measures the angle of elevation to the bottom of the clock face at 42° and the angle of elevation to the top of the clock face at 45.4°. Find the diameter of the clock face to the nearest foot.

Kevin Burke/Passage Unreleased/Getty Images

Solution:

Figure 7-4 reveals that the diameter of the clock face is given by $h_2 - h_1$. From the lower right triangle,

$$\tan 42° = \frac{h_1}{200} \Rightarrow h_1 = (200) \tan 42° \approx 180$$

From the larger right triangle,

$$\tan 45.4° = \frac{h_2}{200} \Rightarrow h_2 = (200) \tan 45.4° \approx 203$$

Therefore, the diameter of the clock face is $h_2 - h_1 \approx 203$ ft $- 180$ ft ≈ 23 ft.

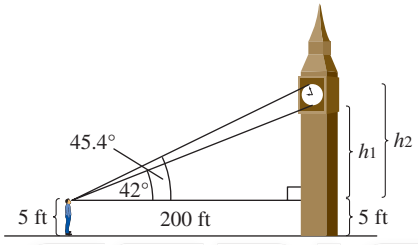

Figure 7-4

Answer
2. 43.6 ft

ISTUDY

Skill Practice 3 From an eye level of 6 ft, an observer standing 30 ft away from a building sights the bottom of a window at an angle of elevation of 6.1°. The observer sights the top of the window at an angle of elevation of 20.1°. Find the vertical dimension of the window. Round to the nearest tenth of a foot.

In Example 4, we use the inverse trigonometric functions to find the measure of an unknown angle in an application.

EXAMPLE 4 Computing an Angle in a Construction Application

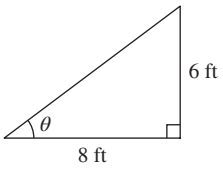
Find the pitch angle of the roof to the nearest tenth of a degree.

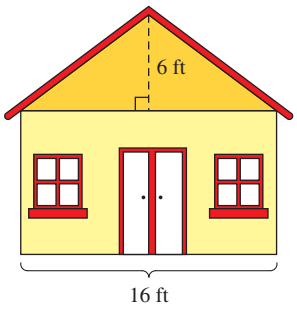
Solution:

The pitch angle is the angle that the roof makes with the horizontal. Using either right triangle formed by the 6-ft altitude and half the width of the house we have

$$\tan\theta = \frac{6}{8}$$

$$\theta = \tan^{-1}\frac{6}{8} \approx 36.9°$$



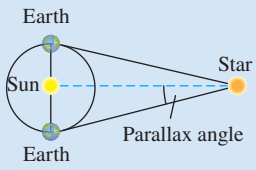


The pitch angle of the roof is approximately 36.9°.

Skill Practice 4 A straight hiking trail is 2500 ft long with a gain in altitude of 310 ft. To the nearest degree, what is the average angle of ascent?

Point of Interest

In Examples 2–4, we used trigonometry to determine distances and angles that are difficult to measure directly. One distance impossible for us to measure directly is the distance between the Earth and a star. Astronomers use an indirect method called the method of parallax. They measure the angle represented by the apparent displacement of a star caused by the change in the position of an observer on Earth. This is done at a 6-month interval when the Earth is at opposite points in its orbit around the Sun. Then using the right triangle formed by the star, Earth, and Sun, astronomers can calculate the distance from the Earth to the star (see Exercises 31–32).

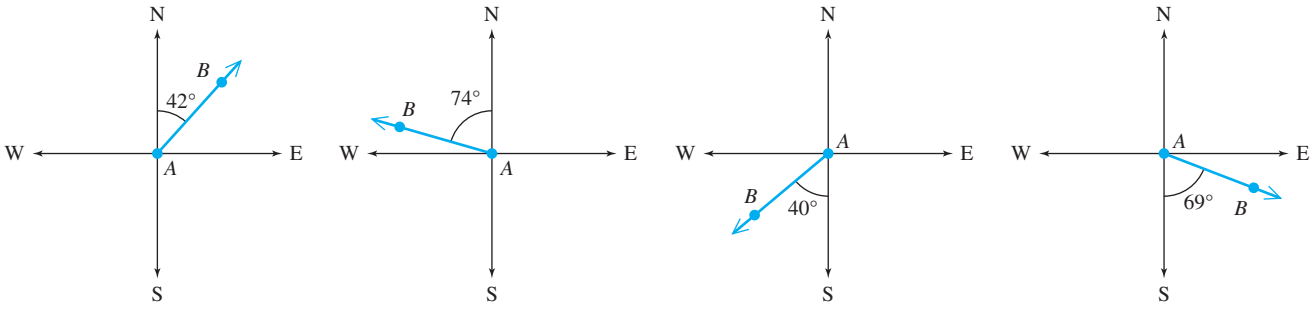


You can simulate parallax by holding your index finger at arm's length in front of your face. View your finger with one eye open and the other eye closed. Then alternate. Your finger will seem to move relative to objects in the background. This demonstrates parallax.

3. Compute the Bearing of an Object

In navigation and surveying applications, the term *bearing* is used to convey the angular relationship from one point to another. The **bearing** from point A to point B is the degree measure of the acute angle formed by ray $\overrightarrow{AB}$ and the north-south line. Figure 7-5 provides four examples of the bearing from A to B.

Answers
3. 7.8 ft
4. 7°



(a) N42°E (b) N74°W (c) S40°W (d) S69°E

Figure 7-5

Notice that a bearing is denoted by the letter N or S (north or south), followed by the measure of the angle in degrees, followed by the letter E or W (east or west). For example, a ship bearing S40°W is heading in a southwesterly direction. Specifically, the ship is traveling 40° to the west of due south.

EXAMPLE 5 Finding and Interpreting Bearing

Refer to Figure 7-6.

a. Find the bearing from O to C.
b. Find the bearing from O to B.
c. Find the bearing from A to O.

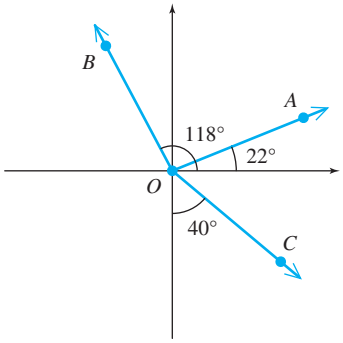


Figure 7-6

Solution:

a. Ray $\overrightarrow{OC}$ is directed 40° to the east of due south.

Therefore, the bearing from O to C is S40°E.

b. Ray $\overrightarrow{OB}$ is directed $118° - 90° = 28°$ to the west of due north.

Therefore, the bearing from O to B is N28°W.

c. To find the bearing from A to O, we need to find the acute angle between ray $\overrightarrow{AO}$ and the north-south line.

It is helpful to sketch a coordinate system with origin at the initial point of the ray (Figure 7-7).

Ray $\overrightarrow{AO}$ is directed $90° - 22° = 68°$ to the west of due south.

Therefore, the bearing from A to O is S68°W.

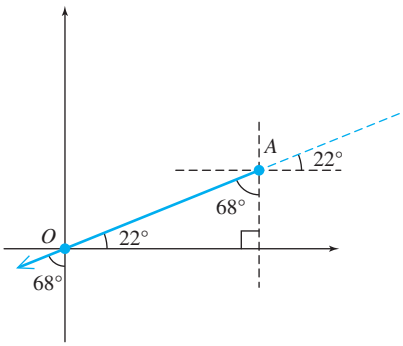

Figure 7-7

TIP Remember that bearing is always measured from the north-south line. Therefore, the letter N or S is written first.

Skill Practice 5 Refer to Figure 7-6.

a. Find the bearing from C to O.
b. Find the bearing from B to O.

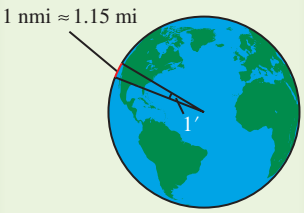
Answers

5. a. N40° W **b.** S28° E

ISTUDY

TIP One nautical mile (1 nmi) is defined as the distance along any meridian through 1′ of latitude. A circle has 360° and 60′ per degree. Thus, 1 nmi is the circumference of the Earth divided by (360)(60).

$$1 \text{ nmi} = \frac{24{,}860 \text{ mi}}{(360)(60)} \approx 1.15 \text{ mi}$$



The unit of nautical miles is often used in navigation for ships and planes. The related unit of speed is 1 nautical mile per hour or 1 knot.

EXAMPLE 6 Interpreting Bearing

A plane leaves an airport heading S32°W at 320 knots (nautical miles per hour). Determine the number of nautical miles (nmi) south and the number of nautical miles west that the plane travels in 1.2 hr. Round to the nearest nautical mile.

Solution:

First sketch the path of the plane from the airport A to a point P, 1.2 hr after take-off (Figure 7-8). After 1.2 hr, the number of nautical miles traveled from A to P is

$$AP = (320 \text{ knots})(1.2 \text{ hr}) = 384 \text{ nmi}$$

The distance that the plane flies south is the vertical leg of ΔAPB, and the distance that the plane flies west is the horizontal leg of ΔAPB.

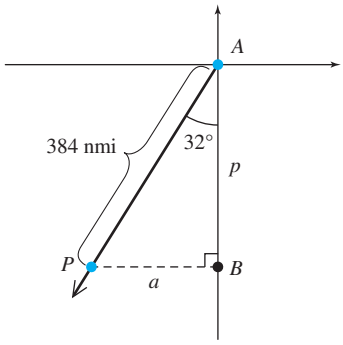


Figure 7-8

$$\text{Distance south: } \cos 32° = \frac{p}{384} \Rightarrow p = 384 \cos 32° \approx 326 \text{ nmi}$$

$$\text{Distance west: } \sin 32° = \frac{a}{384} \Rightarrow a = 384 \sin 32° \approx 203 \text{ nmi}$$

Skill Practice 6 A boat leaves a dock heading N27°W at 6 knots (nautical miles per hour). Determine the number of nautical miles (nmi) north and the number of nautical miles west that the boat travels in 0.5 hr. Round to the nearest tenth of a nautical mile.

EXAMPLE 7 Computing Bearing

A boat leaves a marina heading N52°E at 6 mph. After 1 hr, the boat makes a 90° counterclockwise turn to a new bearing of N38°W. If the boat travels this new course for 2 hr,

a. Find the boat's distance from the marina to the nearest tenth of a mile.

b. To a tenth of a degree, find the bearing required for the boat to return to the marina.

Solution:

a. The distance that the boat travels during the first hour is (6 mph)(1 hr) = 6 mi.

The distance that the boat travels for the last 2 hr is (6 mph)(2 hr) = 12 mi.

Since the boat makes a 90° turn, the path of the boat forms two legs of a right triangle. The length of the hypotenuse is the distance a from the boat to the marina (Figure 7-9). Using the Pythagorean theorem,

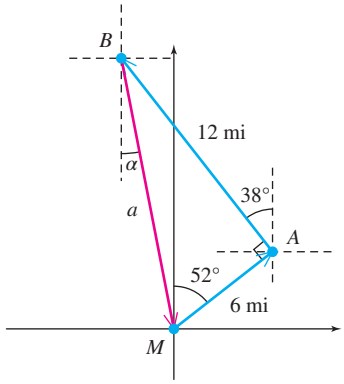

Figure 7-9

$$a^2 = (6)^2 + (12)^2$$

$$a = \sqrt{(6)^2 + (12)^2} = \sqrt{180} = 6\sqrt{5} \approx 13.4$$

The boat is approximately 13.4 mi from the marina.

Answer

6. 2.7 nmi north and 1.4 nmi west

b. To find the bearing from the boat to the marina we need to find the acute angle formed by ray $\overrightarrow{BM}$ and the north-south line. This is labeled α. To find α, our strategy is to find the measure of angle M in ΔBMA and subtract 52°. That is, $\alpha = M - 52°$.

We have $\tan M = \frac{12}{6} \Rightarrow M = \tan^{-1} 2 \approx 63.4°$.

Therefore, $\alpha = 63.4° - 52° = 11.4°$.

The boat should follow a bearing of S11.4°E to return to the marina.

Skill Practice 7 A plane leaves an airport heading S50°E at 450 mph. After 2 hr, the plane makes a 90° clockwise turn to a new bearing of S40°W. If the plane travels this new course for $\frac{1}{2}$ hr,

a. Find the plane's distance from the airport to the nearest mile.

b. To the nearest degree, find the bearing from the airport to the plane.

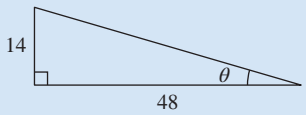
Answers
7. a. 928 mi **b.** S36°E

SECTION 7.1 Practice Exercises

Prerequisite Review

R.1. In a right triangle, one leg measures 15 ft and the hypotenuse measures 25 ft. Find the length of the missing side.

R.2. Find the exact values of the six trigonometric functions for the angle θ.

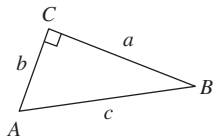


Concept Connections

For Exercises 1–2, refer to triangle *ABC*.

1. If the lengths of sides a and b are known, the inverse _____ or _____ function can be used directly to find the value of angle A.

2. The measure of angle B and the length of side c can be used along with which trigonometric functions to find the length of side a?



3. If the bearing from A to C is N12°E, what is the bearing from C to A?

4. The acute angle used to express the bearing between two points is measured relative to the (north-south or east-west) line.

Objective 1: Solve a Right Triangle

For Exercises 5–12, given right triangle *ABC*, determine if the expression is true or false.

5. $\cot B = \frac{a}{b}$

6. $\sin^{-1}\frac{a}{b} = A$

7. $\csc B = \frac{c}{a}$

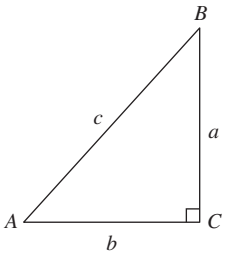
8. $\sec A = \frac{c}{b}$

9. $\cos^{-1}\frac{a}{c} = B$

10. $A + B = 90°$

11. $c^2 - b^2 = a^2$

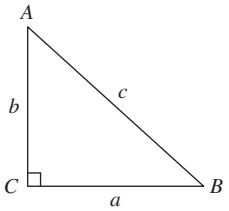
12. $\tan A = \frac{b}{a}$



ISTUDY

Note: ***Due to round-off error, the answers to exercises involving calculations to determine unknown angles and sides may differ slightly from those given.***

For Exercises 13–18, solve the right triangle for the unknown sides and angles. Round values to 1 decimal place if necessary. (See Example 1)



13. $B = 24°$, $c = 18$

14. $A = 28°$, $c = 15$

15. $a = 10$, $b = 7$

16. $a = 2$, $b = 8.6$

17. $A = 38.2°$, $b = 17.8$

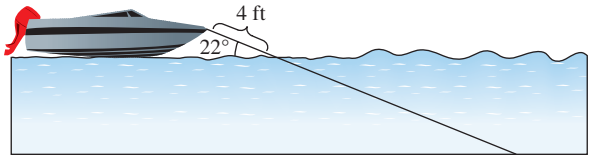
18. $A = 25.6°$, $a = 34$

Objective 2: Solve Applications of Right Triangles

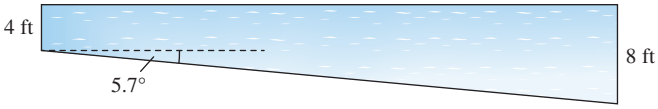
19. A boat is anchored off Elliot Key, Florida. From the bow of the boat, 36 ft of anchor line is out with 4 ft of line above the water. The angle that the line makes with the water line is 22°. **(See Example 2)**

a. How deep is the water? Round to the nearest foot.

b. What is the horizontal distance between the anchor and the bow of the boat? Round to the nearest foot.



20. A swimming pool has a depth of 4 ft at the shallow end and 8 ft at the deep end. The bottom of the pool slopes downward at an angle of 5.7°. How long is the pool? Round to the nearest foot.



21. An airplane climbs at an angle of 11° at an average speed of 420 mph. How long will it take for the plane to reach its cruising altitude of 6.5 mi? Round to the nearest minute.

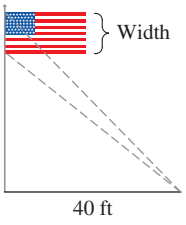
22. An airplane begins its descent with an average speed of 240 mph at an angle of depression of 4°. How much altitude will the plane lose in 5 min? Round to the nearest tenth of a mile.

23. A railroad bridge over New Scotland Road in Slingerlands, New York, has a low clearance for trucks. An engineer standing 20 ft away measures a 15.4° angle of elevation from an eye level of 5.5 ft to the bottom of the bridge. If the road is flat between the engineer and the bridge, how high over the roadway is the bottom of the bridge? Round to the nearest inch.

24. At 11:30 A.M. the angle of elevation of the Sun for Washington, D.C., is 55.7°. If the height of the Washington monument is approximately 555 ft, what is the length of the shadow it will cast at that time? Round to the nearest foot.

25. The suggested size for a United States flag is often determined by the height of the flagpole from which it will fly. Federal recommendations on flag size for flagpole heights are provided in the table. (www.publications.usa.gov)

Flagpole height (ft)	Flag size (ft)
25	5 by 8
40	6 by 10
60	10 by 15
125	20 by 30



Measurements taken 40 ft from the base of a flagpole show the angle of elevation to the top of the flagpole to be 56.3° and the angle of elevation to the bottom of the flag to be 51.3°. **(See Example 3)**

a. Determine the height of the flagpole. Round to the nearest foot.

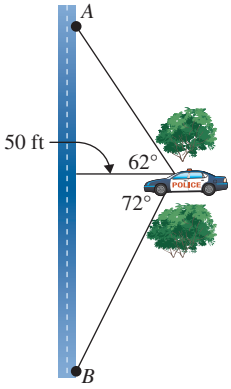
b. Determine the vertical width of the flag. Round to the nearest foot.

c. What other information is needed to determine if the display conforms to the federal guidelines?

26. Roberto has plans to build a tree house in a large oak tree in his backyard. He takes measurements from the ground and uses trigonometry to estimate how tall the tree house can be. Twenty feet from the base of the tree, Roberto measures a 26.6° angle of elevation to the proposed bottom of the tree house and a 42° angle of elevation to the proposed top of the tree house. If Roberto is 6 ft tall, will there be enough room for him to stand inside the tree house?

ISTUDY

27. A police officer hiding between two bushes 50 ft from a straight highway sights two points A and B. The angle from the police car to A is 62°, and the angle to point B is 72°.



a. Find the distance between A and B. Round to the nearest foot.

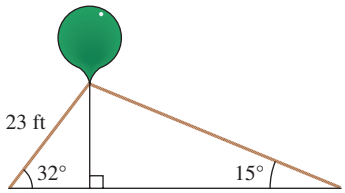
b. Suppose that a motorist takes 2.7 sec to pass from A to B. Using the rounded distance from part (a), find the motorist's speed in ft/sec. Round to 1 decimal place.

c. Determine the motorist's speed in mph. Round to the nearest mph.

28. A large weather balloon is tethered by two ropes. One rope measures 23 ft and attaches to the balloon at an angle of 32° from the ground. The second rope attaches to the base of the balloon at an angle of 15° with the ground.

a. How far from the ground is the balloon floating? Round to the nearest tenth of a foot.

b. Find the length of the second rope. Round to the nearest tenth of a foot.

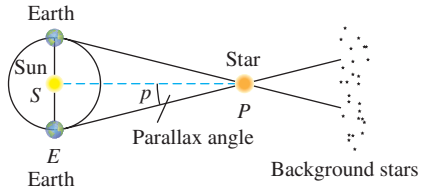


c. If both ropes suddenly detach and the balloon rises straight up at a rate of 3 ft/sec, how long will it take the balloon to reach a height of 50 ft from the ground? Round to the nearest tenth of a second.

29. The Duquesne Incline is a century-old railroad scaling Mt. Washington in Pittsburgh's south side neighborhood. The incline is 244 m long and rises 120 m in elevation. What is the angle of the incline to the nearest tenth of a degree? **(See Example 4)**

30. The Jackson Hole Aerial Tram takes passengers from an elevation of 6311 ft to an elevation of 10,450 ft up the slope of Rendezvous Mountain in Wyoming. If the tram runs on a cable measuring 12,463 ft in length, what is the angle of incline of the tram to the nearest tenth of a degree?

To approximate the distance from the Earth to stars relatively close by, astronomers often use the method of parallax. Parallax is the apparent displacement of an object caused by a change in the observer's point of view. As the Earth orbits the Sun, a nearby star will appear to move against the more distant background stars. Astronomers measure a star's position at times exactly 6 months apart when the Earth is at opposite points in its orbit around the Sun. The Sun, Earth, and star form the vertices of a right triangle with $\angle PSE = 90°$. The length of $\overline{SE}$ is the distance between the Earth and Sun, approximately 92,900,000 mi. The parallax angle (or simply parallax**) is denoted by p. Use this information for Exercises 31–32.**



31. **a.** Find the distance between the Earth and Proxima Centauri (the closest star to the Earth beyond the Sun) if the parallax angle is 0.772″ (arcseconds). Round to the nearest hundred billion miles.

b. Write the distance in part (a) in light-years. Round to 1 decimal place. (*Hint*: 1 light-year is the distance that light travels in 1 yr and is approximately 5.878×10^{12} mi.)

32. **a.** Find the distance between the Earth and Barnard's Star if the parallax angle is 0.547 arcseconds. Round to the nearest hundred billion miles.

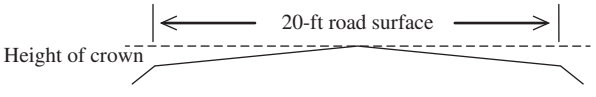
b. Write the distance in part (a) in light-years. Round to 1 decimal place. (*Hint*: 1 light-year is the distance that light travels in 1 yr and is approximately 5.878×10^{12} mi.)

33. A sewer line must have a minimum slope of 0.25 in. per horizontal foot but not more than 3 in. per horizontal foot. A slope less than 0.25 in. per foot will cause drain clogs, and a slope of more than 3 in. per foot will allow water to drain without the solids.

a. To the nearest tenth of a degree, find the angle of depression for the minimum slope of a sewer line.

b. Find the angle of depression for the maximum slope of a sewer line. Round to the nearest tenth of a degree.

34. In order for gravel roads to have proper drainage, the highest point on the road (the crown) should slope downward on either side to the shoulders of the road. EPA guidelines for maintaining gravel roads with a low volume of traffic suggest that a 20-ft wide road should have a centerline crown that is 5 to 7 in. high. (*Source*: http://water.epa.gov)

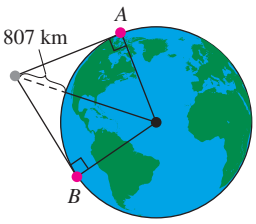


a. To the nearest tenth of a degree, find the angle of depression for a 5-in. centerline crown.

b. To the nearest tenth of a degree, find the angle of depression for a 7-in. centerline crown.

ISTUDY

35. The weather satellite NOAA-15 orbits the Earth every 101 min at an altitude of 807 km as shown in the figure. The cameras on the satellite have a maximum range defined by the set of lines tangent to the Earth from the satellite. Using the radius of the Earth as 6357 km, approximate the length of the arc from A to B to the nearest kilometer. This is the maximum distance along the surface of the Earth "seen" by the satellite's cameras.



36. A communications satellite is in geosynchronous orbit. This means that its orbit coincides with the rotation period of the Earth so that it remains above a fixed point on the surface of the Earth at all times. The altitude of the satellite is 35,786 km. The sender and receiver of a signal must both be within the line of sight of the satellite. What is the maximum distance along the surface of the Earth for which the sender and receiver can communicate? Take the radius of the Earth to be 6357 km and round to the nearest kilometer.

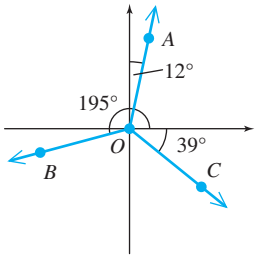
Objective 3: Compute the Bearing of an Object

37. a. Find the bearing from O to A. (**See Example 5**)

b. Find the bearing from O to B.

c. Find the bearing from O to C.

d. Find the bearing from C to O.

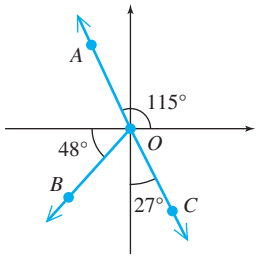


38. a. Find the bearing from O to A.

b. Find the bearing from O to B.

c. Find the bearing from O to C.

d. Find the bearing from A to O.

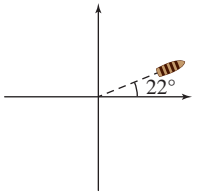


For Exercises 39–42, make a sketch to illustrate the bearing.

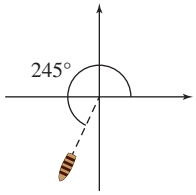
39. N45°W **40.** S10°W **41.** S67°E **42.** N75°E

For Exercises 43–46, find the bearing of the ship. Round to the nearest tenth of a degree if necessary.

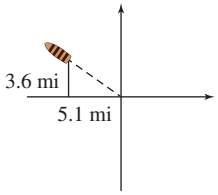
43.



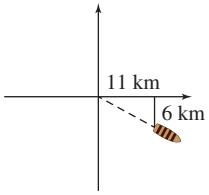
44.



45.



46.



For Exercises 47–50, find the bearing to the nearest tenth of a degree.

47. A runner jogs 5 mi east then 2 mi south. What is the bearing from the starting point?

48. A cyclist rides west for 7 mi and then north 10 mi. What is the bearing from the starting point?

49. A boat leaves Matheson Hammock Marina at a constant speed of 3.5 mph. The boat travels south for 36 min and then east for 24 min to a favorite fishing spot. After a day of fishing, find the bearing that the captain should use to travel back to the marina.

50. A plane leaves Atlanta's Hartsfield Airport and flies north for 1 hr and west for 2 hr at an average speed of 400 mph. Find the bearing that the plane should take for the return trip.

For Exercises 51–54, round answers to the nearest unit.

51. A fishing boat leaves a dock at a bearing of N34°E. After running for 1.4 hr at 25 mph, how far north and east has it traveled? (**See Example 6**)

52. A helicopter takes off from the roof of a building and travels at 100 mph on a bearing of S53°E. The flight takes 3.2 hr. How far south and how far east has the helicopter traveled?

53. An airplane flying 310 knots has a bearing of S44°W. After flying for 2.4 hr, how many nautical miles (nmi) south and west has it traveled?

54. A ship traveling 6.4 knots has a bearing of N11°W. After 3 hr, how many nautical miles (nmi) north and west has it traveled?

55. A ship leaves port at 8 knots heading N27°W. After 2 hr it makes a 90° clockwise turn to a new bearing of N63°E and travels for 1.4 hr. (**See Example 7**)

a. Find the ship's distance from port to the nearest tenth of a nautical mile.

b. Find the bearing required for the ship to return to port. Round to the nearest degree.

56. A plane leaves an airport heading S82°E at 320 mph. After 1.2 hr, it makes a 90° counterclockwise turn to a new bearing of N8°E and travels for 45 min.

a. Find the plane's distance from the airport to the nearest mile.

b. Find the bearing required for the plane to return to the airport. Round to the nearest degree.

ISTUDY

57. A boat leaves a dock at a bearing of N42°W and travels 24 mph for 1 hr. The boat then makes a 90° left turn and travels 8 mi to its destination.

a. Find the exact distance from the dock to the boat's destination.

b. Find the bearing required to locate the boat from the dock. Round to the nearest degree.

58. A runner leaves the starting point of a race and heads N10°W at 6.3 mph. After running for 20 min, the runner makes a 90° right turn and runs 3 more miles at a speed of 6.8 mph.

a. Find the total time of the run to the nearest minute.

b. Find the bearing required to locate the runner from the starting point. Round to the nearest degree.

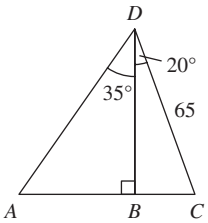
Mixed Exercises

For Exercises 59–60, find the lengths of the sides to the nearest tenth of a unit and the measures of the angles to the nearest tenth of a degree if necessary.

59. $A =$ _____ $C =$ _____

$AB =$ _____ $BC =$ _____

$AD =$ _____ $DB =$ _____

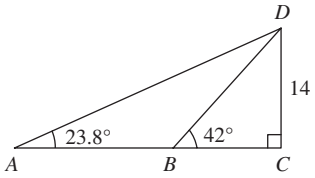


60. $\angle ADC =$ _____ $\angle ADB =$ _____

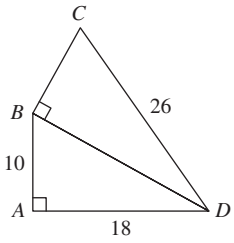
$\angle BDC =$ _____ $BC =$ _____

$AC =$ _____ $AD =$ _____

$BD =$ _____ $AB =$ _____



61. Find the measures of the sides and angles. Round angle measures to the nearest tenth of a degree. Give exact answers for the lengths of sides.



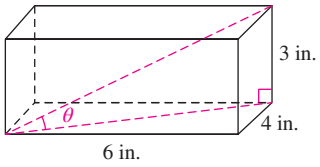
$\angle ADC =$ _____,

$\angle CBA =$ _____,

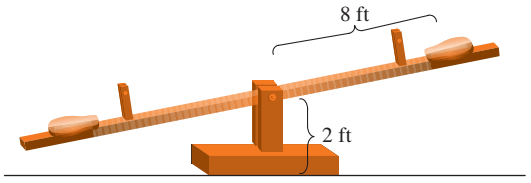
$\angle DCB =$ _____,

$BD =$ _____, $BC =$ _____

62. A rectangular prism measures 6 in. by 4 in. by 3 in. Find the angle θ formed by the diagonal of the prism and the diagonal of the base, as shown. Round to 1 decimal place.



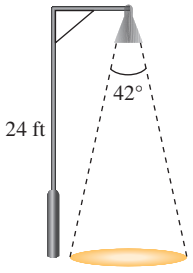
63. Two children sit on either end of an 18-ft teeter totter. The center of the teeter totter is 2 ft off the ground, and the position of each child is 8 ft from the center.



a. When one end of the teeter totter is on the ground, find the angle that the teeter totter makes with the ground. Round to the nearest tenth of a degree.

b. When one end of the teeter totter is on the ground, how high is the child's seat at the other end? Round to 1 decimal place.

64. A light fixture mounted 24 ft above the ground illuminates a cone of light with an angle of 42° at the top.



a. What is the radius of the circle of light on the ground? Round to 1 decimal place.

b. How many square feet will be lit on the ground? Round to the nearest whole unit.

ISTUDY

For Exercises 65–66, refer to the table giving the angle of the Sun at noon at the first day of each season based on the latitude of the observer in the northern hemisphere. The term 23.5° represents the tilt of the Earth to the ecliptic plane (plane of the Earth's orbit around the Sun).

Date	Sun's angle at noon
First day of spring: March equinox	90° – latitude
First day of fall: September equinox	90° – latitude
First day of summer: Summer solstice	90° – latitude + 23.5°
First day of winter: Winter solstice	90° – latitude – 23.5°

65. In 1987, a group of protesters led by Jacqueline Kennedy Onassis defeated a plan to build two high rises that would have blocked sunlight to a significant swath of New York City's Central Park. Eventually the design was scaled down and the buildings' height reduced from approximately 1020 ft to what is now the Time Warner Center at 750 ft.

a. The latitude of New York City is 40.7° N. Find the angle of elevation of the Sun at noon on the winter solstice (shortest day of the year).

b. At noon on the winter solstice, how long is the shadow cast by a 1020-ft building?

c. At noon on the winter solstice, how long is the shadow cast by a 750-ft building?

66. The Earth is tilted 23.5° on its axis. Therefore, at noon on the summer solstice, the Earth is tilted 23.5° toward the Sun, and all points on the Earth with latitude 23.5° N will see the Sun directly overhead at noon. Points on the Earth with latitude 23.5° N are on the Tropic of Cancer. Key West, Florida, has latitude 24.6° N, just above the Tropic of Cancer.

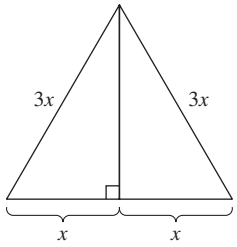
a. Find the angle of elevation of the Sun at noon in Key West on the first day of summer and on the first day of winter.

b. Find the length of a shadow cast by a 105-ft building at noon on the first day of summer and on the first day of winter. Round to the nearest tenth of a foot.

c. Find the length of a shadow cast by a 40-ft tree at noon on the first day of fall or spring.

67. OSHA safety regulations require that the base of a ladder be placed 1 ft from the wall for every 4 ft of ladder length. To the nearest tenth of a degree, find the angle that the ladder forms with the ground and the angle that it forms with the wall.

68. An A-frame storage shed is constructed such that the slanted roof line is always 3 times as long as the distance from the bottom corner of the roof to the centerline of the shed. To the nearest degree, what is the angle at the top of the roof?

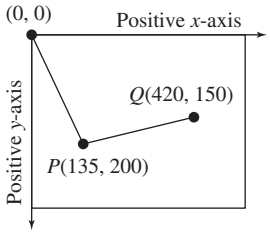


69. An airplane needs to fly to an airfield located 189 mi east and 568 mi north of its current location. To the nearest tenth of a degree, determine the bearing at which the plane should fly.

70. Software used to program video games often uses an origin at the top left of the display canvas. The positive x-axis is to the right and the positive y-axis is downward. Suppose that a player moves on a direct path from the origin to a point P with pixel location (135, 200). Then the player moves directly to point Q at a pixel location of (420, 150).

a. Find the player's bearing from the origin to point P. Round to one-hundredth of a degree.

b. Find the player's bearing from point P to point Q. Round to one-hundredth of a degree.



71. Two ships leave port at the same time. One travels N72° E at 20 knots and the other travels S18° E at a rate of 30 knots.

a. After 2 hr, how far apart are the two ships? Give an exact answer in nautical miles.

b. Find the bearing from the ship farther to the north to the ship farther to the south. Round to the nearest tenth of a degree.

72. Deshauna lives 17 mi due west of her friend Jasmine. They both like to bicycle and decide to meet for lunch at a restaurant 13 mi from Deshauna's house. If the bearing from Deshauna's house to the restaurant is N20.2° E, how far does Jasmine have to ride? Round to the nearest tenth of a mile.

Write About It

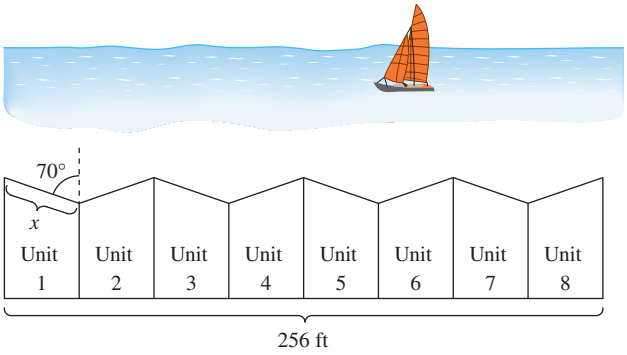
73. Explain how to represent the bearing from point P to point Q.

74. What is meant by solving a triangle?

ISTUDY

Expanding Your Skills

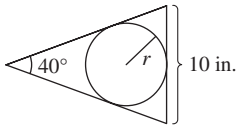
75. A contractor building eight ocean-front condominiums wants to maximize the view of the ocean for each unit. The side of the building facing the ocean is not built in a straight line parallel to the ocean, but instead is built in a zigzag pattern, as shown in the figure. Each condo has a window of length x facing the ocean at an angle of 70° from a line perpendicular to the ocean.



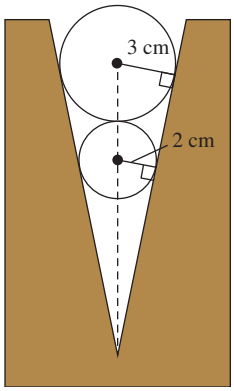
a. Find the length x of each window. Round to the nearest foot.

b. The windows facing the ocean are 8 ft high and x feet wide. By using the zigzag pattern, how much more ocean-front viewing area does each window provide than if the windows were parallel to the ocean? Round to the nearest square foot.

76. A circle is inscribed within an isosceles triangle such that the circle is tangent to all three sides as shown in the figure. Using the fact that the radius r of the circle is perpendicular to any line tangent to the circle, find the value of r to the nearest tenth of an inch.

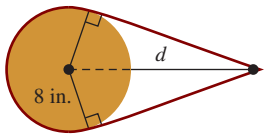


77. A tool requires a V-shaped block to hold two rollers of radius 3 cm and 2 cm. Determine the angle of the "V" cut to the nearest tenth of a degree.

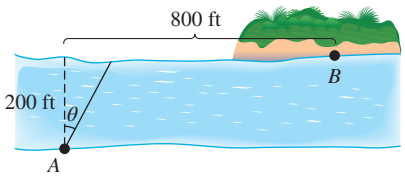


Technology Connections

78. A 5-ft (60-in.) belt is to be looped around a rotating drum of radius 8 in. and a small spindle located d inches from the rim of the drum. Find the distance d between the spindle and the rim of the drum to the nearest tenth of an inch. (*Hint*: Set up an equation and use a graphing utility to approximate the solution.)



79. Pipe for a water line must be installed from a main water line at point A to a building on Hontoon Island State Park at point B as shown in the figure. The cost to install water pipe over land is \$10 per foot, and the cost to install pipe under water is \$20 per foot.



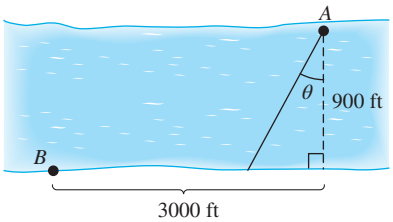
a. Write an expression in terms of θ to represent the total cost c (in dollars) to lay pipe from point A to point B.

b. Use the TABLE function on a calculator to find the cost for $\theta = 20°, 25°, 30°, 35°$, and $40°$. Round to 1 decimal place.

c. Which angle from part (b) yields the least cost?

d. Using calculus, we can show that the angle needed to minimize the total cost is a solution to the equation $4000\sec\theta\tan\theta - 2000\sec^2\theta = 0$. Solve the equation for θ, where $0° < \theta < 90°$.

80. An athlete participating in a triathlon can run 11 ft/sec and swim 3 ft/sec. Starting at point A, 900 ft from a straight shoreline, the athlete must swim to shore and then run to point B, 3000 ft down the beach.



a. Write an expression representing the total time t (in seconds) needed to get from point A to point B as a function of θ.

b. Use the TABLE function on a calculator to find the time t for $\theta = 0°, 5°, 10°, 15°, 20°$, and $25°$. Round to 1 decimal place.

c. Which angle from part (b) gives the shortest total time?

d. Using calculus, we can show that the angle needed to minimize the total time is a solution to the equation $300\sec\theta\tan\theta - \frac{900}{11}\sec^2\theta = 0$. Solve the equation for θ, where $0° < \theta < 90°$. Round to the nearest tenth of a degree.

ISTUDY

SECTION 7.2 The Law of Sines

OBJECTIVES

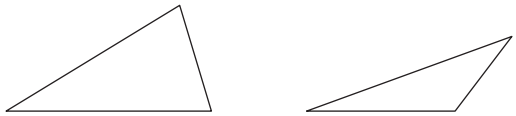
1. Solve a Triangle Using the Law of Sines (SAA or ASA)
2. Solve a Triangle Using the Law of Sines (SSA) Ambiguous Case
3. Compute the Area of a Triangle Given SAS
4. Apply the Law of Sines

1. Solve a Triangle Using the Law of Sines (SAA or ASA)

A mechanical engineer designing a new tool will use computer software for digital prototyping. It is imperative that the precise measure of each line segment, angle, and curve is entered and represented correctly before manufacturing takes place. The software uses mathematical relationships among the sides and angles in 2- and 3-dimensional figures as a means to check the engineer's measurements.

As a simple example, suppose that an engineer wants to draw a triangle with sides of lengths 3 cm, 5 cm, and 15 cm. No such triangle is possible because the length of the longest side exceeds the sum of the lengths of the other two sides. The law of sines and law of cosines presented in this chapter enable us to determine conditions under which a triangle cannot be constructed.

A triangle that does not contain a right angle is called an **oblique triangle.** An oblique triangle will have either three acute angles or one obtuse angle and two acute angles (Figure 7-10).



(a) Acute Triangle
All angles acute

(b) Obtuse Triangle
One angle obtuse

Figure 7-10

TIP Notation such as ASA is a shortcut used to convey what parts of an oblique triangle are known. For example, ASA stands for "Angle-Side-Angle."

For an oblique triangle, given the length of a side and any other two parts of the triangle we can solve the triangle. To organize this discussion, we outline four distinct cases involving known angles (A) and known sides (S).

1. Two angles and any side are known (ASA or SAA).
2. Two sides and an angle opposite one of them are known (SSA).
3. Three sides are known (SSS).
4. Two sides and the angle between them are known (SAS).

The first two cases can be solved by using the law of sines (presented in this section), whereas cases 3 and 4 require the law of cosines (presented in Section 7.3).

Law of Sines

If ΔABC is a triangle with sides of lengths a, b, and c opposite angles A, B, and C, respectively, then

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \quad \text{or} \quad \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$

In words: The ratio of the length of a side of a triangle to the sine of the angle opposite that side is the same for all three side-angle combinations.

ISTUDY

To prove the law of sines, refer to Figure 7-11. The altitude h drawn from vertex C to side c is a common leg of two right triangles. From the right triangles, we have

$$\sin A = \frac{h}{b} \Rightarrow h = b \sin A$$

$$\sin B = \frac{h}{a} \Rightarrow h = a \sin B$$

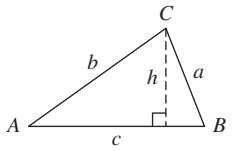


Figure 7-11

Equating the expressions for h gives

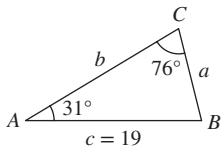
$$b \sin A = a \sin B \Rightarrow \frac{b}{\sin B} = \frac{a}{\sin A}$$

Drawing an altitude from vertex A to side a and applying similar reasoning can be used to show that $\frac{b}{\sin B} = \frac{c}{\sin C}$, thus completing the law of sines.

To apply the law of sines, we need to have one complete ratio and one other piece of information about the triangle. That is, we need to know the measure of one side and the angle opposite it, along with one other part of the triangle.

EXAMPLE 1 Solving an Oblique Triangle Given SAA

Solve the triangle with $A = 31°$, $C = 76°$, and $c = 19$. Round the lengths of the sides to 1 decimal place.



Solution:

In this situation, side c and angle C provide a complete ratio and angle A is a third piece of information. To find the length of side a, we have

$$\frac{c}{\sin C} = \frac{a}{\sin A} \Rightarrow \frac{19}{\sin 76°} = \frac{a}{\sin 31°} \Rightarrow a = \frac{19 \sin 31°}{\sin 76°} \approx 10.1$$

The measure of angle B is given by $B = 180° - (31° + 76°) = 73°$.

To find the length of side b, we can use $\frac{c}{\sin C} = \frac{b}{\sin B}$ or $\frac{a}{\sin A} = \frac{b}{\sin B}$.

However, we choose the equation on the left because it does not include any values that were rounded in previous calculations.

$$\frac{c}{\sin C} = \frac{b}{\sin B} \Rightarrow \frac{19}{\sin 76°} = \frac{b}{\sin 73°} \Rightarrow b = \frac{19 \sin 73°}{\sin 76°} \approx 18.7$$

In summary, $A = 31°$, $B = 73°$, $C = 76°$, $a \approx 10.1$, $b \approx 18.7$, and $c = 19$.

Skill Practice 1 Solve ΔABC with $B = 70°$, $C = 48°$, and $b = 15$ cm. Round the lengths of the sides to 1 decimal place.

TIP Notice that the units of measurement were left off the calculations in Example 1. Since sin θ is unitless, the values of a and b will have the same units of measurement as c. For simplicity, when applying the law of sines or cosines, the units are left off in the equations and applied later once a solution is found.

In Example 2, we solve an oblique triangle with two given angles and the side between them known (ASA).

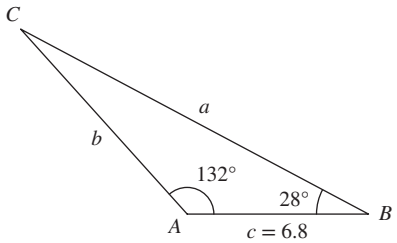
Answer

1. $A = 62°$, $B = 70°$, $C = 48°$, $a \approx 14.1$, $b = 15$, $c \approx 11.9$

ISTUDY

EXAMPLE 2 **Solving an Oblique Triangle Given ASA**

Solve the triangle with $A = 132°$, $B = 28°$, and $c = 6.8$. Round the lengths of the sides to 1 decimal place.



Solution:

First note that $C = 180° - (132° + 28°) = 20°$.

With the measure of angle C known, angle C and side c provide a complete ratio. To find the length of side a, we have

$$\frac{c}{\sin C} = \frac{a}{\sin A} \Rightarrow \frac{6.8}{\sin 20°} = \frac{a}{\sin 132°} \Rightarrow a = \frac{6.8 \sin 132°}{\sin 20°} \approx 14.8$$

To find the length of side b, we have

$$\frac{c}{\sin C} = \frac{b}{\sin B} \Rightarrow \frac{6.8}{\sin 20°} = \frac{b}{\sin 28°} \Rightarrow b = \frac{6.8 \sin 28°}{\sin 20°} \approx 9.3$$

In summary, $A = 132°$, $B = 28°$, $C = 20°$, $a \approx 14.8$, $b \approx 9.3$, and $c = 6.8$.

Skill Practice 2 Solve ΔABC with $A = 33°$, $B = 112°$, and $c = 16$. Round the lengths of the sides to 1 decimal place.

2. Solve a Triangle Using the Law of Sines (SSA) Ambiguous Case

In Examples 1 and 2, the measures of two angles and a side of a triangle were given, and we found a unique solution for the measures of the remaining sides and angle. Now we address the case where the lengths of two sides and the measure of an angle opposite one of the known sides are given. A great deal of care must be given to this scenario because the given information may define a unique triangle, two different triangles, or no triangle.

Suppose that the measure of angle A and the lengths of sides a and b of a triangle are given (Figure 7-12). The altitude h of the triangle is given by

$$\sin A = \frac{h}{b} \Rightarrow h = b \sin A$$

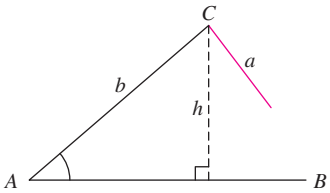


Figure 7-12

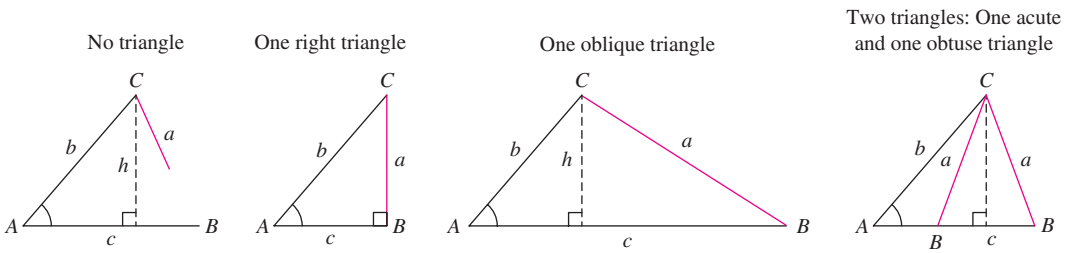
Depending on the length of side a (shown in red) relative to the length of the altitude h, we have four different scenarios.

Answer

2. $A = 33°$, $B = 112°$, $C = 35°$, $a \approx 15.2$, $b \approx 25.9$, $c = 16$

Law of Sines Ambiguous Case



(a) $a < h$
Side a is too short to meet side c.

(b) $a = h$
Side a exactly equals the altitude.

(c) $a > b$
One triangle is possible.

(d) $h < a < b$
Side a intersects side c at an obtuse angle or acute angle.

EXAMPLE 3 Solving a Triangle Given SSA (One Solution)

Solve the triangle with $A = 57°$, $a = 62$, and $b = 50$. Round the measures of the unknown angles and side to 1 decimal place.

Solution:

We begin with a sketch. For convenience we draw side c as a horizontal line segment and angle A in standard position relative to side c (Figure 7-13). Since $a > b$, side a is long enough to meet side c. Furthermore, side a must extend to the right as shown in Figure 7-13.

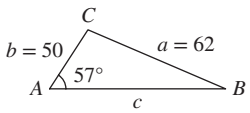


Figure 7-13

From the law of sines,

$$\frac{a}{\sin A} = \frac{b}{\sin B} \Rightarrow \frac{62}{\sin 57°} = \frac{50}{\sin B} \Rightarrow \sin B = \frac{50 \sin 57°}{62} \approx 0.6763$$

TIP In Example 3, since $a > b$, side a must extend to the right of the altitude. This means that angle B must be acute. Therefore, angle B is the first quadrant angle equal to $\sin^{-1}(50 \sin 57°/62)$.

Using a calculator, we determine that $\sin^{-1}\left(\frac{50 \sin 57°}{62}\right) \approx 42.6°$. However, there are two angles between 0° and 180° for which $\sin B \approx 0.6763$.

$$B \approx 42.6° \text{ or } B \approx 180° - 42.6° \approx 137.4°$$

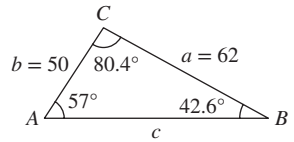
However, angle B cannot equal 137.4° because taken together with $A = 57°$, the sum exceeds 180° (137.4° + 57° = 194.4°). This tells us that $B \approx 42.6°$, and consequently, there is one unique triangle that can be formed from the given information.

With $A = 57°$ and $B \approx 42.6°$, we have $C = 180° - (57° + 42.6°) \approx 80.4°$.

$$\frac{a}{\sin A} = \frac{c}{\sin C} \Rightarrow \frac{62}{\sin 57°} \approx \frac{c}{\sin 80.4°}$$

$$c \approx \frac{62 \sin 80.4°}{\sin 57°}$$

$$c \approx 72.9$$



In summary, $A = 57°$, $B \approx 42.6°$, $C \approx 80.4°$, $a = 62$, $b = 50$, and $c \approx 72.9$.

Skill Practice 3 Solve ΔABC with $A = 49°$, $a = 32$, and $b = 28$. Round the measures of the unknown angles and side to 1 decimal place.

EXAMPLE 4 Solving a Triangle Given SSA (No Solution)

Solve the triangle with $C = 39°$, $c = 6$, and $a = 15$. Round the measures of the unknown angles and side to 1 decimal place.

Solution:

We begin with a sketch. For convenience we draw side b as a horizontal line segment and angle C in standard position relative to side b (Figure 7-14). Intuitively, we might question whether the length of side c is long enough to intersect side b.

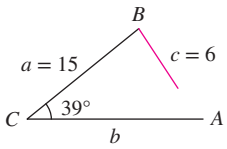


Figure 7-14

From the law of sines,

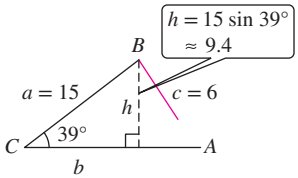
$$\frac{c}{\sin C} = \frac{a}{\sin A} \Rightarrow \frac{6}{\sin 39°} = \frac{15}{\sin A} \Rightarrow \sin A = \frac{15 \sin 39°}{6} \approx 1.5733$$

This is not possible because $-1 \le \sin A \le 1$ for any angle A. No triangle can be constructed from the given information.

Alternative Approach:

The altitude h drawn from vertex B to side b can be computed by

$$\sin 39° = \frac{h}{15} \Rightarrow h = 15 \sin 39°$$
$$h \approx 9.4$$



The length of side c would need to be at least 9.4 units long to reach side b. Therefore, no triangle is possible.

Skill Practice 4 Solve ΔABC with $B = 31°$, $b = 3$, $a = 6.2$. Round the measures of the unknown angles and side to 1 decimal place.

EXAMPLE 5 Solving a Triangle Given SSA (Two Solutions)

Solve the triangle with $A = 29°$, $a = 7$, and $b = 10$. Round the measures of the unknown angles and side to 1 decimal place.

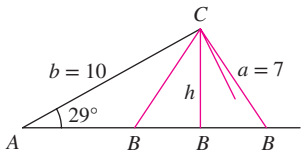
Answers

3. $A = 49°$, $B \approx 41.3°$, $C \approx 89.7°$, $a = 32$, $b = 28$, $c \approx 42.4$

4. No triangle

Solution:

From a preliminary sketch, we do not know if side a is long enough to reach side c, or if side a makes up the third side of one or two triangles.



To determine whether the given information defines zero, one, or two triangles, we can apply the law of sines to determine the possible values for angle B. Or we can compare the length of side a to the altitude h.

Using the law of sines:

$$\frac{a}{\sin A} = \frac{b}{\sin B} \Rightarrow \frac{7}{\sin 29°} = \frac{10}{\sin B}$$

$$\sin B = \frac{10 \sin 29°}{7} \approx 0.6926$$

Using a calculator we determine that $\sin^{-1}\left(\frac{10 \sin 29°}{7}\right) \approx 43.8°$. However, there are two angles between 0° and 180° for which $\sin^{-1} 0.6926$.

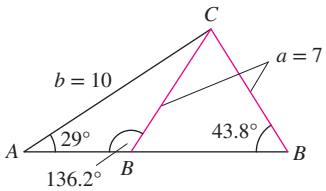
$$B \approx 43.8° \text{ or } B \approx 180° - 43.8° \approx 136.2°$$

Finding the altitude h:

$$\sin A = \frac{h}{10}$$

$$h = 10 \sin 29° \approx 4.8$$

Since $h < a < b$ (that is, $4.8 < 7 < 10$), there are two possible triangles.

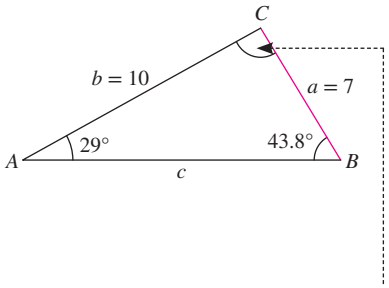


Adding either value for angle B to the given angle results in a sum less than 180°.

$A + B = 29° + 43.8° = 72.8° < 180°$
$A + B = 29° + 136.2° = 165.2° < 180°$

With two viable values for angle B, we can construct two triangles.

Triangle 1: $\angle B$ acute



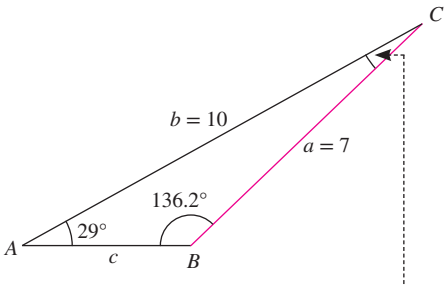
$C \approx 180° - (29° + 43.8°) \approx 107.2°$

$$\frac{a}{\sin A} = \frac{c}{\sin C}$$

$$\frac{7}{\sin 29°} = \frac{c}{\sin 107.2°}$$

$$c = \frac{7 \sin 107.2°}{\sin 29°} \approx 13.8$$

Triangle 2: $\angle B$ obtuse



$C \approx 180° - (29° + 136.2°) \approx 14.8°$

$$\frac{a}{\sin A} = \frac{c}{\sin C}$$

$$\frac{7}{\sin 29°} = \frac{c}{\sin 14.8°}$$

$$c = \frac{7 \sin 14.8°}{\sin 29°} \approx 3.7$$

In summary we have
Triangle 1: $A = 29°$, $B \approx 43.8°$, $C \approx 107.2°$, $a = 7$, $b = 10$, $c \approx 13.8$
Triangle 2: $A = 29°$, $B \approx 136.2°$, $C \approx 14.8°$, $a = 7$, $b = 10$, $c \approx 3.7$

Avoiding Mistakes

After solving a triangle, confirm that the longest side is opposite the largest angle and that the shortest side is opposite the smallest angle. To further confirm your results, you can double check that the three ratios $a/\sin A$, $b/\sin B$, and $c/\sin C$ are the same. For example, for Triangle 1 in Example 5, $7/\sin 29° \approx 14.4$, $10/\sin 43.8° \approx 14.4$, and $13.8/\sin 107.2° \approx 14.4$.

Skill Practice 5 Solve ΔABC with $A = 40°$, $a = 22$, and $b = 25$. Round the measures of the unknown angles and the third side to 1 decimal place.

Answer

5. Triangle 1: $A = 40°$, $B \approx 46.9°$, $C \approx 93.1°$, $a = 22$, $b = 25$, $c \approx 34.2$;
Triangle 2: $A = 40°$, $B \approx 133.1°$, $C \approx 6.9°$, $a = 22$, $b = 25$, $c \approx 4.1$

3. Compute the Area of a Triangle Given SAS

The approach we used to prove the law of sines can be used to find a formula for the area of a triangle given the lengths of two sides and the angle between them.

In Figure 7-15, we have the relationship

$$\sin A = \frac{h}{b} \Rightarrow h = b \sin A$$

The area of ΔABC is $\frac{1}{2}$(base)(height) $= \frac{1}{2}cb \sin A$.

The area is one-half the product of the lengths of the two sides times the sine of the angle between them.

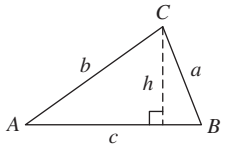


Figure 7-15

Area of a Triangle Given Two Sides and the Angle Between Them

For a triangle ΔABC, with sides of lengths a, b, and c across from angles A, B, and C, respectively, the area of the triangle is given by

$$\text{Area} = \frac{1}{2}bc \sin A \quad \text{or} \quad \text{Area} = \frac{1}{2}ab \sin C \quad \text{or} \quad \text{Area} = \frac{1}{2}ac \sin B$$

The proofs of the second and third relationships are found in a similar way by drawing the altitude from vertex B and vertex A, respectively.

EXAMPLE 6 Finding the Area of an Oblique Triangle (SAS)

A triangle has sides of 5 cm and 8 cm, and the angle between them is 121°. Find the area of the triangle. Round to 1 decimal place.

Solution:

Let A denote the vertex of the given angle, and let sides b and c represent the lengths of the two given sides (Figure 7-16).

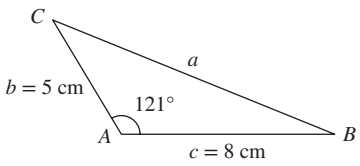

Figure 7-16

$$\text{Area} = \frac{1}{2}bc \sin A = \frac{1}{2}(5 \text{ cm})(8 \text{ cm}) \sin 121°$$
$$\approx 17.1 \text{ cm}^2$$

The area is approximately 17.1 cm^2.

Skill Practice 6 A triangle has sides of 12 m and 6 m, and the angle between them is 76°. Find the area of the triangle. Round to 1 decimal place.

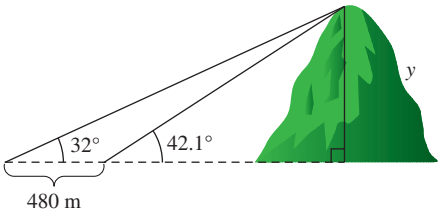
4. Apply the Law of Sines

The law of sines can be used in applications in which the value of an angle in a triangle and the length of the side opposite it are known, along with one other part of the triangle.

Answer
6. 34.9 m^2

EXAMPLE 7 Apply the Law of Sines to Find Height

To estimate the height of a hill, the angle of elevation is measured at two points 480 m apart on a direct line to the hill. The angle of elevation from the closer point is 42.1°. If the angle of elevation from the farther point is 32°, find the height of the hill. Round to the nearest meter.



Solution:

A sketch is provided with the relevant angles and sides labeled (Figure 7-17). $\angle CBA$ is supplementary to $\angle DBC$. Therefore,

$$\angle CBA = 180° - 42.1° = 137.9°$$

From ΔABC, $C = 180° - (32° + 137.9°) = 10.1°$.

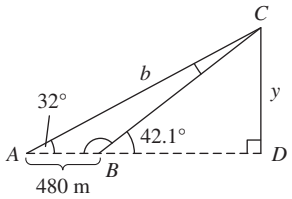


Figure 7-17

Using ΔABC and the law of sines,

$$\frac{480}{\sin 10.1°} = \frac{b}{\sin 137.9°}$$

$$b = \frac{480 \sin 137.9°}{\sin 10.1°} \approx 1835 \text{ m}$$

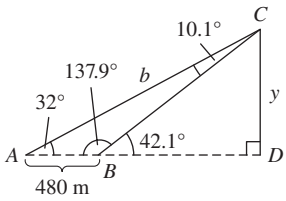

Figure 7-18

Finally, we can use the right triangle ADC to find the value of y (Figure 7-18).

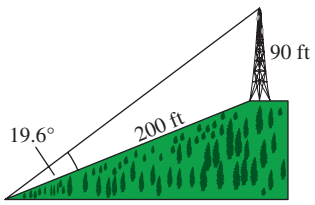
$$\frac{y}{b} = \sin 32° = \frac{y}{1835} \Rightarrow y = 1835 \sin 32° \approx 972$$

The height of the hill is approximately 972 m.

Skill Practice 7 To measure the maximum height of the water in a fountain, a trigonometry student measures the angle of elevation of the maximum point to be 25°. At a point 30 ft farther away along the same line of sight, the angle of elevation is 18°. If the eye level of the student is 5.5 ft, find the maximum height of the water. Round to the nearest tenth of a foot.

EXAMPLE 8 Apply the Law of Sines to Find Angles

A 90-ft cell tower is located at the top of a hill. An observer 200 ft down the hill measures the angle between the bottom and top of the tower to be 19.6°. Determine the angle of inclination of the hill to the nearest tenth of a degree.



Answer
7. 37.6 ft

ISTUDY

Solution:

To begin, we can solve ΔABC for angles B and C (Figure 7-19).

$$\frac{\sin B}{200} = \frac{\sin 19.6°}{90} \Rightarrow \sin B = \frac{200 \sin 19.6°}{90}$$

Since the observer is looking uphill, angle C must be greater than 90°. Therefore, angle B must be acute.

$$B = \sin^{-1}\left(\frac{200 \sin 19.6°}{90}\right) \approx 48.2° \text{ and}$$

$$C \approx 180° - (19.6° + 48.2°) \approx 112.2°$$

Let α represent the angle of inclination of the hill. From Figure 7-20,

$$\beta \approx 180° - 112.2° \approx 67.8° \text{ and}$$
$$\alpha = 90° - \beta \approx 90° - 67.8° \approx 22.2°$$

The angle of the hill is approximately 22.2°.

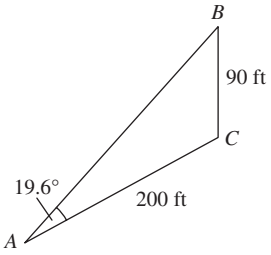


Figure 7-19

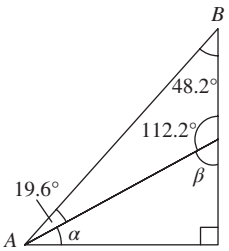

Figure 7-20

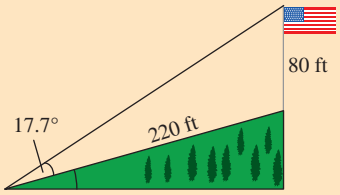
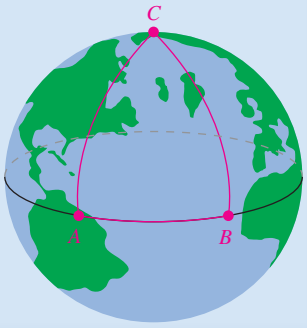
Skill Practice 8 An 80-ft flagpole is located at the top of a hill. An observer 220 ft down the hill measures the angle formed by the bottom of the pole to the top of the pole to be 17.7°. Determine the angle of inclination of the hill to the nearest tenth of a degree.



Point of Interest

In addition to the six trigonometric functions, other related functions were used by early mathematicians and astronomers to address specific applications. For example, the *haversine* function is given by haversin $\theta = \sin^2\frac{\theta}{2}$. The haversine function is used in navigation to compute great-circle distances between two points on a sphere based on the latitude and longitude of each point. Furthermore, the *law of haversines* is used to relate the sides and angles of a triangle whose vertices are on a spherical surface rather than a flat surface.



Answer
8. 15.6°

SECTION 7.2 Practice Exercises

Prerequisite Review

R.1. Use a calculator to approximate the value of $\sin^{-1} 0.76$ to the nearest tenth of a degree.

R.2. Use a calculator to approximate the degree measure of θ for $\sin\theta = \frac{3}{4}$ and $90° \le \theta \le 180°$.

Concept Connections

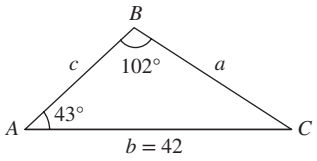
1. To apply the law of sines, an angle must be given and a side (opposite/adjacent) the given angle must be given, along with one other known side or angle.
2. In which cases can the law of sines be used to solve a triangle? Choose from ASA, SAA, SSA, SSS, SAS.
3. Suppose that ΔABC is a triangle with sides of length a, b, and c opposite angles A, B, and C, respectively. Write the law of sines.
4. Suppose that the lengths of two sides a and b in a triangle are known along with the measure of the angle C between them. Then the area is given by Area = _____.
5. Suppose that we know the measure of angle A and the lengths of sides a and b of a triangle. If $a > b$, how many possible triangles can be formed?
6. Suppose that we know the measure of angle A and the lengths of sides a and b of a triangle. If $b\sin A < a < b$, how many possible triangles can be formed?

Objective 1: Solve a Triangle Using the Law of Sines (SAA or ASA)

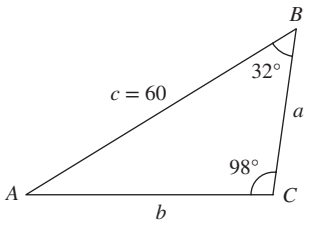
Note: ***Due to round-off error, the answers to exercises involving calculations to determine unknown angles and sides may differ slightly from those given.***

For Exercises 7–12, solve the triangle. For the sides, give an expression for the exact value of the length and an approximation to 1 decimal place. (See Examples 1–2)

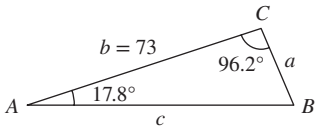
7.



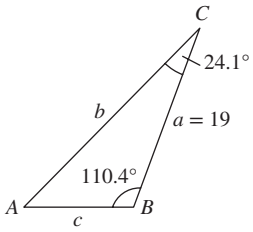
8.



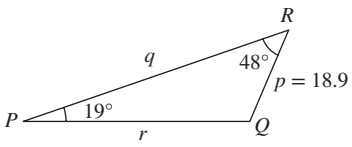
9.



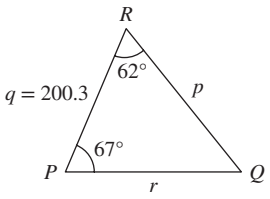
10.



11.



12.



For Exercises 13–20, solve ΔABC subject to the given conditions. Round the lengths of sides and measures of the angles to 1 decimal place if necessary. (See Examples 1–2)

13. $A = 127°$, $B = 34°$, $a = 42$

14. $A = 27°$, $B = 71°$, $b = 186$

15. $A = 122.1°$, $B = 24.3°$, $c = 102$

16. $A = 10.6°$, $C = 98.8°$, $b = 59$

17. $A = 34.7°$, $C = 68.1°$, $c = 43.9$

18. $A = 112.7°$, $C = 50.2°$, $a = 12.3$

19. $B = 28.1°$, $C = 45°$, $a = \frac{2}{3}$

20. $A = 53.8°$, $B = 60°$, $c = \frac{17}{9}$

Objective 2: Solve a Triangle Using the Law of Sines (SSA) Ambiguous Case

For Exercises 21–28, information is given about ΔABC. Determine if the information gives one triangle, two triangles, or no triangle. Solve the resulting triangle(s). Round the lengths of sides and measures of the angles to 1 decimal place if necessary. (See Examples 3–5)

21. $b = 33$, $c = 25$, $B = 38°$

22. $b = 5$, $c = 12$, $C = 73°$

23. $a = 185$, $c = 132$, $C = 63°$

24. $b = 6$, $c = 12$, $B = 38°$

25. $a = 13$, $b = 18$, $A = 45°$

26. $a = 3$, $b = 1$, $B = 17°$

27. $a = 132.5$, $b = 108.2$, $B = 13.1°$

28. $a = 48.8$, $c = 39.9$, $C = 22°$

ISTUDY

Objective 3: Compute the Area of a Triangle Given SAS

For Exercises 29–34, find the area of a triangle with the given measurements. Round to 1 decimal place. (See Example 6)

29. $A = 107°$, $b = 17$ ft, $c = 3$ ft

30. $A = 143°$, $b = 20$ m, $c = 16$ m

31. $B = 98.8°$, $a = 2.1$ in., $c = 5.3$ in.

32. $B = 2.6°$, $a = 3.5$ cm, $c = 10.8$ cm

33. $C = 74.6°$, $a = \frac{1}{3}$ mm, $b = \frac{2}{3}$ mm

34. $C = 125.7°$, $a = \frac{17}{8}$ mi, $b = \frac{23}{9}$ mi

35. The area in the Atlantic Ocean known as the Bermuda Triangle is defined by an imaginary triangle connecting Miami, Florida; San Juan, Puerto Rico; and the island of Bermuda. Measuring on a map, the distance from both Miami to San Juan and from Miami to Bermuda is approximately 1033 mi. Assuming that the angle from Bermuda to Miami to San Juan is approximately 65°, what is the area of the Bermuda Triangle? Round to the nearest square mile.

36. A gabled roof has a traditional triangular shape that can vary in pitch (the slope of the sides) from a medium pitch in warmer regions to a steep pitch in regions that experience considerable snow in the winter.

a. If the triangular face of a gabled roof measures 33.8 ft on each sloping side with an angle of 134.8° at the top of the roof, what is the area of the face? Round to the nearest square foot.

b. A homeowner plans to apply aluminum facing made from recycled cans to the face of the gable. If the cost of installation is $11.50 per square foot, what is the price for the new facing? Round to the nearest dollar.

Objective 4: Apply the Law of Sines

37. Two fire lookout towers at points A and B are 2 mi apart. Find the distances from points A and B to a fire at point C if $\angle ABC$ is 78°48′ and $\angle BAC$ is 84°36′. Round to the nearest tenth of a mile.

38. A news helicopter hovers directly over a large group of demonstrators on a city street. The demonstrators are concerned that the helicopter is hovering too close and want to estimate the height of the helicopter. Luckily, two nearby trigonometry students take simultaneous observations from locations at points A and B separated by 900 ft on the street. They find that the angle of elevation to the helicopter from A is 42°30′ and the angle of elevation from B is 30°12′.

a. What is the distance from each location to the helicopter? Round to the nearest foot.

b. How high is the helicopter from the ground at the moment of observation? Round to the nearest foot.

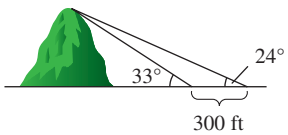
39. A surveyor wants to measure the distance across a lake from a point A due north to a point B. The surveyor runs a 1500-ft line from point A to point C in the direction N52°E. Then, the surveyor runs a second line from C to B in the direction N41°24′W.

a. To the nearest foot, how long is the second line?

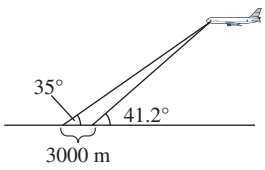
b. To the nearest foot, what is the distance between A and B?

40. A catamaran sails due north parallel to a straight shoreline at a constant speed of 8 mph. The captain records a bearing of N30°E to a lighthouse on shore. Then, 1.5 hr later, the captain records the bearing to the lighthouse as S42°E. To the nearest tenth of a mile, what is the distance from the catamaran to the lighthouse at the time the second bearing is recorded?

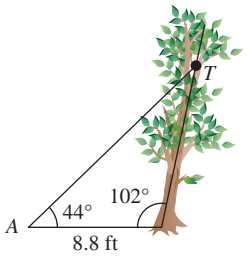
41. From a point along a straight road, the angle of elevation to the top of a hill is 33°. From 300 ft farther down the road, the angle of elevation to the top of the hill is 24°. How high is the hill? Round to the nearest foot. (**See Example 7**)



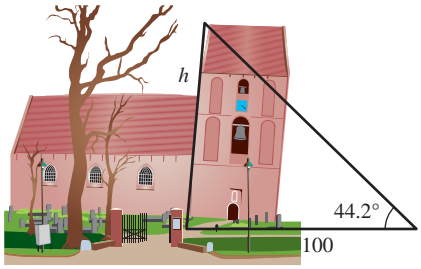
42. An observer on the ground sights a plane at an angle of elevation of 41.2°. At the same time, a second observer 3000 m farther away along the same line of sight measures the angle of elevation as 35°. How high is the plane? Round to the nearest 100 m.



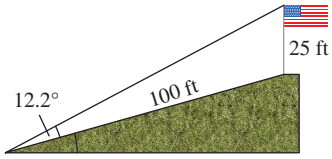
43. A wire is fastened to a point T on a tree and to point A located 8.8 ft from the base of the tree along level ground (see figure). The angle that the wire makes with level ground is 44°, and the tree leans 12° from vertical away from point A. How high off the ground is the point where the wire is fastened to the tree? Round to the nearest tenth of a foot.



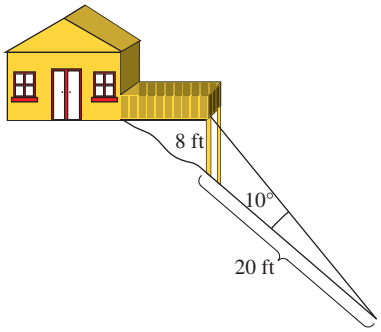
44. The Leaning Tower of Suurhusen is a medieval steeple in Suurhusen, Germany. The tower leans at an angle of 5.1939° from the vertical. (In comparison, the Leaning Tower of Pisa leans at an angle of 3.97°.) The angle of elevation to the top of the tower is 44.2° when measured 100 ft from the base of the tower. Find the distance h from the base of the tower to the top of the tower. Round to the nearest tenth of a foot.



45. A 25-ft flagpole is oriented vertically at the top of a hill. An observer standing 100 ft downhill measures the angle formed between the top and bottom of the pole as 12.2°. To the nearest degree, determine the angle of inclination of the hill. (**See Example 8**)



46. A mountain cabin is built on the side of a hill with a porch extending over a portion of the downhill slope. An observer 20 ft downhill from one of the 8-ft vertical support beams measures the angle formed from the top of the beam to the bottom as 10°. Find the angle of inclination of the hill to the nearest tenth of a degree.



47. A citizen advisory board is recommending an expansion of affordable housing for workers in a metropolitan region. Two residential buildings will be constructed with a grassy recreational area equipped for outdoor exercising between them. The taller building is 700 ft high. From the roof of the shorter building, the angle of elevation to the top of the taller building is 78° and the angle of depression to the base of the taller building is 62°.

a. How tall is the shorter building? Round to the nearest foot.

b. What is the distance between the buildings? Round to the nearest foot.

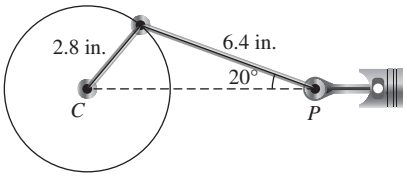
48. A hiker wants to estimate the height of a mountain before attempting a climb to the top. The first measurement shows an angle of elevation to the top of the mountain as 63.4°. The second measurement, taken 950 ft closer to the base of the mountain, yields an angle of elevation of 75.3°. From these measurements, estimate the height of the mountain. Round to the nearest hundred feet.

49. A surveyor fixes a 420-ft baseline between points A and B, where B is due east of A. The bearing from A to a third point P is N52°E and the bearing from B to P is N27°W. Find the perimeter and area of the triangular plot of land formed by A, B, and P. Round the perimeter to the nearest foot and the area to the nearest hundred square feet.

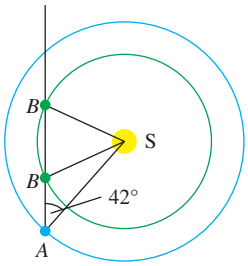
50. A surveyor fixes a 200-ft baseline between points A and B, where B is due east of A. The bearing from A to a third point P is S37°W and the bearing from B to P is S62°W. Find the perimeter and area of the triangular plot of land formed by A, B, and P. Round the perimeter to the nearest foot and the area to the nearest 100 square feet.

ISTUDY

51. The connecting rod from the piston to the crankshaft in a certain 2.0-L engine is 6.4 in. The radius of the crank circle is 2.8 in. If the angle made by the connecting rod with the horizontal at the wrist pin P is 20°, how far is the wrist pin from the center C of the crankshaft? Round to the nearest tenth of an inch.



52. Two planets follow a circular orbit around a central star in the same plane. The distance between the star at point S and one planet at point A is 135 million miles. The distance between the star and the other planet at point B is 100 million miles. If an observer on the first planet at point A sights the second planet such that $\angle SAB = 42°$, find the distance between the planets. Round to the nearest million miles.



Mixed Exercises

For Exercises 53–66, solve ΔABC. Round the lengths of sides and measures of the angles to 1 decimal place if necessary.

53. $A = 117°$, $B = 32°$, $b = 8.2$

54. $a = 42$, $c = 60$, $C = 17°$

55. $b = 6$, $c = 8$, $B = 24°$

56. $A = 103.1°$, $B = 13°$, $c = 3.8$

57. $B = 13.3°$, $C = 68.4°$, $c = 12$

58. $a = 11$, $c = 3$, $C = 142°$

59. $a = 118$, $c = 112$, $C = 24.6°$

60. $B = 47.8°$, $C = 99.3°$, $a = 183$

61. $a = 16$, $b = 15.1$, $A = 113°$

62. $b = 15.1$, $c = 18.6$, $B = 113°$

63. $A = 4.6°$, $C = 1.2°$, $a = 23$

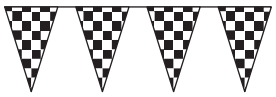
64. $B = 12°$, $C = 136°$, $b = 800$

65. $a = 325$, $c = 221$, $C = 78.8°$

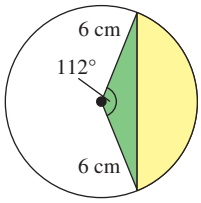
66. $A = 153°$, $C = 2°$, $b = 2$

67. After a hurricane, two homeowners examine the trees on their property for damage. They think a 20-ft palm tree is leaning slightly from its original vertical position. From a point 23 ft away, they measure the angle of elevation to the top of the palm tree as 43°. Is the palm tree leaning? If so, by how many degrees from the vertical? Round to the nearest tenth of a degree.

68. A company manufactures pennants in the shape of an isosceles triangle. The long sides of each triangle are 18 in., and the angle between the long sides is 40°. The weatherproof fabric from which the pennants are made costs \$6.95/yd^2. How much will it cost the company to make 10,000 pennants? Round to the nearest dollar.



69. Consider a sector of a circle of radius 6 cm with central angle 112°.



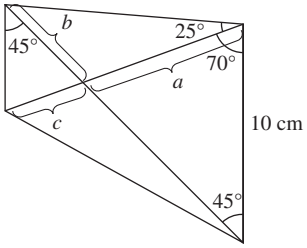
a. Find the area of the triangular region shaded in green. Round to the nearest hundredth of a square centimeter.

b. Find the area of the region in yellow bounded by the circle and the chord of the circle.

70. Refer to the figure.

a. Write expressions for the exact values of a, b, and c.

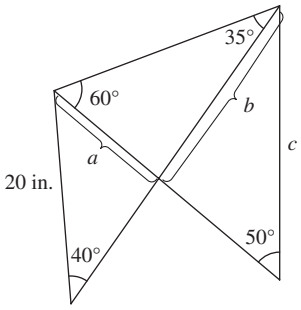
b. Approximate the values of a, b, and c to the nearest tenth of a centimeter.



71. Refer to the figure.

a. Write expressions for the exact values of a, b, and c.

b. Approximate the values of a, b, and c to the nearest tenth of an inch.

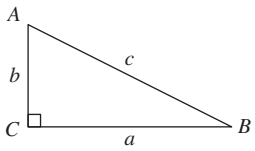


72. Given ΔABC with sides of lengths a, b, and c opposite angles A, B, and C, respectively, use the law of sines to show that

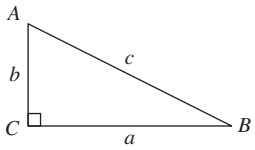
$$\frac{a+b}{b} = \frac{\sin A + \sin B}{\sin B}.$$

73. Fire station A is located 10 mi due west of fire station B. Smoke is spotted at a bearing of S37°20′E from fire station A and at a bearing of S47°30′W from fire station B. How far is the fire from each station? Round to the nearest tenth of a mile.

74. Show that the law of sines holds true for a right triangle.



75. Show that the expression $c^2 = a^2 + b^2 - 2ab\cos C$ holds true for a right triangle and reduces to the Pythagorean theorem when solving for the hypotenuse.



Write About It

76. Explain why the law of sines can be used to solve a triangle if the measure of an angle is given along with the length of its opposite side and the measure of one other side or angle.

77. Given SSA (the *ambiguous case*), outline the four possible scenarios regarding the number of triangles that are possible.

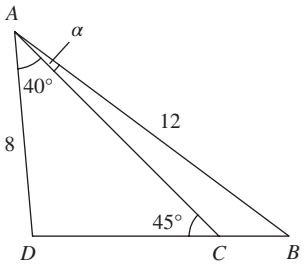
78. List various methods to confirm your answers after solving a triangle using the law of sines.

79. A triangle ΔABC has sides a, b, and c across from angles A, B, and C, respectively. Explain the relationship given by $\text{Area} = \frac{1}{2}bc\sin A$.

ISTUDY

Expanding Your Skills

80. From the figure, show that $\sin(45° - \alpha) = \frac{2}{3}\sin 95°$.



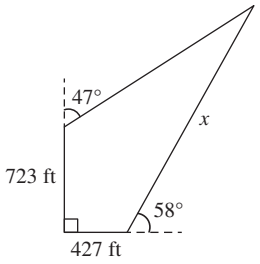
81. Use the law of sines in the form $\frac{\sin A}{\sin B} = \frac{a}{b}$ (1)

to prove the law of tangents: $\frac{a-b}{a+b} = \frac{\tan\left(\frac{A-B}{2}\right)}{\tan\left(\frac{A+B}{2}\right)}$.

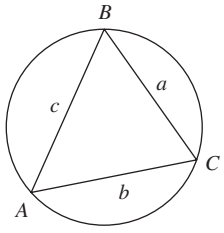
[*Hint*: Subtract 1 from both sides of equation (1) and simplify to get a second equation. Then add 1 to both sides of (1) and simplify to get a third equation. Then divide the results.]

82. Use the relationships $\frac{a}{c} = \frac{\sin A}{\sin C}$ and $\frac{b}{c} = \frac{\sin B}{\sin C}$ from the law of sines to show that $\frac{a+b}{c} = \frac{\cos\frac{A-B}{2}}{\sin\frac{C}{2}}$. This is called a Mollweide equation, named after German mathematician and astronomer Karl Mollweide (1774–1825). Notice that the equation uses all six parts of a triangle, and for this reason, is sometimes used to check the solution to a triangle.

83. When given two sides and the included angle, SAS, a triangle may be solved using the law of tangents and the law of sines. The law of tangents will give the angles opposite the given sides, and the law of sines can be used to find the third side. Mollweide's equation may be used to check the answer. Find the value of x in the figure. Round to the nearest foot.



84. Given ΔABC circumscribed by a circle, show that the diameter d of the circle is $d = \frac{b}{\sin B}$. (*Hint*: Draw two radii from the center of the circle to points A and C. Use a theorem from geometry relating the measure of an inscribed angle of a circle to the corresponding central angle.) Note that it follows from the law of sines that $d = \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$.



SECTION 7.3 The Law of Cosines

OBJECTIVES

1. Solve a Triangle Using the Law of Cosines (SAS)
2. Solve a Triangle Using the Law of Cosines (SSS)
3. Apply the Law of Cosines
4. Use Heron's Formula to Compute the Area of a Triangle

1. Solve a Triangle Using the Law of Cosines (SAS)

Given the measure of an angle in a triangle, the side opposite the angle, and one other part of the triangle, we can use the law of sines to solve the triangle. The law of sines applies in such a case because the known angle and opposite side form a complete ratio such as $\frac{a}{\sin A}$. We now look at the cases in which a complete ratio is not given.

- Two sides and the angle between them are known (SAS).
- Three sides are known (SSS).

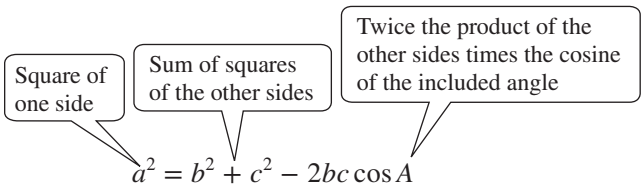
In these cases, we use the law of cosines.

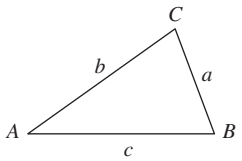
Law of Cosines

If ΔABC has sides of lengths a, b, and c opposite vertices A, B, and C, respectively, then

	Law of Cosines	Alternative Form
(1)	$a^2 = b^2 + c^2 - 2bc\cos A$	$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$
(2)	$b^2 = a^2 + c^2 - 2ac\cos B$	$\cos B = \frac{a^2 + c^2 - b^2}{2ac}$
(3)	$c^2 = a^2 + b^2 - 2ab\cos C$	$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$

The formulas for the law of cosines looks daunting, but they all share the same pattern.





The alternative forms of equations (1)–(3) have the cosine factor isolated for the purpose of computing the measure of an unknown angle in a triangle given the lengths of the sides.

We will prove the first of the three formulas given by the law of cosines. Formulas (2) and (3) are proved likewise.

First, place ΔABC in a rectangular coordinate system with vertex A at the origin, side c on the positive x-axis, and vertex B at $(c, 0)$. Let (x, y) represent point C (Figure 7-21).

From the right triangle on the left,

$$\cos A = \frac{x}{b} \Rightarrow x = b\cos A$$

$$\sin A = \frac{y}{b} \Rightarrow y = b\sin A$$

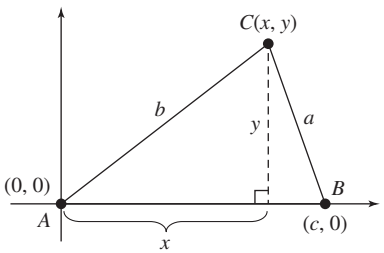


Figure 7-21

Therefore, the ordered pair representing point C is $(b\cos A, b\sin A)$. The distance from C to B is the length of side a.

$a = \sqrt{(x-c)^2 + (y-0)^2}$ Apply the distance formula.

$a^2 = (x-c)^2 + y^2$ Square both sides.

$a^2 = (b\cos A - c)^2 + (b\sin A)^2$ Substitute $x = b\cos A$ and $y = b\sin A$.

$a^2 = b^2\cos^2 A - 2bc\cos A + c^2 + b^2\sin^2 A$ Square each term.

$a^2 = b^2\cos^2 A + b^2\sin^2 A - 2bc\cos A + c^2$ Group terms with b^2.

$a^2 = b^2(\cos^2 A + \sin^2 A) - 2bc\cos A + c^2$ Factor out b^2.

$a^2 = b^2(1) - 2bc\cos A + c^2$ Replace $\sin^2 A + \cos^2 A$ with 1.

$a^2 = b^2 + c^2 - 2bc\cos A$ Law of cosines

In Example 1, we solve an oblique triangle given two sides and the angle between them (SAS). We use the following guidelines.

Guidelines for Solving an Oblique Triangle Given SAS

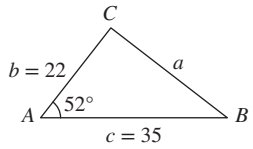
1. Find the length of the side opposite the known angle by using the law of cosines.
2. Use the law of sines to find the measure of the angle opposite the shorter of the two given sides. This angle will always be acute. Alternatively, use the law of cosines (alternative form) to find either remaining angle.
3. Find the measure of the third angle by subtracting the sum of the measures of the other two angles from 180°.

The rationale for step 2 is as follows:

- The angles opposite the shorter two sides in a triangle are always acute angles. Therefore, the measure of the smaller of the two given angles must be acute. Applying the law of sines to find this angle will not involve the ambiguous case.
- The law of cosines can be used to find the measure of *either* remaining angle because the inverse cosine will return an acute angle or an obtuse angle, depending on whether the argument is positive or negative.

EXAMPLE 1 Solving an Oblique Triangle Given SAS

Solve the triangle with $A = 52°$, $b = 22$, and $c = 35$. Round the measures of the unknown side and angles to 1 decimal place.



Solution:

We begin by finding the length of the side opposite the known angle.

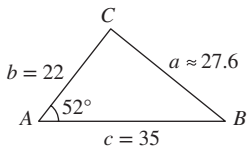
$a^2 = b^2 + c^2 - 2bc\cos A$ Apply the law of cosines.

$a^2 = (22)^2 + (35)^2 - 2(22)(35)\cos 52°$ Substitute $b = 22$, $c = 35$, $A = 52°$.

$a = \sqrt{(22)^2 + (35)^2 - 2(22)(35)\cos 52°}$ Take the principal square root.

≈ 27.6

Of the two remaining unknown angles, angle B is opposite the shortest side. Using the law of sines,



$$\frac{a}{\sin A} = \frac{b}{\sin B} \Rightarrow \frac{27.6}{\sin 52^\circ} = \frac{22}{\sin B}$$

$$\sin B \approx \frac{22 \sin 52^\circ}{27.6}$$

$$B = \sin^{-1}\left(\frac{22 \sin 52^\circ}{27.6}\right) \approx 38.9^\circ$$

With the measures of angles A and B known,

$$C = 180^\circ - (A + B) \approx 180^\circ - (52^\circ + 38.9^\circ) \approx 89.1^\circ.$$

In summary $A = 52^\circ$, $B \approx 38.9^\circ$, $C \approx 89.1^\circ$, $a \approx 27.6$, $b = 22$, and $c = 35$.

Skill Practice 1 Solve ΔABC with $B = 61^\circ$, $c = 19$, and $a = 28$. Round the measures of the unknown side and angles to 1 decimal place.

TIP In Example 1, we used a calculator to approximate the length of side a. Notice that no rounding was done until all calculations were completed. Then we used the value of side a to find the measure of angle B. The level of rounding used for side a can affect the result of subsequent calculations. For example,

$$B = \sin^{-1}\left(\frac{22 \sin 52^\circ}{27.6}\right) \approx 38.91188771 \text{ and } B = \sin^{-1}\left(\frac{22 \sin 52^\circ}{27.58407744}\right) \approx 38.93859082^\circ$$

The result of your calculations may differ slightly from those given in the text. This may be due to round-off error or the order in which you solve for the sides and angles in a triangle.

2. Solve a Triangle Using the Law of Cosines (SSS)

In Example 2, we apply the law of cosines to find the measures of the angles of a triangle where the lengths of the three sides are known. We recommend the following guidelines.

Guidelines for Solving an Oblique Triangle Given SSS

1. Use the alternative formulas for the law of cosines to find the largest angle of the triangle (angle opposite the longest side).
2. Find either of the remaining two angles using either the law of sines or the law of cosines. Since the largest angle was found in step 1, the two remaining angles are guaranteed to be acute.
   - The law of sines may be easier for you to remember and apply, but the drawback is that you will have to use a rounded value from a prior calculation.
   - The benefit of using the law of cosines is that it involves using the lengths of the three given sides, rather than a rounded value from a prior calculation.
3. Find the measure of the third angle by subtracting the sum of the measures of the other two angles from 180°.

Avoiding Mistakes

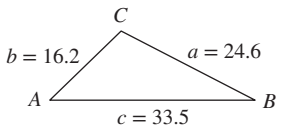
You can also use the law of cosines to find the measure of the third angle as a check.

Answer

1. $A = 77.5^\circ$, $B = 61^\circ$, $C = 41.5^\circ$, $a = 28$, $b \approx 25.1$, $c = 19$

EXAMPLE 2 Solving an Oblique Triangle Given SSS

Solve the triangle with $a = 24.6$, $b = 16.2$, and $c = 33.5$. Round the measures of the angles to the nearest tenth of a degree.



Solution:

We begin by finding angle C because it is opposite the longest side.

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$ Apply the alternative form of the law of cosines.

$$\cos C = \frac{(24.6)^2 + (16.2)^2 - (33.5)^2}{2(24.6)(16.2)}$$ Substitute $a = 24.6$, $b = 16.2$, $c = 33.5$.

$$C = \cos^{-1}\left[\frac{(24.6)^2 + (16.2)^2 - (33.5)^2}{2(24.6)(16.2)}\right]$$ Take the inverse cosine.

$$\approx 108.6^\circ$$

Now solve for either of the other two angles. We will solve for angle B.

Using the law of cosines:

$$\cos B = \frac{a^2 + c^2 - b^2}{2ac}$$

$$\cos B = \frac{(24.6)^2 + (33.5)^2 - (16.2)^2}{2(24.6)(33.5)}$$

$$B = \cos^{-1}\left[\frac{(24.6)^2 + (33.5)^2 - (16.2)^2}{2(24.6)(33.5)}\right]$$

$$\approx 27.3^\circ$$

Using the law of sines:

$$\frac{c}{\sin C} = \frac{b}{\sin B}$$

$$\frac{33.5}{\sin 108.6^\circ} = \frac{16.2}{\sin B}$$

$$\sin B = \frac{16.2 \sin 108.6^\circ}{33.5}$$

$$B = \sin^{-1}\left(\frac{16.2 \sin 108.6^\circ}{33.5}\right)$$

$$\approx 27.3^\circ$$

With the measures of angles B and C known,

$$A = 180^\circ - (B + C) \approx 180^\circ - (27.3^\circ + 108.6^\circ) \approx 44.1^\circ$$

In summary $A \approx 44.1^\circ$, $B \approx 27.3^\circ$, $C \approx 108.6^\circ$, $a = 24.6$, $b = 16.2$, and $c = 33.5$.

TIP In Example 2, using the law of sines to find the second angle requires that we use the rounded value 108.6° from the previous calculation. Using the law of cosines does not require the use of a rounded value.

Skill Practice 2 Solve ΔABC with $a = 62$, $b = 48$, and $c = 41$. Round the measures of the angles to the nearest tenth of a degree.

3. Apply the Law of Cosines

EXAMPLE 3 Applying the Law of Cosines

A Coast Guard ship on a routine training run leaves its base at 16 knots (nautical miles per hour) on a course of N82°E. Three hours later, a distress call comes in from a cargo ship located 180 nmi (nautical miles) from base at a bearing of N48°E.

a. How far is the Coast Guard ship from the cargo ship? Round to the nearest tenth of a nautical mile.

b. What bearing should the Coast Guard ship follow to reach the cargo ship? Round to the nearest tenth of a degree.

Answer

2. $A \approx 87.9^\circ$, $B \approx 50.7^\circ$, $C \approx 41.4^\circ$, $a = 62$, $b = 48$, $c = 41$

Solution:

a. Let A represent the location of the base, let C represent the location of the Coast Guard ship after 3 hr, and let B be the location of the cargo ship (Figure 7-22). The distance c between the base and the cargo ship is given as 180 nmi. The distance b between the base and the Coast Guard ship is

$b = (16 \text{ knots})(3 \text{ hr}) = 48 \text{ nmi}$

From Figure 7-22, $\angle BAC = 82° - 48° = 34°$.

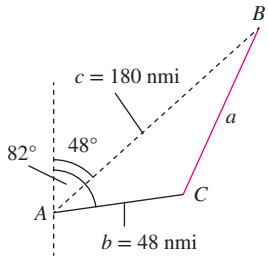


Figure 7-22

In ΔABC we know the lengths of sides b and c and the angle between them, so we can apply the law of cosines SAS case (Figure 7-23). To find the length of side a, we have

$a^2 = b^2 + c^2 - 2bc\cos A$

$a^2 = (48)^2 + (180)^2 - 2(48)(180)\cos 34°$

$a = \sqrt{(48)^2 + (180)^2 - 2(48)(180)\cos 34°}$

$\approx 142.8 \text{ nmi}$

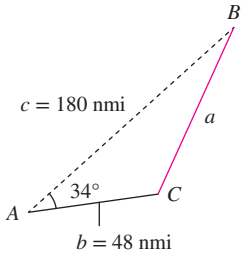

Figure 7-23

The Coast Guard ship is approximately 142.8 nmi from the cargo ship.

b. To find the bearing α from the Coast Guard ship to the cargo ship, we will first find the measure of angle C (Figure 7-24).

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \frac{(142.8)^2 + (48)^2 - (180)^2}{2(142.8)(48)}$$

$$C = \cos^{-1}\left[\frac{(142.8)^2 + (48)^2 - (180)^2}{2(142.8)(48)}\right]$$

$\approx 135.1°$

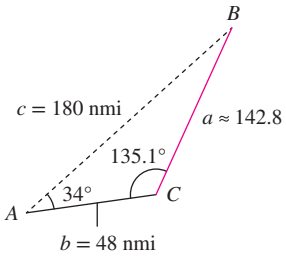

Figure 7-24

From Figure 7-25,

$\alpha = C - 98°$

$\alpha \approx 135.1° - 98° \approx 37.1°$

The bearing from the Coast Guard ship to the cargo ship is N37.1°E.

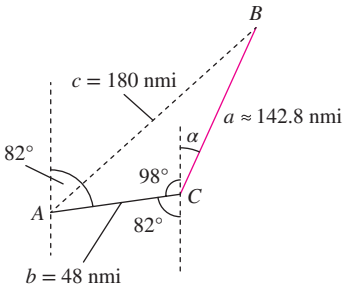

Figure 7-25

Skill Practice 3 Repeat Example 3 with the initial bearing of the Coast Guard ship N17°W at a speed of 18 mph for 3 hr.

4. Use Heron's Formula to Compute the Area of a Triangle

Point of Interest

In addition to his formula for finding the area of a triangle and many other contributions in mathematics, Heron was an accomplished engineer. He is credited with inventing the first steam engine, referred to as Hero's ball, the first known device that could transform steam into rotary motion.

Suppose that the lengths of three sides of a triangle are known (SSS). We can use the law of cosines to find the measures of the three angles. Then from Section 7.2, we can use any of the expressions $\frac{1}{2}ab\sin C$, $\frac{1}{2}bc\sin A$, or $\frac{1}{2}ac\sin B$ to find the area of ΔABC. The question then arises, is there a more direct route to finding the area? The answer is yes. We can use Heron's formula, named in honor of its discoverer, Greek mathematician Heron of Alexandria (c. A.D. 62), to find the area of a triangle given the lengths of its sides.

Heron's Formula for the Area of a Triangle

Given a triangle with sides of lengths a, b, and c, the area is given by

$$\text{Area} = \sqrt{s(s-a)(s-b)(s-c)}$$

where s is the semi-perimeter: $s = \frac{1}{2}(a+b+c)$.

Not surprisingly, the proof of Heron's formula uses the law of cosines as outlined in Exercise 64.

EXAMPLE 4 Finding the Area of a Triangle with Heron's Formula

Find the area of a triangle with sides of length $a = 12.2$ cm, $b = 16$ cm, and $c = 9.8$ cm. Round to the nearest tenth of a square centimeter.

Solution:

The semi-perimeter is given by:

$$s = \frac{1}{2}(a+b+c) = \frac{1}{2}(12.2 + 16 + 9.8) = 19$$

The area is given by:

$$\begin{aligned}\text{Area} &= \sqrt{s(s-a)(s-b)(s-c)}\\ &= \sqrt{19(19-12.2)(19-16)(19-9.8)}\\ &\approx 59.7\end{aligned}$$

The area is approximately 59.7 cm^2.

Skill Practice 4 Find the area of a triangle with sides of length $a = 15.4$ m, $b = 22.6$ m, and $c = 26$ m. Round to the nearest square meter.

Answer

4. 173 m^2

SECTION 7.3 Practice Exercises

Prerequisite Review

R.1. Find the exact distance between the points $(-7, 2)$ and $(-6, -5)$.

R.2. Determine if the points $(-3, 7)$, $(-1, 5)$ and $(-7, 3)$ form the vertices of a right triangle.

R.3. Evaluate $\cos^{-1}\left(\frac{5}{8}\right)$ in degrees to 2 decimal places.

Concept Connections

1. In which situation(s) can the law of cosines be used to solve for the remaining angles and sides of an oblique triangle? Choose from AAS, SAS, ASS, SSS.

2. Given ΔABC with sides a, b, and c opposite vertices A, B, and C, write an expression for a^2 in terms of the lengths of the other sides and opposite angle.

3. Given ΔABC with sides a, b, and c opposite vertices A, B, and C, write an expression for $\cos B$ in terms of the lengths of the sides of the triangle.

4. Given a triangle of sides of lengths a, b, and c, Heron's formula gives the area of the triangle as _____, where s represents half the perimeter of the triangle. That is $s =$ _____.

Objectives 1 and 2: Solve Triangles Using the Law of Cosines

For Exercises 5–22, solve ΔABC subject to the given conditions if possible. Round the lengths of sides and measures of the angles (in degrees) to 1 decimal place if necessary. (See Examples 1–2)

19. $b = 146.8$, $c = 122.7$, $A = 110.4°$

20. $b = 802.5$, $c = 436.1$, $A = 103.7°$

21. $a = 4.4$, $b = 6.2$, $c = 11.1$

22. $a = 18$, $b = 32$, $c = 10$

Objective 3: Apply the Law of Cosines

23. A boat leaves port and follows a course of N77°E at 9 knots for 3 hr and 20 min. Then, the boat changes to a new course of S28°E at 12 knots for 5 hr. (**See Example 3**)

a. How far is the boat from port?

b. Suppose that the boat becomes disabled. How long will it take a rescue boat to arrive if the rescue boat leaves from port and travels 18 knots? Round to the nearest minute.

c. What bearing should the rescue boat follow?

24. A fishing boat leaves a marina and follows a course of S62°W at 6 knots for 20 min. Then the boat changes to a new course of S30°W at 4 knots for 1.5 hr.

a. How far is the boat from the marina?

b. What course should the boat follow for its return trip to the marina?

ISTUDY

25. Two planes leave the same airport. The first plane leaves at 1:00 P.M. and averages 480 mph at a bearing of S62°E. The second plane leaves at 1:15 P.M. and averages 410 mph at a bearing of N12°W.

a. How far apart are the planes at 2:45 P.M.?

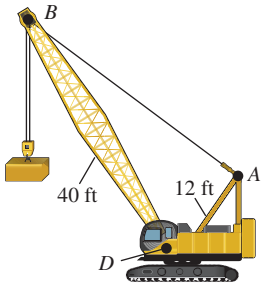
b. What is the bearing from the first plane to the second plane at that time? Round to the nearest degree.

26. Two boats leave a marina at the same time. The first boat travels 6 knots at a bearing of N39°E, and the second boat travels 4 knots at a bearing of S87°W.

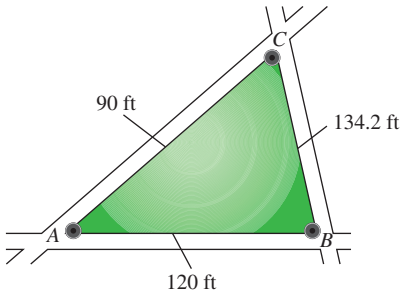
a. How far apart are the boats at the end of 2 hr?

b. What is the bearing from the first boat to the second boat at that time?

27. A 40-ft boom on a crane is attached to the crane platform at point D. A cable is attached to the end of the boom at point B and to a 12-ft A-frame at point A anchored by the counterweight. If $\angle BDA$ is 85.2°, find the length of the cable to the nearest tenth of a foot.



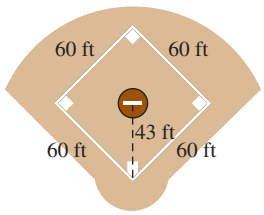
28. In a public park, a triangular region of grass is bounded by walkways. Sprinkler heads are placed at the vertices of the triangle as shown in the figure. Each sprinkler head can be set to limit its angle of rotation. For each sprinkler head, how large should the angle of rotation be set so as to keep the walkways dry and to conserve water? Round to the nearest degree.



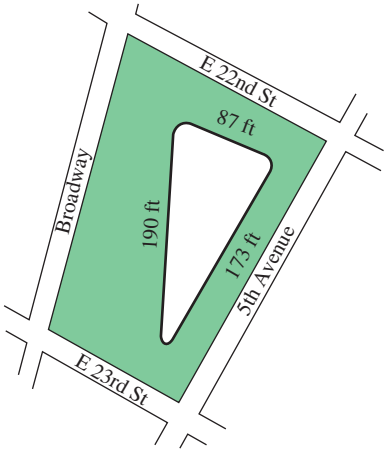
29. A regulation fast-pitch softball diamond for high school competition is a square, 60 ft on a side. The pitcher's mound is collinear with home plate and second base. Furthermore, the distance from the back of home plate to the center of the pitcher's mound is 43 ft. To the nearest tenth of a foot, find the distance between

a. The pitcher's mound and first base.

b. The pitcher's mound and second base.

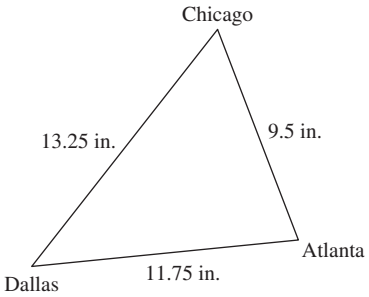


30. The Flatiron Building in New York City is said to have gotten its name because its cross section resembles the shape of the household appliance of the same name. The perimeter of the building is bounded by Broadway, 5th Avenue, and East 22nd and 23rd Streets. Using side lengths of approximately 87 ft, 190 ft, and 173 ft, determine the angle at the "point" of the Flatiron Building at the corner of 5th Avenue and East 23rd Street. Round to the nearest tenth of a degree.

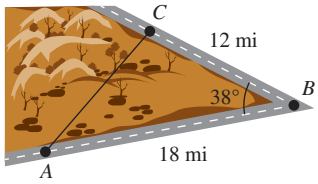


HDR Exposed-Dave DiCello Photography/Flickr/Getty Images

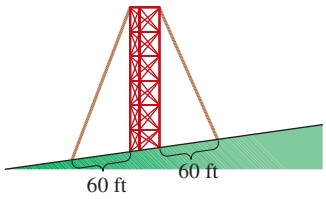
31. The distance between Dallas, Texas, and Atlanta, Georgia, on a map is 11.75 in. The distance from Atlanta to Chicago, Illinois, is 9.5 in., and the distance from Chicago to Dallas is 13.25 in. If the bearing from Dallas to Atlanta is N85°E, find the bearing from Chicago to Dallas. Round to the nearest tenth of a degree.



32. A bicyclist is at point A on a paved road and must ride to point C on another paved road. The two roads meet at an angle of 38° at point B. The distance from A to B is 18 mi, and the distance from B to C is 12 mi (see the figure). If the bicyclist can ride 22 mph on the paved roads and 6.8 mph off-road, would it be faster for the bicyclist to ride from A to C on the paved roads or to ride a direct line from A to C off-road? Explain.



33. A 150-ft tower is anchored on a hill by two guy wires. The angle of elevation of the hill is 8°. Each guy wire extends from the top of the tower to a ground anchor 60 ft from the base of the tower and in line with the tower. Find the length of each guy wire. Round to the nearest foot.



34. A 75-ft tower is located on the side of a hill that is inclined 26° to the horizontal. A cable is attached to the top of the tower and anchored uphill a distance of 35 ft from the base of the tower. Find the length of the cable. Round to the nearest foot.

Objective 4: Use Heron's Formula to Compute the Area of a Triangle

In Exercises 35–38, use Heron's formula to find the area of the triangle with sides of the given lengths. Round to the nearest tenth of a square unit. (See Example 4)

35. $a = 13$ in., $b = 7$ in., $c = 8$ in.

36. $a = 10$ mi, $b = 17$ mi, $c = 9$ mi

37. $a = 18.6$ cm, $b = 12.3$ cm, $c = 25.9$ cm

38. $a = 7.9$ yd, $b = 12.1$ yd, $c = 19.3$ yd

39. A triangular sail for a Bolger Tortise sailboat (named after boat designer Phil Bolger) has sides of length 8′1″, 10′1″, and 9′10″. What is the sail area?

40. Find the area of the grassy region from Exercise 28. Round to the nearest square foot.

41. A farmer wants to fertilize a triangular field with sides of length 300 yd, 220 yd, and 180 yd. Fertilizer costs \$180 per acre (1 acre = 4840 yd^2). Furthermore, the time required to fertilize 1 acre is approximately 2.8 hr with combined labor and equipment costs of \$23.00 per hour.

a. To the nearest acre, how big is the field?

b. Using the number of acres from part (a), estimate the cost to fertilize the field. Round to the nearest dollar.

42. An artist lays down a white triangular background on a building on which to paint a Penrose triangle. The triangular area measures 20 ft on each side and will be covered with three layers of primer paint.

a. To the nearest square foot, what is the area of the triangular region to be primed?

b. If primer paint covers 200 ft^2/gal, how many gallons of primer must be purchased?

ISTUDY

Mixed Exercises

For Exercises 43–46, the vertices of a triangle are defined by the given points. To the nearest tenth, determine

a. the perimeter of the triangle.

b. the area of the triangle.

c. the measure of the angles in the triangle.

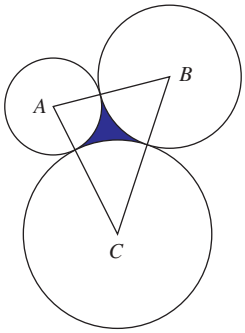
43. $A(2, 2)$, $B(4, 7)$, $C(8, 1)$

44. $A(1, 5)$, $B(5, 8)$, $C(10, 3)$

45. $A(-3, -2)$, $B(-1, 5)$, $C(6, 1)$

46. $A(-2, -1)$, $B(10, 2)$, $C(5, -4)$

47. Three mutually tangential circles with radii located at A, B, and C have radii of 2 ft, 3 ft, and 4 ft, respectively.

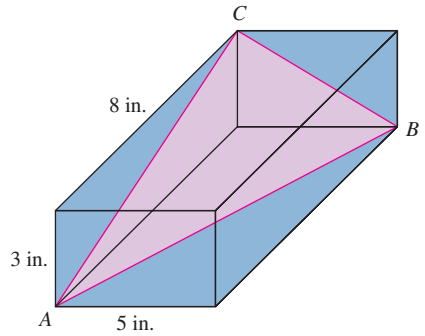


a. Find the area of ΔABC. Round to the nearest tenth of a square foot.

b. Find the measures of angles A, B, and C. Round to the nearest tenth of a degree.

c. Find the area of the shaded region. Round to the nearest tenth of a square foot.

48. The rectangular box shown in the figure is 8 in. long, 5 in. wide, and 3 in. high. Line segment $\overline{AC}$ connects opposite vertices on the left side of the box. Line segment $\overline{CB}$ connects opposite vertices at the back of the box, and line segment $\overline{AB}$ connects opposite vertices on the bottom of the box.



a. Find the measure of $\angle ABC$. Round to the nearest degree.

b. Find the area of the triangle.

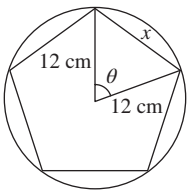
49. A parallelogram has adjacent sides of 12.2 cm and 9.6 cm, and the included angle is 62.5°. To the nearest tenth of a centimeter,

a. Find the length of the shorter diagonal.

b. Find the length of the longer diagonal.

50. A regular octagon (8-sided figure with sides of equal length) is inscribed in a circle of radius 10 in. Find the perimeter of the octagon to the nearest inch.

51. A regular pentagon is inscribed in a circle of radius 12 cm. Find the length of one side of the pentagon. Round to the nearest tenth of a centimeter.



52. A truck leaves an intersection at an average speed of 54 mph. Five minutes later, a car leaves the same intersection and travels on a street that makes an angle of 110° with the truck. If the car travels at an average speed of 68 mph, and the roads are straight, how far apart are the two vehicles 15 minutes after the car leaves the intersection? Round to the nearest tenth of a mile.

ISTUDY

53. Three mobile phone towers A, B, and C are situated as follows: The bearing from tower A to tower B is S70°E and the distance between towers A and B is 36 km. The bearing from tower C to tower B is N15°W and the distance between towers C and B is 45 km.

a. Find the distance between towers C and A to the nearest tenth of a kilometer.

b. Find the bearing from tower A to tower C. Round to the nearest tenth of a degree.

Write About It

54. Why is the law of sines not an option to solve a triangle given SAS or SSS?

55. To solve a triangle given SAS, the law of cosines is used first to find the length of the side opposite the known angle. Then, if you choose to use the law of sines to solve for one of the two remaining angles, the guidelines suggest solving for the angle opposite the *shorter* of the two given sides. Why is this the case?

56. Given the lengths of the three sides of a triangle (SSS), why is the law of cosines used to find the measure of the largest angle first?

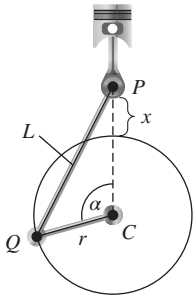
57. When applying the law of cosines (or law of sines) how can you minimize round-off error?

58. Suppose that ΔABC is a right triangle with right angle at vertex C. What is the result when the law of cosines is used to find the length of side c?

59. If the measures of the three angles in a triangle are known, can you solve for the lengths of the sides?

Expanding Your Skills

60. A piston in an engine is attached to a connector rod of length L at the wrist pin at point P. As the piston travels back and forth, the connector cap at point Q travels counterclockwise along a circular path of radius r. If $L > 2r$, and α represents $\angle PCQ$,



a. Use the law of cosines to show that the distance x from the wrist pin to the crank circle is given by $x = r\cos\alpha + \sqrt{r^2\cos^2\alpha - r^2 + L^2} - r$.

b. Find the distance between the wrist pin and crank circle for a truck engine with connecting rod of length 5.9 in. and crank radius of 1.7 in. when $\alpha = 105°$. Round to the nearest tenth of an inch.

c. Find the maximum and minimum distances that the wrist pin is to the crank circle, using the values from part (b).

61. Two sides of a parallelogram are 8 ft and 12 ft. The length of the shorter diagonal is 6 ft. Find the exact length of the long diagonal.

62. Use the law of cosines to show that

$$\frac{\cos A}{a} + \frac{\cos B}{b} + \frac{\cos C}{c} = \frac{a^2 + b^2 + c^2}{2abc}.$$

63. Use the law of cosines to show that $a = b\cos C + c\cos B$

64. Complete the proof of Heron's formula.

a. Begin with the formula Area $= \frac{1}{2}bc\sin A$ and square both sides.

b. In the equation from part (a), replace $\sin^2 A$ by $1 - \cos^2 A$.

c. In the equation from part (b), factor $1 - \cos^2 A$ as a difference of squares.

d. Take the square root of both sides and write the area as

$$\text{Area} = \sqrt{\left[\frac{1}{2}bc(1 + \cos A)\right]\left[\frac{1}{2}bc(1 - \cos A)\right]} \qquad (1)$$

ISTUDY

e. Use the law of cosines to show that

$$\frac{1}{2}bc(1+\cos A)=\frac{a+b+c}{2}\cdot\frac{-a+b+c}{2} \qquad (2)$$

Note: Using similar logic, we can also show that

$$\frac{1}{2}bc(1-\cos A)=\frac{a-b+c}{2}\cdot\frac{a+b-c}{2} \qquad (3)$$

f. Use the substitution $s=\frac{1}{2}(a+b+c)$ to rewrite equation (2) as $\frac{1}{2}bc(1+\cos A)=s(s-a)$ (4)

Note: Using similar logic, we can also show that $\frac{1}{2}bc(1-\cos A)=(s-b)(s-c)$ (5)

g. Substitute equations (4) and (5) into equation (1).

PROBLEM RECOGNITION EXERCISES

Solving Triangles Using a Variety of Tools

For Exercises 1–12, solve ΔABC subject to the given conditions, if possible. Round the lengths of the sides and the measures of the angles to 2 decimal places, if necessary.

1. $a=20, b=29, B=90°$

2. $b=16.2, c=12, A=113°$

3. $a=16.2, b=18.5, c=28.6$

4. $a=19, b=26, A=72°$

5. $c=20, b=17, A=90°$

6. $a=14.1, A=28°, B=110°$

7. $a=7, b=8.8, A=40°$

8. $b=18, c=26, C=56°$

9. $b=108, B=62°, C=54°$

10. $a=12, c=48, B=62°$

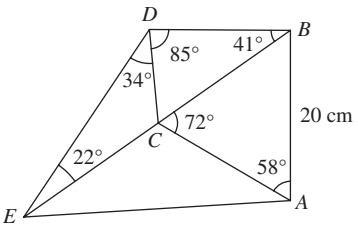
11. $a=106, b=58, c=172$

12. $a=46, b=61, B=136°$

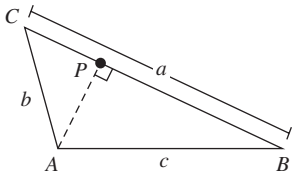
13. Refer to the figure. Find the indicated values to the nearest hundredth of a centimeter or hundredth of a degree.

a. Find the lengths of BC, AC, DB, DC, ED, EC, and EA.

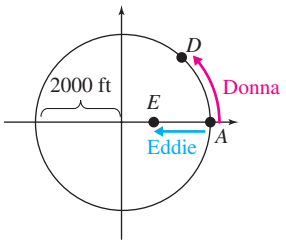
b. Find the measure of $\angle AEC$ and $\angle CAE$.



14. Use the right triangles ΔAPB and ΔAPC to show that for ΔABC, the length of side a is given by $a=b\cos C+c\cos B$.



15. A hiking trail is roughly in the shape of a circle with radius 2000 ft. Suppose that a rectangular coordinate system is set up with the origin at the center of the circle. Donna and Eddie start walking from point $A(2000, 0)$ at 220 ft/min. Eddie goes off-trail and walks directly toward the center of the circle and Donna walks along the trail counterclockwise.



a. Find the coordinates of each person after 5 min. Round the coordinates to the nearest foot.

b. How far apart are Eddie and Donna after 5 min? Round to the nearest foot.

c. If Eddie can no longer walk because he sprains his ankle after foolishly leaving the trail, at what bearing would Donna walk to find him? Round to the nearest tenth of a degree.

SECTION 7.4 Harmonic Motion

OBJECTIVES

1. Model Simple Harmonic Motion
2. Interpret Damped Harmonic Motion

1. Model Simple Harmonic Motion

The wavelike appearance of the graphs of the sine and cosine functions suggests that they would be good models to describe the motion of an oscillating or rotating object. For example, suppose that a block is attached to a spring hanging from the ceiling. If the block is pushed upward to compress the spring or pulled downward to stretch the spring, the spring applies a force on the block in the opposite direction. This is called a *restorative force* because it acts to return the block toward the equilibrium position (natural resting state). The greater the displacement d of the block from its equilibrium position, the more force F the spring applies to the block. In the absence of other forces called damping forces such as internal friction in the spring, the block will travel down and up indefinitely in a motion we call **simple harmonic motion.**

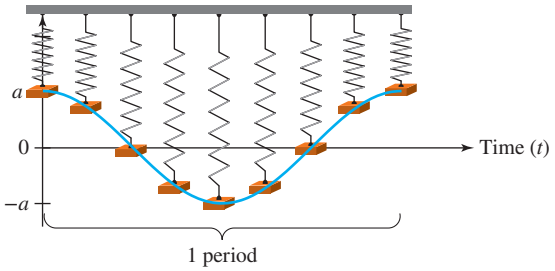


Figure 7-26 Spring-Mass System in Simple Harmonic Motion

TIP In physics, you will often see the period of an object in simple harmonic motion represented by the letter T. This is because the period is a value of time.

In Figure 7-26, a block at the end of the spring is displaced a units upward from equilibrium position and then released. In the absence of damping, the model $d = a\cos\omega t$ describes the vertical displacement d as a function of the time t after release. The constant ω (omega) is generally taken to be positive and is related to the **period** P (time required to complete one up-and-down cycle). From our discussion in Section 5.5, $P = \frac{2\pi}{\omega}$. The **frequency** f with which the block oscillates up and down is the number of complete cycles per unit time. Therefore, the frequency is the reciprocal of the period.

Simple Harmonic Motion

If the displacement d of an object at time t is given by

$$d = a\sin\omega t \quad \text{or} \quad d = a\cos\omega t$$

then the object is said to have **simple harmonic motion.**

- The amplitude of motion is $|a|$.
- The period is given by $P = \frac{2\pi}{\omega}$ (time required for one complete cycle).
- The frequency f is the reciprocal of the period, $f = \frac{1}{P}$ or equivalently, $f = \frac{\omega}{2\pi}$ and is the number of cycles per unit time.
- The relationship $\omega = \frac{2\pi}{P}$ implies that $\omega = 2\pi f$. Therefore, simple harmonic motion can also be modeled by $d = a\cos 2\pi ft$ and $d = a\sin 2\pi ft$.

ISTUDY

The difference between the models $d = a\cos\omega t$ and $d = a\sin\omega t$ is the position of the object at $t = 0$. Initially, if $d = 0$, then the motion "starts" with a displacement of 0 which is modeled most conveniently by the sine function. If $d = a$ or $d = -a$ initially, then the motion "starts" at a high or low point in the curve and is best modeled by the cosine function. If d is something other than 0, a, or $-a$ initially, then either function can be used with a phase shift.

EXAMPLE 1 Writing a Model for Simple Harmonic Motion

Suppose that the block at the end of the spring in Figure 7-26 is originally compressed 10 in. upward. After release, the block makes one complete down-and-up cycle in 0.5 sec.

a. What is the period of motion?
b. What is the frequency of motion?
c. What is the amplitude?
d. Write a function of the form $d = a\cos\omega t$ to model the displacement d (in inches) of the block as a function of the time t (in seconds) after release.
e. Find the position of the block 6.25 sec after release.

Solution:

a. The period P is given as 0.5 sec.
This means that one up-and-down cycle is completed in $\frac{1}{2}$ sec.

b. To find the frequency, we have $f = \frac{1}{P} = \frac{1}{0.5} = 2$.
A frequency of 2 means that 2 cycles are completed in 1 sec. The unit of measurement assigned to frequency is "cycles per second" or Hertz (abbreviated Hz). Therefore, $f = 2$ Hz.

c. The amplitude is the maximum deviation from the equilibrium position.
$|a| = |10| = 10$. The amplitude is 10 in.

d. The starting position is positive 10 in. above equilibrium. Therefore, we will use $d = a\cos\omega t$ with $a = 10$.
Since $P = \frac{2\pi}{\omega}$, we have $\omega = \frac{2\pi}{P} = \frac{2\pi}{0.5} = 4\pi$.
The model is $d = 10\cos 4\pi t$.

e. When $t = 6.25$ sec, we have: $d = 10\cos 4\pi(6.25)$
$= 10\cos 25\pi = 10(-1) = -10$
Therefore, 6.25 sec after release, the block is 10 in. *below* the equilibrium position.

Skill Practice 1 Suppose the block from Example 1 is initially pulled 6 in. *below* the equilibrium position. Repeat Example 1 if it takes the block 0.25 sec to return to its starting position.

In Example 2, we demonstrate that the position of an object rotating at a uniform speed can also be modeled by simple harmonic motion.

Answers
1. **a.** $P = 0.25$ sec
b. $f = 4$ Hz **c.** $a = 6$ in.
d. $d = -6\cos 8\pi t$ **e.** -6 in.

ISTUDY

EXAMPLE 2 Writing and Interpreting an Application of Simple Harmonic Motion

A Ferris wheel is 150 ft in diameter with its lowest point 3 ft off the ground. Once all the passengers have been loaded, the wheel makes one full rotation counterclockwise in 2.5 min. Suppose that two children are seated at the lowest point on the wheel and are the last passengers to be loaded. Choose a coordinate system with the origin at ground level below the center of the wheel.

a. Write a model representing the children's horizontal position x (in feet) at a time t min after the ride starts.

b. Write a model representing the children's height y (in feet) above ground level, t min after the ride starts.

c. Describe the children's position 2 min into the ride.

Solution:

a. Figure 7-27 shows the Ferris wheel and a coordinate system with origin 3 units below the lowest point on the wheel. The children's seat on the Ferris wheel is initially at (0, 3). Notice that the x-coordinate of the children's position is initially zero and then turns positive as the wheel begins its counterclockwise motion. Therefore, we will use the sine function $x = a\sin 2\pi ft$ with $a > 0$ to model the children's position to the right or left of the center of the wheel.

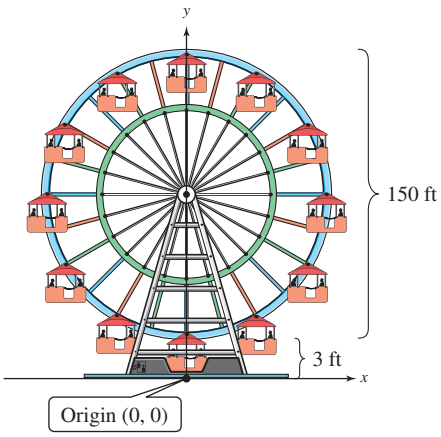

Figure 7-27

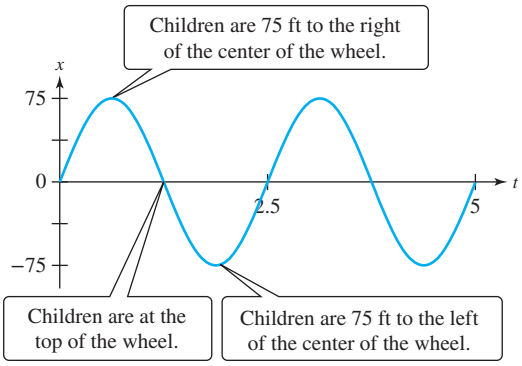


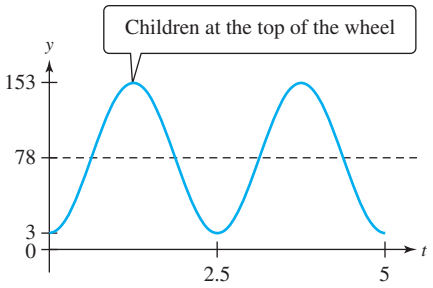
- The maximum deviation from $x = 0$ is equal to the radius of the wheel. Therefore, $a = 75$.
- The period is 2.5 min, and the frequency is $f = \dfrac{1}{2.5} = 0.4$ rpm.

Therefore, the horizontal position of the children is $x = 75\sin(2\pi \cdot 0.4t)$ or simply $x = 75\sin 0.8\pi t$.

TIP Recall from Section 5.5 that the vertical shift is the midpoint of the range of a sine or cosine function.

The amplitude is half the difference between the maximum and minimum values.

b. The children's height starts at the lowest point $y = 3$ at $t = 0$ and increases to the highest point $y = 153$ at the half-way point during the revolution. Therefore, we will use the cosine function $y = a\cos 2\pi ft$ with a vertical shift of $(3 + 153)/2 = 78$.



The amplitude is $(153 - 3)/2 = 75$, but the value of a is taken to be -75 because the starting point is at the lowest point on the wheel. Therefore, the height is $y = -75\cos(2\pi \cdot 0.4t) + 78$ or simply $y = 78 - 75\cos 0.8\pi t$.

c. At $t = 2$ min,

$$x = 75\sin[0.8\pi(2)] \approx -71.3$$
$$y = 78 - 75\cos[0.8\pi(2)] \approx 54.8$$

Two minutes into the ride, the children have completed $\frac{2}{2.5} = 0.8$ revolution. They are on the way down from the high point to the low point at a position 71.3 ft to the left of center and 54.8 ft above ground. This is $(-71.3, 54.8)$.

Skill Practice 2 Repeat Example 2 with a Ferris wheel 120 ft in diameter that completes one revolution in 1.25 min.

2. Interpret Damped Harmonic Motion

The spring-mass system in Example 1 would realistically be subject to internal friction within the spring and a small degree of air resistance. As a result, if the block were pushed up or pulled down from its natural resting position and then released, the distance it moves with each recovery will decrease until the block ultimately comes to rest. In such a case, the amplitude decreases with time and we say that the block undergoes **damped harmonic motion.** Air resistance and the force of friction are called **damping forces** because they dissipate energy in the form of heat, causing a decrease of movement.

TIP The negative factor in the model for damped harmonic motion is a result of the damping force acting in the opposite direction of motion.

Damped Harmonic Motion

The displacement d of an object oscillating under damped harmonic motion at time t is given by

$$d = ae^{-ct}\cos\omega t \quad \text{or} \quad d = ae^{-ct}\sin\omega t \quad \text{for } c > 0$$

- a is the displacement of the object at $t = 0$.
- c is a constant called the **damping factor** and is related to the damping force opposing motion.*
- The value of ω is related to the period P and the frequency f by $P = 2\pi/\omega$ and $\omega = 2\pi f$.**

*If the damping factor $c = 0$, then there is no damping, and the model simplifies to that of simple harmonic motion: $d = a\cos\omega t$ or $d = a\sin\omega t$.

**Damped harmonic motion is not actually periodic because the amplitude decreases over time. However, we use the word "period" in this context as the time required for one complete back-and-forth cycle.

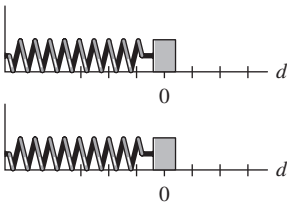
Answers

2. a. $60\sin 1.6\pi t$
b. $63 - 60\cos 1.6\pi t$
c. Two minutes into the ride, the children have completed 1.6 revolutions. Their position is (−35.3, 111.5) on the way down from the maximum height for the second time.

ISTUDY

EXAMPLE 3 Comparing Models Involving Damped Harmonic Motion

Suppose that two blocks of equal mass are attached to two horizontal springs and pulled 8 cm to the right of the natural rest positions of the springs. Due to internal friction in the springs and friction on the surface of movement, the blocks move in damped harmonic motion. The damping factor for the first spring is 0.6 and the damping factor for the second spring is 0.2.



a. If each spring-mass system oscillates at 1 Hz, write a function to model the displacement for each system t seconds after release. Assume that a displacement to the right of equilibrium is positive.

b. Graph the functions from part (a) on a graphing utility.

c. Describe the differences in the graphs.

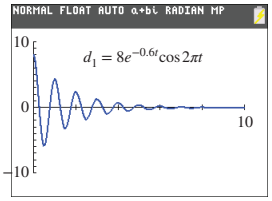
Solution:

a. The frequency f is given as 1 Hz. Therefore, $\omega = 2\pi f = 2\pi(1) = 2\pi$. Since the initial displacement is 8 cm from the equilibrium position, we choose the cosine model $d = ae^{-ct}\cos \omega t$ with $a = 8$.

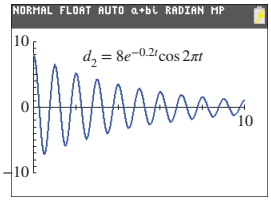
Spring 1: $d_1 = 8e^{-0.6t}\cos 2\pi t$

Spring 2: $d_2 = 8e^{-0.2t}\cos 2\pi t$

b. Spring 1



Spring 2



c. The graphs show that the "amplitude" decreases more rapidly for a function with a greater damping factor (graph of Spring 1).

TIP If the restorative force of the spring (the force that causes recoil) is greater than the damping forces, the system is said to be *lightly damped*. In such a case the motion of the object oscillates, but with progressively smaller amplitudes (as in Example 3). If the damping forces are greater than the restorative force of the spring, then motion is said to be *overdamped* and follows a path of exponential decay.

Skill Practice 3 Two spring-mass systems have an initial displacement of 6 cm and then oscillate at 0.25 Hz. The damping factors are 0.4 and 0.1, for spring 1 and spring 2, respectively. Write a function to model the displacement for each system t seconds after release.

From Example 3, the graphs of $d_1 = 8e^{-0.6t}\cos 2\pi t$ and $d_2 = 8e^{-0.2t}\cos 2\pi t$ both show a decrease in the "amplitude" for increasing time. In fact, plotting points at the relative maxima reveals a pattern of exponential decay. In Exercise 42, we show that the displacement of an object in damped harmonic motion is bounded above and below by $d = ae^{-ct}$ and $d = -ae^{-ct}$ (Figures 7-28 and 7-29).

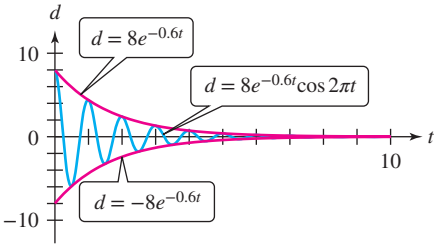


Figure 7-28

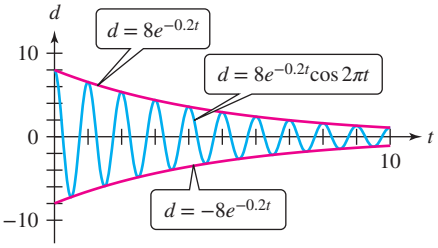

Figure 7-29

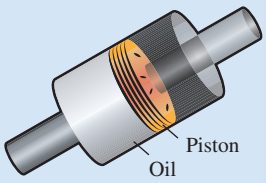
Answer

3. Spring 1: $d_1 = 6e^{-0.4t}\cos 0.5\pi t$; Spring 2: $d_2 = 6e^{-0.1t}\cos 0.5\pi t$

Point of Interest

Harmonic motion is in evidence in the world all around us. For example, a shock absorber mounted in the suspension system of a vehicle consists of a piston in a reservoir of hydraulic fluid. When a vehicle encounters vibration or a bump in the road, the piston moves through the fluid, which introduces a damping force. This turns the kinetic energy of suspension movement into heat energy that is dissipated through the hydraulic fluid. Ultimately, the shock absorber keeps the vehicle from bouncing up and down on its springs.

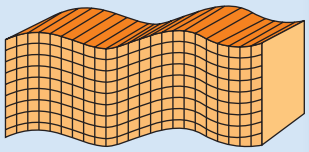


Exactostock/Stockbyte/SuperStock

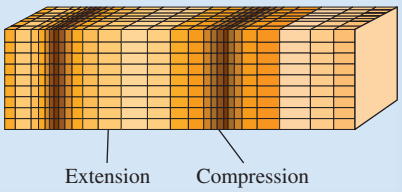
When a guitar string is plucked, the string vibrates and produces sound. But the sound fades away as internal friction in the string causes a decrease in the amplitude of vibration.

Scientists study earthquake waves as a means to build stronger structures in areas prone to earthquakes. *P* waves and *S* waves are the fundamental waves that result after an earthquake. *P* waves (primary waves) alternatively push (compress) and pull (dilate) the rock through which they travel. *S* waves (secondary waves) shear rock at right angles to the direction of travel. Areas affected by earthquakes feel the *P* waves first because they travel faster than *S* waves. However, *S* waves tend to cause more damage because they have greater amplitude, and because the undulation of the earth caused by *S* waves is particularly stressful to structures.

S waves: Shear waves



P waves: Push and pull



SECTION 7.4 Practice Exercises

Prerequisite Review

R.1. Identify the amplitude and period.

$$y = 2\cos 4x$$

R.2. Identify the amplitude and period.

$$y = 3\sin\frac{\pi}{3}x$$

R.3. Solve the equation. Write the solution set with the exact value given in terms of common or natural logarithms. Also give the approximate solution to 4 decimal places.

$$2600 = 20{,}800e^{-0.2r}$$

Concept Connections

1. The _____ of an object in simple harmonic motion is the amount of time required for one complete cycle.

2. For an object in simple harmonic motion, the number of cycles per unit time is called the _____.

3. Given an object in damped harmonic motion, the amplitude (increases/decreases) with time.

ISTUDY

4. The term "ultrasound" refers to sound waves of a frequency greater than those detectable by the human ear (> 20,000 Hz). Suppose that a medical imaging device produces ultrasound with a period of 5 μs (microseconds: note that 5 μs = 0.000005 sec). What is the frequency?

5. The frequency of middle C on a piano is 264 Hz. What is the time required for one complete cycle?

6. If the displacement d of an object moving under simple harmonic motion is maximized at time $t = 0$, which model would be most convenient? $d = a\sin\omega t$ or $d = a\cos\omega t$

Objective 1: Model Simple Harmonic Motion

For Exercises 7–14, suppose that an object moves in simple harmonic motion with displacement d (in centimeters) at time t (in seconds). Determine the

a. Amplitude

b. Period

c. Frequency

d. Phase shift

e. Least positive value of t for which $d = 0$

7. $d = 6\cos 80\pi t$

8. $d = -2\cos 120\pi t$

9. $d = -0.25\sin\frac{\pi}{4}t$

10. $d = 0.125\sin\frac{\pi}{2}t$

11. $d = -\cos\left(t - \frac{\pi}{6}\right)$

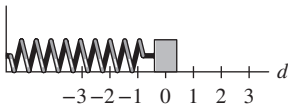
12. $d = -\cos\left(t + \frac{\pi}{4}\right)$

13. $d = \frac{1}{4}\sin\left(\frac{1}{2}t + 1\right)$

14. $d = \frac{1}{3}\sin\left(\frac{1}{4}t + \frac{1}{2}\right)$

For Exercises 15–22, suppose that an object is attached to a horizontal spring subject to the given conditions. Find a model for the displacement d as a function of the time t. (See Example 1)

	Initial Displacement (d at $t = 0$)	Amplitude	Period or Frequency
15.	2.5 in.	2.5 in.	1.2 sec
16.	4.1 cm	4.1 cm	2 sec
17.	−6 ft	6 ft	2 Hz
18.	−12 m	12 m	4 Hz
19.	0 cm Initially moving to the right	8.5 cm	0.2 sec
20.	0 cm Initially moving to the right	15 cm	0.125 sec
21.	0 ft Initially moving to the left	0.25 ft	0.1 Hz
22.	0 m Initially moving to the left	1 m	0.01 Hz



23. A block hangs on a spring attached to the ceiling and is pulled down 5 in. below its equilibrium position. After release, the block makes one complete up-and-down cycle in 1 sec and follows simple harmonic motion. (**See Example 1**)

a. What is the period of motion?

b. What is the frequency?

c. What is the amplitude?

d. Write a function to model the displacement d (in inches) as a function of the time t (in seconds) after release. Assume that a displacement above the equilibrium position is positive.

e. Find the displacement of the block and direction of movement at $t = 0.125$ sec.

24. The bob on a simple pendulum is pulled to the left 4 in. from its equilibrium position. After release, the pendulum makes one complete back-and-forth cycle in 2 sec and follows simple harmonic motion.

a. What is the period of motion?

b. What is the frequency?

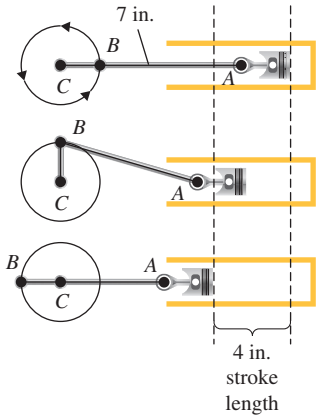
c. What is the amplitude?

d. Write a function to model the displacement d (in inches) of the bob as a function of the time t (in seconds) after release. Assume that a displacement to the right of the equilibrium position is positive.

e. Find the position and direction of movement of the bob at $t = 1.25$ sec.

ISTUDY

25. A 7-in. connecting rod in an engine connects the wrist pin of a piston at point A to the end of a second rod at point B on the crankshaft. As the piston moves forward and back, the crankshaft is turned counterclockwise around point C. The stroke length of the engine is the distance that the piston travels (one way) within its cylinder. If the stroke length is 4 in., and the engine turns at 1800 rpm, write a model representing the distance d (in inches) from A to the center of the crankshaft C as a function of the time t (in minutes). Assume that at $t = 0$, the piston is at its farthest point from the crankshaft.



26. The blood pressure p for a certain individual follows a pattern of simple harmonic motion during the pumping cycle between heartbeats. The minimum pressure is 80 mmHg (millimeters of mercury) and the maximum pressure is 120 mmHg. The individual's pulse is 60 beats per minute or equivalently 1 beat per second. Write a model representing the blood pressure p at a time t seconds into the cycle. Assume that at $t = 0$, the blood pressure is 100 mmHg and is initially increasing.

27. A Ferris wheel at a county fair is 180 ft in diameter with its lowest point 2.5 ft off the ground. Once all the passengers have been loaded, the wheel makes one full rotation counterclockwise in 1.2 min. Suppose that two children are seated at the lowest point on the wheel and are the last passengers to be loaded when the wheel starts. **(See Example 2)**

a. Write a model representing the children's horizontal position x (in feet) relative to the center of the Ferris wheel, t minutes after the ride starts.

b. Write a model representing the children's height y (in feet) above ground level, t minutes after the ride starts.

c. Give the coordinates of the children's position 1 min into the ride, and describe the location.

28. The 30-ft-diameter waterwheel at Deleon Springs State Park is an old sugar mill that turns at a rate of 2 rev/min, counterclockwise. Suppose that a coordinate system is chosen with the origin at the bottom of the wheel (at water level). At $t = 0$, suppose that a point on the wheel is located at (0, 0).

a. Write a function that represents the x position (in feet) of the point as a function of the time t in minutes.

b. Write a function that represents the y position (in feet) of the point as a function of the time t in minutes.

c. Give the coordinates of the point at $t = 40$ sec, and describe the location.

29. Refer to the piston and crankshaft from Exercise 25. The stroke length of the engine is 4 in. and the engine turns at 1800 rpm. The connecting rod cap at point B rotates around the crank circle centered at point C. Assume that at $t = 0$, the piston is at its farthest point from the center of the crank circle.

a. How many revolutions per second is the engine turning?

b. Write a model representing the horizontal position x (in inches) of the connecting rod cap (point B) relative to the center of the crank circle (point C) at time t (in seconds).

c. Write a model representing the vertical position y (in inches) of the connecting rod cap relative to the center of the crank circle at time t (in seconds).

30. A laboratory centrifuge is a piece of equipment that spins blood samples at a high speed to separate substances within the blood of greater or lesser density. Suppose that a test tube is placed at a point 10 cm to the right of the center of rotation and that the centrifuge spins at 3600 rpm counterclockwise.

a. How many revolutions does the centrifuge make per second?

b. Write a model representing the horizontal position x (in centimeters) of the test tube relative to the center of the centrifuge at time t (in seconds).

c. Write a model representing the vertical position y (in centimeters) of the test tube relative to the center of the centrifuge at time t (in seconds).

ISTUDY

31. An alternating current generator generates current with a frequency of 60 Hz. Suppose that initially, the current is at its maximum of 5 amperes. If the current varies in simple harmonic motion over time, write a model for the current I (in amperes) as a function of the time t (in seconds).

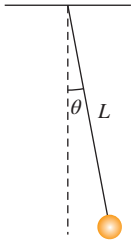
32. An alternating current generator in the United Kingdom generates current with a frequency of 50 Hz. Suppose that initially, the current is at its maximum of 12 amperes. If the current varies in simple harmonic motion over time, write a model for the current I (in amperes) as a function of the time t (in seconds).

The angular displacement θ (in radians) of a pendulum swinging through a small angle with limited air resistance and internal friction can be approximated by the simple harmonic motion models $\theta = a\sin\omega t$ or $\theta = a\cos\omega t$. The period T (time required for one back-and-forth swing) is given by $T = 2\pi\sqrt{\frac{L}{g}}$, where L is the length of the pendulum and g is the acceleration due to gravity. The maximum angular displacement is $|a|$, and positive angles are taken to the right of the center position. Use this information for Exercises 33–34.

33. A 4-ft pendulum is initially at its rightmost position of 12°.

a. Determine the period for one back-and-forth swing. Use $g = 32$ ft/sec^2.

b. Write a model for the angular displacement θ of the pendulum after t seconds. (*Hint*: Be sure to convert the initial position to radians.)



34. A 1.4-m pendulum is initially at its leftmost position of −9°.

a. Determine the period for one back-and-forth swing. Use $g = 9.8$ m/sec^2.

b. Write a model for the angular displacement θ of the pendulum after t seconds.

35. The brightness of a "young" star sometimes increases and decreases as a result of regional areas of "hot" and "cold" on the star's surface as well as variations in the density of the star's planet-forming debris, which can obstruct light. Suppose that for a particular star, the average magnitude (measure of brightness) is 4.3 with a variation of ±0.31 (on the magnitude scale, brighter objects have a smaller magnitude than dimmer objects). Furthermore, the magnitude of a star is initially observed to be 4.61, and the time between minimum brightness and maximum brightness is 6.4 days. Write a simple harmonic motion model to describe the magnitude M of the star for day t.

36. The magnitude of a star named Delta Cephei varies from an apparent magnitude of 3.6 to an apparent magnitude of 4.3 with a period of 5.4 days. At $t = 0$ days, the star is at its brightest with a magnitude of 3.6 (on the magnitude scale, brighter objects have a smaller magnitude than dimmer objects). Write a simple harmonic motion model to describe the magnitude M of the star for day t.

For Exercises 37–38, the ordered pair (t, d) gives the displacement d (in centimeters) of an object undergoing simple harmonic motion at time t (in seconds).

37. Suppose that the object has a minimum at (24, 32) and next consecutive maximum at (48, 54).

a. What is the period?

b. What is the frequency?

c. What is the amplitude?

d. Write a model representing the displacement as a function of time.

38. Suppose that the object has a maximum at (4, 16) and then returns to its next equilibrium position at (6, 11).

a. What is the period?

b. What is the frequency?

c. What is the amplitude?

d. Write a model representing the displacement as a function of time.

39. Write a function $y = f(t)$ for simple harmonic motion whose graph has a minimum at $\left(\frac{\pi}{4}, -6\right)$ and next consecutive equilibrium at $\left(\frac{\pi}{2}, 2\right)$.

40. Write a function $y = f(t)$ for simple harmonic motion whose graph has a maximum at $\left(\frac{\pi}{3}, 8\right)$ and next consecutive minimum at $(\pi, -2)$.

Objective 2: Interpret Damped Harmonic Motion

41. Use a graphing utility to graph the functions of the form $d = ae^{-ct}\cos\omega t$ and comment on the role of the damping factor $c > 0$ in the equation. (**See Example 3**)

a. $d = 6e^{-0.1t}\cos\pi t$

b. $d = 6e^{-0.3t}\cos\pi t$

c. $d = 6e^{-0.5t}\cos\pi t$

42. Show that the graph of $d = ae^{-ct}\cos\omega t$ is bounded by $y = ae^{-ct}$ and $y = -ae^{-ct}$ for $a > 0$ and $c > 0$.

ISTUDY

For Exercises 43–46, use a graphing utility to graph the function and bounding curves for $t \geq 0$.

43. $d = -10e^{-0.125t} \sin 1.25t$

44. $d = 2e^{-0.55t} \sin 16t$

45. $d = 8e^{-1.2t} \cos 4\pi t$

46. $d = -4e^{-0.008t} \cos \frac{\pi}{8} t$

47. Suppose that a guitar string is plucked such that the center of the string is initially displaced 10 mm and then vibrates under damped harmonic motion. The note produced has a frequency of 110 Hz. The note is no longer audible to a normal human ear once the displacement at the middle of the string is less than 0.1 mm. What is the damping factor if the sound is no longer audible after 2.5 sec? Round to 2 decimal places.

48. A tuning fork is struck, and the tips of the prongs (tines) are initially displaced 0.4 mm from their natural position at rest. The prongs oscillate at 440 Hz under damped harmonic motion. The sound is no longer audible once the displacement is less than 0.1 mm. What is the damping factor if the sound is no longer audible after 4.0 sec? Round to 2 decimal places.

Write About It

49. Explain the criteria under which you would choose the model $d = a \sin \omega t$ versus $d = a \cos \omega t$ to represent the displacement d of an object moving in simple harmonic motion.

50. Explain the difference between an object moving in simple harmonic motion versus damped harmonic motion.

Expanding Your Skills

51. Consider the function defined by $y = x + 2 \sin x$.

a. As $x \to \infty$, which term in the function will contribute most to the y value?

b. Before graphing the function, speculate about its general behavior.

c. Graph $y = x$ and $y = x + 2 \sin x$ on a graphing utility.

52. Consider the function defined by $y = e^x + \cos x$.

a. As $x \to \infty$, which term in the function will contribute most to the y value?

b. Before graphing the function, speculate about its general behavior.

c. Graph $y = e^x$ and $y = e^x + \cos x$ on a graphing utility.

For Exercises 53–54, use the model $d = ae^{-ct} \cos \omega t$ or $d = ab^{kt} \cos \omega t$ to represent damped harmonic motion.

53. Suppose that a mass at the end of a spring is initially pulled in the positive direction 8 in. from its equilibrium position. Upon release, the displacement of the mass follows a pattern of damped harmonic motion with each cycle lasting 1 sec. If the maximum displacement for each cycle decreases by 25%, find a function that models the displacement of the mass t sec after being released.

54. A pendulum is pulled $\frac{\pi}{18}$ radians to one side and then released. The angular displacement θ follows a pattern of damped harmonic motion with each cycle lasting 2 sec. If the maximum displacement for each cycle decreases by 20%, find a function that models the angular displacement t sec after being released.

In a course in differential equations or physics, a more specific model for a mass moving in damped harmonic motion is found as $d = ae^{-bt/(2m)} \cos\left(t\sqrt{\omega^2 - \left(\frac{b}{2m}\right)^2}\right)$, where b is a damping constant unique to the physical system, m is the mass of the object, and $|a|$ is the displacement at time $t = 0$. The value $\frac{2\pi}{\omega}$ is the related period under simple harmonic motion. Use this model for Exercises 55–56.

55. **a.** Write a model for damped harmonic motion for a mass of 5 kg oscillating on a spring with initial displacement 0.8 m, period of 6 sec, and damping constant $b = 0.3 \frac{\text{N} \cdot \text{s}}{\text{m}}$ (Newton-second/meter).

b. Graph the model from part (a) on the window [0, 10, 1] by [−1, 1, 0.1].

56. **a.** Write a model for damped harmonic motion for the bob of a pendulum of mass of 2 kg originally pulled to the right of its equilibrium position 0.6 m. Upon release, the bob makes one complete swing back and forth in 2 sec with a damping constant $b = 0.2 \frac{\text{N} \cdot \text{s}}{\text{m}}$.

b. Graph the model from part (a) on the window [0, 10, 1] by [−0.8, 0.8, 0.1].

ISTUDY

57. Given the model $d = 20e^{-0.6t}\cos 2\pi t$, for an object in damped harmonic motion,

a. Determine the initial displacement, d (in centimeters).

b. Graph the model on a graphing utility.

c. Determine the time t (in seconds) between two consecutive relative maxima.

d. By what percentage is the displacement of the object decreased with each successive oscillation between consecutive maxima? Round to the nearest tenth of a percent.

58. Given the model $d = -8e^{-0.4t}\cos \pi t$, for an object in damped harmonic motion,

a. Determine the initial displacement, d (in centimeters).

b. Graph the model on a graphing utility.

c. Determine the time t (in seconds) between two consecutive relative maxima.

d. By what percentage is the displacement of the object decreased with each successive oscillation between consecutive maxima? Round to the nearest tenth of a percent.

Given a point on the Earth of latitude α, the angle of elevation of the Sun is at its minimum of $90° - \alpha - 23.5°$ at noon at the winter solstice. The angle of elevation of the Sun is at its maximum of $90° - \alpha + 23.5°$ at noon on the summer solstice. The angle of elevation follows simple harmonic motion as it varies from its minimum to its maximum over the course of 365 days. Use this information for Exercises 59–60.

59. Dallas, Texas, has latitude 32.8°N.

a. Find the angle of elevation of the Sun at noon on the winter solstice and summer solstice.

b. Suppose that the winter solstice is 10 days before the end of a given year. Write a function representing the angle A (in degrees) of the Sun as a function of the day number t for the following year. (*Hint*: Use a phase shift of -10 days.)

c. Graph the function from part (b) on a graphing utility.

d. Determine the angle of elevation of the Sun at noon on February 1 for Dallas. Round to the nearest tenth of a degree.

e. How many days into the year will the spring and fall equinoxes occur? Round to the nearest day. (*Hint*: The angle of elevation of the Sun at noon on an equinox will be halfway between its minimum and maximum values. This is the day of the year when the duration of daylight equals the duration of darkness.)

60. Denver, Colorado, has latitude 39.7°N.

a. Find the angle of elevation of the Sun at noon on the winter solstice and summer solstice.

b. Suppose that the winter solstice is 10 days before the end of a given year. Write a function representing the angle A (in degrees) of the Sun as a function of the day number t for the following year. (*Hint*: Use a phase shift of -10 days.)

c. Graph the function from part (b) on a graphing utility.

d. Determine the angle of elevation of the Sun at noon on January 15 for Denver. Round to the nearest tenth of a degree.

CHAPTER 7 KEY CONCEPTS

SECTION 7.1 Applications of Right Triangles	Reference
Finding the measures of the angles and sides of a right triangle when two sides or a side and an angle are known is called **solving a right triangle.**	p. 704
The **bearing** from point A to point B is the degree measure of the acute angle formed by ray $\overrightarrow{AB}$ and the north-south line. In the figure, the bearing from A to B is S39°W and the bearing from B to A is N39°E. 	p. 706

SECTION 7.2 The Law of Sines

Reference

A triangle that does not contain a right angle is called an **oblique triangle.** To solve an oblique triangle,

- Use the law of sines if two angles and a side are known (ASA or SAA) or if two sides and the angle opposite one of them are known (SSA).
- Use the law of cosines if three sides are known (SSS) or if two sides and the angle between them are known (SAS).

p. 716

Law of Sines

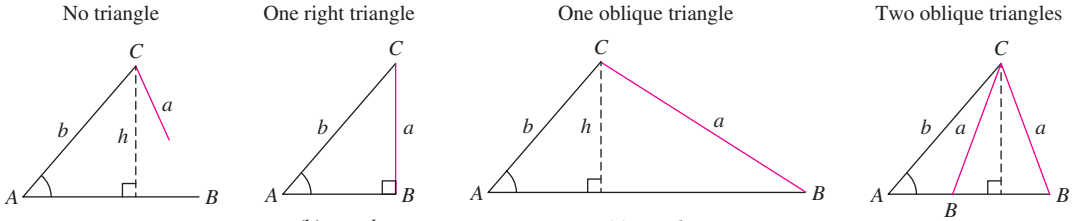
If ΔABC is a triangle with sides of lengths a, b, and c opposite angles A, B, and C, respectively, then

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \text{ or equivalently } \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$

p. 716

Law of Sines—Ambiguous Case

When the lengths of two sides and the measure of an angle opposite one of the known sides are given, then four cases are possible regarding the number of triangles that can be constructed.



(a) $a < h$ (b) $a = h$ (c) $a > b$ (d) $h < a < b$

p. 719

Given two sides and the angle between them, the area of ΔABC is given by

$$\text{Area} = \frac{1}{2}bc\sin A \quad \text{or} \quad \text{Area} = \frac{1}{2}ab\sin C \quad \text{or} \quad \text{Area} = \frac{1}{2}ac\sin B$$

p. 722

SECTION 7.3 The Law of Cosines

Reference

Use the law of cosines to solve an oblique triangle when

- Two sides and the angle between them are known (SAS).
- Three sides are known (SSS).

p. 731

Law of Cosines

If ΔABC has sides of lengths a, b, and c opposite vertices A, B, and C, respectively, then

	Law of Cosines	Alternative Form
(1)	$a^2 = b^2 + c^2 - 2bc\cos A$	$\cos A = \dfrac{b^2 + c^2 - a^2}{2bc}$
(2)	$b^2 = a^2 + c^2 - 2ac\cos B$	$\cos B = \dfrac{a^2 + c^2 - b^2}{2ac}$
(3)	$c^2 = a^2 + b^2 - 2ab\cos C$	$\cos C = \dfrac{a^2 + b^2 - c^2}{2ab}$

p. 731

For a triangle with sides of lengths a, b, and c, the area is given by

$$\text{Area} = \sqrt{s(s-a)(s-b)(s-c)}$$

where s is the semi-perimeter of the triangle: $s = \frac{1}{2}(a + b + c)$.

p. 736

SECTION 7.4 Harmonic Motion

Reference

An object moving indefinitely in a sinusoidal manner with constant amplitude is said to be moving in **simple harmonic motion.** The **period** is the time required to complete one cycle, and the **frequency** is the number of cycles per unit time.

p. 743

The displacement d of an object undergoing simple harmonic motion is given by $d = a\sin\omega t$ or $d = a\cos\omega t$ or equivalently $d = a\sin 2\pi ft$ or $d = a\cos 2\pi ft$ where t is the time after recording begins. • The amplitude of motion is $\lvert a\rvert$. • The period is given by $P = \frac{2\pi}{\omega}$. The frequency f is the reciprocal of the period, $f = \frac{1}{P}$.	p. 743
An object undergoes **damped harmonic motion** if the amplitude of oscillation decreases with time. The displacement of an object under damped harmonic motion at time t is given by $d = ae^{-ct}\cos\omega t$ or $d = ae^{-ct}\sin\omega t$ for $c > 0$ • a is the displacement of the object at $t = 0$. • c is a constant called the **damping factor** and is related to the damping force opposing motion. • The value of ω is related to the period P and frequency f by $P = 2\pi/\omega$ and $\omega = 2\pi f$.	p. 746

Detailed Chapter Summaries are available with the online resources.

CHAPTER 7 Review Exercises

SECTION 7.1

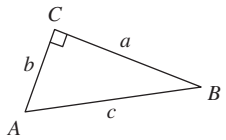
For Exercises 1–4, solve the right triangle for the unknown sides and angles. Round values to 1 decimal place if necessary.

1. $B = 37°$, $a = 17$

2. $A = 7.8°$, $c = 29$

3. $b = 12.6$, $c = 40.8$

4. $a = 427$, $b = 120$



5. A 20-ft-tall light post casts a 25-ft shadow along level ground. What is the angle of elevation of the Sun at that time? Round to the nearest degree.

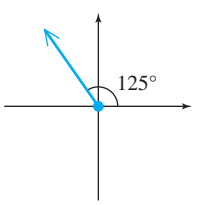
6. A passenger lift runs 680 ft up the side of a mountain from the base to an exit station. If the change in elevation of the lift from the bottom to the top of the mountain is 228 ft, what is the angle of incline to the nearest degree?

7. A 75-ft wire is attached to the top of a tower. If the guy wire makes an angle of 38.2° with the ground, how tall is the tower? Round to the nearest tenth of a foot.

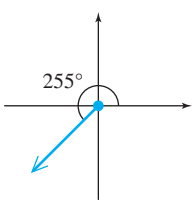
8. A 125-ft kite string is anchored to the ground. If the string makes an angle of 49° with the ground, what is the distance from the anchor site to a point directly beneath the kite? Round to the nearest foot.

For Exercises 9–10, find the bearing.

9.



10.



11. A plane flies due west for 2 hr then due south for 1 hr at an average speed of 375 mph. To the nearest degree, what bearing should the plane take for the return trip?

12. A boat travels 3 mi east then 7 mi south. To the nearest tenth of a degree, what is the bearing from its starting point?

13. A ship leaves a dock on a bearing of S48.2°W. After traveling for 1.6 hr at 28 mph, how far south and west has the ship traveled? Round to the nearest tenth of a mile.

14. A plane flying 275 mph on a bearing of N73.5°W travels for 4 hr. How far north and west has the plane traveled? Round to the nearest mile.

SECTION 7.2

For Exercises 15–20, solve ΔABC subject to the given conditions. Round the lengths of sides and measures of the angles (in degrees) to 1 decimal place if necessary.

15. $B = 63°$, $a = 26$, $b = 42$

16. $C = 140°$, $b = 100$, $c = 200$

17. $A = 26°$, $a = 8$, $b = 10$

18. $B = 12°$, $C = 122°$, $b = 17$

19. $A = 78°$, $a = 4$, $b = 18$

20. $A = 113°$, $B = 28°$, $a = 20$

For Exercises 21–22, find the area of a triangle with the given measurements. Round to 1 decimal place.

21. $A = 129°$, $b = 14.8$ mi, $c = 24$ mi

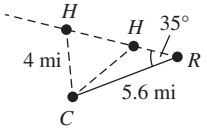
22. $C = 16.3°$, $a = 2.1$ cm, $b = 1.4$ cm

ISTUDY

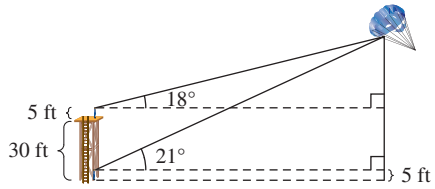
23. Points on a straight shoreline, A and B, are separated by 700 yd. Observers at each point record the bearing to a ship at sea. The observer at point A locates the ship at N50°E, while the observer at point B notes the ship on a bearing of N38°W. If point A is due west of point B, how far is the ship from each observer? Round to the nearest yard.

24. Two landing points, A and B, lie on the straight bank of a river and are separated by 45 ft. Find the distance from each landing point to a boat pulled ashore on the opposite bank at a point C if $\angle ABC$ is 68° and $\angle BAC$ is 73°. Round to the nearest foot.

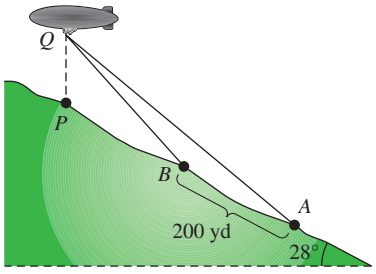
25. A ranger station at a point R in a wilderness area is located 5.6 mi from a campground at point C (see figure). A camper hikes 4 mi in a linear path away from the campground to point H, and then shoots a flare straight up as a distress signal. The signal is seen from the ranger station such that $\angle HRC = 35°$. To the nearest tenth of a mile, how far is the camper from the ranger station?



26. Standing on top of a 30-ft lifeguard tower, an observer measures the angle of elevation of a parasail to be 18°. The same observer standing on the ground next to the tower measures the angle of elevation as 21°. If the eye level of the observer is 5 ft, determine the height of the parasail to the nearest foot.



27. Points A, B, and P are collinear points along a hillside. A blimp located at point Q is directly overhead point P. Points A and B are 200 yd apart, and the angle of elevation (relative to the horizontal) from B to the blimp is 48°. The angle of elevation from point A farther down the hill to the blimp is 44°.

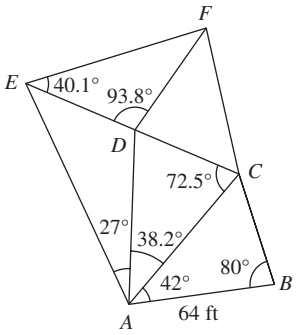


a. To the nearest yard, approximate the distance between point A and the blimp and the distance between point B and the blimp.

b. Find the exact height of the blimp relative to ground level (distance between P and Q).

c. Approximate the height from part (b).

28. A surveyor fixes a baseline of 64 ft between two points A and B on a plot of land.



a. Write an expression for the exact length of AD.

b. Approximate AD to the nearest tenth of a foot.

SECTION 7.3

For Exercises 29–32, solve ΔABC subject to the given conditions if possible. Round the lengths of the sides and measures of the angles (in degrees) to 1 decimal place if necessary.

29. $a = 42$, $b = 66$, $c = 31$

30. $a = 3.1$, $b = 2.3$, $c = 5$

31. $a = 17.3$, $b = 24.2$, $C = 63°$

32. $b = 231$, $c = 478$, $A = 12.1°$

For Exercises 33–34, find the measures of the angles within the triangle formed by the given points. Round to the nearest tenth of a degree.

33. $A(1, 0)$, $B(5, 2)$, $C(2, 5)$

34. $A(0, 3)$, $B(5, 1)$, $C(2, 4)$

In Exercises 35–36, find the area of the triangle with sides of the given lengths. Round to the nearest tenth of a square unit.

35. $a = 26.8$ ft, $b = 12.2$ ft, $c = 20$ ft

36. $a = 47$ mm, $b = 32$ mm, $c = 60$ mm

37. Two straight jogging paths begin at a kiosk in a park, and the angle between the paths is 73°. Two runners leave the kiosk at the same time, each taking one of the paths. One person runs at a rate of 5 mph, the other at a rate of 6.2 mph. After 30 min, how far apart are the runners? Round to the nearest tenth of a mile.

38. Given points $A(6, 2)$ and $B(1, 4)$ on the coordinate plane, find the measure of angle $\angle AOB$, where point O is at the origin. Round to the nearest tenth of a degree.

39. A boat leaves a marina and travels due south for 1 hr. The boat then changes course to a bearing of S47°E and travels for another 2 hr.

a. If the boat keeps a constant speed of 15 mph, how far from the marina is the boat after 3 hr? Round to the nearest tenth of a mile.

b. Find the bearing from the boat back to the marina. Round to the nearest tenth of a degree.

ISTUDY

40. Two planes take off from an airport at the same time. The first plane averages 480 mph and flies on a bearing of N20°E. The second plane averages 360 mph and heads out at a bearing of N35°W.

a. After 1.5 hr, how far apart are the two planes? Round to the nearest tenth of a mile.

b. Find the bearing from the first plane to the second plane. Round to the nearest tenth of a degree.

41. Two sides of a triangular plot of land measure 510 ft and 237 ft and the angle between them is 78.1°.

a. If the land is \$5500 per acre, what is the cost for this plot? Round to the nearest dollar and use the fact that 1 acre is 4840 yd^2.

b. If materials for a chain-link fence cost \$4.20 per linear foot, what is the cost to completely enclose the property? Round to the nearest dollar.

42. A gardener digs out a space for a triangular flower bed by a home's front entryway. The triangular plot measures 10 ft by 12 ft by 14 ft and is 6 in. deep. How many cubic feet of potting mix will be needed to fill the plot? Round to the nearest tenth of a cubic foot.

SECTION 7.4

For Exercises 43–46, suppose that an object moves in simple harmonic motion with displacement *d* (in centimeters) at time *t* (in seconds). Determine the

a. Amplitude **b.** Period **c.** Frequency **d.** Phase shift

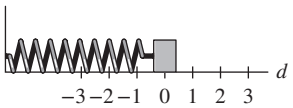
43. $d = -8\cos\frac{\pi}{6}t$

44. $d = 5\sin 30\pi t$

45. $d = 2\sin\left(t - \frac{\pi}{3}\right)$

46. $d = \frac{1}{2}\cos\left(\frac{1}{3}t + \frac{1}{6}\right)$

For Exercises 47–48, a block is attached to a horizontal spring.



47. At time $t = 0$, the block is initially pulled to the right 6 cm and then released. If the block completes one back-and-forth cycle in 2 sec, write a model for the displacement *d* as a function of the time *t* (in seconds) after release.

48. At time $t = 0$, if the block is moving to the left with an initial displacement of 0 ft, a maximum displacement of $\frac{1}{3}$ ft, and a frequency of 3 Hz, find a model for the displacement *d* as a function of time *t*.

49. The angular displacement θ (in radians) for a simple pendulum is given by $\theta = 0.175\sin\pi t$.

a. Determine the period of the pendulum.

b. How many swings are completed in 1 sec?

c. To the nearest degree, what is the maximum displacement of the pendulum?

d. The length *L* of a pendulum is related to the period *T* by the equation $T = 2\pi\sqrt{\frac{L}{g}}$, where *g* is the acceleration due to gravity. Find the length of the pendulum to the nearest meter ($g = 9.8$ m/sec^2).

50. A Ferris wheel is 200 ft in diameter with its lowest point 3 ft off the ground. Once all the passengers have been loaded, the wheel makes one full rotation counterclockwise in 3 min. Suppose that a couple are seated at the lowest point on the wheel and are the last passengers to be loaded.

a. Write a model representing the couple's horizontal position *x* (in feet) relative to the center of the Ferris wheel, *t* minutes after the ride starts.

b. Write a model representing the couple's height *y* (in feet) above ground level, *t* minutes after the ride starts.

c. Give the coordinates of the couple's position 2 min into the ride, and describe the position.

For Exercises 51–52, use a graphing utility to graph the function and bounding curves for $t \geq 0$.

51. $d = 4e^{-0.03t}\cos 1.4t$

52. $d = -6e^{-1.3t}\sin 5\pi t$

CHAPTER 7 Test

For Exercises 1–8, solve ΔABC subject to the given conditions. Round the lengths of sides and measures of the angles to 1 decimal place if necessary.

1. $A = 62°$, $C = 90°$, $a = 17$

2. $a = 17.6$, $b = 20$, $c = 12.8$

3. $B = 97.3°$, $C = 12.7°$, $b = 77.1$

4. $B = 14.8°$, $C = 90°$, $a = 213$

5. $C = 81°$, $a = 59$, $b = 44$

6. $A = 120°$, $B = 30°$, $a = 51$

7. $B = 13°$, $a = 7$, $b = 2$

8. $B = 13°$, $a = 7$, $b = 1$

ISTUDY

For Exercises 9–12, find the area of ΔABC with the given measurements. Round to 1 decimal place.

9. $A = 102°$, $b = 230$ yd, $c = 188$ yd

10. $C = 90°$, $c = 56$ cm, $a = 12$ cm

11. $a = 28$ m, $b = 46$ m, $c = 23$ m

12. $B = 43°$, $a = 1.8$ ft, $c = 6.8$ ft

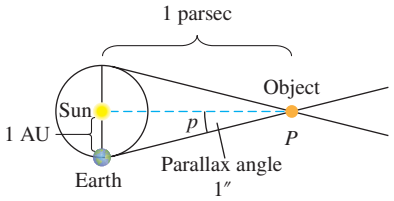
13. A ship travels west at 25 knots. At 7:30 P.M., the captain sees a floating beacon due south of the ship. By 9:15 P.M., the captain sights the beacon at a bearing of S32°E. What was the distance from the ship to the beacon at the time of the first sighting? Round to the nearest nautical mile.

14. Over the course of a day, as the angle of inclination of the Sun decreases from 64° to 49°, the length of the shadow of a building increases by 60 ft. How tall is the building? Round to the nearest foot.

15. To determine the height of a tower, a surveyor notes that the angle of elevation to the top of the tower is 48° when measured at a point on the ground 45 ft from the base of the tower. To the nearest tenth of a foot, how tall is the tower?

16. In addition to the light-year to quantify large distances in outer space, astronomers often use two other units of measurement.

- the **astronomical unit** (AU), which is the average distance between the Earth and Sun (1 AU ≈ 93,000,000 mi).
- the **parsec** (pc), which is the distance from the Earth to an object having a parallax angle of 1″ (1 second of arc).



a. To the nearest whole unit, how many astronomical units are in 1 parsec?

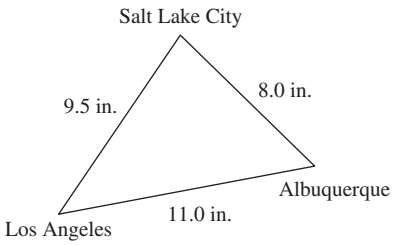
b. How many light-years are in 1 parsec? Round to 2 decimal places. (*Hint*: 1 light-year ≈ 5.878×10^{12} mi.)

17. A triangular shade sail has sides of length 12′3″ and 15′6″, and the angle between them is 73°18′.

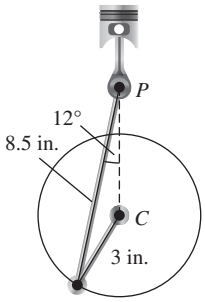
a. If the cost of the sail material is \$8.75/ft^2, how much would this sail cost? Round to the nearest dollar.

b. If the cost of wrapping the edges of the sail with a decorative border in a contrasting color is \$1.25/yd, what is the added cost to the sail? Round to the nearest dollar.

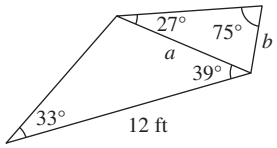
18. The distance between Los Angeles, California, and Salt Lake City, Utah, on a map is 9.5 in. The distance from Salt Lake City to Albuquerque, New Mexico, is 8.0 in., and the distance from Albuquerque to Los Angeles is 11.0 in. If the bearing from Salt Lake City to Los Angeles is S34°W, find the bearing from Albuquerque to Los Angeles. Round to the nearest tenth of a degree.



19. The connecting rod from the piston to the crankshaft in a certain engine is 8.5 in. The radius of the crank circle is 3 in. If the angle made by the connecting rod with the vertical at the wrist pin P is 12°, how far is the wrist pin from the center C of the crankshaft? Round to the nearest tenth of an inch.



20. Refer to the figure.



a. Write expressions for the exact values of a and b.

b. Approximate a and b to the nearest tenth of a foot.

21. Explain what the relationships $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$ given in the law of sines represent.

22. The displacement of an object attached to a spring that moves in simple harmonic motion is given by $d = -1.8\cos 12\pi t$, where the displacement d is in centimeters at time t in seconds. Determine the amplitude and frequency for the motion of the object.

23. The displacement of an object attached to a spring that moves in simple harmonic motion is given by $d = 4\sin\left(2t - \frac{\pi}{4}\right)$, where the displacement d is in centimeters and time t is in seconds. Determine the period and phase shift for the motion of the object.

ISTUDY

24. A block hangs on a spring attached to the ceiling and is pulled down 8 in. below its equilibrium position. After release, the block makes one complete up-and-down cycle in 1.2 sec and follows simple harmonic motion.

a. Write a function to model the displacement d (in inches) as a function of the time t (in seconds) after release. Assume that a displacement above the equilibrium position is positive.

b. Find the displacement of the block and direction of movement at $t = 0.3$ sec.

25. The angular displacement θ (in radians) for a simple pendulum is given by $\theta = 0.14 \sin \frac{\pi}{2} t$.

a. Determine the period of the pendulum.

b. How many swings are completed in 1 sec?

c. To the nearest degree, what is the maximum displacement of the pendulum?

d. The length L of a pendulum is related to the period T by the equation $T = 2\pi\sqrt{\frac{L}{g}}$, where g is the acceleration due to gravity. Find the length of the pendulum to the nearest foot ($g = 32$ ft/sec^2).

26. A 20-ft-diameter waterwheel operates at a grain mill and turns at a rate of 1.5 rev/min, counterclockwise. Suppose that a coordinate system is chosen with the origin at the bottom of the wheel (at water level). At $t = 0$, suppose that a point on the wheel is located at (0, 0).

a. Write a function that represents the x position (in feet) of the point as a function of the time t in minutes.

b. Write a function that represents the y position (in feet) of the point as a function of the time t in minutes.

c. Give the coordinates of the point at $t = 10$ sec and describe the location.

27. Use a graphing utility to graph the function $d = 4e^{-0.25t} \sin 1.3t$ and bounding curves for $t \geq 0$.

CHAPTER 7 Cumulative Review Exercises

1. Write the equation of the line in slope-intercept form that passes through the point $\left(-3, \frac{1}{2}\right)$ with slope $m = \frac{2}{3}$.

2. Write the equation of a circle in standard form with a center of $(-8, 12)$ and that passes through the point $(-15, 12)$.

3. Write the function defined by $f(x) = -2x^2 - 12x$ in vertex form and identify the vertex of the parabola.

4. Write a polynomial $f(x)$ of degree 5, with integer coefficients, and with zeros -2 (multiplicity 2), 6, and $2i$.

5. Write equations for the asymptotes for the graph of $f(x) = \dfrac{2x^2 + 5x - 3}{x - 8}$.

6. Write equations for the asymptotes for the graph of $f(x) = \sec 2x$ on the interval $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

7. Given $f(x) = \dfrac{x + 1}{x - 3}$, write an equation for the inverse function.

8. Write an equation for a sine function with an amplitude of 6, a period of π, and a phase shift of $\frac{\pi}{6}$.

9. Write an equation for a tangent function with a period of $\frac{1}{3}$ and a phase shift of $-\frac{4}{3}$.

10. A motorist drives on a toll road to and from work each day and pays \$4.25 in tolls one-way.

a. Write a model for the cost C (in \$) for tolls in terms of the number of working days, x.

b. The department of transportation offers a prepaid toll pass for \$150 a month. How many working days are required for the motorist to save money by buying the pass?

11. a. Write a variation model using k as the constant of variation if Z is directly proportional to the cube of A and inversely proportional to the square root of B.

b. If $Z = 100$ when $A = 2$ and $B = 25$, what is the constant of proportionality k?

12. a. Write an equation representing the fact that the product of two consecutive odd integers is 323.

b. Solve the equation from part (a) to find the two integers.

13. A salesperson makes a base salary of \$2500 per month. After reaching \$30,000 in total sales, the salesperson earns an additional 5% commission on the amount in sales over \$30,000. Write a piecewise-defined function to model the salesperson's total monthly salary $S(x)$ (in \$) as a function of the amount in sales x.

ISTUDY

14. The cost to buy tickets to a concert is \$50 per ticket.

a. Write a function that represents the cost $C(x)$ (in \$) for x tickets to the concert.

b. There is a sales tax of 6% and a processing fee of \$5 for a group of tickets. Write a function that represents the total cost $T(a)$ for a dollars spent on tickets.

c. Find $(T \circ C)(x)$.

d. Find $(T \circ C)(10)$ and interpret its meaning in the context of this problem.

15. Suppose that the population of a country in the year 2000 was 19.0 million and grew to 22.6 million in 2010. Write a model of the form $P(t) = P_0e^{kt}$, where $P(t)$ is the population in millions, t years after the year 2000. Round the growth rate to 5 decimal places.

16. The bob on a simple pendulum is pulled to the left 6 in. from its equilibrium position. After release, the pendulum makes one complete back-and-forth cycle in 3 sec and follows simple harmonic motion. Write a function to model the displacement d (in inches) of the bob as a function of the time t (in seconds) after release. Assume that a displacement to the right of the equilibrium position is positive.

17. Simplify to a single trigonometric function.

$$\frac{1}{1 - \cos x} + \frac{1}{1 + \cos x}$$

18. Find the exact value of $\cos 200^\circ \cos 50^\circ + \sin 200^\circ \sin 50^\circ$.

For Exercises 19–20, solve ΔABC subject to the given conditions. Round the lengths of sides and measures of the angles to 1 decimal place if necessary.

19. $a = 12.8$, $b = 20$, $c = 17.1$

20. $a = 12.8$, $b = 20$, $B = 98.7^\circ$

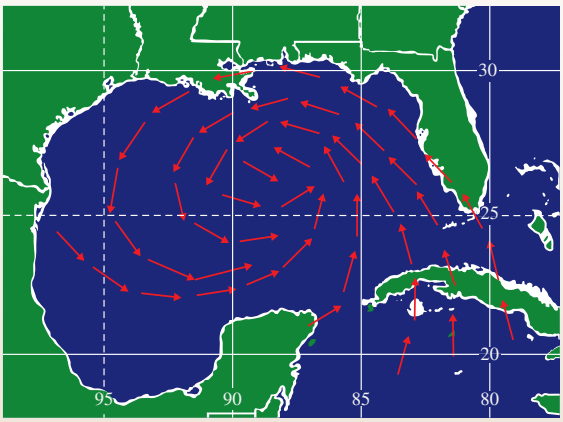
Suppose that a mathematically inclined friend tells you that a bag with $1000 in cash is yours if you can find the bag. Your friend also tells you that the bag is located 5 mi from your current location. As a clever student of mathematics, you would know that the bag is located somewhere on a circle of radius 5 mi centered at your current location. Unfortunately, walking the circumference of the circle to find the bag might be a long walk. Now suppose that your friend tells you that the bag is located 5 mi from your current location in a specific direction, such as northeast. Then after walking 5 mi in the designated direction, you will be $1000 richer.

The distance 5 mi by itself is called a *scalar* quantity because it tells us how much of something (in this case, distance). However, the quantity 5 mi northeast is a *vector* quantity because it tells us how far *and* in what direction. The study of vectors is critically important in mathematics, physics, navigation, and many branches of engineering.

In this chapter we will study vectors, along with two other topics that may seem unrelated, but are actually very similar mathematically. The first is the study of a polar coordinate system in which points in a plane are located according to their distance from the origin and direction from a line of reference. The second is the study of the complex plane, where we can graph complex numbers and visualize their properties geometrically.



Meteorologists use vectors to describe the speed and direction of wind in a weather system.

SECTION 8.1 Polar Coordinates

OBJECTIVES

1. Plot Points Using Polar Coordinates
2. Convert Ordered Pairs Between Polar and Rectangular Coordinates
3. Convert Between Equations in Polar and Rectangular Coordinates

1. Plot Points Using Polar Coordinates

Suppose that a ship leaves port and sends out a distress call after traveling 10 mi at a bearing of N30°E. Although the rescue team does not have the x- and y-coordinates of the ship relative to the port (the origin), the exact location of the ship is known. The ship's location is defined by its distance from port, 10 mi, and its direction, 30° east of north.

Defining a point in a plane by using distance and direction is the basis of a coordinate system called a polar coordinate system.

Polar Coordinate System

A **polar coordinate system** consists of a fixed point O called the **pole** (or origin), and a ray called the **polar axis,** with endpoint at the pole (Figure 8-1). Each point P in the plane is defined by an ordered pair of the form (r, θ), where r is the directed distance from the pole to P.

- If $r > 0$, point P is located r units from the pole in the direction of θ.
- If $r < 0$, point P is located $|r|$ units from the pole in the direction of $\theta + \pi$ (the direction *opposite* θ).
- If $r = 0$, point P is located at the pole.

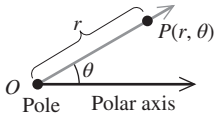


Figure 8-1

θ is a directed angle from the polar axis to line $\overleftrightarrow{OP}$.

- $\theta > 0$ is measured counterclockwise from the polar axis.
- $\theta < 0$ is measured clockwise from the polar axis.

TIP The polar axis in a polar coordinate system is usually aligned with the positive x-axis in a rectangular coordinate system.

EXAMPLE 1 Plotting Points in a Polar Coordinate System

Plot the points whose polar coordinates are given.

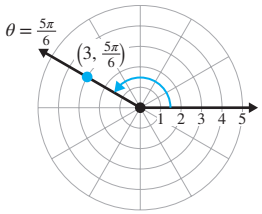
a. $\left(3, \frac{5\pi}{6}\right)$ **b.** $\left(5, -\frac{\pi}{4}\right)$ **c.** $(3.5, 3\pi)$ **d.** $\left(-4, \frac{\pi}{3}\right)$

Solution:

Polar graph paper consists of concentric circles centered at the pole whose radii represent incremental distances from the pole.

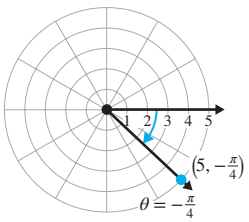
TIP Polar coordinates are sometimes given with θ in degree measure. For example, the point $\left(3, \frac{5\pi}{6}\right)$ can also be represented by (3, 150°).

a. $\left(3, \frac{5\pi}{6}\right)$



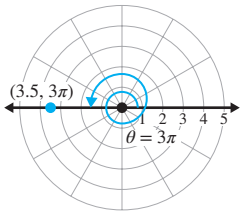
To locate $\left(3, \frac{5\pi}{6},\right)$ draw the terminal side of angle $\theta = \frac{5\pi}{6}$. Then measure 3 units from the pole in that direction.

b. $\left(5, -\frac{\pi}{4}\right)$



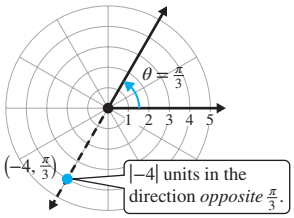
To locate $\left(5, -\frac{\pi}{4}\right)$, draw the terminal side of angle $\theta = -\frac{\pi}{4}$. Then measure 5 units from the pole in that direction.

c. $(3.5,\ 3\pi)$



To locate $(3.5, 3\pi)$, draw the terminal side of angle $\theta = 3\pi$. Then measure 3.5 units from the pole in that direction.

d. $\left(-4, \frac{\pi}{3}\right)$



To locate $\left(-4, \frac{\pi}{3}\right)$, draw the terminal side of angle $\theta = \frac{\pi}{3}$. Then measure $|-4| = 4$ units in the direction opposite $\theta = \frac{\pi}{3}$. That is, measure 4 units from the pole in the direction of $\frac{\pi}{3} + \pi$.

Skill Practice 1 Plot the points whose polar coordinates are given.

a. $\left(3, \frac{5\pi}{4}\right)$ **b.** $\left(4, -\frac{7\pi}{6}\right)$ **c.** $(2.5,\ 4\pi)$ **d.** $\left(-3, \frac{4\pi}{3}\right)$

The location of a point is uniquely described by an ordered pair (x, y) in a rectangular coordinate system. However, with polar coordinates, an infinite number of ordered pairs can represent a point in the plane. For example, the ordered pairs (r, θ) and $(r, \theta + 2n\pi)$ for any integer n represent the same point in polar coordinates. The coordinate $\theta + 2n\pi$ represents infinitely many angles coterminal to θ. One such example is shown in Figure 8-2. Likewise, (r, θ) and $(-r, \theta + (2n + 1)\pi)$ represent the same point. The coordinate $\theta \pm (2n + 1)\pi$ represents θ plus or minus an odd multiple of π. This is an angle with terminal side in the opposite direction of θ (Figure 8-3).

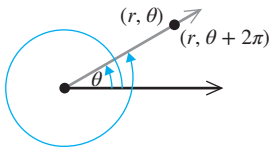


Figure 8-2

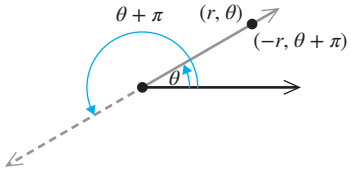

Figure 8-3

EXAMPLE 2 Finding Multiple Representations of a Point in Polar Coordinates

Given $\left(4, \frac{\pi}{6}\right)$ in polar coordinates, find two other polar coordinate representations

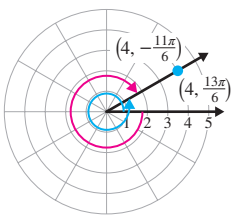
a. with $r > 0$. **b.** with $r < 0$.

Solution:

a. Using a positive value for r, we have $r = 4$. Since r is unchanged, any angle coterminal to $\theta = \frac{\pi}{6}$ will complete the ordered pair: $\left(4, \frac{\pi}{6} + 2n\pi\right)$.

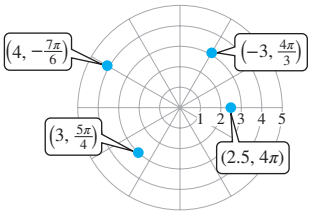
For example: $\left(4, \frac{\pi}{6} + 2\pi\right) = \left(4, \frac{13\pi}{6}\right)$

$\left(4, \frac{\pi}{6} - 2\pi\right) = \left(4, -\frac{11\pi}{6}\right)$



Answers

1. a. – d.

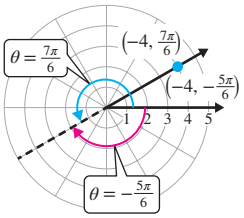


TIP Although an infinite number of ordered pairs can represent a point in polar coordinates, we often use the simplest representation with $r > 0$ and $0 \le \theta < 2\pi$.

b. Using a negative value for r, we have $r = -4$. Any angle coterminal to $\theta = \frac{\pi}{6} + \pi$ will complete the ordered pair. For example:

$$\left(-4, \frac{\pi}{6} + \pi\right) = \left(-4, \frac{7\pi}{6}\right)$$

$$\left(-4, \frac{\pi}{6} - \pi\right) = \left(-4, -\frac{5\pi}{6}\right)$$



Skill Practice 2 Given $\left(7, \frac{3\pi}{2}\right)$ in polar coordinates, find two other polar coordinate representations

a. with $r > 0$. **b.** with $r < 0$.

2. Convert Ordered Pairs Between Polar and Rectangular Coordinates

A point in a plane can be described by an ordered pair in rectangular coordinates or by an ordered pair in polar coordinates. It seems reasonable that we should be able to convert between the two coordinate systems.

To convert the coordinates of a point P in polar coordinates (r, θ) to rectangular coordinates (x, y), first consider the case with $r > 0$. From Figure 8-4,

$$x = r\cos\theta \quad \text{and} \quad y = r\sin\theta \qquad (1)$$

If $r = 0$, then P is at the pole with rectangular coordinates $(0, 0)$ and equation (1) holds true.

If $r < 0$, then point P can be represented by $(-r, \theta + \pi)$, where $-r > 0$. Since $\cos(\theta + \pi) = -\cos\theta = \frac{x}{-r}$, we have $x = r\cos\theta$. Likewise, since $\sin(\theta + \pi) = -\sin\theta = \frac{y}{-r}$, we have $y = r\sin\theta$. Thus, equation (1) holds true for any real number r.

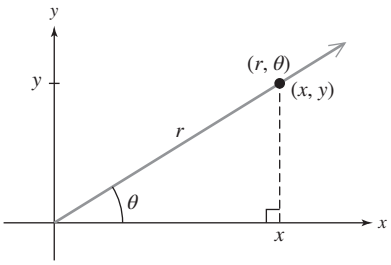


Figure 8-4

Convert Between Rectangular and Polar Coordinates

1. To convert the polar coordinates (r, θ) to rectangular coordinates (x, y), use $x = r\cos\theta$ and $y = r\sin\theta$.
2. To convert the rectangular coordinates (x, y) to polar coordinates (r, θ), use $r^2 = x^2 + y^2$ and $\tan\theta = \frac{y}{x}$ for $x \ne 0$.

EXAMPLE 3 Converting from Polar to Rectangular Coordinates

Convert the ordered pairs in polar coordinates to rectangular coordinates.

a. $\left(4, \frac{3\pi}{2}\right)$ **b.** $\left(-2, -\frac{5\pi}{6}\right)$

Answers

2. a. $\left(7, \frac{7\pi}{2}\right), \left(7, -\frac{\pi}{2}\right)$
   b. $\left(-7, \frac{\pi}{2}\right), \left(-7, -\frac{3\pi}{2}\right)$

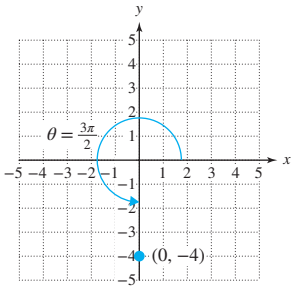
Solution:

a. Given $\left(4, \frac{3\pi}{2}\right)$,

$$x = r\cos\theta = 4\cos\frac{3\pi}{2} = 4(0) = 0$$

$$y = r\sin\theta = 4\sin\frac{3\pi}{2} = 4(-1) = -4.$$

The rectangular coordinates are $(0, -4)$.

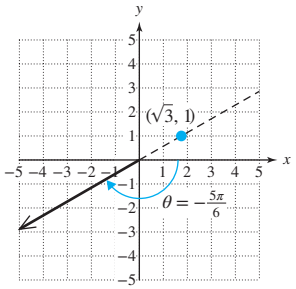


b. First note that $\left(-2, -\frac{5\pi}{6}\right)$ defines a point in Quadrant I. Therefore, we expect the x- and y-coordinates to be positive.

$$x = r\cos\theta = -2\cos\left(-\frac{5\pi}{6}\right) = -2\left(-\frac{\sqrt{3}}{2}\right) = \sqrt{3}$$

$$y = r\sin\theta = -2\sin\left(-\frac{5\pi}{6}\right) = -2\left(-\frac{1}{2}\right) = 1$$

The rectangular coordinates are $(\sqrt{3}, 1)$.



Skill Practice 3 Convert the ordered pairs in polar coordinates to rectangular coordinates.

a. $(5, \pi)$ **b.** $\left(-10, -\frac{2\pi}{3}\right)$

Changing from polar coordinates to rectangular coordinates as in Example 3 is generally easier than the reverse process because the rectangular coordinates of a point are unique. In Example 4, we will convert from rectangular coordinates to polar coordinates, where we see that the value of r (whether taken positive or negative) depends on the choice of θ and vice versa.

EXAMPLE 4 Converting from Rectangular to Polar Coordinates

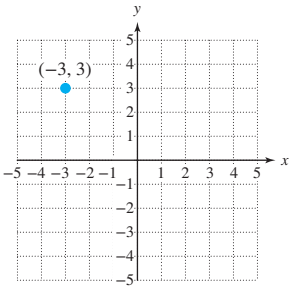
Convert $(-3, 3)$ from rectangular coordinates to polar coordinates. Give two representations, one with $r > 0$ and one with $r < 0$.

Solution:

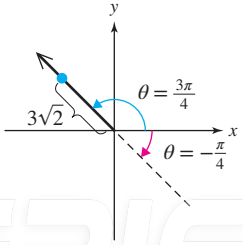
The point $(-3, 3)$ is in Quadrant II with $x = -3$ and $y = 3$.

$r^2 = x^2 + y^2 = (-3)^2 + (3)^2 = 18$,
so $r = \pm\sqrt{18} = \pm 3\sqrt{2}$

$$\tan\theta = \frac{y}{x} = \frac{3}{-3} = -1$$



- Taking $r > 0$, we require $\tan\theta = -1$ for θ in Quadrant II. One possibility is $r = 3\sqrt{2}$ and $\theta = \frac{3\pi}{4}$.
- Taking $r < 0$, we require $\tan\theta = -1$ for θ in Quadrant IV. One possibility is $r = -3\sqrt{2}$ and $\theta = -\frac{\pi}{4}$.



In polar coordinates, we have $\left(3\sqrt{2}, \frac{3\pi}{4}\right)$ and $\left(-3\sqrt{2}, -\frac{\pi}{4}\right)$.

Answers
3. a. $(-5, 0)$ **b.** $(5, 5\sqrt{3})$

Skill Practice 4 Convert $(-2, -2\sqrt{3})$ from rectangular coordinates to polar coordinates. Give two representations, one with $r > 0$ and one with $r < 0$.

EXAMPLE 5 Converting from Rectangular to Polar Coordinates

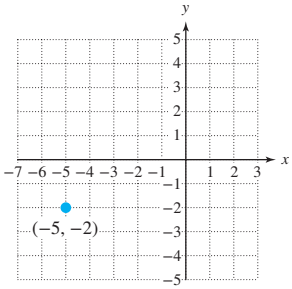
Convert $(-5, -2)$ from rectangular coordinates to polar coordinates. Give two representations, one with $r > 0$ and one with $r < 0$.

Solution:

The point $(-5, -2)$ is in Quadrant III with $x = -5$ and $y = -2$.

$r^2 = x^2 + y^2 = (-5)^2 + (-2)^2 = 29$, so $r = \pm\sqrt{29}$.

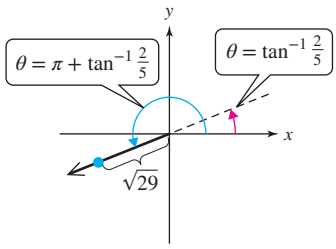
$\tan\theta = \frac{y}{x} = \frac{-2}{-5} = \frac{2}{5}$. Therefore, $\theta = n\pi + \tan^{-1}\frac{2}{5}$.



- Taking $r > 0$, we require $\tan\theta = \frac{2}{5}$ for θ in Quadrant III.

  One possibility is $r = \sqrt{29}$ and $\theta = \pi + \tan^{-1}\frac{2}{5}$.

- Taking $r < 0$, we require $\tan\theta = \frac{2}{5}$ for θ in Quadrant I. One possibility is $r = -\sqrt{29}$ and $\theta = \tan^{-1}\frac{2}{5}$.



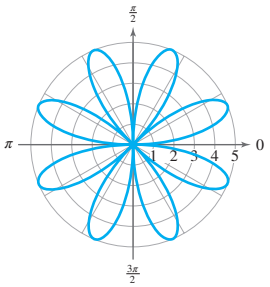
In polar coordinates we have $\left(\sqrt{29}, \pi + \tan^{-1}\frac{2}{5}\right)$ and $\left(-\sqrt{29}, \tan^{-1}\frac{2}{5}\right)$.

Skill Practice 5 Convert $(2, -3)$ from rectangular coordinates to polar coordinates. Give two representations, one with $r > 0$ and one with $r < 0$.

3. Convert Between Equations in Polar and Rectangular Coordinates

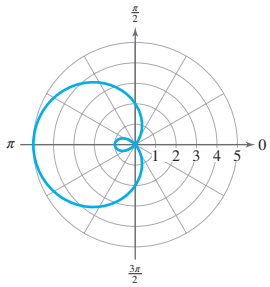
Why do we introduce a polar coordinate system when a rectangular coordinate system (at least to this point) seems to suffice? The answer is that many curves are more easily represented by a polar equation than by an equation in rectangular coordinates. A **polar equation** is an equation described in a polar coordinate system with variables r and θ rather than x and y.

The relationships $x = r\cos\theta$ and $y = r\sin\theta$ between polar and rectangular coordinates are based on trigonometric functions of the unit circle. Therefore, it seems reasonable that circles, ellipses, and other curves with loops such as those shown in Figures 8-5 and 8-6 may be easier to represent in polar form.



$r = 5\sin 4\theta$

Figure 8-5



$r = 2 - 3\cos\theta$

Figure 8-6

TIP Notice that the curves in Figures 8-5 and 8-6 fail the vertical line test and do not define y as a function of x in a rectangular coordinate system.

Answers

4. $\left(4, \frac{4\pi}{3}\right), \left(-4, \frac{\pi}{3}\right)$

5. $\left(\sqrt{13}, \tan^{-1}\left(-\frac{3}{2}\right)\right)$, $\left(-\sqrt{13}, \pi + \tan^{-1}\left(-\frac{3}{2}\right)\right)$

ISTUDY

We convert equations from rectangular coordinates to polar coordinates by substituting $x = r\cos\theta$ and $y = r\sin\theta$. This is demonstrated in Example 6.

EXAMPLE 6 Converting an Equation from Rectangular to Polar Coordinates

Write an equivalent equation using polar coordinates.

a. $2x + y = 4$ **b.** $x^2 + (y - 2)^2 = 4$

Solution:

a. $2x + y = 4$ The equation represents the line $y = -2x + 4$ in rectangular coordinates.

$2r\cos\theta + r\sin\theta = 4$ Substitute $x = r\cos\theta$ and $y = r\sin\theta$.

$r(2\cos\theta + \sin\theta) = 4$ Factor out r.

$r = \dfrac{4}{2\cos\theta + \sin\theta}$ Isolate r to write r as a function of θ.

The polar equation is $r = \dfrac{4}{2\cos\theta + \sin\theta}$.

b. $x^2 + (y - 2)^2 = 4$ This equation in rectangular coordinates represents a circle with center (0, 2) and radius 2.

$(r\cos\theta)^2 + (r\sin\theta - 2)^2 = 4$ Substitute $x = r\cos\theta$ and $y = r\sin\theta$.

$r^2\cos^2\theta + r^2\sin^2\theta - 4r\sin\theta + 4 = 4$ Square the binomial $(a - b)^2 = a^2 - 2ab + b^2$.

$r^2(\cos^2\theta + \sin^2\theta) - 4r\sin\theta = 0$ Factor out r^2 and subtract 4 from both sides.

$r^2 - 4r\sin\theta = 0$ Substitute 1 for $\cos^2\theta + \sin^2\theta$.

$r(r - 4\sin\theta) = 0$ Factor out r.

$r = 0$ or $r = 4\sin\theta$ Set each factor equal to zero.

The graph of $r = 0$ is simply the pole. This point is included in the graph of $r = 4\sin\theta$ because $r = 0$ when $\theta = n\pi$. Therefore, the equation $r = 4\sin\theta$ by itself is sufficient to represent the equation $x^2 + (y - 2)^2 = 4$.

The polar equation is $r = 4\sin\theta$.

TIP In Example 6, notice that the linear equation $2x + y = 4$ is simpler in rectangular coordinates, but an equation of a circle such as $r = 4\sin\theta$ is simpler in polar coordinates.

Skill Practice 6 Write an equivalent equation using polar coordinates.

a. $y = -3$ **b.** $y = x^2$

TECHNOLOGY CONNECTIONS

Graphing a Polar Equation

Most graphing utilities have the capability to graph polar equations. To begin, hit the MODE button and verify that the calculator is in radian mode and that the POLAR setting is highlighted (Figure 8-7). Then, in the graphing editor, enter the equation with r in terms of θ (Figure 8-8). In the WINDOW menu,

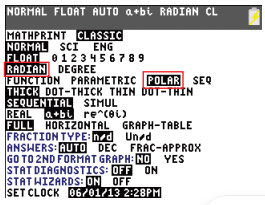


Figure 8-7

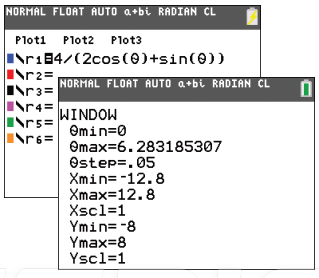

Figure 8-8

Answers

6. a. $r = -3\csc\theta$

b. $r = \tan\theta\sec\theta$

give a range for θ, x, and y. For now, choose θmin = 0 and θmax to be 2π (Figure 8-8). More will be discussed about the range for θ in Section 8.2. The value of θstep gives the increment by which θ is increased to compute successive values of r. Small values of θstep produce more points and render a smoother curve than a graph rendered with a large value of θstep. A large value of θstep yields fewer points and a more jagged curve but takes less time to graph.

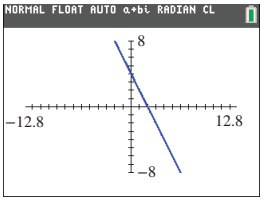

Figure 8-9

The graph of $r = \dfrac{4}{2\cos\theta + \sin\theta}$ from Example 6(a) is shown in Figure 8-9.

Notice that the graph of the polar equation is a line with slope -2 and y-intercept 4 as expected.

To convert an equation from polar coordinates to rectangular coordinates, the goal is to write an equation exclusively with x and y rather than r and θ. This is sometimes cumbersome, and to help with the task, we can use one or more of the following strategies.

1. Apply one or more of the relationships

   $x = r\cos\theta$, $y = r\sin\theta$, $x^2 + y^2 = r^2$, or $\tan\theta = \dfrac{y}{x}$ for $(x \neq 0)$.

2. Multiply both sides by r.
3. Square both sides of the equation.

EXAMPLE 7 Converting an Equation from Polar to Rectangular Coordinates

Write an equivalent equation using rectangular coordinates and identify the type of curve that the equation represents.

a. $r = 2$ **b.** $\theta = \dfrac{\pi}{3}$ **c.** $r = 4\csc\theta$ **d.** $r = -8\cos\theta$

Solution:

a.

$r = 2$

$r^2 = 4$ — Square both sides to get r^2 on the left, which in turn can be written as $x^2 + y^2$.

$x^2 + y^2 = 4$ — This is an equation of a circle centered at the origin with radius 2.

b.

$\theta = \dfrac{\pi}{3}$

$\tan\theta = \tan\dfrac{\pi}{3}$ — Take the tangent of both sides so that $\tan\theta$ can be written in rectangular coordinates as $\frac{y}{x}$.

$\dfrac{y}{x} = \sqrt{3}$ — Substitute $\frac{y}{x}$ for $\tan\theta$.

$y = \sqrt{3}x$ — Write the equation in slope-intercept form. The equation is a line through the origin with a slope of $\sqrt{3}$.

c.

$r = 4\csc\theta$

$r = \dfrac{4}{\sin\theta}$ — Write the expression on the right in terms of $\sin\theta$ for the possibility of applying the substitution $y = r\sin\theta$.

$r\sin\theta = 4$ — Multiply both sides by $\sin\theta$.

$y = 4$ — Replace $r\sin\theta$ by y. The equation is a horizontal line.

ISTUDY

d.

$$r = -8\cos\theta$$

Multiply both sides by r. By so doing, we have r^2 on the left, which can be replaced by $x^2 + y^2$. On the right, $r\cos\theta$ can be replaced by x.

$$r^2 = -8r\cos\theta$$

$$x^2 + y^2 = -8x$$

Collect variable terms on the left.

$$x^2 + 8x + y^2 = 0$$

Complete the square on the left. Add $\left[\frac{1}{2}(8)\right]^2$ to both sides.

$$x^2 + 8x + 16 + y^2 = 16$$

The equation is a circle centered at $(-4, 0)$ with radius 4.

$$(x + 4)^2 + y^2 = 16$$

Skill Practice 7 Write an equivalent equation using rectangular coordinates, and identify the type of curve the equation represents.

a. $r = -3$ **b.** $\theta = -\frac{\pi}{4}$ **c.** $r = 6\sec\theta$ **d.** $r = 6\sin\theta$

- The result of Example 7(a) suggests that a polar equation of the form $r = a$ for $a \neq 0$ is a circle centered at the pole with radius $|a|$ (see Exercise 72). The equation $r = a$ represents all points $|a|$ units from the pole regardless of the value of θ (regardless of the direction taken).
- The result of Example 7(b) suggests that a polar equation of the form $\theta = k$ is a line through the origin making an angle k with the polar axis (see Exercise 71). Of particular interest are the graphs of $\theta = 0$ and $\theta = \frac{\pi}{2}$. If the polar axis is positioned to coincide with the positive x-axis in a rectangular coordinate system, these equations represent the x- and y-axes, respectively (Figures 8-10 and 8-11).

Answers

7. a. $x^2 + y^2 = 9$; Circle centered at the origin, radius 3
b. $y = -x$; Line through the origin with a slope of -1
c. $x = 6$; Vertical line
d. $x^2 + (y - 3)^2 = 9$; Circle centered at $(0, 3)$ with radius 3

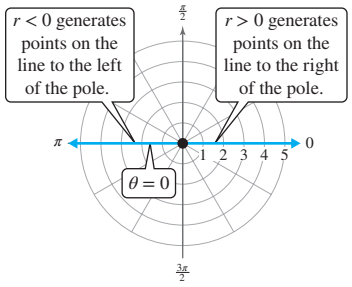

Figure 8-10

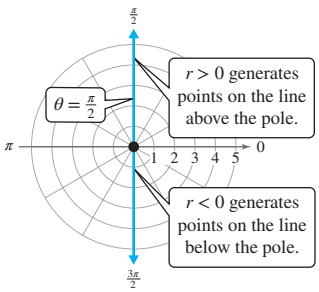

Figure 8-11

SECTION 8.1 Practice Exercises

Prerequisite Review

R.1. Given a circle with center $(-7, 3)$ and radius 3, write an equation of the circle in standard form.

R.2. Write the equation in slope-intercept form and determine the slope.

$$4x + 3y = 12$$

R.3. Find the exact distance between the points $(-9, 4)$ and $(-4, -1)$.

Concept Connections

1. The origin of a polar coordinate system is called the _____.

2. Given a point P represented by the ordered pair (r, θ) in polar coordinates, the distance from P to $(0, 0)$ is _____.

3. To convert an ordered pair (r, θ) in polar coordinates to rectangular coordinates, use the relationships $x =$ _____ and $y =$ _____.

4. To convert an ordered pair (x, y) from rectangular coordinates to polar coordinates, use the relationships $r^2 =$ _____ and $\tan\theta =$ _____.

5. Use an equation in polar coordinates to describe the set of points 4 units from the pole.

6. Write three ordered pairs in polar coordinates that represent the pole.

Objective 1: Plot Points Using Polar Coordinates

For Exercises 7–14, match each point in polar coordinates to the points *A*, *B*, *C*, or *D*.

$A\left(3, \frac{\pi}{6}\right)$ $B\left(3, \frac{3\pi}{4}\right)$ $C\left(3, -\frac{\pi}{6}\right)$ $D\left(-3, \frac{\pi}{4}\right)$

7. $\left(3, -\frac{5\pi}{4}\right)$ **8.** $\left(3, \frac{11\pi}{6}\right)$ **9.** $\left(3, -\frac{11\pi}{6}\right)$ **10.** $\left(3, \frac{5\pi}{4}\right)$

11. $\left(3, \frac{13\pi}{4}\right)$ **12.** $\left(-3, \frac{7\pi}{4}\right)$ **13.** $\left(-3, \frac{5\pi}{6}\right)$ **14.** $\left(-3, \frac{7\pi}{6}\right)$

For Exercises 15–18, plot the points whose polar coordinates are given. (See Example 1)

15. a. $\left(5, \frac{\pi}{2}\right)$ **b.** $\left(2.5, \frac{8\pi}{3}\right)$ **c.** $\left(-2, \frac{\pi}{6}\right)$ **d.** $\left(-4, \frac{5\pi}{4}\right)$

16. a. $\left(3, \frac{\pi}{3}\right)$ **b.** $\left(4.5, \frac{11\pi}{4}\right)$ **c.** $\left(-5, \frac{5\pi}{6}\right)$ **d.** $\left(-3, \frac{\pi}{4}\right)$

17. a. $\left(4, -\frac{5\pi}{6}\right)$ **b.** $\left(3, -\frac{5\pi}{4}\right)$ **c.** $\left(-2, -\frac{\pi}{3}\right)$ **d.** $\left(-4.5, -\frac{2\pi}{3}\right)$

18. a. $\left(2, -\frac{2\pi}{3}\right)$ **b.** $(3, -\pi)$ **c.** $\left(-4, -\frac{\pi}{4}\right)$ **d.** $\left(-5, -\frac{5\pi}{6}\right)$

For Exercises 19–22, given a point in polar coordinates, find two other polar coordinate representations. (See Example 2)

a. with $r > 0$. **b.** with $r < 0$.

19. $\left(7, \frac{5\pi}{6}\right)$ **20.** $\left(3.6, \frac{\pi}{2}\right)$ **21.** $\left(-8, \frac{7\pi}{4}\right)$ **22.** $\left(-2, \frac{4\pi}{3}\right)$

Objective 2: Convert Ordered Pairs Between Polar and Rectangular Coordinates

For Exercises 23–32, convert the ordered pair in polar coordinates to rectangular coordinates. (See Example 3)

23. $\left(8, \frac{5\pi}{6}\right)$ **24.** $\left(6, \frac{2\pi}{3}\right)$ **25.** $\left(-1.2, \frac{5\pi}{4}\right)$ **26.** $\left(-\frac{3}{4}, \frac{7\pi}{4}\right)$

27. $\left(17, -\frac{\pi}{3}\right)$ **28.** $\left(5, -\frac{7\pi}{6}\right)$ **29.** $\left(-4, -\frac{11\pi}{6}\right)$ **30.** $\left(-8, -\frac{4\pi}{3}\right)$

31. $\left(7, \frac{\pi}{2}\right)$ **32.** $(16, \pi)$

ISTUDY

For Exercises 33–38, convert the ordered pair in rectangular coordinates to polar coordinates with $r > 0$ and $0 \le \theta < 2\pi$. (See Examples 4–5)

33. $(-3, 3\sqrt{3})$ **34.** $(-7\sqrt{3}, 7)$ **35.** $(8\sqrt{2}, -8\sqrt{2})$

36. $(5, -5\sqrt{3})$ **37.** $(2, -6)$ **38.** $(4, -10)$

For Exercises 39–44, convert the ordered pair in rectangular coordinates to polar coordinates with $r < 0$ and $0 \le \theta < 2\pi$. (See Examples 4–5)

39. $\left(\frac{5\sqrt{3}}{2}, \frac{5}{2}\right)$ **40.** $\left(\frac{3\sqrt{2}}{2}, -\frac{3\sqrt{2}}{2}\right)$ **41.** $(-1, \sqrt{3})$

42. $(10\sqrt{2}, 10\sqrt{2})$ **43.** $(-3, -8)$ **44.** $(-5, -1)$

Objective 3: Convert Between Equations in Polar and Rectangular Coordinates

For Exercises 45–56, write an equivalent equation using polar coordinates. (See Example 6)

45. $x - y = 10$ **46.** $3x + 2y = 6$ **47.** $x = -6$

48. $y = 2$ **49.** $x^2 + y^2 = 16$ **50.** $2x^2 + 2y^2 = 50$

51. $x^2 = 3y$ **52.** $x = 2y^2$ **53.** $(x + 2)^2 + y^2 = 4$

54. $x^2 + (y - 1)^2 = 1$ **55.** $(x - 5)^5 + (y + 6)^2 = 61$ **56.** $(x + 3)^2 + (y - 4)^2 = 25$

For Exercises 57–70, convert the polar equation to rectangular form and identify the type of curve represented. (See Example 7)

57. $r = 3$ **58.** $r = 7$ **59.** $r = 2\csc\theta$

60. $r = \sec\theta$ **61.** $r = 4\cos\theta$ **62.** $r = -2\sin\theta$

63. $\theta = \frac{3\pi}{4}$ **64.** $\theta = \frac{\pi}{6}$ **65.** $r = a\sin\theta \ (a \ne 0)$

66. $r = a\cos\theta \ (a \ne 0)$ **67.** $r = \frac{a}{\sin\theta} \ (a \ne 0)$ **68.** $r = \frac{a}{\cos\theta} \ (a \ne 0)$

69. $r = 2h\cos\theta + 2k\sin\theta$ **70.** $r = h\cos\theta + k\sin\theta$

71. Suppose that the polar axis is positioned to coincide with the positive x-axis in a rectangular coordinate system. Describe the graphs of the polar equations as they relate to a rectangular coordinate system.

a. $\theta = 0$ **b.** $\theta = \frac{\pi}{4}$ **c.** $\theta = \frac{\pi}{2}$

72. Show that a polar equation of the form $r = a \ (a \ne 0)$ represents a circle centered at the pole with radius $|a|$.

Mixed Exercises

For Exercises 73–76, determine whether the two ordered pairs in polar coordinates represent the same point in the plane. If not, explain the change needed to make the two ordered pairs represent the same point. Assume that n is any integer.

73. (r, θ) and $(-r, -\theta)$ **74.** $(-r, \theta)$ and $(r, \theta + 2n\pi)$

75. $(-r, \theta)$ and $(r, \pi - \theta)$ **76.** (r, θ) and $(r, \theta + 2n\pi)$

For Exercises 77–78, determine whether the statement is true or false for two points $P(r_1, \theta_1)$ and $Q(r_2, \theta_2)$ represented in polar coordinates. If the statement is false, give a counterexample.

77. If $|r_1| = |r_2|$, then P and Q are the same distance from the pole.

78. If $|\theta_1| = |\theta_2|$, then P and Q lie on the same line through the pole.

For Exercises 79–82, a point in polar coordinates is given. Let n be an integer and find *all* other polar representations of the given point.

79. $\left(3, \frac{\pi}{4}\right)$ **80.** $\left(-2, -\frac{4\pi}{3}\right)$ **81.** $\left(-4, \frac{5\pi}{6}\right)$ **82.** $\left(6, -\frac{7\pi}{4}\right)$

ISTUDY

For Exercises 83–88, describe the graph of the set of points (r, θ) represented by the polar inequality. Assume that the polar axis is oriented to coincide with the positive x-axis in a rectangular coordinate system.

83. $r < 8$

84. $r \geq 5$

85. $2 \leq r \leq 4$

86. $1 < r < 2$

87. $0 < \theta < \frac{\pi}{4}$

88. $\frac{\pi}{2} < \theta < \pi$

89. Suppose that seating in a theater is in an area defined in polar coordinates where the pole is located at the front and center of the stage labeled as point A. The seating area is defined by $-\frac{\pi}{4} \leq \theta \leq \frac{\pi}{4}$ and $30 \leq r \leq 100$, and the values of r are in feet.

a. Sketch the seating area.

b. Determine the amount of area for seating. Write the exact answer in terms of π and give an approximation to the nearest square foot.

90. A rotating sprinkler spreads water over an area defined by $\frac{\pi}{6} \leq \theta \leq \frac{5\pi}{6}$ and $4 \leq r \leq 24$ relative to the sprinkler head at the pole at point A and an imaginary line defined by $\theta = 0$. The values of r are in feet.

a. Sketch the area that is watered.

b. Determine the amount of area that is watered. Write the exact answer in terms of π and give an approximation to the nearest square foot.

91. A player in a video game must knock out a target located 84 pixels above and 156 pixels to the left of his position. Choose a polar coordinate system with the player at the pole and the polar axis extending to the player's right. Find the polar coordinates of the target (this determines the distance and angle at which the player should fire his gun). Find r to the nearest pixel and θ in degree measure to the nearest tenth of a degree.

92. A gunner on a naval ship sights a target located 2.1 mi north and 0.8 mi east of the ship's position. Choose a polar coordinate system with the gunner at the pole and the polar axis extending to the east. Find the polar coordinates of the target. Find r to the nearest hundredth of a mile and θ in degree measure to the nearest hundredth of a degree.

Write About It

93. Explain the significance of $r < 0$ in an ordered pair (r, θ) in polar coordinates.

94. Explain why a point in the plane can be represented by infinitely many ordered pairs in polar coordinates.

Expanding Your Skills

95. **a.** Given points $P(r_1, \theta_1)$ and $Q(r_2, \theta_2)$ represented in polar coordinates, write the ordered pairs in rectangular coordinates.

b. Use the rectangular coordinates from part (a) and the distance formula to show that the distance d between P and Q is given by $d = \sqrt{r_1^2 + r_2^2 - 2r_1r_2\cos(\theta_2 - \theta_1)}$.

96. Use the results of Exercise 95.

a. If $\theta_1 = \theta_2$, what is the distance between P and Q? Explain the significance of the answer.

b. If $\theta_1 - \theta_2 = \frac{\pi}{2}$, what is the distance between P and Q? Explain the significance of the answer.

97. Given points $P(r_1, \theta_1)$ and $Q(r_2, \theta_2)$ represented in polar coordinates with $\theta_1 \neq \theta_2$ and $r_1 > 0$ and $r_2 > 0$, use the law of cosines to show that the distance d between P and Q is given by $d = \sqrt{r_1^2 + r_2^2 - 2r_1r_2\cos(\theta_2 - \theta_1)}$.

98. Use the results of Exercise 97.

Find the distance between the points $\left(2, \frac{\pi}{6}\right)$ and $\left(4, \frac{\pi}{3}\right)$.

Technology Connections

For Exercises 99–102, use a graphing utility to graph the polar equation for the given intervals of θ, x, and y to confirm your answer to the given exercise. Use the window setting for $0 \leq \theta \leq \pi$, $-4.83 \leq x \leq 4.83$, and $-3 \leq y \leq 3$.

99. $r = 2\csc\theta$; Exercise 59

100. $r = \sec\theta$; Exercise 60

101. $r = 4\cos\theta$; Exercise 61

102. $r = -2\sin\theta$; Exercise 62

SECTION 8.2 Graphs of Polar Equations

OBJECTIVES

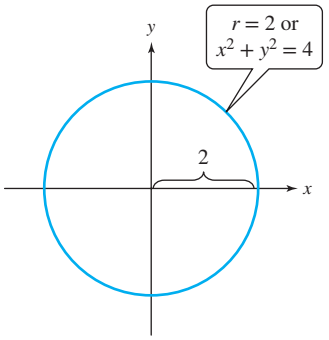
1. Graph Polar Equations by Plotting Points
2. Test Polar Equations for Symmetry
3. Categorize Polar Equations and Their Graphs

1. Graph Polar Equations by Plotting Points

JPL-Caltech/NASA

Galaxies are clusters of millions of stars, planets, and space debris held together by gravitational attraction that when seen from a very large distance often appear in organized patterns. Perhaps the most beautiful pattern is the classic spiral galaxy. Interestingly, the graph of a spiral can be represented by a simple equation represented in a polar coordinate system (see Example 6).

A **solution** to a polar equation is an ordered pair (r, θ) that satisfies the equation. The graph of a polar equation is the graph of all solutions to the equation. In some cases, we can convert a polar equation to rectangular coordinates and then graph the equation from its rectangular form. For example, in Section 8.1, we determined that the equation $r = 2$ is equivalent to the rectangular equation $x^2 + y^2 = 4$. Thus, the graph of $r = 2$ is a circle with center at the pole and radius 2 units.



Converting a polar equation to an equation in rectangular coordinates does not always produce a rectangular equation that we recognize. As a result, it is sometimes necessary to make a table of solutions and plot the points to graph a polar equation.

EXAMPLE 1 Graph a Polar Equation by Plotting Points

Graph $r = 6\sin\theta$.

Solution:

The equation $r = 6\sin\theta$ is written with r as a function of θ. Therefore, we organize a table with arbitrary values of θ and solve for r (Table 8-1).

Table 8-1

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π
r	0	3	$3\sqrt{2}$	$3\sqrt{3}$	6	$3\sqrt{3}$	$3\sqrt{2}$	3	0
$r \approx$	0	3	4.2	5.2	6	5.2	4.2	3	0

θ	$\frac{7\pi}{6}$	$\frac{5\pi}{4}$	$\frac{4\pi}{3}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
r	-3	$-3\sqrt{2}$	$-3\sqrt{3}$	-6	$-3\sqrt{3}$	$-3\sqrt{2}$	-3	0
$r \approx$	-3	-4.2	-5.2	-6	-5.2	-4.2	-3	0

The graph of $r = 6\sin\theta$ is shown in Figure 8-12. The graph is a circle with radius 3, centered at $\left(3, \frac{\pi}{2}\right)$ [or equivalently (0, 3) in rectangular coordinates].

Notice that the graph of the circle is traced completely by graphing solutions with $0 \le \theta \le \pi$. The points in Table 8-1 with $\pi < \theta \le 2\pi$ are redundant. For example, $\left(-3, \frac{7\pi}{6}\right)$ is the same point in the plane as $\left(3, \frac{\pi}{6}\right)$.

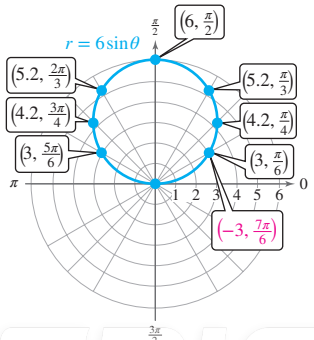


Figure 8-12

Skill Practice 1 Graph $r = -4\cos\theta$.

The graph from Example 1 is consistent with the result obtained by converting the equation to rectangular form.

$$r = 6\sin\theta$$
$$r^2 = 6r\sin\theta \quad \text{Multiply both sides by } r.$$
$$x^2 + y^2 = 6y \quad \text{Replace } r^2 \text{ by } x^2 + y^2 \text{ and } r\sin\theta \text{ by } y.$$
$$x^2 + y^2 - 6y + 9 = 9 \quad \text{Complete the square. Add } \left[\tfrac{1}{2}(-6)\right]^2 = 9 \text{ to both sides.}$$
$$x^2 + (y-3)^2 = 9 \quad \text{The equation is a circle centered at } (0, 3) \text{ with radius 3.}$$

We also notice in Figure 8-12 that the graph of $r = 6\sin\theta$ is symmetric with respect to the line $\theta = \dfrac{\pi}{2}$ (y-axis). Knowing that the graph of $r = 6\sin\theta$ is traced completely for $0 \le \theta \le \pi$ and that the graph is symmetric to the line $\theta = \dfrac{\pi}{2}$ means that we can significantly reduce the number of points needed to construct the graph. We can graph $r = 6\sin\theta$ by plotting points for θ on the interval $\left[0, \dfrac{\pi}{2}\right]$ and using symmetry.

2. Test Polar Equations for Symmetry

Figures 8-13, 8-14, and 8-15 show a point P and a corresponding point Q that is symmetric to P with respect to the polar axis, the line $\theta = \dfrac{\pi}{2}$, and the pole, respectively.

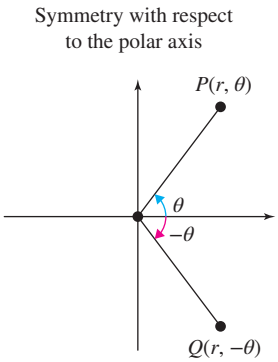

Figure 8-13

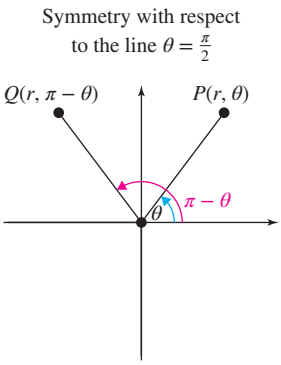

Figure 8-14

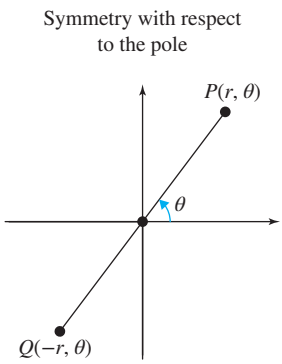

Figure 8-15

Table 8-2

Tests for Symmetry in Polar Coordinates

For an equation in polar coordinates, if the indicated substitution produces an equivalent equation, then the graph has the indicated type of symmetry.

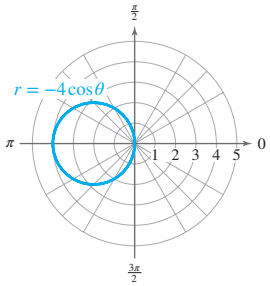
(1) Symmetry with respect to the polar axis: Replace (r, θ) by $(r, -\theta)$

(2) Symmetry with respect to the line $\theta = \dfrac{\pi}{2}$: Replace (r, θ) by $(r, \pi - \theta)$

(3) Symmetry with respect to the pole: Replace (r, θ) by $(-r, \theta)$

Answer

1.



It is very important to note that the three tests for symmetry given in Table 8-2 are inconclusive if the given substitution fails to produce an equivalent equation. For example, a graph may be symmetric with respect to the polar axis, but a different

representation of the point $(r, -\theta)$ satisfies the equation determining the graph. A rigorous test for symmetry would require that we test *all* representations of the point $(r, -\theta)$ in the original equation. That is, we would need to substitute $(r, -\theta + 2n\pi)$ and $(-r, (\pi - \theta) + 2n\pi)$ to determine if we reach an equivalent equation for some value of n.

For example, consider the graph of $r = 4\sin\frac{\theta}{2}$. From Figure 8-16, the graph is symmetric with respect to the polar axis. However, applying (1) from Table 8-2 results in a different equation, giving us no information about symmetry.

$$r = 4\sin\frac{\theta}{2}$$
$$r = 4\sin\frac{-\theta}{2}$$
$$r = -4\sin\frac{\theta}{2} \quad \text{Different}$$

TIP Apply the odd function property of the sine function.
$\sin(-\theta) = -\sin\theta$

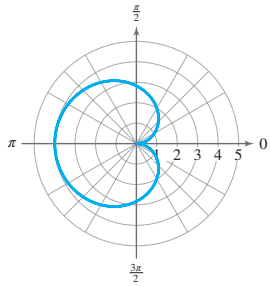


Figure 8-16

Although the graph is actually symmetric with respect to the polar axis, the test is inconclusive.

However, substituting a *different* representation of the point $(r, -\theta)$ such as $(r, 2\pi - \theta)$ may result in an equivalent equation and indicate that symmetry exists.

$$r = 4\sin\frac{\theta}{2}$$

Replace (r, θ) by $(r, 2\pi - \theta)$ and apply the difference formula for $\sin(a - b) = \sin a\cos b - \cos a\sin b$

$$r = 4\sin\frac{2\pi - \theta}{2} = 4\sin\left(\pi - \frac{\theta}{2}\right)$$
$$= 4\left(\sin\pi\cos\frac{\theta}{2} - \cos\pi\sin\frac{\theta}{2}\right) = 4\left[0\cdot\cos\frac{\theta}{2} - (-1)\cdot\sin\frac{\theta}{2}\right] = 4\sin\frac{\theta}{2}$$

Since substituting $(r, 2\pi - \theta)$ into the original equation results in an equivalent equation, we confirm that the graph is symmetric with respect to the polar axis.

EXAMPLE 2 Using Symmetry to Graph a Polar Equation

Graph $r = 2 - 2\cos\theta$.

Solution:

First test for symmetry.

Test for symmetry with respect to the polar axis:

$$r = 2 - 2\cos\theta$$
$$r = 2 - 2\cos(-\theta)$$
$$= 2 - 2\cos\theta \quad \text{Same}$$

Replace (r, θ) by $(r, -\theta)$.

The cosine function is even: $\cos\theta = \cos(-\theta)$.

The graph is symmetric with respect to the polar axis.

Test for symmetry with respect to the line $\theta = \frac{\pi}{2}$:

$$r = 2 - 2\cos\theta$$
$$r = 2 - 2\cos(\pi - \theta)$$
$$= 2 - 2(-\cos\theta)$$
$$= 2 + 2\cos\theta \quad \text{Different}$$

Replace (r, θ) by $(r, \pi - \theta)$.

$\cos(\pi - \theta) = -\cos\theta$

The test is inconclusive.

ISTUDY

Test for symmetry with respect to the pole:

$$r = 2 - 2\cos\theta$$
$$-r = 2 - 2\cos\theta \qquad \text{Replace } (r, \theta) \text{ by } (-r, \theta).$$
$$r = -2 + 2\cos\theta \qquad \text{Different}$$

The test is inconclusive.

Since the graph of $r = 2 - 2\cos\theta$ is symmetric with respect to the polar axis, we can plot several points for $0 \le \theta \le \pi$ (Figure 8-17) and then use symmetry to plot additional points for $\pi < \theta < 2\pi$ (Figure 8-18).

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π
r	0	$2-\sqrt{3}$	$2-\sqrt{2}$	1	2	3	$2+\sqrt{2}$	$2+\sqrt{3}$	4
$r \approx$	0	0.27	0.59	1	2	3	3.41	3.73	4

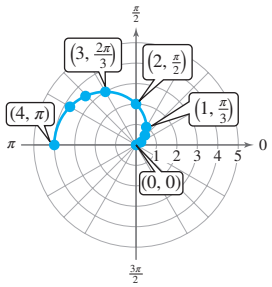

Figure 8-17

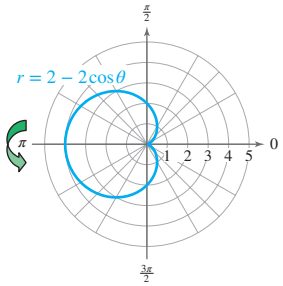

Figure 8-18

The graph of $r = 2 - 2\cos\theta$ is called a limaçon (pronounced "lee-ma-sohn") and is further categorized as a cardioid because it resembles the shape of a heart.

Skill Practice 2 Graph $r = 3 + 3\sin\theta$.

Another tool in our analysis of polar equations is identifying the maximum value of $|r|$ if it exists. In Example 2, the value of $|r|$ in the equation $r = 2 - 2\cos\theta$ is maximized when $\cos\theta = -1$. Therefore, for $\theta = \pi$,

$$|r| = |2 - 2\cos(\pi)| = |2 - 2(-1)| = 4 \text{ (maximum value of } |r|).$$

The maximum value of $|r|$ tells us the distance from the pole of the point or points on a graph that are farthest from the pole. This can be helpful when setting up a viewing window to graph a polar equation by hand or by using a graphing utility.

TECHNOLOGY CONNECTIONS

Graphing a Polar Equation

To graph a polar equation on a graphing utility, the calculator must be in RADIAN mode with the POLAR option highlighted (Figure 8-19). It is also important to set appropriate window parameters. To graph $r = 2 - 2\cos\theta$ from Example 2, we know that the maximum value of $|r|$ is 4. We need a window at least as large as $-4 \le x \le 4$ and $-4 \le y \le 4$. However, we choose $-6.4 \le x \le 6.4$ and $-4 \le y \le 4$ to accommodate an aspect ratio of width (x) to height (y) of 1.6 to 1 (Figure 8-20). This ensures a viewing window without distortion (Figure 8-21). Check the user's manual to determine the correct aspect ratio for your device.

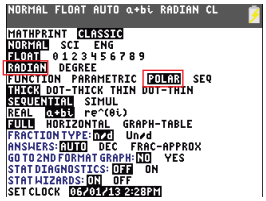

Figure 8-19

The value of θmin and θmax are the endpoints of an interval over which the graph is traced once, in this case $[0, 2\pi)$. The value of θstep is the incremental change in θ between consecutive points. Smaller values of θstep result in a smoother curve and a graph traced more slowly than graphs traced with larger values of θstep.

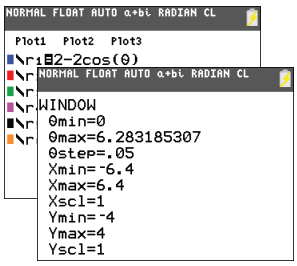

Figure 8-20

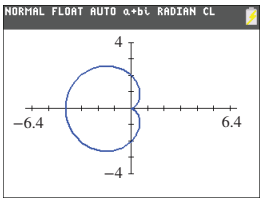

Figure 8-21

EXAMPLE 3 Using Symmetry to Graph a Polar Equation

Graph $r = 2 + 3\sin\theta$.

Solution:

Test for symmetry with respect to the polar axis:

$$r = 2 + 3\sin\theta$$

$$r = 2 + 3\sin(-\theta) \qquad \text{Replace } (r, \theta) \text{ by } (r, -\theta).$$

$$= 2 + 3(-\sin\theta)$$

$$= 2 - 3\sin\theta \qquad \text{Different} \qquad \text{The sine function is odd: } \sin(-\theta) = -\sin\theta.$$

The test is inconclusive.

ISTUDY

Test for symmetry with respect to the line $\theta = \frac{\pi}{2}$:

$r = 2 + 3\sin\theta$

$r = 2 + 3\sin(\pi - \theta)$ Replace (r, θ) by $(r, \pi - \theta)$.

$= 2 + 3\sin\theta$ Same $\sin(\pi - \theta) = \sin\theta$

The graph is symmetric with respect to the line $\theta = \frac{\pi}{2}$.

Test for symmetry with respect to the pole:

$r = 2 + 3\sin\theta$

$-r = 2 + 3\sin\theta$ Replace (r, θ) by $(-r, \theta)$.

$r = -2 - 3\sin\theta$ Different

The test is inconclusive.

Since the graph of $r = 2 + 3\sin\theta$ is symmetric with respect to the line $\theta = \frac{\pi}{2}$, we can plot points for $0 \le \theta \le \frac{\pi}{2}$ and $\frac{3\pi}{2} \le \theta \le 2\pi$ (Figure 8-22) and then use symmetry to plot additional points for $\frac{\pi}{2} < \theta < \frac{3\pi}{2}$ (Figure 8-23).

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{3\pi}{2}$	$\frac{5\pi}{3}$	$\frac{7\pi}{4}$	$\frac{11\pi}{6}$	2π
r	2	$\frac{7}{2}$	$2 + \frac{3\sqrt{2}}{2}$	$2 + \frac{3\sqrt{3}}{2}$	5	-1	$2 - \frac{3\sqrt{3}}{2}$	$2 - \frac{3\sqrt{2}}{2}$	$\frac{1}{2}$	2
$r \approx$	2	3.5	4.1	4.6	5	-1	-0.6	-0.1	0.5	2

Shown in Figure 8-22 in blue | Shown in Figure 8-22 in red

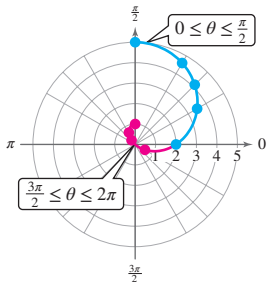

Figure 8-22

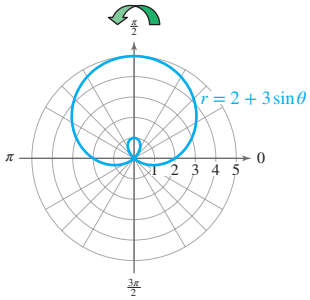

Figure 8-23

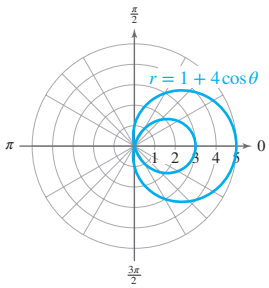
The graph of $r = 2 + 3\sin\theta$ (Figure 8-23) is another type of limaçon and is further categorized as a limaçon with a loop.

Skill Practice 3 Graph $r = 1 + 4\cos\theta$.

Answer

3.



In Example 3, the graph passes through the pole twice for θ on the interval $[0, 2\pi)$. The values of θ for which $r = 0$ sometimes tell us where a loop "begins" or "ends" and is helpful to graph a polar equation. We demonstrate this in Example 4.

EXAMPLE 4 Using Symmetry to Graph a Polar Equation

Graph $r = 4\cos 2\theta$.

Solution:

The graph is at the pole when $r = 0$.

$$r = 4\cos 2\theta = 0 \text{ for } \theta = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}, \ldots$$

Test for symmetry.

Polar axis:

$r = 4\cos 2\theta$

$r = 4\cos 2(-\theta)$

$r = 4\cos 2\theta$ — Same

The graph is symmetric with respect to the polar axis.

Line $\theta = \frac{\pi}{2}$:

$r = 4\cos 2\theta$

$r = 4\cos[2(\pi - \theta)]$

$r = 4\cos(2\pi - 2\theta)$

$r = 4\cos 2\theta$ — Same

The graph is symmetric with respect to the line $\theta = \frac{\pi}{2}$.

Pole:

$r = 4\cos 2\theta$

$-r = 4\cos 2\theta$

$r = -4\cos 2\theta$ — Different

The test for symmetry about the pole is inconclusive.

Since the graph of $r = 4\cos 2\theta$ is symmetric with respect to both the polar axis and the line $\theta = \frac{\pi}{2}$, we can plot points for $0 \le \theta \le \frac{\pi}{2}$ (Figure 8-24) and then use symmetry to plot additional points.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
r	4	2	0	-2	-4

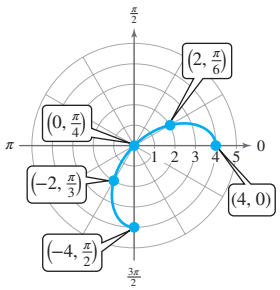


Figure 8-24

Applying symmetry with respect to the polar axis, we can sketch a mirror image of the part of the curve above the polar axis. Applying symmetry with respect to the line $\theta = \frac{\pi}{2}$, we can sketch a mirror image of the curve to the left of $\theta = \frac{\pi}{2}$ (Figure 8-25).

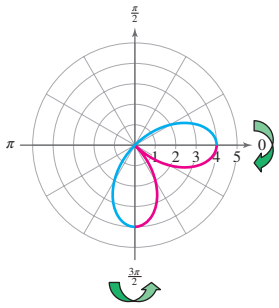

Figure 8-25

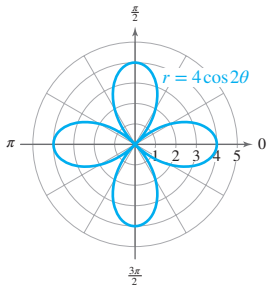

Figure 8-26

Applying symmetry with respect to the polar axis and line $\theta = \frac{\pi}{2}$ results in a graph of a "rose" with four petals (Figure 8-26).

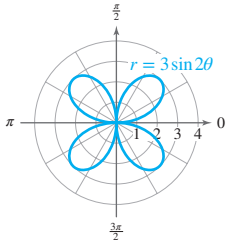
Skill Practice 4 Graph $r = 3\sin 2\theta$.

TIP From Figure 8-26, the graph of $r = 4\cos 2\theta$ is traced through the pole four times for $0 \le \theta < 2\pi$. This is consistent with our analysis that $r = 4\cos 2\theta = 0$ for $\theta = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$, and so on.

Among other applications in calculus, we will find the area enclosed by polar graphs. Identifying symmetry and points on a graph that pass through the pole are important parts of this analysis.

Answer

4.



3. Categorize Polar Equations and Their Graphs

Throughout the text, we have categorized a number of different types of equations in a rectangular coordinate system along with their graphs. For example, the graph of a linear equation in two variables $Ax + By = C$ is a line, the graph of a quadratic equation $y = ax^2 + bx + c$ is a parabola, and so on. We now present a library of polar equations and their associated graphs (Table 8-3).

Table 8-3

Common Polar Equations and Their Graphs

Lines	 $\theta = 0$ x-axis $\theta = \frac{\pi}{2}$ y-axis	 $\theta = a$ Line through origin	 $r = \frac{a}{\sin\theta}$ Horizontal line ($y = a$)	 $r = \frac{a}{\cos\theta}$ Vertical line ($x = a$)
Circles and Spirals	 $r = a$ Circle: center at the pole, radius $\lvert a \rvert$	 $r = a\cos\theta$ Circle: center on polar axis, radius $\left\lvert \frac{a}{2} \right\rvert$	 $r = a\sin\theta$ Circle: center on $\theta = \frac{\pi}{2}$, radius $\left\lvert \frac{a}{2} \right\rvert$	 $r = a\theta$ Spiral
Limaçons $r = a \pm b\cos\theta$ $r = a \pm b\sin\theta$ $(a > 0, b > 0)$ The orientation and symmetry depend on the trigonometric function and the sign of the sine or cosine term.	 $a < b$ limaçon with a loop	 $a = b$ cardioid	 $b < a < 2b$ dimpled limaçon	 $a \geq 2b$ convex limaçon

Roses $r = a\cos n\theta$ $r = a\sin n\theta$ n petals if n is odd $2n$ petals if n is even	 $r = a\sin 2\theta$ 4-petal rose	 $r = a\sin 4\theta$ 8-petal rose	 $r = a\sin 3\theta$ 3-petal rose	 $r = a\sin 5\theta$ 5-petal rose
Lemniscates $r^2 = a^2\cos 2\theta$ $r^2 = a^2\sin 2\theta$ Figure-eight symmetric to the polar axis (cosine) or symmetric to the line $\theta = \frac{\pi}{4}$ (sine)	 $r^2 = a^2\cos 2\theta$ figure-eight	 $r^2 = a^2\sin 2\theta$ figure-eight		

EXAMPLE 5 Identifying and Graphing a Polar Equation

Graph $r^2 = 16\sin 2\theta$.

Solution:

- The graph of $r^2 = 16\sin 2\theta$ is a lemniscate of the form $r^2 = a^2\sin 2\theta$. It is a figure-eight curve symmetric with respect to the line $\theta = \frac{\pi}{4}$ ($y = x$ in rectangular coordinates) and to the pole.
- The graph is at the pole when $r = 0$. We have $\pm\sqrt{16\sin 2\theta} = 0$ for $\theta = \frac{\pi}{2}, \pi, \frac{3\pi}{2}, \ldots$.
- The maximum value of $|r|$ is 4 and occurs when $\sin 2\theta = 1$ or $\theta = \frac{\pi}{4}, \frac{5\pi}{4}, \ldots$.

The value of $16\sin 2\theta$ is negative for $\frac{\pi}{2} < \theta < \pi$, and consequently, the equation has no solution on this interval (r^2 cannot be negative). Therefore, we can plot points for $0 \le \theta \le \frac{\pi}{2}$ and apply symmetry to graph the curve (Figure 8-27).

TIP The graph of a lemniscate looks like a propeller on an airplane. The two loops meet at the pole for values of θ for which $r = 0$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
r	0	$\pm 2\sqrt{2\sqrt{3}}$	± 4	$\pm 2\sqrt{2\sqrt{3}}$	0
$\approx r$	0	± 3.7	± 4	± 3.7	0

Since a lemniscate of the form $r^2 = a^2\sin 2\theta$ is symmetric with respect to the line $\theta = \frac{\pi}{4}$, we could have limited the table to $0 \le \theta \le \frac{\pi}{4}$ and then used symmetry to complete the curve.

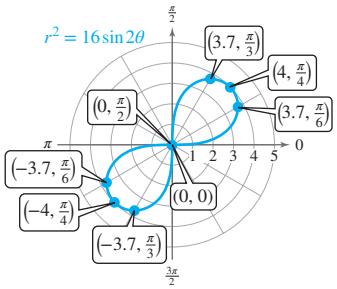


Figure 8-27

Skill Practice 5 Graph $r^2 = 25\cos 2\theta$.

EXAMPLE 6 Identifying and Graphing a Polar Equation

Graph $r = -0.4\theta$ for $\theta \geq 0$.

Solution:

- The graph of $r = -0.4\theta$ is a spiral and is not symmetric with respect to the polar axis, line $\theta = \frac{\pi}{2}$, or the pole.
- The value of $|r|$ increases for increasing values of $|\theta|$ and has no upper bound.
- The graph is at the pole only for $\theta = 0$.

To see several revolutions of the spiral, we take values of θ and r on the interval $0 \leq \theta \leq 4\pi$. The graph is shown in Figure 8-28.

θ	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$	2π	$\frac{5\pi}{2}$	3π	$\frac{7\pi}{2}$	4π
$r \approx$	0	−0.63	−1.26	−1.88	−2.51	−3.14	−3.77	−4.40	−5.03

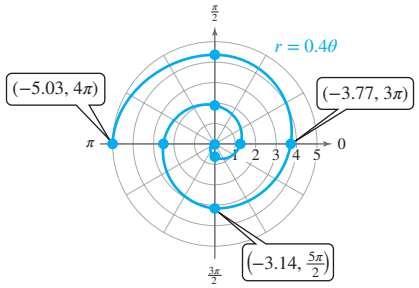

Figure 8-28

Skill Practice 6 Graph $r = 0.8\theta$ for $\theta \geq 0$.

Point of Interest

The logarithmic spiral, represented by $r = ae^{b\theta}$, was referred to by the Swiss mathematician Jacob Bernoulli (1654–1705) as *spira mirabilis* (marvelous spiral). Bernoulli was so fascinated with the properties of the logarithmic spiral that he asked to have it inscribed on his tombstone. Ironically, the spiral found on Bernoulli's tomb was carved incorrectly. It is *not* a logarithmic spiral, but rather an Archimedean spiral given by $r = a\theta$.

SECTION 8.2 Practice Exercises

Prerequisite Review

For Exercises R.1–R.4, determine whether the graph of the equation is symmetric with respect to the x-axis, y-axis, origin, or none of these.

R.1. $y = -|x| - 6$

R.2. $x = y^2 + 3$

R.3. $x^2 + y^2 = 7$

R.4. $y = x^2 + 2x + 5$

R.5. Solve $2\sin 2x = 1$ on the interval $(0, \pi]$.

R.6. Solve $\cos 3x = 1$ on the interval $[0, 2\pi)$.

Concept Connections

1. If replacing (r, θ) by $(r, -\theta)$ in a polar equation results in an equivalent equation, then the graph of the equation is symmetric with respect to the _____.

2. If replacing (r, θ) by $(r, \pi - \theta)$ in a polar equation results in an equivalent equation, then the graph of the equation is symmetric with respect to the _____.

3. If replacing (r, θ) by $(-r, \theta)$ in a polar equation results in an equivalent equation, then the graph of the equation is symmetric with respect to the _____.

4. The graph of a polar equation of the form $r = a\cos\theta$ is symmetric with respect to the _____, whereas the graph of a polar equation of the form $r = a\sin\theta$ is symmetric with respect to the _____.

5. Determining the ordered pairs for which $r = 0$ in a polar equation gives what information?

6. What is the maximum value of r for the equation $r = a\sin\theta + 2$? What is the minimum value of r?

Objective 1: Graph Polar Equations by Plotting Points

For Exercises 7–14, graph the polar equation. (See Example 1)

7. $r = 3$

8. $r = 4$

9. $\theta = \frac{3\pi}{4}$

10. $\theta = \frac{\pi}{4}$

11. $r = 4\cos\theta$

12. $r = -4\sin\theta$

13. $r\sin\theta = -2$

14. $r\cos\theta = 3$

Objective 2: Test Polar Equations for Symmetry

For Exercises 15–22, determine whether the tests for symmetry in Table 8-2 detect symmetry with respect to

a. The polar axis. Replace (r, θ) by $(r, -\theta)$.

b. The line $\theta = \frac{\pi}{2}$. Replace (r, θ) by $(r, \pi - \theta)$.

c. The pole. Replace (r, θ) by $(-r, \theta)$.

Otherwise, indicate that the test is inconclusive.

15. $r^2 = 16\cos 2\theta$

16. $r = 5\cos 4\theta$

17. $r = 3\cos 3\theta$

18. $r = 6 - 4\cos\theta$

19. $r = \frac{3}{4 + \sin\theta}$

20. $r = 3 + 2\sin\theta$

21. $r = 2\theta$

22. $r^2 = 9\sin 2\theta$

For Exercises 23–30, use symmetry to graph the polar curve and identify the type of curve. (See Examples 2–4)

23. $r = -2 - 2\sin\theta$

24. $r = 3 + 3\cos\theta$

25. $r = 2 - 4\cos\theta$

26. $r = 1 + 7\sin\theta$

27. $r = 3\cos 5\theta$

28. $r = 8\sin 4\theta$

29. $r = 3 - 2\sin\theta$

30. $r = -3 + 2\cos\theta$

ISTUDY

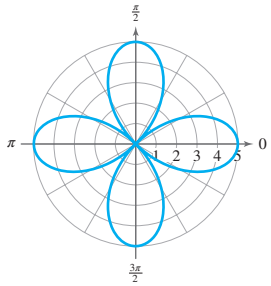
Objective 3: Categorize Polar Equations and Their Graphs

For Exercises 31–40,

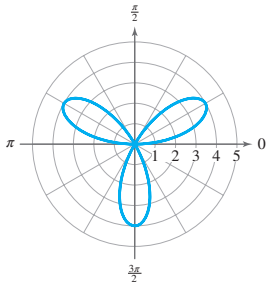
a. Identify the type of polar curve from among those listed in Table 8-3.

b. Write a polar equation that represents the given graph.

31.



32.



33.

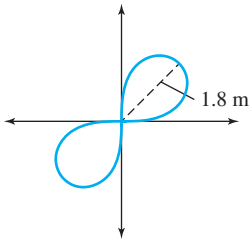
56. $r = 4 + \cos 4\theta$

57. A quilter wants to make a design in the shape of a daisy where the "petals" are 3.5 in. long and plans to use a computer to print a graph of the outline of the figure. Determine an equation that could be used.

58. The outline of a propeller on an airplane is in the shape of a lemniscate. Write an equation that could be used for the outline.



59. a. Given $r = 8\sin 4\theta$, determine the set of values of θ for which $r = 0$ on the interval $[0, 2\pi)$.

b. Use a graphing utility to graph $r = 8\sin 4\theta$ on the given intervals.

i. $0 \le \theta \le \frac{\pi}{2}$ **ii.** $\frac{\pi}{2} \le \theta \le \pi$

iii. $\pi \le \theta \le \frac{3\pi}{2}$ **iv.** $\frac{3\pi}{2} \le \theta \le 2\pi$

60. a. Given $r = 6\sin 3\theta$, determine the set of values of θ for which $r = 0$ on the interval $[0, \pi)$.

b. Use a graphing utility to graph $r = 6\sin 3\theta$ on the given intervals.

i. $0 \le \theta \le \frac{\pi}{3}$ **ii.** $\frac{\pi}{3} \le \theta \le \frac{2\pi}{3}$

iii. $\frac{2\pi}{3} \le \theta \le \pi$

61. If $r = f(\sin\theta)$, that is, if r is expressed as a function of $\sin\theta$, what type of symmetry does the graph have? Explain.

62. If $r = f(\cos\theta)$, that is, if r is expressed as a function of $\cos\theta$, what type of symmetry does the graph have? Explain.

For Exercises 63–66, use the results of Exercises 61–62 to determine by inspection whether the graph of the given equation is symmetric with respect to the polar axis or to the line $\theta = \frac{\pi}{2}$.

63. $r = 2\sin\theta + 3$

64. $r = \sin^2\theta + \sin\theta - 1$

65. $r = 2\cos^2\theta - 3\cos\theta + 1$

66. $r = 1 - 5\cos\theta$

67. Given $r = 1 + \sec\theta$ (*conchoid*),

a. For what value(s) of θ on the interval $[0, 2\pi)$ is r undefined?

b. Use a graphing utility to graph $r = 1 + \sec\theta$ on the interval $[0, 2\pi)$.

c. Discuss the behavior of the graph for values of θ near those found in part (a).

68. Given $r = \frac{2}{\theta}$ (*hyperbolic spiral*),

a. For what value of θ is r undefined?

b. Use a graphing utility to graph $r = \frac{2}{\theta}$ on the interval $[-4\pi, 4\pi]$.

c. Discuss the behavior of the graph for values of θ near 0.

69. Use a graphing utility to graph the equations on the same viewing window for $0 \le \theta \le 2\pi$.

a. $r = 6\sin 2\theta$

b. $r = 6\sin\left[2\left(\theta + \frac{\pi}{4}\right)\right]$

c. How do the graphs of $r = 6\sin 2\theta$ and $r = 6\sin\left[2\left(\theta + \frac{\pi}{4}\right)\right]$ differ?

70. Use a graphing utility to graph the equations on the same viewing window for $0 \le \theta \le 2\pi$.

a. $r = 2 + 4\cos\theta$

b. $r = 2 + 4\cos\left(\theta - \frac{\pi}{4}\right)$

c. $r = 2 + 4\cos\left(\theta - \frac{\pi}{2}\right)$

d. Based on the results of parts (a)–(c), make a hypothesis about the effect of α on the graph of $r = f(\theta - \alpha)$.

ISTUDY

71. A logarithmic spiral is represented by $r = ae^{b\theta}$.

a. Graph $r = 0.5e^{0.1\theta}$ and $r = 0.5e^{-0.1\theta}$ over the interval $0 \le \theta \le 4\pi$.

b. What appears to be the difference between the graphs for $b = 0.1$ and $b = -0.1$?

72. An Archimedean spiral is represented by $r = a\theta$.

a. Graph $r = 0.5\theta$ and $r = -0.5\theta$ over the interval $0 \le \theta \le 8\pi$ and use a ZOOM square viewing window.

b. Archimedean spirals have the property that a ray through the origin will intersect successive turns of the spiral at a constant distance of $2\pi|a|$. What is the distance between each point of the spiral $r = 0.5\theta$ along the line $\theta = \frac{\pi}{2}$?

In Exercises 73–78, consider the graphs of polar equations of the following forms where a and b are positive real numbers.

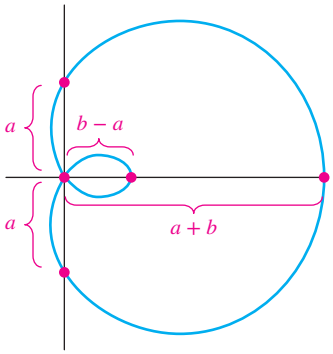
$r = a + b\cos\theta$ **(loop is to the right)** $\quad r = a - b\cos\theta$ **(loop is to the left)**

$r = a + b\sin\theta$ **(loop is upward)** $\quad r = a - b\sin\theta$ **(loop is downward)**

Depending on the values of a and b, the graph will be a limaçon with a loop, a cardioid, or a limaçon with a dimple. The sine or cosine term tells us whether the graph is symmetric to the vertical axis or the horizontal axis, respectively. With a positive cosine term, the loop is to the right, and with a negative cosine term, the loop is to the left. With a positive sine term, the loop is upward, and with a negative sine term, the loop is downward. In the figures below, the graphs were generated using a positive cosine term. The curves illustrate the relationship between a and b in the function.

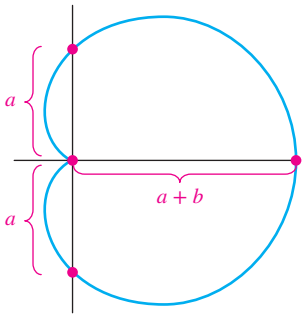
Limaçon with a loop

$a < b$ or $\frac{a}{b} < 1$



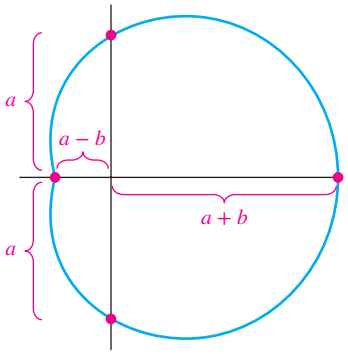
Cardioid

$a = b$ or $\frac{a}{b} = 1$



Limaçon with a dimple

$b < a < 2b$ or $1 < \frac{a}{b} < 2$



For Exercises 73–78, identify the type of curve (limaçon with a loop, cardioid, or limaçon with a dimple), and write a polar equation that might represent the curve. (Answers may vary.)

79. Graph the limaçons given by the equation $r = a + b\cos\theta$ for $a = 1, 2, 3, 4, 5$, and 6, and $b = 3$. Comment on the effect of $\frac{a}{b}$ on the graph.

80. Graph the limaçons given by the equation $r = a + b\cos\theta$ for $a = 1, 2$, and 3 and $b = 4$. Comment on the effect of $\frac{a}{b}$ on the graph.

Expanding Your Skills

81. Find the values of θ on the interval $[0, 2\pi)$ for which the graphs of $r = 1 + \sin\theta$ and $r = 1 - \sin\theta$ intersect.

82. Find the values of θ on the interval $[0, 2\pi)$ for which the graphs of $r = \cos\theta$ and $r = 1 - \cos\theta$ intersect.

83. Given $r = 6\cos\frac{\theta}{2}$,

a. Replace (r, θ) by $(r, \pi - \theta)$ in the equation. Does this show that the graph of the equation is symmetric with respect to the line $\theta = \frac{\pi}{2}$?

b. The ordered pair $(-r, 2\pi - \theta)$ is another representation of the point $(r, \pi - \theta)$. Replace (r, θ) by $(-r, 2\pi - \theta)$ in the equation. Does this show that the graph of the equation is symmetric with respect to the line $\theta = \frac{\pi}{2}$?

c. What other type of symmetry (if any) does the graph of the equation have?

d. Use a graphing utility to graph the equation on a graphing utility for $0 \le \theta \le 4\pi$.

84. Given $r = 4\sin\frac{\theta}{4}$,

a. Replace (r, θ) by $(r, -\theta)$ in the equation. Does this show that the graph of the equation is symmetric with respect to the polar axis?

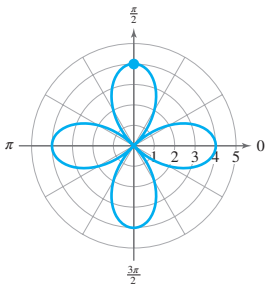
b. The ordered pair $(r, 4\pi - \theta)$ is another representation of the point $(r, -\theta)$. Replace (r, θ) by $(r, 4\pi - \theta)$ in the equation. Does this show that the graph of the equation is symmetric with respect to the polar axis?

c. What other type of symmetry (if any) does the graph of the equation have?

d. Use a graphing utility to graph the equation on a graphing utility for $0 \le \theta \le 8\pi$.

ISTUDY

85. The graph of $r = 4\cos 2\theta$ is shown.



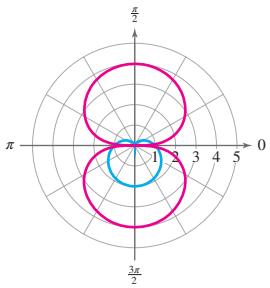
a. Is $\left(4, \frac{\pi}{2}\right)$ a solution to the equation?

b. The point $\left(4, \frac{\pi}{2}\right)$ appears to lie on the curve. How do you explain this?

86. Given the equations of two curves in rectangular coordinates, we can find the points of intersection by solving the equations simultaneously. In polar coordinates, solving systems of equations simultaneously may reveal some intersection points without finding others. For example, the graphs of $r = 1 - \sin\theta$ (shown in blue) and $r^2 = 16\sin\theta$ (shown in red) on the interval $0 \le \theta < 2\pi$ intersect in four points.

$r = 1 - \sin\theta$

$r^2 = 16\sin\theta$



a. Solve the system simultaneously for r. (*Hint*: From the second equation, $\sin\theta = \frac{r^2}{16}$. Substitute $\frac{r^2}{16}$ for $\sin\theta$ in the first equation and solve for r.)

b. From the graph, are both values of r reasonable?

c. Find the points of intersection corresponding to the reasonable value of r found in part (a). Round r and θ to 3 decimal places.

d. Do the results in part (c) give all points of intersection between the two curves?

PROBLEM RECOGNITION EXERCISES

Comparing Equations in Polar and Rectangular Form

For Exercises 1–8,

a. Match the polar or rectangular equation on the left with the letter of the rectangular or polar equation on the right.
b. Describe the graph.
c. Determine if the graph is symmetric with respect to the origin (pole), x-axis (polar axis), or y-axis $\left(\text{line } \theta = \frac{\pi}{2}\right)$.

1. $x^2 + y^2 = 144$	**A.** $2x + y = 4$
2. $x = -3$	**B.** $r = -10\sin\theta$
3. $r = \frac{4}{2\cos\theta + \sin\theta}$	**C.** $r = 12$
4. $r = -6\cos\theta$	**D.** $\theta = \frac{2\pi}{3}$
5. $y = -\sqrt{3}x$	**E.** $y = 5$
6. $x^2 + (y+5)^2 = 25$	**F.** $r = -3\sec\theta$
7. $r = 5\csc\theta$	**G.** $(x-1)^2 + (y-1)^2 = 2$
8. $r = 2\sin\theta + 2\cos\theta$	**H.** $(x+3)^2 + y^2 = 9$

ISTUDY

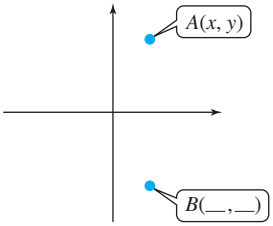
For Exercises 9–10, use a graphing utility to graph the polar equation, and describe the graph in a rectangular coordinate system.

9. $r = \dfrac{3}{1 - \sin\theta}$

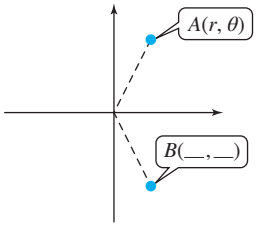
10. $r = \dfrac{2}{1 + \cos\theta}$

For Exercises 11–13, points *A* and *B* make up a graph that has an indicated type of symmetry for all polar representations of point *B*. Fill in an ordered pair for point *B* that would satisfy the condition of symmetry. Note that for ordered pairs in polar form, there is more than one correct answer.

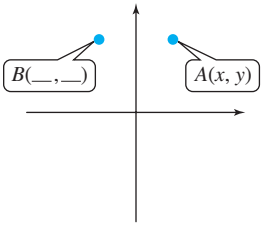
11. a. Symmetry: x-axis



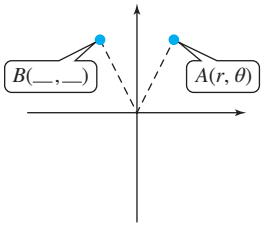
b. Symmetry: polar axis



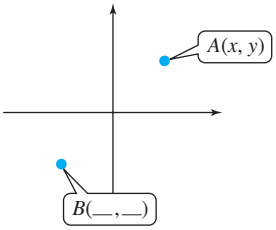
12. a. Symmetry: y-axis



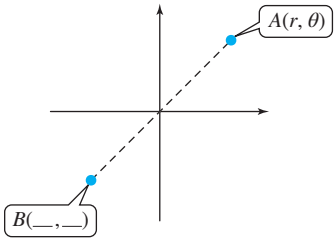
b. Symmetry: Line $\theta = \dfrac{\pi}{2}$



13. a. Symmetry: Origin



b. Symmetry: Pole



ISTUDY

SECTION 8.3 Complex Numbers in Polar Form

OBJECTIVES

1. Plot Complex Numbers in the Complex Plane
2. Write the Polar Form of a Complex Number
3. Compute Products and Quotients of Complex Numbers in Polar Form
4. Compute Powers of Complex Numbers (De Moivre's Theorem)
5. Find the *n*th Roots of a Complex Number

1. Plot Complex Numbers in the Complex Plane

A real number can be represented as a point on the real number line. Since a complex number $a + bi$ has two parts, the real part a and the imaginary part b, two axes are required to represent $a + bi$ graphically. The horizontal axis (called the **real axis**) represents the real part of a complex number, and the vertical axis (called the **imaginary axis**) represents the imaginary part. Together, the real and imaginary axes form the **complex plane.** A complex number $z = a + bi$ is written as an ordered pair (a, b) and can then be graphed as such in the complex plane (Figure 8-29).

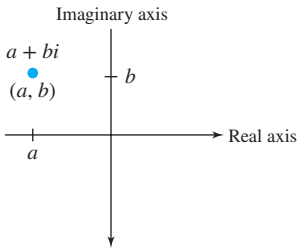


Figure 8-29 Complex Plane

EXAMPLE 1 Graphing Complex Numbers

Graph the complex numbers in the complex plane.

a. $3 + 4i$ **b.** $4 - 2i$ **c.** -5 **d.** $-2i$

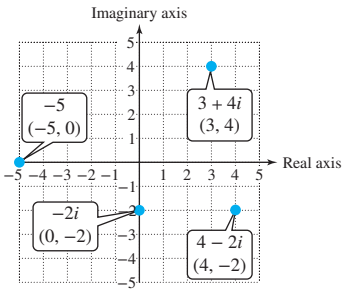
Solution:

a. $3 + 4i$ is represented by the point $(3, 4)$.

b. $4 - 2i$ is represented by the point $(4, -2)$.

c. $-5 = -5 + 0i$ is represented by the point $(-5, 0)$ on the real axis.

d. $-2i = 0 - 2i$ is represented by the point $(0, -2)$ on the imaginary axis.



TIP Complex numbers are often denoted by the variable z such as $z = 3 + 4i$.

Skill Practice 1 Graph the complex numbers in the complex plane.

a. $-1 + 3i$ **b.** $-4 - 5i$ **c.** 3 **d.** $4i$

TIP Notice that for a complex number of the form $a + 0i$, the absolute value is $\sqrt{a^2 + 0^2} = |a|$. This is consistent with the absolute value of a real number a.

Geometrically, the absolute value of a real number is its distance from zero on the real number line. Given a complex number $z = a + bi$, the absolute value of z, denoted $|z|$, is the distance between (a, b) and $(0, 0)$ in the complex plane (Figure 8-30). The absolute value of a complex number is more commonly called the *modulus* of the number.

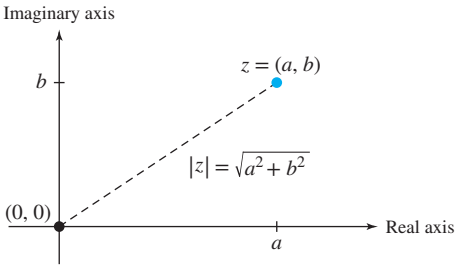


Figure 8-30

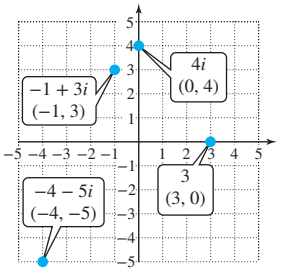
Answers

1. a. – d.



Absolute Value of a Complex Number

If $z = a + bi$ is a complex number, then the absolute value of z (also called the **modulus** or **magnitude** of z) is given by

$$|z| = \sqrt{a^2 + b^2}.$$

EXAMPLE 2 Finding the Modulus (Absolute Value) of a Complex Number

Find the modulus.

a. $z = 3 - 4i$ **b.** $z = -8 + 2i$

Solution:

a. $|z| = |3 - 4i| = \sqrt{(3)^2 + (-4)^2} = \sqrt{9 + 16} = \sqrt{25} = 5$

b. $|z| = |-8 + 2i| = \sqrt{(-8)^2 + (2)^2} = \sqrt{64 + 4} = \sqrt{68} = 2\sqrt{17}$

Skill Practice 2 Find the modulus.

a. $z = -5 - 12i$ **b.** $z = 4 + 6i$

2. Write the Polar Form of a Complex Number

The complex number $z = a + bi$ is said to be in rectangular (or Cartesian) form because a and b are the coordinates of the point (a, b) in the rectangular coordinate system formed by the complex plane. For a and b not both zero, let r represent the length of the line segment between (a, b) and $(0, 0)$. Thus, $r = |z| = \sqrt{a^2 + b^2} \geq 0$ (Figure 8-31). Taking angle θ to be in standard position with terminal side through (a, b), we have $a = r\cos\theta$ and $b = r\sin\theta$.

Therefore, $z = a + bi$
$= r\cos\theta + i \cdot r\sin\theta$
$= r(\cos\theta + i\sin\theta)$

This is called the polar form (or trigonometric form) of a complex number.

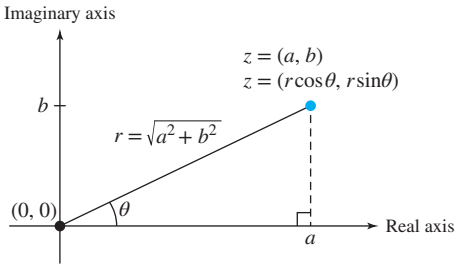


Figure 8-31

Polar Form of a Complex Number

The **polar form** (or **trigonometric form**) of a complex number $z = a + bi$ is

$$z = r(\cos\theta + i\sin\theta)$$

where $a = r\cos\theta$, $b = r\sin\theta$, $r = \sqrt{a^2 + b^2}$, and $\tan\theta = \frac{b}{a}$ $(a \neq 0)$. The value of r is the modulus of z, and we say that θ is an argument of z. There are infinitely many choices for θ, but normally, θ is taken on the interval $0 \leq \theta < 2\pi$ or $0° \leq \theta < 360°$.

Answers

2. a. 13 **b.** $2\sqrt{13}$

ISTUDY

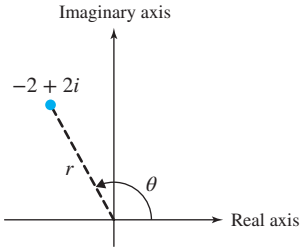
EXAMPLE 3 Convert a Complex Number from Rectangular Form to Polar Form

Write the complex number in polar form.

a. $z = -2 + 2i$ **b.** $z = 8 - 15i$

Solution:

a. The point $z = -2 + 2i$ is in Quadrant II.



$$r = \sqrt{a^2 + b^2} = \sqrt{(-2)^2 + (2)^2} = \sqrt{8} = 2\sqrt{2}$$

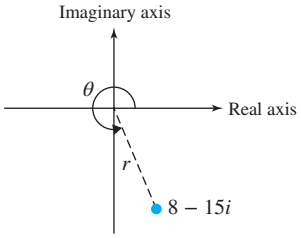
$$\tan\theta = \frac{b}{a} = \frac{2}{-2} = -1$$

Taking θ in Quadrant II on the interval $0 \le \theta < 2\pi$, we have $\theta = \frac{3\pi}{4}$.

Modulus Argument

Polar form: $z = 2\sqrt{2}\left(\cos\frac{3\pi}{4} + i\sin\frac{3\pi}{4}\right)$

b. The point $z = 8 - 15i$ is in Quadrant IV.



$$r = \sqrt{a^2 + b^2} = \sqrt{(8)^2 + (-15)^2} = \sqrt{289} = 17$$

$$\tan\theta = \frac{-15}{8} \Rightarrow \theta = \tan^{-1}\left(-\frac{15}{8}\right)$$

Taking θ in Quadrant IV on the interval $0 \le \theta < 2\pi$, we have $\theta = 2\pi + \tan^{-1}\left(-\frac{15}{8}\right)$.

Polar form: $z = 17\left[\cos\left(2\pi + \tan^{-1}\left(-\frac{15}{8}\right)\right) + i\sin\left(2\pi + \tan^{-1}\left(-\frac{15}{8}\right)\right)\right]$

$$z \approx 17(\cos 5.2 + i\sin 5.2)$$

Skill Practice 3 Write the complex number in polar form.

a. $z = 1 - i$ **b.** $z = 3 + 4i$

Point of Interest

The complex number $z = r(\cos\theta + i\sin\theta)$ is sometimes shortened to $z = r\,\text{cis}\,\theta$, where "cis" stands for "cosine *i* sine." For example,

$$z = 5\left(\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right) \text{ would be written as } z = 5\,\text{cis}\,\frac{\pi}{4}.$$

Another form in which a complex number can be written makes use of Euler's formula. Swiss mathematician Leonhard Euler (pronounced "Oy-ler") (1707–1783), discovered a relationship between the exponential function of a complex number and the trigonometric functions. For a real number θ, Euler's formula states that $e^{i\theta} = \cos\theta + i\sin\theta$. Thus, the complex number

$$z = 5\left(\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right) \text{ can be written as } z = 5e^{\frac{\pi}{4}i}.$$

Answers

3. a. $z = \sqrt{2}\left(\cos\frac{7\pi}{4} + i\sin\frac{7\pi}{4}\right)$

b. $z = 5\left[\cos\left(\tan^{-1}\frac{4}{3}\right) + i\sin\left(\tan^{-1}\frac{4}{3}\right)\right]$

ISTUDY

In Example 4, we perform the simpler task of writing a complex number in rectangular form.

EXAMPLE 4 **Convert a Complex Number from Polar Form to Rectangular Form**

Write $z = 4(\cos 120° + i \sin 120°)$ in rectangular form, $a + bi$.

Solution:

$$z = 4(\cos 120° + i \sin 120°) = 4\left(-\frac{1}{2} + i \cdot \frac{\sqrt{3}}{2}\right) = -2 + 2\sqrt{3}i$$

Skill Practice 4 Write $z = 6(\cos 150° + i \sin 150°)$ in rectangular form.

3. Compute Products and Quotients of Complex Numbers in Polar Form

In Chapter 1, we learned how to add, subtract, multiply, and divide complex numbers in rectangular form. We now present the procedure to multiply and divide complex numbers in polar form.

Products and Quotients of Complex Numbers in Polar Form

If $z_1 = r_1(\cos\theta_1 + i \sin\theta_1)$ and $z_2 = r_2(\cos\theta_2 + i \sin\theta_2)$, then

$$z_1 z_2 = r_1 r_2[\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)] \quad (1)$$

$$\frac{z_1}{z_2} = \frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)] \quad (z_2 \neq 0) \quad (2)$$

TIP The word "moduli" is the plural of the word "modulus."

In words, to multiply two complex numbers in polar form, multiply their moduli and add their arguments. To divide two complex numbers in polar form, divide their moduli and subtract their arguments.

To prove (1), we have

Recall that $i^2 = -1$.

$$\begin{aligned} z_1 z_2 &= r_1(\cos\theta_1 + i \sin\theta_1) \cdot r_2(\cos\theta_2 + i \sin\theta_2) \\ &= r_1 r_2(\cos\theta_1 \cos\theta_2 + i \cos\theta_1 \sin\theta_2 + i \sin\theta_1 \cos\theta_2 + i^2 \sin\theta_1 \sin\theta_2) \\ &= r_1 r_2[(\cos\theta_1 \cos\theta_2 - \sin\theta_1 \sin\theta_2) + i(\sin\theta_1 \cos\theta_2 + \cos\theta_1 \sin\theta_2)] \\ &= r_1 r_2[\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)] \end{aligned}$$

Apply the sum formulas for sine and cosine.

The proof of (2) is similar and left as an exercise (Exercise 85).

EXAMPLE 5 **Multiplying Complex Numbers in Polar Form**

Given $z_1 = 4\left(\cos\frac{4\pi}{3} + i \sin\frac{4\pi}{3}\right)$ and $z_2 = 2\left(\cos\frac{\pi}{2} + i \sin\frac{\pi}{2}\right)$, find $z_1 z_2$ and write the product in polar form.

Answer
4. $-3\sqrt{3} + 3i$

ISTUDY

TIP In Example 5, the product is left in polar form. To find the corresponding rectangular form,

$$\begin{aligned} &8\left(\cos\tfrac{11\pi}{6}+i\sin\tfrac{11\pi}{6}\right)\\ &=8\left(\tfrac{\sqrt{3}}{2}-\tfrac{1}{2}i\right)\\ &=4\sqrt{3}-4i \end{aligned}$$

Solution:

$$\begin{aligned} z_1z_2 &= 4\left(\cos\frac{4\pi}{3}+i\sin\frac{4\pi}{3}\right)\cdot 2\left(\cos\frac{\pi}{2}+i\sin\frac{\pi}{2}\right)\\ &= 4\cdot 2\left[\cos\left(\frac{4\pi}{3}+\frac{\pi}{2}\right)+i\sin\left(\frac{4\pi}{3}+\frac{\pi}{2}\right)\right]\\ &= 8\left(\cos\frac{11\pi}{6}+i\sin\frac{11\pi}{6}\right) \quad \text{(polar form)} \end{aligned}$$

Multiply the moduli and add the arguments. Note that $\frac{4\pi}{3}+\frac{\pi}{2}=\frac{8\pi}{6}+\frac{3\pi}{6}=\frac{11\pi}{6}$

Skill Practice 5 Given $z_1=3\left(\cos\frac{\pi}{12}+i\sin\frac{\pi}{12}\right)$ and $z_2=2\left(\cos\frac{\pi}{6}+i\sin\frac{\pi}{6}\right)$, find z_1z_2 and write the product in polar form.

In Exercise 83, we verify the result of Example 5 by converting the complex numbers to rectangular form and then multiplying.

EXAMPLE 6 Dividing Complex Numbers in Polar Form

Given $z_1=4(\cos 15^\circ+i\sin 15^\circ)$ and $z_2=12(\cos 285^\circ+i\sin 285^\circ)$, find $\frac{z_1}{z_2}$ and write the quotient in polar form.

Solution:

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{4(\cos 15^\circ+i\sin 15^\circ)}{12(\cos 285^\circ+i\sin 285^\circ)}\\ &= \frac{1}{3}[\cos(15^\circ-285^\circ)+i\sin(15^\circ-285^\circ)] \quad \text{Divide the moduli and subtract the arguments.}\\ &= \frac{1}{3}[\cos(-270^\circ)+i\sin(-270^\circ)]\\ &= \frac{1}{3}[\cos(90^\circ)+i\sin(90^\circ)] \quad 90^\circ \text{ is coterminal to } -270^\circ \text{ and on the interval } 0^\circ\le\theta<360^\circ. \end{aligned}$$

Skill Practice 6 Given $z_1=18(\cos 75^\circ+i\sin 75^\circ)$ and $z_2=2(\cos 255^\circ+i\sin 255^\circ)$, find $\frac{z_1}{z_2}$ and write the quotient in polar form.

4. Compute Powers of Complex Numbers (De Moivre's Theorem)

Given $z=a+bi$, the value of z^n, where n is a positive integer, can be computed by using repeated multiplication of the base z in its polar form.

Let $z=r(\cos\theta+i\sin\theta)$. Then,

$$\begin{aligned} z^2 &= r(\cos\theta+i\sin\theta)\cdot r(\cos\theta+i\sin\theta)=r^2(\cos 2\theta+i\sin 2\theta)\\ z^3 &= r^2(\cos 2\theta+i\sin 2\theta)\cdot r(\cos\theta+i\sin\theta)=r^3(\cos 3\theta+i\sin 3\theta)\\ z^4 &= r^3(\cos 3\theta+i\sin 3\theta)\cdot r(\cos\theta+i\sin\theta)=r^4(\cos 4\theta+i\sin 4\theta)\\ &\vdots\\ z^n &= r^{n-1}[\cos(n-1)\theta+i\sin(n-1)\theta]\cdot r(\cos\theta+i\sin\theta)=r^n(\cos n\theta+i\sin n\theta). \end{aligned}$$

Answers

5. $6\left(\cos\frac{\pi}{4}+i\sin\frac{\pi}{4}\right)$

6. $9[\cos(180^\circ)-i\sin(180^\circ)]$

This pattern involving integer powers of a complex number is known as De Moivre's theorem named after the French mathematician Abraham de Moivre (pronounced "duh mwah-vruh") (1667–1754).

De Moivre's Theorem

If $z = r(\cos\theta + i\sin\theta)$ and n is a positive integer, then

$$z^n = [r(\cos\theta + i\sin\theta)]^n = r^n(\cos n\theta + i\sin n\theta).$$

In words, to raise z to a positive integer power n, raise the modulus to the nth power and multiply the argument by n.

EXAMPLE 7 Raising a Complex Number to a Power

Compute $[5(\cos 75° + i\sin 75°)]^4$ and write the result in rectangular form $a + bi$.

Solution:

$$\begin{aligned}
[5(\cos 75° + i\sin 75°)]^4 &= 5^4[\cos(4 \cdot 75°) + i\sin(4 \cdot 75°)] \\
&= 625(\cos 300° + i\sin 300°) && \text{Polar form} \\
&= 625\left(\frac{1}{2} - i\frac{\sqrt{3}}{2}\right) && \text{Evaluate } \cos 300° \text{ and } \sin 300° \text{ to convert to rectangular form.} \\
&= \frac{625}{2} - \frac{625\sqrt{3}}{2}i && \text{Rectangular form}
\end{aligned}$$

Skill Practice 7 Compute $[4(\cos 70° + i\sin 70°)]^3$ and write the result in rectangular form $a + bi$.

TIP Recall that $a + (-bi)$ is usually written as $a - bi$. Likewise, a real number or pure imaginary number is usually simplified. For example, $a + 0i$ is usually written as a, and $0 + bi$ is usually written as bi.

EXAMPLE 8 Raising a Complex Number to a Power

Compute $(-3 + 3i)^6$ and write the result in rectangular form $a + bi$.

Solution:

Computing the product in rectangular form would be very tedious to carry out:

$$(-3 + 3i)^6 = (-3 + 3i)(-3 + 3i)(-3 + 3i)(-3 + 3i)(-3 + 3i)(-3 + 3i)$$

Instead, we will write $-3 + 3i$ in polar form and then apply De Moivre's theorem.

$z = -3 + 3i = (-3, 3)$ is in Quadrant II.

$r = \sqrt{(-3)^2 + (3)^2} = \sqrt{18} = 3\sqrt{2}$

$\tan\theta = \dfrac{3}{-3} = -1 \Rightarrow \theta = \dfrac{3\pi}{4}$ for θ in Quadrant II.

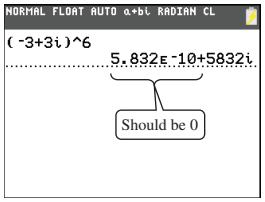
$$\begin{aligned}
\text{Thus, } (-3 + 3i)^6 &= \left[(3\sqrt{2})\left(\cos\frac{3\pi}{4} + i\sin\frac{3\pi}{4}\right)\right]^6 \\
&= (3\sqrt{2})^6\left[\cos\left(6 \cdot \frac{3\pi}{4}\right) + i\sin\left(6 \cdot \frac{3\pi}{4}\right)\right] \\
&= 3^6 \cdot 2^3\left(\cos\frac{9\pi}{2} + i\sin\frac{9\pi}{2}\right) \\
&= 5832(0 + i) \\
&= 5832i
\end{aligned}$$

Answer
7. $-32\sqrt{3} - 32i$

ISTUDY

TECHNOLOGY CONNECTIONS

The calculation from Example 8 performed on a graphing utility results in a small round-off error. The real part is displayed as 5.832×10^{-10} when in fact it should be zero.



Skill Practice 8 Compute $(-2 - 2i)^4$ and write the result in rectangular form $a + bi$.

5. Find the *n*th Roots of a Complex Number

Point of Interest

In addition to his discovery of the roots of a complex number, French mathematician Abraham de Moivre (1667–1754) was noted for his study of probability and statistics. He made numerous publications involving the probabilities associated with games of chance and had investigated mortality statistics that laid the foundation of the theory of annuities. As de Moivre aged, a popular anecdote suggests that he slept 15 min longer each night, and that he correctly predicted the date of his death by linear extrapolation to the day that he would sleep for 24 hr.

For a positive integer $n \geq 2$, an nth root of a complex number z is a complex number w such that $w^n = z$. In Example 7, we found that

$$[5(\cos 75^\circ + i \sin 75^\circ)]^4 = 625(\cos 300^\circ + i \sin 300^\circ)$$

This means that $5(\cos 75^\circ + i \sin 75^\circ)$ is a fourth root of $625(\cos 300^\circ + i \sin 300^\circ)$. Likewise, in Example 8, we found that $(-3 + 3i)^6 = 5832i$. This means that $-3 + 3i$ is a sixth root of $5832i$. In general, there are n distinct nth roots of a complex number.

*n*th Roots of a Complex Number

If $z = r(\cos\theta + i \sin\theta)$, then for an integer $n \geq 2$, z has n distinct nth roots of the form

$$(3)\quad w_k = \sqrt[n]{r}\left[\cos\left(\frac{\theta + 2\pi k}{n}\right) + i \sin\left(\frac{\theta + 2\pi k}{n}\right)\right] \text{ for } k = 0, 1, 2, \ldots, n - 1$$

or

$$w_k = \sqrt[n]{r}\left[\cos\left(\frac{\theta + 360^\circ k}{n}\right) + i \sin\left(\frac{\theta + 360^\circ k}{n}\right)\right] \text{ for } k = 0, 1, 2, \ldots, n - 1$$

Equation (3) generates n nth roots of a complex number z, and the argument of each root corresponds to a value of k between 0 and $n - 1$, inclusive. Values of $k \geq n$ do not need to be considered because they generate arguments that are coterminal to those generated by $k = 0, 1, 2, \ldots, n - 1$ and would therefore be redundant.

While we will not take up a formal proof of equation (3), we can use De Moivre's theorem to show that the complex numbers listed in equation (3) are indeed roots of $z = r(\cos\theta + i \sin\theta)$. We require that $w^n = z$.

Answer
8. −64

ISTUDY

Avoiding Mistakes

It is important to note that this is not a complete proof of equation (3) because we have not shown that the n roots given are the only roots that exist.

$$(w_k)^n = \left(\sqrt[n]{r}\left[\cos\left(\frac{\theta + 2\pi k}{n}\right) + i\sin\left(\frac{\theta + 2\pi k}{n}\right)\right]\right)^n$$ Definition of an nth root of a complex number.

$$= (\sqrt[n]{r})^n\left[\cos\left(n \cdot \frac{\theta + 2\pi k}{n}\right) + i\sin\left(n \cdot \frac{\theta + 2\pi k}{n}\right)\right]$$ Apply De Moivre's theorem.

$$= r[\cos(\theta + 2\pi k) + i\sin(\theta + 2\pi k)]$$ Simplify.

$$= r(\cos\theta + i\sin\theta)$$ θ and $\theta + 2\pi k$ are coterminal for all integers k.

$$= z$$

EXAMPLE 9 Finding the nth Roots of a Complex Number

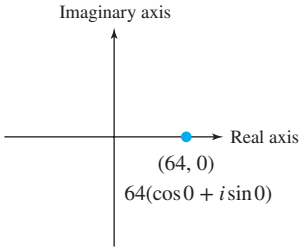
Find the sixth roots of 64 over the set of complex numbers. Write the results in rectangular form $a + bi$.

Solution:

First write $z = 64 + 0i$ in polar form.

$r = \sqrt{(64)^2 + (0)^2} = 64$ and $\theta = 0$

Therefore, $z = 64(\cos 0 + i\sin 0)$.



The sixth roots of $z = 64(\cos 0 + i\sin 0)$ are

$$w_k = \sqrt[6]{64}\left[\cos\left(\frac{0 + 2\pi k}{6}\right) + i\sin\left(\frac{0 + 2\pi k}{6}\right)\right] \text{ for } k = 0, 1, 2, 3, 4, \text{ and } 5$$

$$= 2\left[\cos\left(\frac{\pi}{3}k\right) + i\sin\left(\frac{\pi}{3}k\right)\right] \text{ for } k = 0, 1, 2, 3, 4, \text{ and } 5$$

$$w_0 = 2\left[\cos\left(\frac{\pi}{3} \cdot 0\right) + i\sin\left(\frac{\pi}{3} \cdot 0\right)\right] = 2(\cos 0 + i\sin 0) = 2(1 + 0i) = 2$$

$$w_1 = 2\left[\cos\left(\frac{\pi}{3} \cdot 1\right) + i\sin\left(\frac{\pi}{3} \cdot 1\right)\right] = 2\left(\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}\right) = 2\left(\frac{1}{2} + \frac{\sqrt{3}}{2}i\right) = 1 + \sqrt{3}i$$

$$w_2 = 2\left[\cos\left(\frac{\pi}{3} \cdot 2\right) + i\sin\left(\frac{\pi}{3} \cdot 2\right)\right] = 2\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right) = 2\left(-\frac{1}{2} + \frac{\sqrt{3}}{2}i\right) = -1 + \sqrt{3}i$$

$$w_3 = 2\left[\cos\left(\frac{\pi}{3} \cdot 3\right) + i\sin\left(\frac{\pi}{3} \cdot 3\right)\right] = 2(\cos\pi + i\sin\pi) = 2(-1 + 0i) = -2$$

$$w_4 = 2\left[\cos\left(\frac{\pi}{3} \cdot 4\right) + i\sin\left(\frac{\pi}{3} \cdot 4\right)\right] = 2\left(\cos\frac{4\pi}{3} + i\sin\frac{4\pi}{3}\right) = 2\left(-\frac{1}{2} - \frac{\sqrt{3}}{2}i\right) = -1 - \sqrt{3}i$$

$$w_5 = 2\left[\cos\left(\frac{\pi}{3} \cdot 5\right) + i\sin\left(\frac{\pi}{3} \cdot 5\right)\right] = 2\left(\cos\frac{5\pi}{3} + i\sin\frac{5\pi}{3}\right) = 2\left(\frac{1}{2} - \frac{\sqrt{3}}{2}i\right) = 1 - \sqrt{3}i$$

Notice that the six roots all have the same magnitude 2. This means that they all lie on a circle centered at the origin of the complex plane with radius 2. Furthermore, the argument of each root differs by a constant angular measure of $\frac{\pi}{3}$ (Figure 8-32). Geometrically, this means that the six 6th roots are all equally spaced around the circle. This is true in general when we find the nth roots of a complex number.

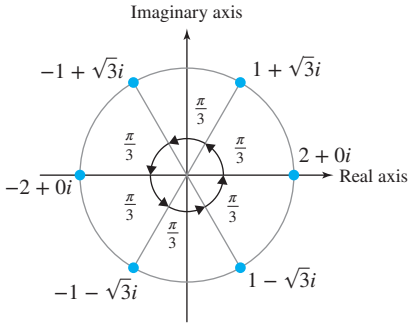


Figure 8-32

Skill Practice 9 Find the cube roots of -64 over the set of complex numbers. Write the results in rectangular form $a + bi$.

Answers

9. $2 + 2\sqrt{3}i$, -4, and $2 - 2\sqrt{3}i$

From the fundamental theorem of algebra presented in Section 3.4, we know that a polynomial equation of degree n has n complex solutions. Therefore, the six 6th roots of 64 can also be found by solving the equation $x^6 = 64$ (Exercise 93).

EXAMPLE 10 Finding the *n*th Roots of a Complex Number

Find the fourth roots of $-\sqrt{3} - i$ over the set of complex numbers. Write the results in polar form using degree measure for the argument.

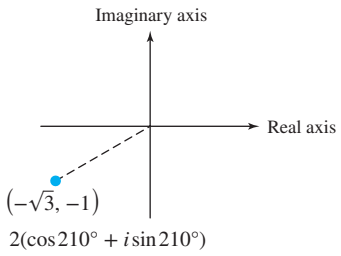
Solution:

First write $z = -\sqrt{3} - i$ in polar form.

$$r = \sqrt{(-\sqrt{3})^2 + (-1)^2} = \sqrt{3+1} = 2$$

$$\tan\theta = \frac{-1}{-\sqrt{3}} = \frac{\sqrt{3}}{3}$$

Since $z = -\sqrt{3} - i$ is in Quadrant III, $\theta = 210°$.
Thus, $z = 2(\cos 210° + i\sin 210°)$



The fourth roots of $z = 2(\cos 210° + i\sin 210°)$ are

$$w_k = \sqrt[4]{2}\left[\cos\left(\frac{210° + 360°k}{4}\right) + i\sin\left(\frac{210° + 360°k}{4}\right)\right] \text{ for } k = 0, 1, 2, \text{ and } 3$$

$$= \sqrt[4]{2}[\cos(52.5° + 90°k) + i\sin(52.5° + 90°k)] \text{ for } k = 0, 1, 2, \text{ and } 3.$$

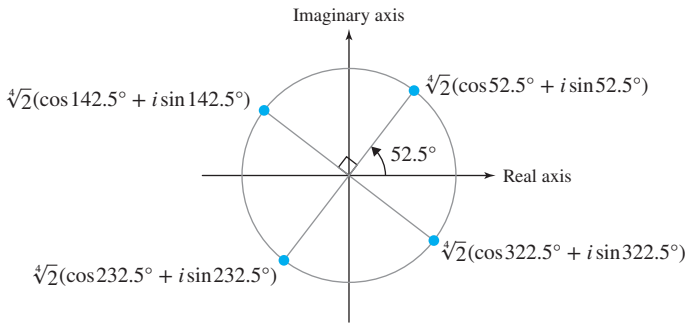
$$w_0 = \sqrt[4]{2}[\cos(52.5° + 90° \cdot 0) + i\sin(52.5° + 90° \cdot 0)] = \sqrt[4]{2}(\cos 52.5° + i\sin 52.5°)$$

$$w_1 = \sqrt[4]{2}[\cos(52.5° + 90° \cdot 1) + i\sin(52.5° + 90° \cdot 1)] = \sqrt[4]{2}(\cos 142.5° + i\sin 142.5°)$$

$$w_2 = \sqrt[4]{2}[\cos(52.5° + 90° \cdot 2) + i\sin(52.5° + 90° \cdot 2)] = \sqrt[4]{2}(\cos 232.5° + i\sin 232.5°)$$

$$w_3 = \sqrt[4]{2}[\cos(52.5° + 90° \cdot 3) + i\sin(52.5° + 90° \cdot 3)] = \sqrt[4]{2}(\cos 322.5° + i\sin 322.5°)$$

The fourth roots are equally spaced around a circle of radius $\sqrt[4]{2}$ centered at the origin in the complex plane. The arguments of the polar forms of the roots differ by $\frac{360°}{n} = \frac{360°}{4} = 90°$.



Skill Practice 10 Find the fourth roots of $3 + 3\sqrt{3}i$ over the set of complex numbers. Write the results in polar form using degree measure for the argument.

Answer

10. $\sqrt[4]{6}(\cos 15° + i\sin 15°)$, $\sqrt[4]{6}(\cos 105° + i\sin 105°)$, $\sqrt[4]{6}(\cos 195° + i\sin 195°)$, $\sqrt[4]{6}(\cos 285° + i\sin 285°)$

SECTION 8.3 Practice Exercises

Prerequisite Review

For Exercises R.1–R.5, perform the indicated operations and write the result in standard form $a + bi$.

R.1. $\left(\frac{1}{3} - \frac{1}{2}i\right) - \left(\frac{1}{6} - \frac{7}{12}i\right)$

R.2. $3i(8 - 5i)$

R.3. $(2 + 3i)(-3 - 9i)$

R.4. $(10 - 3i)^2$

R.5. $\frac{-5 + 8i}{3 - 9i}$

Concept Connections

1. The complex plane has two axes. The horizontal axis is called the _____ axis, and the vertical axis is called the _____ axis.

2. Given $z = a + bi$, the value $|z| =$ _____.

3. The rectangular form of a complex number z is $a + bi$ and the polar form (or trigonometric form) is given by $z =$ _____, where $r =$ _____ and $\tan\theta =$ _____ for _____ $\neq 0$.

4. Given $z = r(\cos\theta + i\sin\theta)$, the value r is called the _____ of z and θ is called a(n) _____ of z.

5. If $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$ and $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$, then $z_1 \cdot z_2 =$ _____ and $\frac{z_1}{z_2} =$ _____ for $z_2 \neq 0$.

6. If $z = r(\cos\theta + i\sin\theta)$, then $z^n =$ _____ for a positive integer n. An nth root of z is a complex number w such that _____ $= z$.

Objective 1: Plot Complex Numbers in the Complex Plane

For Exercises 7–8, graph the complex numbers in the complex plane. (See Example 1)

7. a. $z = -3 + 4i$ **b.** $z = 2 - 5i$ **c.** $z = -2i$ **d.** $z = 3$

8. a. $z = -2 - i$ **b.** $z = 5 + i$ **c.** $z = -4$ **d.** $z = 3i$

For Exercises 9–14, find the modulus of each complex number. (See Example 2)

9. a. $20 - 21i$ **b.** $-11 + 60i$

10. a. $5 + 12i$ **b.** $7 - 24i$

11. a. $4 - 6i$ **b.** $-5 + 5i$

12. a. $-14 + 6i$ **b.** $3 + 9i$

13. a. $-\frac{1}{3} - \frac{2}{3}i$ **b.** $\frac{3}{8} + \frac{7}{8}i$

14. a. $\frac{\sqrt{2}}{2} - 2i$ **b.** $-1 + \frac{\sqrt{3}}{3}i$

Objective 2: Write the Polar Form of a Complex Number

For Exercises 15–22, write the complex number in polar form with $0 \le \theta < 2\pi$. (See Example 3)

15. a. $3 + 3i$ **b.** $-3 - 3i$

16. a. $2 - 2\sqrt{3}i$ **b.** $-2 + 2\sqrt{3}i$

17. a. $-4\sqrt{3} + 4i$ **b.** $10\sqrt{3} - 10i$

18. a. $3\sqrt{2} - 3\sqrt{2}i$ **b.** $-\sqrt{2} + \sqrt{2}i$

19. a. $24 + 7i$ **b.** $-20 + 21i$

20. a. $35 - 12i$ **b.** $-28 - 45i$

21. a. 17 **b.** $-4i$

22. a. $10i$ **b.** -12

ISTUDY

For Exercises 23–30, convert the complex number from polar form to rectangular form $a + bi$. (See Example 4)

23. $18\left(\cos\frac{5\pi}{3} + i\sin\frac{5\pi}{3}\right)$

24. $35(\cos 330° + i\sin 330°)$

25. $15(\cos 315° + i\sin 315°)$

26. $24\left(\cos\frac{\pi}{6} + i\sin\frac{\pi}{6}\right)$

27. $18.6\left(\cos\frac{4\pi}{3} + i\sin\frac{4\pi}{3}\right)$

28. $12.3\left(\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right)$

29. $43\pi(\cos 90° + i\sin 90°)$

30. $\sqrt{5}(\cos 180° + i\sin 180°)$

Objective 3: Compute Products and Quotients of Complex Numbers in Polar Form

For Exercises 31–42, given complex numbers z_1 and z_2,

a. Find z_1z_2 and write the product in polar form.

b. Find $\frac{z_1}{z_2}$ and write the quotient in polar form. **(See Examples 5–6)**

31. $z_1 = 20(\cos 31° + i\sin 31°)$, $z_2 = 40(\cos 14° + i\sin 14°)$

32. $z_1 = 27(\cos 67° + i\sin 67°)$, $z_2 = 9(\cos 53° + i\sin 53°)$

33. $z_1 = 3\left(\cos\frac{7\pi}{4} + i\sin\frac{7\pi}{4}\right)$, $z_2 = 6\left(\cos\frac{7\pi}{12} + i\sin\frac{7\pi}{12}\right)$

34. $z_1 = 10\left(\cos\frac{11\pi}{12} + i\sin\frac{11\pi}{12}\right)$, $z_2 = 2\left(\cos\frac{5\pi}{4} + i\sin\frac{5\pi}{4}\right)$

35. $z_1 = \cos 40° + i\sin 40°$, $z_2 = \cos 120° + i\sin 120°$

36. $z_1 = \cos 17° + i\sin 17°$, $z_2 = \cos 73° + i\sin 73°$

37. $z_1 = \frac{3}{4}\left(\cos\frac{\pi}{12} + i\sin\frac{\pi}{12}\right)$, $z_2 = \frac{1}{12}\left(\cos\frac{5\pi}{12} + i\sin\frac{5\pi}{12}\right)$

38. $z_1 = \frac{5}{6}\left(\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right)$, $z_2 = 30\left(\cos\frac{3\pi}{4} + i\sin\frac{3\pi}{4}\right)$

39. $z_1 = 2 - 2i$ and $z_2 = 3 + 3i$

40. $z_1 = -5 - 5i$ and $z_2 = 10 + 10i$

41. $z_1 = -12\sqrt{3} - 12i$, $z_2 = -6 + 6\sqrt{3}\,i$

42. $z_1 = 24 + 24\sqrt{3}\,i$, $z_2 = 4\sqrt{3} - 4i$

Objective 4: Compute Powers of Complex Numbers (De Moivre's Theorem)

For Exercises 43–52, use De Moivre's theorem to find the indicated power. Write the result in rectangular form $a + bi$. (See Examples 7–8)

43. $\left[6\left(\cos\frac{\pi}{36} + i\sin\frac{\pi}{36}\right)\right]^6$

44. $\left[4\left(\cos\frac{4\pi}{15} + i\sin\frac{4\pi}{15}\right)\right]^5$

45. $\left[2\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)\right]^3$

46. $\left[3\left(\cos\frac{3\pi}{8} + i\sin\frac{3\pi}{8}\right)\right]^4$

47. $[\sqrt{3}(\cos 35° + i\sin 35°)]^9$

48. $[\sqrt{5}(\cos 60° + i\sin 60°)]^5$

49. $[2(\cos 26.25° + i\sin 26.25°)]^8$

50. $[4(\cos 33.75° + i\sin 33.75°)]^4$

51. $(2\sqrt{3} - 2i)^5$

52. $(4 + 4\sqrt{3}\,i)^3$

Objective 5: Find the nth Roots of a Complex Number

53. When expressing the fourth roots w_k of a complex number generated by $w_k = \sqrt[n]{r}\left[\cos\left(\frac{\theta + 360°k}{n}\right) + i\sin\left(\frac{\theta + 360°k}{n}\right)\right]$ for $k = 0, 1, 2, \ldots, n - 1$, by how many degrees will consecutive roots differ? In general, given an integer $n \geq 2$, by how many degrees will consecutive nth roots differ?

54. When expressing the fifth roots w_k of a complex number generated by $w_k = \sqrt[n]{r}\left[\cos\left(\frac{\theta + 2\pi k}{n}\right) + i\sin\left(\frac{\theta + 2\pi k}{n}\right)\right]$ for $k = 0, 1, 2, \ldots, n - 1$, by how many radians will consecutive roots differ?

ISTUDY

For Exercises 55–60, find the indicated complex roots by first writing the number in polar form. Write the results in rectangular form $a + bi$. (See Example 9)

55. The sixth roots of 729

56. The fourth roots of 625

57. The cube roots of $27i$

58. The cube roots of $-125i$

59. The square roots of $-8 + 8\sqrt{3}\,i$

60. The square roots of $50 - 50\sqrt{3}\,i$

For Exercises 61–64, find the indicated complex roots. Write the results in polar form.

61. The square roots of $16\left(\cos\frac{3\pi}{4} + i\sin\frac{3\pi}{4}\right)$

62. The square roots of $49\left(\cos\frac{11\pi}{6} + i\sin\frac{11\pi}{6}\right)$

63. The fifth roots of $16\sqrt{3} + 16i$

64. The sixth roots of $\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i$

For Exercises 65–70, find the indicated complex roots. Write the results in polar form using degree measure for the argument. (See Example 10)

65. The cube roots of $27(\cos 114° + i\sin 114°)$

66. The fourth roots of $256(\cos 228° + i\sin 228°)$

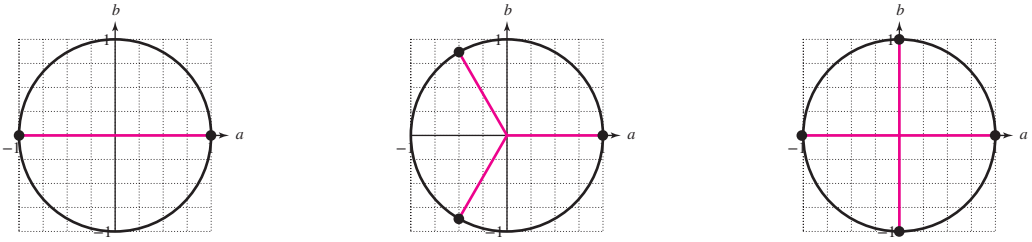
67. The square roots of $\frac{81\sqrt{2}}{2} - \frac{81\sqrt{2}}{2}i$

68. The square roots of $-\frac{3\sqrt{3}}{2} + \frac{3}{2}i$

69. The sixth roots of $-2 - 2\sqrt{3}\,i$

70. The fifth roots of $5\sqrt{3} - 5i$.

71. The square roots, cube roots, and fourth roots of 1 are shown in the figure from left to right, respectively. Use the pattern to describe how to find the nth roots of 1.



72. Use the results of Exercise 71 to find the fifth roots of 1.

73. Use De Moivre's theorem to show that $2\left(\cos\frac{2\pi}{9} + i\sin\frac{2\pi}{9}\right)$ is a cube root of $8\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)$.

74. Use De Moivre's theorem to show that $1 - i$ is a cube root of $2\sqrt{2}\left(\cos\frac{5\pi}{4} + i\sin\frac{5\pi}{4}\right)$.

Mixed Exercises

For Exercises 75–78, shade the area in the complex plane.

75. $\{z = a + bi \mid a < 3,\ b \geq 2\}$

76. $\{z = a + bi \mid a \geq -1,\ b < 3\}$

77. $\{z = a + bi \mid |z| < 3\}$

78. $\{z = a + bi \mid |z| \geq 2\}$

For Exercises 79–82, convert the complex number from polar form to rectangular form, $a + bi$. (*Hint*: To evaluate the sine or cosine of the given angle, use the sum or difference formulas for sine and cosine.)

79. $4\left(\cos\frac{13\pi}{12} + i\sin\frac{13\pi}{12}\right)$

80. $36\left(\cos\frac{7\pi}{12} + i\sin\frac{7\pi}{12}\right)$

81. $\cos 15° + i\sin 15°$

82. $\cos 285° + i\sin 285°$

83. Verify the results of Example 5 by converting z_1 and z_2 to rectangular form and then computing the product.

84. Given $z_1 = 2 + 2i$ and $z_2 = 3i$,

a. Find $\frac{z_1}{z_2}$ by dividing the numbers in rectangular form and then converting the quotient to polar form.

b. Find $\frac{z_1}{z_2}$ by dividing the numbers in polar form.

ISTUDY

85. Let $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$ and $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$. Prove that $\frac{z_1}{z_2} = \frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i\sin(\theta_1 - \theta_2)]\,(z_2 \neq 0)$.

86. Show that $z_1 = r(\cos\theta + i\sin\theta)$ and $z_2 = r[\cos(-\theta) + i\sin(-\theta)]$ are conjugates.

87. Let $z = r(\cos\theta + i\sin\theta)$.

a. Prove that $z^{-1} = r^{-1}[\cos(-\theta) + i\sin(-\theta)]$

b. Prove that $z^{-2} = r^{-2}[\cos(-2\theta) + i\sin(-2\theta)]$

Repeating this argument, we can show that De Moivre's theorem

$z^n = [r(\cos\theta + i\sin\theta)]^n = r^n(\cos n\theta + i\sin n\theta)$ also holds for negative integers.

88. Use De Moivre's theorem to find the indicated power. Write the result in rectangular form $a + bi$.

a. $(-4\sqrt{2} - 4\sqrt{2}\,i)^{-2}$ **b.** $(-1 + \sqrt{3}\,i)^{-4}$ **c.** $\left(\frac{\sqrt{3}}{2} - \frac{1}{2}i\right)^{-3}$

For Exercises 89–92, simplify and write the solution in rectangular form, $a + bi$. (*Hint*: Convert the complex numbers to polar form before simplifying.)

89. $(1 + i)^3(-1 - i)^4$ **90.** $(1 + i)^4(-3i)^5$ **91.** $\frac{(-3 + \sqrt{3}\,i)^5}{(1 - \sqrt{3}\,i)^2}$ **92.** $\frac{(5\sqrt{2} - 5\sqrt{2}\,i)^4}{(-\sqrt{3} - i)^3}$

93. Solve $x^6 = 64$ by factoring and applying the zero product property to show that the results are the same as the six 6th roots of 64 as found in Example 9 on page 797.

94. Solve $x^3 = -64$ by factoring and applying the zero product property to show that the results are the same as the three cube roots of -64 as found in Skill Practice Exercise 9 on page 797.

For Exercises 95–98, find all complex solutions to the equation. Write the solutions in polar form.

95. $z^4 + 8\sqrt{2} = -8\sqrt{2}\,i$ **96.** $z^5 = 16\sqrt{2}(1 + i)$ **97.** $2z^3 + \sqrt{3} = i$ **98.** $z^3 = 8i$

Write About It

99. How is the absolute value of a complex number $z = a + bi$ similar to the absolute value of a real number x?

100. Is the polar representation of a complex number $z = a + bi$ unique? Explain.

Expanding Your Skills

101. Euler's formula states that $e^{i\theta} = \cos\theta + i\sin\theta$.

a. Evaluate $e^{(\pi/4)i}$.

b. Use Euler's formula to show that $e^{\pi i} + 1 = 0$. This equation relates five fundamental numbers used in mathematics (0, 1, e, π, and i).

102. In calculus, we can show that

$$e^x = 1 + \frac{x}{1} + \frac{x^2}{2\cdot 1} + \frac{x^3}{3\cdot 2\cdot 1} + \frac{x^4}{4\cdot 3\cdot 2\cdot 1} + \cdots,$$

$$\cos x = 1 - \frac{x^2}{2\cdot 1} + \frac{x^4}{4\cdot 3\cdot 2\cdot 1} - \frac{x^6}{6\cdot 5\cdot 4\cdot 3\cdot 2\cdot 1} + \cdots, \text{ and}$$

$$\sin x = x - \frac{x^3}{3\cdot 2\cdot 1} + \frac{x^5}{5\cdot 4\cdot 3\cdot 2\cdot 1} - \frac{x^7}{7\cdot 6\cdot 5\cdot 4\cdot 3\cdot 2\cdot 1} + \cdots$$

Write the first eight terms of the expansion of e^{ix} to illustrate that $e^{ix} = \cos x + i\sin x$.

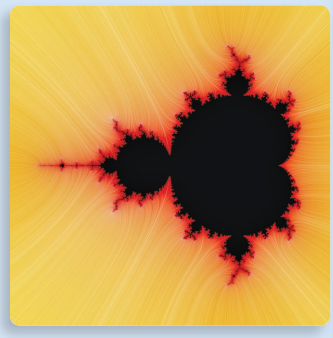
103. Show that $3e^{\pi i/12}$ is a solution to $z^8 - 81z^4 + 6561 = 0$.

104. Show that $e^{7\pi i/12}$ is a solution to $z^8 - z^4 + 1 = 0$.

ISTUDY

Point of Interest

The Mandelbrot set is named for the French-American mathematician Benoit Mandelbrot (1924–2010) who discovered it in 1980. The representation of the Mandelbrot set is depicted in numerous places on the internet (and on T-shirts and posters) and shows the members of the set as points on the complex plane. In the image, the Mandelbrot set is depicted in black; all other colors are points outside the set.



bluecrayola/Shutterstock

The Mandelbrot set is calculated from the equation

$z_{n+1} = (z_n)^2 + c$ where c is a complex number: $c = x + yi$ (c is called the *seed*) and $z_0 = 0$.

The calculation begins with $z_0 = 0$ and proceeds with each previous answer being input into the next step. For example, consider the point on the complex plane $z = 0 + i$. Thus, we proceed with $c = i$ and $z_0 = 0$:

$$z_1 = (z_0)^2 + c = 0 + i = i$$
$$z_2 = (z_1)^2 + c = i^2 + i = -1 + i$$
$$z_3 = (z_2)^2 + c = (-1 + i)^2 + i = 1 - 2i + i^2 + i = 1 - 2i - 1 + i = -i$$
$$z_4 = (z_3)^2 + c = (-i)^2 + i = i^2 + i = -1 + i$$

Once we observe that the value for z_4 is the same as the value for z_2, we know this list of values will repeat endlessly in the same pattern.

$$0, i, -1 + i, -i, -1 + i, -i, -1 + i, -i, \ldots$$

This list of values is called the *orbit* of z_0 under $z_{n+1} = (z_n)^2 + c$.

We may also consider the modulus of each value:

$$|z_1| = |i| = \sqrt{0^2 + 1^2} = 1$$
$$|z_2| = |-1 + i| = \sqrt{(-1)^2 + 1^2} = \sqrt{2}$$
$$|z_3| = |-i| = \sqrt{0^2 + (-1)^2} = 1$$

The Mandelbrot set contains all the values c such that the distance from (0, 0) to z_n does *not* become infinitely large. For our example, we have $c = 0 + i$, and as such, we would place a black dot at the point (0, 1) in the complex plane to show it is within the Mandelbrot set.

What about the colors? To answer this question, let's examine another seed, $c = 2i$, and the values of $|z_n|$.

$$z_1 = (z_0)^2 + c = 0 + 2i = 2i \qquad |z_1| = \sqrt{0^2 + 2^2} = 2$$
$$z_2 = (z_1)^2 + c = (2i)^2 + 2i = 4i^2 + 2i = -4 + 2i \qquad |z_2| = \sqrt{(-4)^2 + 2^2} = 2\sqrt{5}$$
$$z_3 = (z_2)^2 + c = (-4 + 2i)^2 + 2i = 12 - 14i \qquad |z_3| = 2\sqrt{85}$$
$$z_4 = (z_3)^2 + c = (12 - 14i)^2 + 2i = -52 - 334i \qquad |z_4| = 2\sqrt{28,565}$$

The distance from (0, 0) for this list of values appears to grow without bound. We would *not* place a black dot on the point (0, 2) on the complex plane, but we would assign a color to this point.

A color is assigned depending on how many iterations it takes for $|z_n| > 2$. For example, if it takes 2 iterations, we assign red, for 3 iterations, we assign blue, and so on. The color choice is arbitrary—and artistic! Obviously, this detailed graph is not generated or sketched by hand. When generating the graph on a computer, we would also limit the number of iterations before making a color assignment.

There are many zoomable images of the Mandelbrot set available on the Web. Notice that the interesting and deeply detailed portion of the graph is along the boundary. No matter how much you zoom in on a particular boundary region, you will always see a similar kind of crinkly, complex image. The Mandelbrot set is a fractal.

105. Show that the point $c = 0.3 + i$ is *not* in the Mandelbrot set. Consider the point not in the set once $|z_n| > 2$ where $z_{n+1} = (z_n)^2 + c$ and $z_0 = 0$. (For each value of $z = x + yi$, round the values of x and y to two decimal places and the value of $|z|$ to one decimal place.)

106. Examine $z_{n+1} = (z_n)^2 + c$ and $z_0 = 0$ where $c = -0.23 - 0.07i$ through z_5. Do you think this point is in the Mandelbrot set? Justify your answer. (For each value of $z = x + yi$, round the values of x, y, and $|z|$ to two decimal places.)

107. Research *Mandelbrot iteration orbits* on the internet for a visual representation on the complex plane of the list of values created by $z_{n+1} = (z_n)^2 + c$ and $z_0 = 0$. For a journey into the Mandelbrot set, investigate #mandelbrot on YouTube. Also do a search on the phrases *seahorse valley Mandelbrot set* and *elephant valley Mandelbrot set*.

ISTUDY

SECTION 8.4 Vectors

OBJECTIVES

1. Interpret Vectors Geometrically
2. Represent Vectors in Component Form
3. Perform Operations on Vectors in Component Form
4. Represent Vectors in Terms of i and j
5. Relate Component Form and Direction and Magnitude of a Vector
6. Use Vectors in Applications

1. Interpret Vectors Geometrically

In physics, the mathematical quantities that are used to describe the motion of an object can be divided into two quantities, called scalars and vectors. **Scalars** are quantities that are described by a single value called the **magnitude** (the size or measure of the quantity). **Vectors** are quantities that are described by both magnitude *and* direction. For example, suppose that a bus travels 30 mi. The value 30 mi is a scalar quantity, because it tells us how much distance the bus covered. However, if we say that the bus travels 30 mi east, we know both its magnitude, 30 mi, and direction, east. So this information makes up a vector quantity. This is called a displacement vector because the bus is displaced 30 mi to the east of its starting point.

The **speed** of an object is a scalar quantity that tells us how fast an object travels. By contrast, the **velocity** of an object is a vector quantity, because it tells us how fast the object travels *and* in which direction. For example, suppose that a car travels at a constant speed around a turn at the Daytona International Speedway. Although the speed is constant, the velocity of the car is continuously changing because its direction of travel around the curve changes.

Duomo/Corbis

A variety of scalar and vector quantities are used in physical science courses. Some common scalar quantities are distance, speed, area, mass, volume, and temperature. Common vector quantities are displacement, velocity, acceleration, and force.

Vector quantities are so named because they can be represented by a vector in a plane or in space. A **vector** in a plane is a line segment with a specified direction. For example, in Figure 8-33, we show an arrow with endpoints P and Q pointing from P to Q. We denote this vector as $\overrightarrow{PQ}$. We call P the **initial point** of the vector and Q the **terminal point** of the vector. The **magnitude** of $\overrightarrow{PQ}$, denoted $\|\overrightarrow{PQ}\|$, is the length of the line segment. Using the context of the **displacement** of an object, the vector $\overrightarrow{PQ}$ refers to the object's overall change in position in moving from point P to point Q.

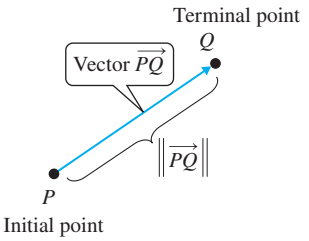


Figure 8-33

Two vectors are equal if they have the same magnitude and direction. The vectors in Figure 8-34 are all equal to $\overrightarrow{AB}$. Notice that the vectors in Figure 8-34 each represent the same displacement left and upward from the initial point to the terminal point.

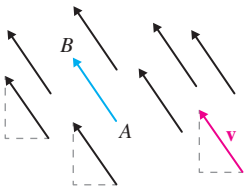

Figure 8-34

To denote vectors, we often use boldface lowercase letters such as **u**, **v**, and **w**. If $\mathbf{v} = \overrightarrow{AB}$, then **v** represents the set of *all* vectors equal to $\overrightarrow{AB}$.

TIP Because it is difficult to depict boldface when using a pencil and paper, we sometimes use an arrow over a lowercase letter to denote a vector such as $\vec{v}$.

EXAMPLE 1 Determining if Two Vectors Are Equal

Vector **v** extends from (0, 0) to (−4, 2). Vector **w** extends from (1, 3) to (−3, 5).

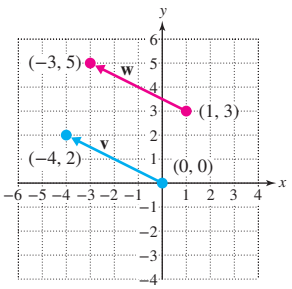
a. Find the magnitude of **v** and the magnitude of **w**.

b. Are **v** and **w** equal?

ISTUDY

Solution:

a. Find the magnitude (length) of each vector by applying the distance formula.



$$\|\mathbf{v}\| = \sqrt{(-4-0)^2 + (2-0)^2} = \sqrt{16+4}$$
$$= \sqrt{20} = 2\sqrt{5}$$
$$\|\mathbf{w}\| = \sqrt{(-3-1)^2 + (5-3)^2} = \sqrt{16+4}$$
$$= \sqrt{20} = 2\sqrt{5}$$

b. The magnitudes of $\mathbf{v}$ and $\mathbf{w}$ are equal, but we must also determine if they have the same direction. Both vectors are directed from the lower right to the upper left. Furthermore, the slopes of the line segments representing $\mathbf{v}$ and $\mathbf{w}$ are equal. Therefore, $\mathbf{v} = \mathbf{w}$.

Slope of line through $\mathbf{v}$: $m = \dfrac{2-0}{-4-0} = -\dfrac{1}{2}$

Slope of line through $\mathbf{w}$: $m = \dfrac{5-3}{-3-1} = -\dfrac{1}{2}$

Skill Practice 1 Vector $\mathbf{v}$ extends from (0, 0) to (3, 4). Vector $\mathbf{w}$ extends from (−2, 3) to (−5, −1).

a. Find the magnitude of $\mathbf{v}$ and magnitude of $\mathbf{w}$.

b. Are $\mathbf{v}$ and $\mathbf{w}$ equal?

We can envision the sum or difference of two vectors by regarding their displacements from their initial points to their terminal points. If vector $\mathbf{v}$ represents the displacement from P to Q and vector $\mathbf{w}$ represents the vector from Q to R, then the vector $\mathbf{v} + \mathbf{w}$ represents the displacement from P to R (Figure 8-35).

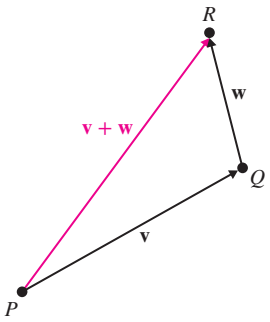


Figure 8-35

Intuitively, the statement $\mathbf{v} + \mathbf{w} = \overrightarrow{PR}$ means that a path directly from P to R represents the same displacement from the starting point as the path from P to Q to R.

Notice that the vector $\mathbf{v} + \mathbf{w}$ is formed by placing $\mathbf{v}$ and $\mathbf{w}$ "tip to tail" (the initial point of $\mathbf{w}$ is placed at the terminal point of $\mathbf{v}$).

The sum $\mathbf{v} + \mathbf{w}$ can also be visualized by placing $\mathbf{v}$ and $\mathbf{w}$ at a common initial point ("tail" to "tail"). The sum $\mathbf{v} + \mathbf{w}$ is the diagonal of the parallelogram from the initial point of $\mathbf{v}$ and $\mathbf{w}$ to the opposite vertex (Figure 8-36).

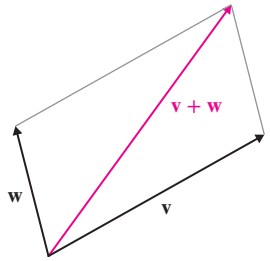

Figure 8-36

If a vector $\mathbf{v}$ is multiplied by a real number k, the magnitude of $k\mathbf{v}$ is $|k|\|\mathbf{v}\|$ (the absolute value of k times the magnitude of $\mathbf{v}$). The direction of $k\mathbf{v}$ is

- in the same direction as $\mathbf{v}$ if $k > 0$ (Figure 8-37).
- in the opposite direction as $\mathbf{v}$ if $k < 0$.

The value k is a scalar, and for this reason, the vector $k\mathbf{v}$ is called a **scalar multiple of v.** Notice that the value of k either stretches or shrinks the length (magnitude) of $\mathbf{v}$ by a factor of $|k|$. If $k = 0$, then $k\mathbf{v}$ is the zero vector, denoted $\mathbf{0}$. The **zero vector** has a magnitude of 0 and is assigned no direction.

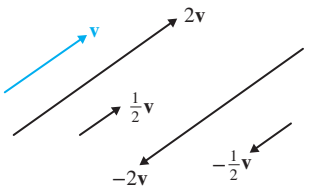

Figure 8-37

Answers

1. **a.** $\|\mathbf{v}\| = 5$, $\|\mathbf{w}\| = 5$
   b. No (their directions are opposite)

ISTUDY

The vector $-\mathbf{v}$ is $-1\mathbf{v}$ and represents the opposite of $\mathbf{v}$ (same magnitude, but opposite direction). We use the opposite of a vector to define vector subtraction. The difference of vectors $\mathbf{v}$ and $\mathbf{w}$ is given by $\mathbf{v} - \mathbf{w} = \mathbf{v} + (-\mathbf{w})$. Geometrically, $\mathbf{v} - \mathbf{w}$ is found by adding the opposite of $\mathbf{w}$ to $\mathbf{v}$ (Figure 8-38). With $\mathbf{v}$ and $\mathbf{w}$ placed at a common initial point, the difference $\mathbf{v} - \mathbf{w}$ is visualized as the diagonal of the parallelogram from the "tip" of $\mathbf{w}$ to the "tip" of $\mathbf{v}$ (Figure 8-39).

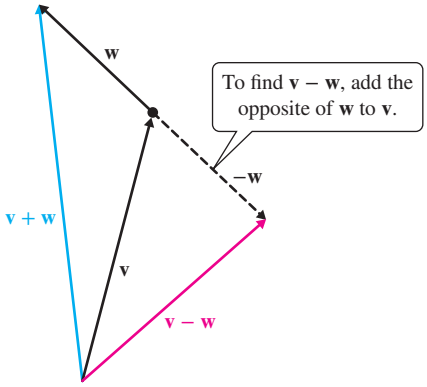

Figure 8-38

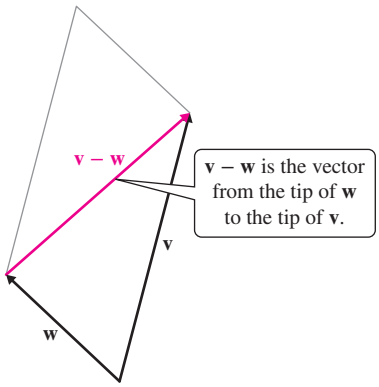

Figure 8-39

2. Represent Vectors in Component Form

Working with vectors geometrically can be a cumbersome process. Fortunately, we have a means to represent vectors algebraically. Suppose that for a vector $\mathbf{v} = \overrightarrow{PQ}$, the horizontal displacement moving from P to Q is a units, and the vertical displacement is b units (Figure 8-40). We can represent $\mathbf{v}$ by a pair of numbers of the form $\langle a, b \rangle$. The notation $\langle a, b \rangle$ is called the **component form** of a vector.

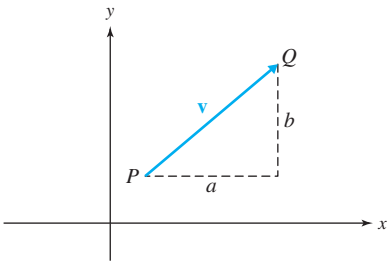

Figure 8-40

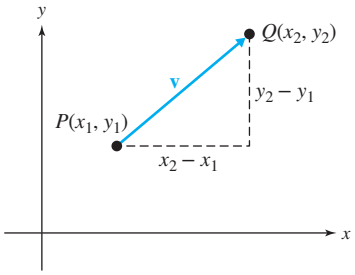
Component Form of a Vector

Let $P(x_1, y_1)$ and $Q(x_2, y_2)$ be points in the plane, and let $\mathbf{v} = \overrightarrow{PQ}$. The component form of $\mathbf{v}$ is given by

$$\mathbf{v} = \langle x_2 - x_1, y_2 - y_1 \rangle$$



Sketching a vector with its initial point at the origin of a rectangular coordinate system is often a convenient location to represent a vector. In such a case, the vector is said to be drawn in **standard position.** For a vector $\mathbf{v} = \langle a, b \rangle$ drawn in standard position, the terminal point of $\mathbf{v}$ is (a, b) (Figure 8-41).

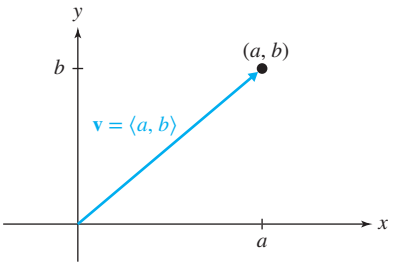


Figure 8-41

EXAMPLE 2 Finding the Component Form of a Vector

Suppose that vector $\mathbf{v}$ has initial point $(-2, 1)$ and terminal point $(2, -5)$.

a. Find the component form of $\mathbf{v}$.

b. Sketch $\mathbf{v}$ in standard position.

c. Sketch $\mathbf{v}$ with its initial point at $(2, 3)$.

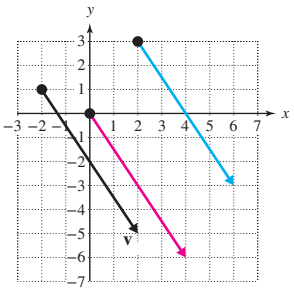
Solution:

a. Label $(-2, 1)$ as (x_1, y_1) and $(2, -5)$ as (x_2, y_2).

$$\text{Then } \mathbf{v} = \langle x_2 - x_1, y_2 - y_1 \rangle = \langle 2 - (-2), -5 - 1 \rangle = \langle 4, -6 \rangle$$

b. In standard position, the initial point of $\mathbf{v}$ is $(0, 0)$ and the terminal point is $(4, -6)$, shown in red.

c. If the initial point is $(2, 3)$, then the terminal point is $(2 + 4, 3 + (-6))$, which is $(6, -3)$, shown in blue.



Skill Practice 2 Suppose that vector $\mathbf{v}$ has initial point $(-4, 5)$ and terminal point $(-1, 12)$.

a. Find the component form of $\mathbf{v}$.

b. If $\mathbf{v}$ is placed with initial point at $(-2, -4)$, what is the terminal point of $\mathbf{v}$?

3. Perform Operations on Vectors in Component Form

With an understanding of the component form of a vector, we have the tools to perform algebraic operations on vectors and to develop important related properties. First, we can state the equality of vectors in terms of their components. Two vectors are equal if and only if their corresponding components are equal.

Equality of Vectors

If $\mathbf{v} = \langle a_1, b_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2 \rangle$, then $\mathbf{v} = \mathbf{w}$ if and only if $a_1 = a_2$ and $b_1 = b_2$.

To add two vectors geometrically, we add their displacements. In component form, this is equivalent to adding their horizontal components and adding their vertical components. Likewise to subtract vectors, we subtract their corresponding components.

Operations on Vectors

Let $\mathbf{v} = \langle a_1, b_1 \rangle$, $\mathbf{w} = \langle a_2, b_2 \rangle$, and c be a real number.

Vector addition: $\mathbf{v} + \mathbf{w} = \langle a_1 + a_2, b_1 + b_2 \rangle$

Vector subtraction: $\mathbf{v} - \mathbf{w} = \langle a_1 - a_2, b_1 - b_2 \rangle$

Multiplication of a vector by a scalar: $c\mathbf{v} = \langle ca_1, cb_1 \rangle$

Answers

2. a. $\langle 3, 7 \rangle$ **b.** $(1, 3)$

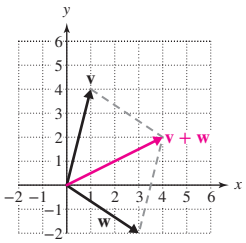
EXAMPLE 3 Applying Operations on Vectors Algebraically

Given $\mathbf{v} = \langle 1, 4\rangle$ and $\mathbf{w} = \langle 3, -2\rangle$, find

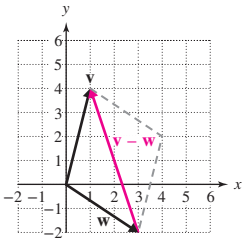
a. $\mathbf{v} + \mathbf{w}$ **b.** $\mathbf{v} - \mathbf{w}$

Solution:

a. $\mathbf{v} + \mathbf{w}$
$= \langle 1, 4\rangle + \langle 3, -2\rangle$
$= \langle 1 + 3, 4 + (-2)\rangle$
$= \langle 4, 2\rangle$



b. $\mathbf{v} - \mathbf{w}$
$= \langle 1, 4\rangle - \langle 3, -2\rangle$
$= \langle 1 - 3, 4 - (-2)\rangle$
$= \langle -2, 6\rangle$



Skill Practice 3 Given $\mathbf{r} = \langle -3, 10\rangle$ and $\mathbf{s} = \langle 12, -7\rangle$, find

a. $\mathbf{r} + \mathbf{s}$ **b.** $\mathbf{s} - \mathbf{r}$

EXAMPLE 4 Applying Operations on Vectors Algebraically

Given $\mathbf{r} = \langle -3, 8\rangle$ and $\mathbf{s} = \langle 2, -5\rangle$, find

a. $5\mathbf{r}$ **b.** $2\mathbf{r} - 3\mathbf{s}$

Solution:

a. $5\mathbf{r} = 5\langle -3, 8\rangle = \langle 5(-3), 5(8)\rangle = \langle -15, 40\rangle$

b. $2\mathbf{r} - 3\mathbf{s} = 2\langle -3, 8\rangle - 3\langle 2, -5\rangle$
$= \langle 2(-3), 2(8)\rangle - \langle 3(2), 3(-5)\rangle$
$= \langle -6, 16\rangle - \langle 6, -15\rangle = \langle -6 - 6, 16 - (-15)\rangle = \langle -12, 31\rangle$

Skill Practice 4 Given $\mathbf{a} = \langle 11, -7\rangle$ and $\mathbf{b} = \langle -4, -6\rangle$, find

a. $6\mathbf{a}$ **b.** $-3\mathbf{a} + 10\mathbf{b}$

Several properties of vectors follow directly from the definition of vector addition, vector subtraction, and multiplication of a vector by a scalar.

Properties of Vectors

If $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are vectors, and c and d are scalars, then

1. $\mathbf{v} + \mathbf{w} = \mathbf{w} + \mathbf{v}$
2. $(\mathbf{v} + \mathbf{w}) + \mathbf{u} = \mathbf{v} + (\mathbf{w} + \mathbf{u})$
3. $\mathbf{v} + \mathbf{0} = \mathbf{v}$
4. $\mathbf{v} + (-\mathbf{v}) = \mathbf{0}$
5. $c(\mathbf{v} + \mathbf{w}) = c\mathbf{v} + c\mathbf{w}$
6. $(c + d)\mathbf{v} = c\mathbf{v} + d\mathbf{v}$
7. $(cd)\mathbf{v} = c(d\mathbf{v})$
8. $1(\mathbf{v}) = \mathbf{v}$
9. $0(\mathbf{v}) = \mathbf{0}$
10. $c(\mathbf{0}) = \mathbf{0}$
11. $\|c\mathbf{v}\| = |c|\|\mathbf{v}\|$

Answers
3. a. $\langle 9, 3\rangle$ **b.** $\langle 15, -17\rangle$
4. a. $\langle 66, -42\rangle$ **b.** $\langle -73, -39\rangle$

ISTUDY

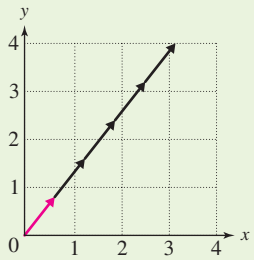
To show that property 1 is true, let $\mathbf{v} = \langle a_1, b_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2 \rangle$, Then

$$\begin{aligned} \mathbf{v} + \mathbf{w} &= \langle a_1 + a_2, b_1 + b_2 \rangle \\ &= \langle a_2 + a_1, b_2 + b_1 \rangle \qquad \text{Commutative property of real numbers} \\ &= \mathbf{w} + \mathbf{v} \end{aligned}$$

Several other properties of vectors are left for verification in the exercises.

4. Represent Vectors in Terms of i and j

TIP Notice that the length of **u** is $\frac{1}{5}$ the length of **v** and in the same direction as **v.** Therefore, $\mathbf{v} = 5\mathbf{u}$.



A vector that has a magnitude of 1 unit is called a **unit vector.** Finding a unit vector in the same direction as a given vector is an important skill in many applications. For example, consider $\mathbf{v} = \langle 3, 4 \rangle$ pictured in standard position in Figure 8-42. The magnitude of **v** is $\|\mathbf{v}\| = \sqrt{3^2 + 4^2} = \sqrt{25} = 5$. We want to find a vector **u** (pictured in red in Figure 8-42) such that **u** is 1 unit in length and in the same direction as **v**. To do this, we apply a scaling factor of $\frac{1}{\|\mathbf{v}\|}$ to vector **v**. That is, $\mathbf{u} = \frac{1}{5}\langle 3, 4 \rangle = \left\langle \frac{3}{5}, \frac{4}{5} \right\rangle$. The vectors **u** and **v** have the same direction because **u** is a positive scalar multiple of **v**. Furthermore, **u** is a unit vector because its magnitude is 1.

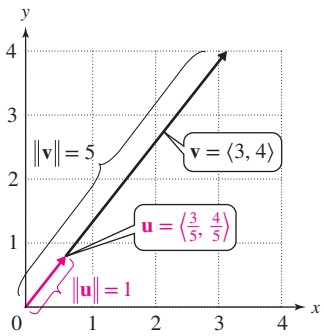


Figure 8-42

$$\|\mathbf{u}\| = \sqrt{\left(\frac{3}{5}\right)^2 + \left(\frac{4}{5}\right)^2} = \sqrt{\frac{9}{25} + \frac{16}{25}} = \sqrt{\frac{25}{25}} = 1$$

We generalize this process as follows.

Find a Unit Vector in the Direction of a Given Vector

If $\mathbf{v} = \langle a, b \rangle$, then a unit vector $\mathbf{u}_\mathbf{v}$ in the direction of **v** is given by

$$\mathbf{u}_\mathbf{v} = \frac{1}{\|\mathbf{v}\|}\mathbf{v} = \frac{1}{\|\mathbf{v}\|}\langle a, b \rangle = \left\langle \frac{a}{\|\mathbf{v}\|}, \frac{b}{\|\mathbf{v}\|} \right\rangle$$

EXAMPLE 5 Finding a Unit Vector

Find a unit vector in the direction of $\mathbf{w} = \langle -3, 2 \rangle$.

Solution:

$$\|\mathbf{w}\| = \sqrt{(-3)^2 + (2)^2} = \sqrt{9 + 4} = \sqrt{13}$$

$$\mathbf{u}_\mathbf{w} = \frac{1}{\|\mathbf{w}\|}\mathbf{w} = \frac{1}{\sqrt{13}}\langle -3, 2 \rangle = \left\langle -\frac{3}{\sqrt{13}}, \frac{2}{\sqrt{13}} \right\rangle \text{ or } \left\langle -\frac{3\sqrt{13}}{13}, \frac{2\sqrt{13}}{13} \right\rangle$$

Skill Practice 5 Find a unit vector in the direction of $\mathbf{v} = \langle 5, -1 \rangle$.

Answer

5. $\left\langle \frac{5}{\sqrt{26}}, -\frac{1}{\sqrt{26}} \right\rangle$ or $\left\langle \frac{5\sqrt{26}}{26}, -\frac{\sqrt{26}}{26} \right\rangle$

ISTUDY

Avoiding Mistakes

We can verify the result from Example 5 by showing that $\|\mathbf{u}_w\| = 1$.

$$\|\mathbf{u}_w\| = \sqrt{\left(-\frac{3}{\sqrt{13}}\right)^2 + \left(\frac{2}{\sqrt{13}}\right)^2} = \sqrt{\frac{9}{13} + \frac{4}{13}} = \sqrt{\frac{13}{13}} = 1 \checkmark$$

Two important unit vectors are $\mathbf{i} = \langle 1, 0\rangle$ and $\mathbf{j} = \langle 0, 1\rangle$ because they are unit vectors in the direction of the positive x- and y-axes, respectively (Figure 8-43). The importance of vectors $\mathbf{i}$ and $\mathbf{j}$ is that any other vector can be expressed as a linear combination of $\mathbf{i}$ and $\mathbf{j}$. Given $\mathbf{v} = \langle a, b\rangle$ we have

$$\begin{aligned}\mathbf{v} &= \langle a, b\rangle \\ &= a\langle 1, 0\rangle + b\langle 0, 1\rangle \\ &= a\mathbf{i} + b\mathbf{j}\end{aligned}$$

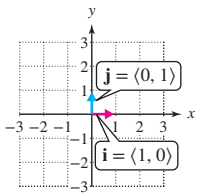

Figure 8-43

Represent Vectors in Terms of i and j

The representation of $\mathbf{v} = \langle a, b\rangle$ in terms of $\mathbf{i}$ and $\mathbf{j}$ is $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$.

The values a and b are called the **scalar horizontal and vertical components** of $\mathbf{v}$, respectively.

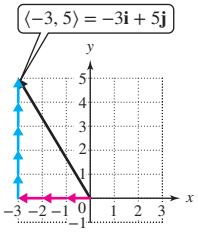
EXAMPLE 6 Writing Vectors in Terms of i and j

a. Write $\langle -3, 5\rangle$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

b. Given $\mathbf{w} = 6.2\mathbf{i} - 3.4\mathbf{j}$ and $\mathbf{v} = -1.7\mathbf{i} + 2.2\mathbf{j}$, write $3\mathbf{w} - 5\mathbf{v}$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

Solution:

a.



b.
$$\begin{aligned}3\mathbf{w} - 5\mathbf{v} &= 3(6.2\mathbf{i} - 3.4\mathbf{j}) - 5(-1.7\mathbf{i} + 2.2\mathbf{j}) \\ &= 18.6\mathbf{i} - 10.2\mathbf{j} + 8.5\mathbf{i} - 11\mathbf{j} \\ &= (18.6 + 8.5)\mathbf{i} + (-10.2 - 11)\mathbf{j} \\ &= 27.1\mathbf{i} - 21.2\mathbf{j}\end{aligned}$$

Skill Practice 6

a. Write $\langle 12, -1\rangle$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

b. Given $\mathbf{a} = -9.4\mathbf{i} + 7.1\mathbf{j}$ and $\mathbf{b} = -0.6\mathbf{i} + 3.2\mathbf{j}$, write $-2\mathbf{a} - 4\mathbf{b}$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

5. Relate Component Form and Direction and Magnitude of a Vector

In many applications of vectors we are given the magnitude and direction of a vector rather than its component form. Given a vector in standard position, its **direction angle** θ is measured counterclockwise from the positive x-axis over the interval

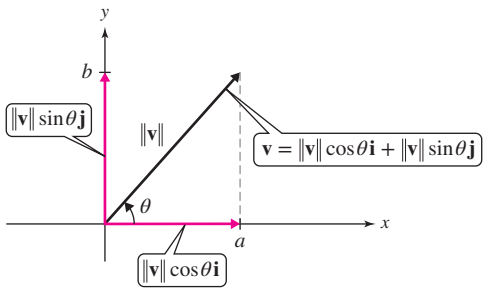
Answers
6. a. $12\mathbf{i} - \mathbf{j}$ **b.** $21.2\mathbf{i} - 27\mathbf{j}$

ISTUDY

$0 \le \theta < 2\pi$ or $0° \le \theta < 360°$. The relationships among the magnitude, direction, and components of a vector are summarized as follows.

Magnitude, Direction, and Components of a Vector

Let $\mathbf{v} = \langle a, b \rangle$ be a vector in standard position, and let $0° \le \theta < 360°$ be the direction of $\mathbf{v}$ measured counterclockwise from the positive x-axis.



- $\|\mathbf{v}\| = \sqrt{a^2 + b^2}$ and $\tan\theta = \dfrac{b}{a}$ $(a \ne 0)$ (magnitude and direction of $\mathbf{v}$)
- $a = \|\mathbf{v}\|\cos\theta$ and $b = \|\mathbf{v}\|\sin\theta$
- $\mathbf{v} = \langle a, b \rangle = \langle \|\mathbf{v}\|\cos\theta, \|\mathbf{v}\|\sin\theta \rangle$ or $\mathbf{v} = a\mathbf{i} + b\mathbf{j} = \|\mathbf{v}\|\cos\theta\,\mathbf{i} + \|\mathbf{v}\|\sin\theta\,\mathbf{j}$

TIP One Newton is the force required to accelerate a mass of 1 kg at 1 m/sec^2. Therefore, 1 N = 1 $\frac{\text{kg}\cdot\text{m}}{\text{sec}^2}$.

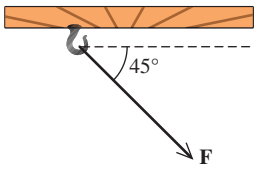
One dyne is the force required to accelerate a mass of 1 g at 1 cm/sec^2. Therefore, 1 dyn = 1 $\frac{\text{g}\cdot\text{cm}}{\text{sec}^2}$.

In Examples 7–12 and in the exercises, we present vectors in an applied setting with several of the following common vector quantities.

- A vector representing the displacement of an object is called a position or displacement vector.
- A vector representing the speed and direction of an object is called a velocity vector.
- A vector representing the force acting on an object in a given direction is called a force vector. Common units of force are pounds (lb), Newtons (N), and dynes (dyn). Force vectors are often denoted by $\mathbf{F}$, by $\mathbf{W}$ (if the force represents a weight), or by $\mathbf{T}$ (if the force represents the tension in a rope or wire).

EXAMPLE 7 Finding the Component Form of a Force Vector

A force of 100 lb is applied to a hook on the ceiling at an angle of 45° with the horizontal. Write the force vector $\mathbf{F}$ in terms of $\mathbf{i}$ and $\mathbf{j}$.



Solution:

The magnitude of the force is $\|\mathbf{F}\| = 100$ lb. Measuring the direction angle counterclockwise from the positive x-axis, we have $\theta = 360° - 45° = 315°$. Then,

$$\begin{aligned}\mathbf{F} &= \|\mathbf{F}\|\cos\theta\,\mathbf{i} + \|\mathbf{F}\|\sin\theta\,\mathbf{j}\\ &= 100\cos 315°\,\mathbf{i} + 100\sin 315°\,\mathbf{j}\\ &= 100 \cdot \frac{\sqrt{2}}{2}\mathbf{i} + 100 \cdot \left(-\frac{\sqrt{2}}{2}\right)\mathbf{j}\\ &= 50\sqrt{2}\,\mathbf{i} - 50\sqrt{2}\,\mathbf{j}\end{aligned}$$

Force $\mathbf{F}$ is applied in a direction to the right and downward. Thus, the horizontal component is positive and the vertical component is negative.

TIP The direction angle θ is usually taken between 0° and 360°, inclusive. However, any angle coterminal to θ results in an equivalent vector. In Example 7,

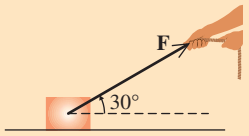
$F = 100\cos(-45°)\mathbf{i} + 100\sin(-45°)\mathbf{j}$

also results in the vector

$50\sqrt{2}\,\mathbf{i} - 50\sqrt{2}\,\mathbf{j}$

ISTUDY

Skill Practice 7 A person exerts a force of 80 lb on an object by pulling on a rope at an angle of 30° from the horizontal. Write the force vector **F** in terms of **i** and **j**.



In Example 8, we are given a velocity vector in terms of **i** and **j** and asked to find the direction and magnitude of the vector.

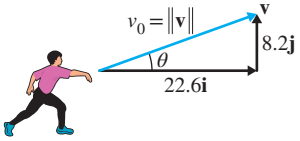
EXAMPLE 8 Finding the Magnitude and Direction of a Vector

A ball is thrown and at the time of release, the velocity of the ball is given by $\mathbf{v} = 22.6\mathbf{i} + 8.2\mathbf{j}$, where each component is given in m/sec. Find the initial velocity v_0 (magnitude of the velocity vector at the time of release) and the angle above the horizontal (in degrees) at which the ball was thrown. Round to 1 decimal place.

Solution:

The initial velocity is the magnitude of the velocity vector.

$$v_0 = \|\mathbf{v}\| = \sqrt{(22.6)^2 + (8.2)^2} \approx 24.0 \text{ m/sec}$$



To find the direction angle, we have $\tan\theta = \dfrac{8.2}{22.6}$.

For θ in Quadrant I, $\theta = \tan^{-1}\dfrac{8.2}{22.6} \approx 19.9°$.

The ball was thrown with an initial velocity of 24.0 m/sec at an angle of 19.9° above the horizontal.

Skill Practice 8 A ball is thrown from a height of 1 m. At the time of release, the velocity of the ball is given by $\mathbf{v} = 27.2\mathbf{i} + 12.7\mathbf{j}$, where each component is given in m/sec. Find the initial velocity v_0 and the angle θ above the horizontal (in degrees) at which the ball was thrown. Round to 1 decimal place.

6. Use Vectors in Applications

In Example 9, a ship travels in open ocean with velocity **v** relative to the water. The ship then encounters a current **c** that alters its course. The resulting velocity **r** of the ship is given by $\mathbf{r} = \mathbf{v} + \mathbf{c}$. As demonstrated in Example 9, finding the component form of vectors **v** and **c** enables us to find the resultant velocity vector.

EXAMPLE 9 Finding a Resultant Vector in an Application

A ship in open ocean travels 18 mph at a bearing of N64°W and encounters a current of 4 mph acting in the direction of N45°E. Rounding to 1 decimal place,

a. Express the velocity of the ship **v** relative to the water in terms of **i** and **j**.
b. Express the velocity of the current **c** in terms of **i** and **j**.
c. Find the true speed and bearing of the ship.

Answers
7. $40\sqrt{3}\mathbf{i} + 40\mathbf{j}$
8. $v_0 \approx 30.0$ m/sec, $\theta \approx 25.0°$

ISTUDY

Solution:

A diagram of the vectors is shown in Figure 8-44.

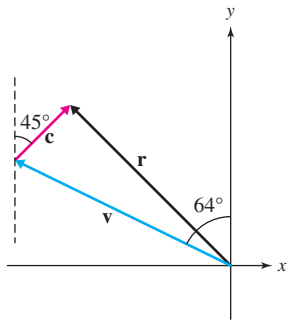


Figure 8-44

a. The direction angle of the ship is $90° + 64° = 154°$, and the magnitude (speed) is 18 mph. Therefore,

$$\begin{aligned}\mathbf{v} &= \|\mathbf{v}\|\cos\theta\mathbf{i} + \|\mathbf{v}\|\sin\theta\mathbf{j}\\ &= 18\cos 154°\mathbf{i} + 18\sin 154°\mathbf{j}\\ &\approx -16.2\mathbf{i} + 7.9\mathbf{j}\end{aligned}$$

b. The direction angle of the current is $90° - 45° = 45°$, and the magnitude is 4 mph. Therefore,

$$\begin{aligned}\mathbf{c} &= \|\mathbf{c}\|\cos\theta\mathbf{i} + \|\mathbf{c}\|\sin\theta\mathbf{j}\\ &= 4\cos 45°\mathbf{i} + 4\sin 45°\mathbf{j}\\ &= 4\cdot\frac{\sqrt{2}}{2}\mathbf{i} + 4\cdot\frac{\sqrt{2}}{2}\mathbf{j} = 2\sqrt{2}\mathbf{i} + 2\sqrt{2}\mathbf{j} \approx 2.8\mathbf{i} + 2.8\mathbf{j}\end{aligned}$$

c. The true velocity of the ship is given by the sum of vectors $\mathbf{v}$ and $\mathbf{c}$. We call this the resultant vector $\mathbf{r}$.

$$\mathbf{r} = \mathbf{v} + \mathbf{c} \approx (-16.2\mathbf{i} + 7.9\mathbf{j}) + (2.8\mathbf{i} + 2.8\mathbf{j}) \approx -13.4\mathbf{i} + 10.7\mathbf{j}$$

The true speed of the ship is the magnitude of $\mathbf{r}$.

$$\|\mathbf{r}\| \approx \sqrt{(-13.4)^2 + (10.7)^2} \approx 17.1 \text{ mph}$$

The true direction of the ship is the direction angle of $\mathbf{r}$.

$$\tan\theta \approx \left(\frac{10.7}{-13.4}\right)$$

For θ in Quadrant II, we have $\theta \approx \tan^{-1}\left(-\frac{10.7}{13.4}\right) + 180° \approx 141.4°$.

The ship travels approximately 17.1 mph at a bearing of N51.4°W.

Skill Practice 9 A plane travels with an air speed of 400 knots at S20°E and encounters a wind of 50 knots acting in the direction of S30°W. Rounding to the nearest whole unit,

a. Express the velocity of the plane $\mathbf{p}$ relative to the air in terms of $\mathbf{i}$ and $\mathbf{j}$.

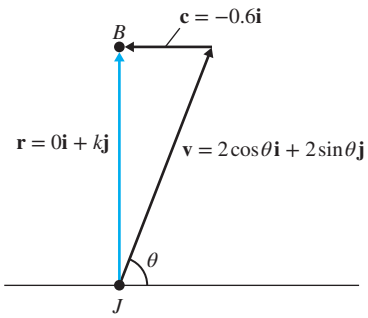
b. Express the velocity of the wind $\mathbf{w}$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

c. Find the true speed (ground speed) and bearing of the plane.

In Example 10, we use vectors to find an unknown direction angle.

EXAMPLE 10 Calculate a Direction Angle

José enters a triathlon and must swim to a buoy offshore and then back again. A current of 0.6 mph flows due west.



a. If José starts at the closest point J on the shoreline to the buoy B, in what direction θ should he swim in order to arrive at the buoy? Assume that José's speed swimming in still water is 2 mph. Round to the nearest tenth of a degree.

b. What is José's true speed? Round to 1 decimal place.

Answers

9. a. $\mathbf{p} \approx 137\mathbf{i} - 376\mathbf{j}$
b. $\mathbf{w} \approx -25\mathbf{i} - 43\mathbf{j}$
c. True speed: 434 knots; Bearing: S15°E

Solution:

From the diagram, the sum of José's velocity $\mathbf{v}$ in still water and the velocity $\mathbf{c}$ of the current must equal the resulting velocity $\mathbf{r}$. The magnitude of $\mathbf{r}$ is José's actual speed k, and the direction of $\mathbf{r}$ is due north. Thus, vector $\mathbf{r}$ is of the form $\mathbf{r} = 0\mathbf{i} + k\mathbf{j}$.

a. $\mathbf{v} + \mathbf{c} = \mathbf{r}$

$$(2\cos\theta\,\mathbf{i} + 2\sin\theta\,\mathbf{j}) + (-0.6\mathbf{i}) = 0\mathbf{i} + k\mathbf{j}$$

$$(2\cos\theta - 0.6)\mathbf{i} = 0\mathbf{i}$$

$$2\cos\theta - 0.6 = 0$$

Equating the horizontal components results in an equation with one unknown and enables us to solve for θ.

$$\cos\theta = \frac{0.6}{2} \Rightarrow \theta = \cos^{-1}\frac{0.6}{2}$$

In Quadrant I, we have $\theta \approx 72.5°$.

b. $2\sin\theta\,\mathbf{j} = k\mathbf{j}$

$$2\sin 72.5° = k$$

$$k \approx 1.9 \text{ mph}$$

José's true speed is the vertical component k of the resultant vector. To solve for k, equate the vertical components.

Skill Practice 10 Repeat Example 10 with José's speed swimming in still water as 2.5 mph, and a current of 0.5 mph due west.

In many applications of physics, we encounter systems with numerous forces acting on an object. If forces $\mathbf{F}_1$, $\mathbf{F}_2$, $\mathbf{F}_3$, … , $\mathbf{F}_n$ act on an object, the sum of the forces is called the resultant force $\mathbf{R}$.

$$\mathbf{R} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 + \cdots + \mathbf{F}_n$$

In Example 11, we find the resultant force of three forces acting on an object.

EXAMPLE 11 Finding the Resultant Force

Three forces, $\mathbf{F}_1$, $\mathbf{F}_2$, and $\mathbf{F}_3$, act on an object in the directions shown in Figure 8-45. If the magnitude of $\mathbf{F}_1$ is 60 lb, the magnitude of $\mathbf{F}_2$ is 100 lb, and the magnitude of $\mathbf{F}_3$ is 85 lb, write the resultant force $\mathbf{R}$ in terms of $\mathbf{i}$ and $\mathbf{j}$. Round the components to the nearest tenth of a pound.

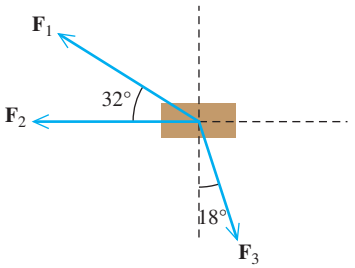


Figure 8-45

Solution:

From Figure 8-45, the direction angle of $\mathbf{F}_1$ is $180° - 32° = 148°$.
The direction angle of $\mathbf{F}_2$ is $180°$.
The direction angle of $\mathbf{F}_3$ is $270° + 18° = 288°$.

TIP Force $\mathbf{F}_2$ acts in the negative x direction in a coordinate plane. Therefore, there is no vertical component of force, and by inspection, we have that $\mathbf{F}_2 = -100\mathbf{i}$.

$$\mathbf{F}_1 = \|\mathbf{F}_1\|\cos\theta\,\mathbf{i} + \|\mathbf{F}_1\|\sin\theta\,\mathbf{j} = 60\cos 148°\,\mathbf{i} + 60\sin 148°\,\mathbf{j}$$
$$\approx -50.9\mathbf{i} + 31.8\mathbf{j}$$

$$\mathbf{F}_2 = \|\mathbf{F}_2\|\cos\theta\,\mathbf{i} + \|\mathbf{F}_2\|\sin\theta\,\mathbf{j} = 100\cos 180°\,\mathbf{i} + 100\sin 180°\,\mathbf{j}$$
$$= -100\mathbf{i} + 0\mathbf{j}$$
$$= -100\mathbf{i}$$

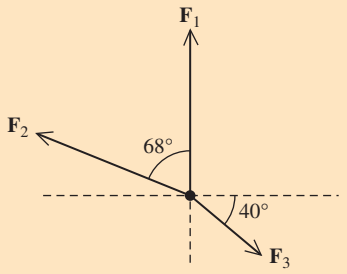
$$\mathbf{F}_3 = \|\mathbf{F}_3\|\cos\theta\,\mathbf{i} + \|\mathbf{F}_3\|\sin\theta\,\mathbf{j} = 85\cos 288°\,\mathbf{i} + 85\sin 288°\,\mathbf{j}$$
$$\approx 26.3\mathbf{i} - 80.8\mathbf{j}$$

Write $\mathbf{F}_1$, $\mathbf{F}_2$, and $\mathbf{F}_3$ in terms of $\mathbf{i}$ and $\mathbf{j}$. Then add the results to get the resultant force.

$$\mathbf{R} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 \approx (-50.9\mathbf{i} + 31.8\mathbf{j}) + (-100\mathbf{i}) + (26.3\mathbf{i} - 80.8\mathbf{j})$$
$$\approx -124.6\mathbf{i} - 49\mathbf{j}$$

Answers
10. a. 78.5° **b.** 2.4 mph

Skill Practice 11 If the magnitude of $\mathbf{F}_1$ is 32 lb, the magnitude of $\mathbf{F}_2$ is 24 lb, and the magnitude of $\mathbf{F}_3$ is 15 lb, write the resultant force $\mathbf{R}$ in terms of $\mathbf{i}$ and $\mathbf{j}$.



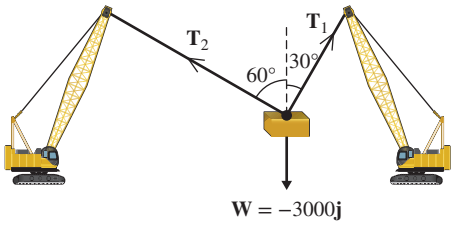
Suppose that forces $\mathbf{F}_1, \mathbf{F}_2, \mathbf{F}_3, \ldots, \mathbf{F}_n$ act on an object. The object is said to be in **static equilibrium** if the resultant force $\mathbf{R}$ is the zero vector. That is,

$$\mathbf{R} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 + \cdots + \mathbf{F}_n = \mathbf{0}$$

For example, the sum of the three forces in Example 11 is $-124.6\mathbf{i} - 49\mathbf{j}$. If a fourth force $\mathbf{F}_4 = 124.6\mathbf{i} + 49\mathbf{j}$ acted on the object, then the sum of the forces would be $0\mathbf{i} + 0\mathbf{j}$ and the object would be in static equilibrium. Intuitively, this means that the forces counteract one another.

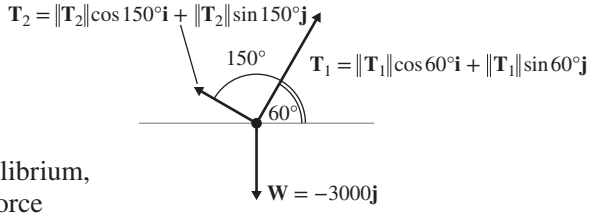
EXAMPLE 12 Solving for Force Vectors in a System in Static Equilibrium

Two cranes support a 3000-lb crate in static equilibrium, as shown in the figure (not drawn to scale). Find the magnitudes of the tension vectors $\mathbf{T}_1$ and $\mathbf{T}_2$. Round to the nearest pound.



Solution:

The weight $\mathbf{W}$ of the crate is directed straight downward and can be expressed as the vector $\mathbf{W} = -3000\mathbf{j}$. We need to solve for $\|\mathbf{T}_1\|$ and $\|\mathbf{T}_2\|$. Since the crate is in static equilibrium, we know that the sum of the force vectors is $\mathbf{0}$. That is, $\mathbf{T}_1 + \mathbf{T}_2 + \mathbf{W} = \mathbf{0}$.



$$(\|\mathbf{T}_1\|\cos 60°\mathbf{i} + \|\mathbf{T}_1\|\sin 60°\mathbf{j}) + (\|\mathbf{T}_2\|\cos 150°\mathbf{i} + \|\mathbf{T}_2\|\sin 150°\mathbf{j}) + (-3000\mathbf{j}) = 0\mathbf{i} + 0\mathbf{j}$$

For two vectors to be equal, their corresponding components must be equal.

$$(\|\mathbf{T}_1\|\cos 60° + \|\mathbf{T}_2\|\cos 150°)\mathbf{i} = 0\mathbf{i} \quad (1)$$ Equate the horizontal components.

$$(\|\mathbf{T}_1\|\sin 60° + \|\mathbf{T}_2\|\sin 150° - 3000)\mathbf{j} = 0\mathbf{j} \quad (2)$$ Equate the vertical components.

Simplifying equations (1) and (2), we have

$$\frac{1}{2}\|\mathbf{T}_1\| - \frac{\sqrt{3}}{2}\|\mathbf{T}_2\| = 0 \quad (3)$$

$$\frac{\sqrt{3}}{2}\|\mathbf{T}_1\| + \frac{1}{2}\|\mathbf{T}_2\| - 3000 = 0 \quad (4)$$

Answer
11. $\mathbf{R} = -10.8\mathbf{i} + 31.3\mathbf{j}$

ISTUDY

From (3) we have $\|\mathbf{T}_1\| = \sqrt{3}\|\mathbf{T}_2\|$. Substituting $\sqrt{3}\|\mathbf{T}_2\|$ for $\|\mathbf{T}_1\|$ in equation (4) we have

$$\frac{\sqrt{3}}{2}(\sqrt{3}\|\mathbf{T}_2\|) + \frac{1}{2}\|\mathbf{T}_2\| - 3000 = 0$$
$$\frac{3}{2}\|\mathbf{T}_2\| + \frac{1}{2}\|\mathbf{T}_2\| - 3000 = 0$$
$$2\|\mathbf{T}_2\| = 3000$$
$$\|\mathbf{T}_2\| = 1500 \text{ lb}$$

Using the relationship $\|\mathbf{T}_1\| = \sqrt{3}\|\mathbf{T}_2\|$, we have $\|\mathbf{T}_1\| = \sqrt{3}(1500) \approx 2598$ lb. The tensions in the cables are 2598 lb and 1500 lb.

Skill Practice 12 Repeat Example 12, with the two cranes supporting a 1-ton (2000-lb) beam in static equilibrium. The direction angles for $\mathbf{T}_1$ and $\mathbf{T}_2$ are 45° and 120°, respectively. Round to the nearest pound.

Point of Interest

The study of *statics* deals with bodies in equilibrium, whereas the study of *dynamics* focuses on bodies under acceleration. Early principles of statics were known in ancient times. For example, the writings of Archimedes show that the ancient Greeks were familiar with the concept of a lever. The study of dynamics came much later because accurate measurements of time were required to investigate bodies in motion. Major contributions were made by Galileo Galilei (1564–1642) and later by Isaac Newton (1642–1727) who formulated three fundamental laws of motion.

Answer

12. $\|\mathbf{T}_1\| \approx 1035$ lb and $\|\mathbf{T}_2\| \approx 1464$ lb

SECTION 8.4 Practice Exercises

Prerequisite Review

For Exercises R.1–R.2, use the distance formula to find the distance between the two points.

R.1. (2, 4) and (−2, 2)

R.2. (3, 7) and (−5, 7)

For Exercises R.3–R.4, make a sketch to illustrate the bearing.

R.3. N53°W

R.4. S38°E

Concept Connections

1. A _____ is a quantity that has magnitude only, whereas a vector has both magnitude and _____.

2. Given a vector $\overrightarrow{AB}$, the initial point is _____ and the terminal point is _____. The _____ of $\overrightarrow{AB}$ is the length of the vector and is denoted by _____.

3. Suppose that a race car driver drives around the 2.5-mi oval track at the Daytona International Speedway.

a. What is the distance traveled? Is this a scalar or a vector?

b. What is the displacement? Is this a scalar or a vector?

4. For a real number k, the vector $k\mathbf{v}$ is in the same direction as $\mathbf{v}$ if k is _____ and in the opposite direction as $\mathbf{v}$ if k is _____.

5. Two vectors $\mathbf{r} = \langle a_1, b_1 \rangle$ and $\mathbf{s} = \langle a_2, b_2 \rangle$ are equal if _____.

6. Given a nonzero vector $\mathbf{v} = \langle a, b \rangle$, a unit vector $\mathbf{u}$ in the same direction as $\mathbf{v}$ is given by $\mathbf{u} =$ _____.

7. In component form, the vector $\mathbf{i} =$ _____ and $\mathbf{j} =$ _____.

ISTUDY

8. If a nonzero vector $\mathbf{v} = \langle a, b \rangle$ has magnitude $\|\mathbf{v}\|$ and direction θ, then $a =$ _____ and $b =$ _____.

9. If a nonzero vector $\mathbf{v} = \langle a, b \rangle$, then the magnitude $\|\mathbf{v}\|$ is given by _____, and the direction is given by $\tan\theta =$ _____ for $0 \le \theta < 2\pi$ and $a \neq 0$.

10. Suppose that forces $\mathbf{F}_1, \mathbf{F}_2, \mathbf{F}_3, \ldots, \mathbf{F}_n$ are acting on an object in static equilibrium. Then the sum of the forces equals _____.

Objective 1: Interpret Vectors Geometrically

For Exercises 11–16, vector v has initial point *P* and terminal point *Q*. Vector w has initial point *R* and terminal point *S*. (See Example 1)

a. Find the magnitude of $\mathbf{v}$. **b.** Find the magnitude of $\mathbf{w}$.

c. Determine whether $\mathbf{v} = \mathbf{w}$ and explain your reasoning.

11. $P(4, 7)$, $Q(5, 10)$ and $R(-2, 8)$, $S(-1, 11)$

12. $P(-2, -10)$, $Q(-5, -8)$ and $R(9, -3)$, $S(6, -1)$

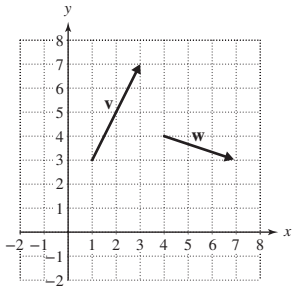
13. $P(4, -1)$, $Q(7, -6)$ and $R(5, 7)$, $S(2, 12)$

14. $P(10, 18)$, $Q(27, -6)$ and $R(9, 12)$, $S(-8, -12)$

15. $P(-12, 10)$, $Q(-16, 7)$ and $R(9, -3)$, $S(1, -9)$

16. $P(-6, 5)$, $Q(10, 35)$ and $R(10, -36)$, $S(34, 9)$

For Exercises 17–20, refer to vectors v and w in the figure.



17. a. Sketch $\mathbf{v} + \mathbf{w}$ by placing the initial point of $\mathbf{w}$ at the terminal point of $\mathbf{v}$.

b. Sketch $\mathbf{v} + \mathbf{w}$ by drawing $\mathbf{v}$ and $\mathbf{w}$ with the same initial point.

18. a. Sketch $\mathbf{v} - \mathbf{w}$ by placing the initial point of $-\mathbf{w}$ at the terminal point of $\mathbf{v}$.

b. Sketch $\mathbf{v} - \mathbf{w}$ by drawing $\mathbf{v}$ and $\mathbf{w}$ with the same initial point.

19. Sketch $-\mathbf{v}$ and $2\mathbf{w}$ in standard position.

20. Sketch $2\mathbf{v}$ and $-2\mathbf{w}$ in standard position.

Objective 2: Represent Vectors in Component Form

For Exercises 21–22, given a vector v with initial point *P* and terminal point *Q*,

a. Write the component form of $\mathbf{v}$.

b. Sketch $\mathbf{v}$ from P to Q and sketch $\mathbf{v}$ in standard position. **(See Example 2)**

21. $P(3, -2)$, $Q(5, -5)$

22. $P(-1, 4)$, $Q(-3, 8)$

For Exercises 23–26, write the component form of a vector v with initial point *P* and terminal point *Q*.

23. $P(-8, -3)$, $Q(-8, -6)$

24. $P(10, 10)$, $Q(12, 10)$

25. $P(8.4, -2.3)$, $Q(6.4, -5.8)$

26. $P(2.5, -1.9)$, $Q(10, 3.1)$

27. Given vector $\mathbf{v}$ with initial point $(16, -30)$ and terminal point $(-22, -10)$,

a. Find the component form of $\mathbf{v}$.

b. If $\mathbf{v}$ is placed with initial point at $(15, 8)$, what is the terminal point of $\mathbf{v}$?

28. Given vector $\mathbf{v}$ with initial point $(17, 80)$ and terminal point $(-72, 53)$,

a. Find the component form of $\mathbf{v}$.

b. If $\mathbf{v}$ is placed with initial point at $(-13, -12)$, what is the terminal point of $\mathbf{v}$?

29. Given $\mathbf{v} = \langle -17, 29 \rangle$ with initial point $(4, -10)$, find the terminal point of $\mathbf{v}$.

30. Given $\mathbf{v} = \langle 5, -8 \rangle$ with initial point $(-1, -7)$, find the terminal point of $\mathbf{v}$.

ISTUDY

Objective 3: Perform Operations on Vectors in Component Form

For Exercises 31–46, perform the indicated operations for the given vectors. (See Examples 3–4)

$\mathbf{v} = \langle 8, -10\rangle$ $\mathbf{w} = \langle -3, 7\rangle$ $\mathbf{s} = \langle -1, -2\rangle$ $\mathbf{r} = \langle 2, 10\rangle$

31. $\mathbf{v} + \mathbf{w}$ **32.** $\mathbf{s} + \mathbf{w}$ **33.** $\mathbf{v} + \mathbf{r}$ **34.** $\mathbf{r} + \mathbf{s}$

35. $\mathbf{w} - \mathbf{v}$ **36.** $\mathbf{w} - \mathbf{s}$ **37.** $\mathbf{r} - \mathbf{w}$ **38.** $\mathbf{v} - \mathbf{r}$

39. $5\mathbf{s}$ **40.** $-4\mathbf{w}$ **41.** $-\frac{1}{2}\mathbf{v}$ **42.** $\frac{2}{3}\mathbf{w}$

43. $\mathbf{v} + \mathbf{s} - \mathbf{r}$ **44.** $\mathbf{s} - \mathbf{r} + \mathbf{w}$ **45.** $2\mathbf{r} - (\mathbf{w} + \mathbf{s})$ **46.** $3(\mathbf{v} + 2\mathbf{w}) - \mathbf{s}$

For Exercises 47–54, let c and d be scalars and let $\mathbf{v} = \langle a_1, b_1\rangle$, $\mathbf{w} = \langle a_2, b_2\rangle$, $\mathbf{u} = \langle a_3, b_3\rangle$, and $\mathbf{0} = \langle 0, 0\rangle$. Prove the given statement.

47. $(\mathbf{v} + \mathbf{w}) + \mathbf{u} = \mathbf{v} + (\mathbf{w} + \mathbf{u})$ **48.** $\mathbf{v} + \mathbf{0} = \mathbf{0} + \mathbf{v}$

49. $\mathbf{v} + (-\mathbf{v}) = \mathbf{0}$ **50.** $c(\mathbf{v} + \mathbf{w}) = c\mathbf{v} + c\mathbf{w}$

51. $(c + d)\mathbf{v} = c\mathbf{v} + d\mathbf{v}$ **52.** $(cd)\mathbf{v} = c(d\mathbf{v})$

53. $0(\mathbf{v}) = \mathbf{0}$ **54.** $\|c\mathbf{v}\| = |c|\|\mathbf{v}\|$

Objective 4: Represent Vectors in Terms of i and j

For Exercises 55–60, find a unit vector in the direction of v. (See Example 5)

55. $\mathbf{v} = 20\mathbf{i} - 21\mathbf{j}$ **56.** $\mathbf{w} = -11\mathbf{i} + 60\mathbf{j}$ **57.** $\mathbf{t} = -0.7\mathbf{i} - 2.4\mathbf{j}$

58. $\mathbf{s} = 3.9\mathbf{i} + 5.2\mathbf{j}$ **59.** $\mathbf{r} = -10\mathbf{i} + 14\mathbf{j}$ **60.** $\mathbf{v} = 6\mathbf{i} - 15\mathbf{j}$

For Exercises 61–68, perform the indicated operations for the given vectors. (See Example 6)

$\mathbf{v} = -3.3\mathbf{i} + 11\mathbf{j}$ $\mathbf{w} = 4\mathbf{i} + \mathbf{j}$ $\mathbf{s} = 7.2\mathbf{i} - 5.4\mathbf{j}$ $\mathbf{r} = -12\mathbf{i} - 5\mathbf{j}$

61. $\mathbf{v} + \mathbf{s}$ **62.** $\mathbf{w} + \mathbf{r}$ **63.** $\mathbf{s} - \mathbf{r}$ **64.** $\mathbf{v} - \mathbf{w}$

65. $-2\mathbf{r} + 3\mathbf{w}$ **66.** $6\mathbf{s} - 4\mathbf{v}$ **67.** $\|\mathbf{r} + \mathbf{w}\|$ **68.** $\|\mathbf{r} - \mathbf{w}\|$

Objective 5: Relate Component Form and Direction and Magnitude of a Vector

For Exercises 69–74, write the vector v in the form $a\mathbf{i} + b\mathbf{j}$, where v has the given magnitude and direction angle.

69. $\|\mathbf{v}\| = 12$, $\theta = 30°$ **70.** $\|\mathbf{v}\| = 18$, $\theta = 150°$

71. $\|\mathbf{v}\| = \sqrt{5}$, $\theta = \frac{3\pi}{4}$ **72.** $\|\mathbf{v}\| = \sqrt{17}$, $\theta = \frac{4\pi}{3}$

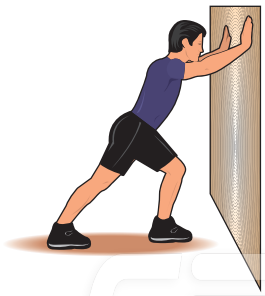
73. $\|\mathbf{v}\| = \frac{3}{8}$, $\theta = 300°$ **74.** $\|\mathbf{v}\| = \frac{6}{7}$, $\theta = 225°$

For Exercises 75–78, find the magnitude and direction angle ($0° \le \theta < 360°$) for the given vector. Round to 1 decimal place.

75. $\mathbf{v} = 4\mathbf{i} + 6\mathbf{j}$ **76.** $\mathbf{w} = -5\mathbf{i} + 8\mathbf{j}$ **77.** $\mathbf{s} = -1.8\mathbf{i} - 3.5\mathbf{j}$ **78.** $\mathbf{r} = \mathbf{i} - 0.8\mathbf{j}$

79. A kick boxer kicks a bag at an angle of 30° from the horizontal with a force of 250 N (Newtons). Write the force vector **F** in terms of **i** and **j**. **(See Example 7)**

80. An athlete stretches his Achilles tendon by extending one leg behind the other and pushing against the wall with his hands. If he pushes against the wall with a force of 120 N at an angle of 20° from the horizontal as shown, write the force vector **F** in terms of **i** and **j**. Round the components to the nearest tenth of a Newton.



ISTUDY

81. A ship travels 18 mph at a bearing of S30°W. Write the velocity vector $\mathbf{v}$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

82. A baseball is thrown with a speed of 70 mph at an angle of 14° from the horizontal. Write the velocity vector $\mathbf{v}$ at the time of release in terms of $\mathbf{i}$ and $\mathbf{j}$. Round the components to the nearest tenth of a mph.

83. A punter kicks a football with an initial velocity given by $\mathbf{v} = 22.2\mathbf{i} + 18.6\mathbf{j}$ m/sec. (**See Example 8**)

a. Find the magnitude of the velocity vector at the time the ball leaves the punter's foot. Round to the nearest m/sec.

b. Find the angle from the horizontal at which the ball was kicked. Round to the nearest degree.

84. The velocity of a ship is given by the vector $-6.4\mathbf{i} + 7.7\mathbf{j}$ mph.

a. Find the speed of the ship. Round to the nearest mph.

b. Find the bearing of the ship. Round to the nearest degree.

Objective 6: Use Vectors in Applications

85. A plane travels N30°W at 450 mph and encounters a wind blowing due west at 30 mph. (**See Example 9**)

a. Express the velocity of the plane $\mathbf{v}_p$ relative to the air in terms of $\mathbf{i}$ and $\mathbf{j}$.

b. Express the velocity of the wind $\mathbf{v}_w$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

c. Express the true velocity of the plane $\mathbf{v}_T$ in terms of $\mathbf{i}$ and $\mathbf{j}$ and find the true speed of the plane.

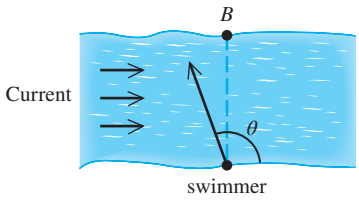
86. A plane flies at a speed of 370 mph on a bearing of S45°E. Relative to the ground, the plane's speed is measured as 345 mph with a true bearing of S40°E. Rounding to the nearest whole unit,

a. Express the velocity of the plane $\mathbf{v}_p$ relative to the air in terms of $\mathbf{i}$ and $\mathbf{j}$.

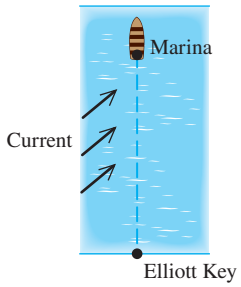
b. Express the true velocity of the plane $\mathbf{v}_T$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

c. Express the velocity of the wind $\mathbf{v}_w$ in terms of $\mathbf{i}$ and $\mathbf{j}$ and find the speed of the wind.

87. A swimmer swims 1.5 mph in still water and wants to swim to a point B due north from the starting point directly across a river. If the current is 0.5 mph due east, at what angle θ should the swimmer swim to reach point B? Round to the nearest tenth of a degree. (**See Example 10**)



88. A boat that travels 6 mph in still water leaves a marina in Miami to travel to an island called Elliott Key due south of the marina. The prevailing current is directed northeast (N45°E) at 0.8 mph. At what bearing should the captain of the boat steer the ship?



For Exercises 89–94, the given forces (in units of pounds) act on an object.

a. Find the resultant force, $\mathbf{R}$.

b. What additional force $\mathbf{F}$ is needed for the object to be in static equilibrium? (**See Example 11**)

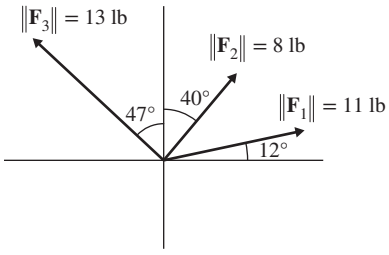
89. $\mathbf{F}_1 = \langle 3, 11\rangle$ and $\mathbf{F}_2 = \langle -8, 6\rangle$

90. $\mathbf{F}_1 = \langle -5, 2\rangle$ and $\mathbf{F}_2 = \langle -7, -3\rangle$

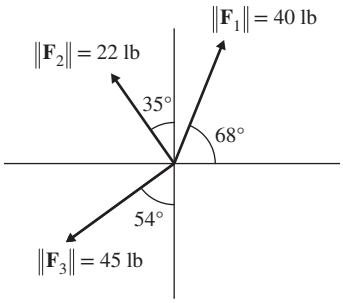
91. $\mathbf{F}_1 = 5\mathbf{i} - \mathbf{j}$, $\mathbf{F}_2 = 4\mathbf{i} - 3\mathbf{j}$, $\mathbf{F}_3 = -9\mathbf{i} + 2\mathbf{j}$

92. $\mathbf{F}_1 = -12\mathbf{i} + 8\mathbf{j}$, $\mathbf{F}_2 = -9\mathbf{i} - 15\mathbf{j}$, $\mathbf{F}_3 = 11\mathbf{i} + 7\mathbf{j}$

93.

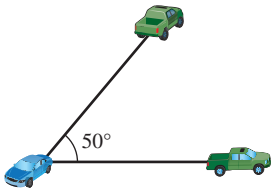


94.



ISTUDY

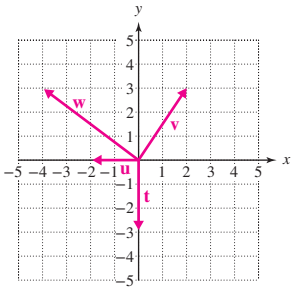
95. Two pickup trucks rescue a car stuck in the sand. The first truck pulls with a force of 5000 lb and the second truck pulls with a force of 4000 lb at an angle of 50° to the first truck. How much force can the combined pull of the two trucks generate? Round to the nearest pound.



96. Two forces act on an object with an angle of 63° between them. If the magnitude of the first force is 48 N and the magnitude of the second force is 70 N, find the magnitude of the resultant force to the nearest Newton.

Mixed Exercises

For Exercises 97–102, refer to vectors t, u, v, and w in the figure and match each vector with an equivalent vector a–f.



a. $-\mathbf{t}$
b. $3\mathbf{u}$
c. $\mathbf{w}$
d. $\mathbf{u} - 2\mathbf{t}$
e. $\mathbf{v}$
f. $-3\mathbf{u}$

97. $2\mathbf{u} - \mathbf{t}$

98. $-\mathbf{u} - \mathbf{t}$

99. $\mathbf{w} - \mathbf{v}$

100. $\mathbf{v} + \mathbf{u}$

101. $\mathbf{v} + \mathbf{w}$

102. $\mathbf{v} - \mathbf{w}$

103. A kayaker paddles 3 mph in still water. If she heads due east but encounters a 0.8-mph current flowing south,

a. Find the actual direction of travel. Write the direction as a bearing and round to the nearest degree.

b. How far will she travel in 2 hr? Round to the nearest tenth of a mile.

104. A long-distance swimmer swims 2 mph in still water. If he heads north but encounters a 0.6-mph current flowing northeast,

a. Find the actual direction of travel. Write the direction as a bearing and round to the nearest degree.

b. How far will he swim in 1.5 hr? Round to the nearest tenth of a mile.

For Exercises 105–106, two vectors v and w act on a point in the plane with the indicated force.

a. Use a parallelogram to sketch the resultant vector $\mathbf{v} + \mathbf{w}$.

b. Use the law of cosines to find the magnitude of the resultant vector. (*Hint:* Adjacent angles in a parallelogram are supplementary.)

c. Use the law of sines to find the angle that $\mathbf{v} + \mathbf{w}$ makes with $\mathbf{v}$.

Round answers to the nearest whole unit.

107. A 15-lb kettlebell rests on a surface inclined at an angle of 20° to the ground. Find the magnitude of the components of the weight parallel to the surface and perpendicular to the surface. Round to the nearest tenth of a pound.

108. A force of 50 lb is applied at an angle of 20° to the horizontal. Resolve the force into the horizontal and vertical components. Round to the nearest tenth of a pound.

Write About It

109. How is the component form of a vector $\langle a, b \rangle$ related to the graph of the vector in standard position?

110. Explain how the sum $\mathbf{v} + \mathbf{w}$ is found geometrically.

111. Explain the geometric significance of the scalar multiple of a vector, such as $k\mathbf{v}$, where k is a real number.

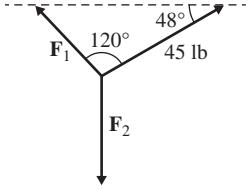
112. Explain how vectors written in component form are added or subtracted.

ISTUDY

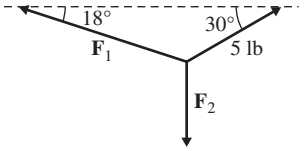
Expanding Your Skills

For Exercises 113–114, assume that the system is in equilibrium with $\mathbf{F}_2$ acting directly downward. Calculate the magnitude of the forces $\mathbf{F}_1$ and $\mathbf{F}_2$. Round to the nearest tenth of a pound.

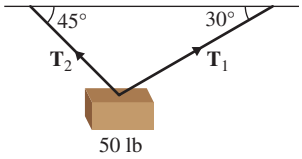
113.



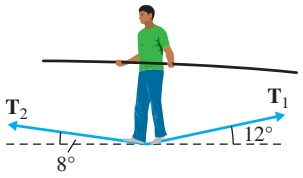
114.



115. A 50-lb box is supported by two ropes attached to the ceiling. Find the magnitudes of the tension vectors $\mathbf{T}_1$ and $\mathbf{T}_2$. Round to the nearest tenth of a pound. (**See Example 12**)



116. A tightrope walker and the balance bar together weigh 175 lb. Find the magnitudes of the tension vectors $\mathbf{T}_1$ and $\mathbf{T}_2$. Round to the nearest tenth of a pound.



SECTION 8.5 Dot Product

OBJECTIVES

1. Compute Dot Product
2. Find the Angle Between Two Vectors
3. Decompose Vectors into Two Orthogonal Vectors
4. Use Vectors to Compute Work

1. Compute Dot Product

In this section, we present a special type of product of vectors called the dot product. The dot product of two vectors has a variety of applications, including decomposing a vector into components parallel to and orthogonal (perpendicular) to another vector. We will also see in Examples 6–7 that the dot product is helpful in finding the amount of work done by a force in moving an object a specified distance.

Definition of Dot Product

If $\mathbf{v} = \langle a_1, b_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2 \rangle$, the **dot product** $\mathbf{v} \cdot \mathbf{w}$ is defined as

$$\mathbf{v} \cdot \mathbf{w} = a_1 a_2 + b_1 b_2$$

It is important to note that the dot product of two vectors is a scalar.

EXAMPLE 1 Finding the Dot Product of Two Vectors

Given $\mathbf{v} = \langle 3, -7 \rangle$ and $\mathbf{w} = \langle -2, 5 \rangle$, find

a. $\mathbf{v} \cdot \mathbf{w}$ **b.** $\mathbf{w} \cdot \mathbf{v}$ **c.** $\mathbf{v} \cdot \mathbf{v}$ **d.** $\|\mathbf{v}\|$

Solution:

a. $\mathbf{v} \cdot \mathbf{w} = 3(-2) + (-7)(5) = -6 - 35 = -41$

b. $\mathbf{w} \cdot \mathbf{v} = -2(3) + 5(-7) = -6 - 35 = -41$

c. $\mathbf{v} \cdot \mathbf{v} = 3(3) + (-7)(-7) = 9 + 49 = 58$

d. $\|\mathbf{v}\| = \sqrt{(3)^2 + (-7)^2} = \sqrt{9 + 49} = \sqrt{58}$

Skill Practice 1 Given $\mathbf{v} = \langle -2, 6 \rangle$ and $\mathbf{w} = \langle -3, -1 \rangle$, find

a. $\mathbf{v} \cdot \mathbf{w}$ **b.** $\mathbf{w} \cdot \mathbf{v}$ **c.** $\mathbf{v} \cdot \mathbf{v}$ **d.** $\|\mathbf{v}\|$

Answers

1. a. 0 **b.** 0 **c.** 40 **d.** $2\sqrt{10}$

ISTUDY

Notice from Examples 1(a) and 1(b) that $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$. We can show that this is true for any two vectors $\mathbf{v}$ and $\mathbf{w}$. That is, the dot product of two vectors is a commutative operation. Given $\mathbf{v} = \langle a_1, b_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2 \rangle$:

$$\begin{aligned} \mathbf{v} \cdot \mathbf{w} &= a_1a_2 + b_1b_2 && \text{Dot product of } \mathbf{v} \text{ and } \mathbf{w} \\ &= a_2a_1 + b_2b_1 && \text{Commutative property of multiplication of real numbers} \\ &= \mathbf{w} \cdot \mathbf{v} && \text{Dot product of } \mathbf{w} \text{ and } \mathbf{v} \end{aligned}$$

Examples 1(c) and 1(d) suggest that the dot product of a vector with itself is the square of the magnitude of the vector. That is, $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$. Given $\mathbf{v} = \langle a_1, b_1 \rangle$:

$$\begin{aligned} \mathbf{v} \cdot \mathbf{v} &= a_1a_1 + b_1b_1 && \text{Dot product of } \mathbf{v} \text{ and } \mathbf{v} \\ &= a_1^2 + b_1^2 \\ &= \left(\sqrt{a_1^2 + b_1^2}\right)^2 && \text{Recall that } \|\mathbf{v}\| = \sqrt{a_1^2 + b_1^2}. \\ &= \|\mathbf{v}\|^2 && \text{Square of the magnitude of } \mathbf{v} \end{aligned}$$

Several important properties of the dot product are given in Table 8-4. The proofs of the remaining properties in Table 8-4 are addressed in Exercises 29–32.

Table 8-4

Properties of Dot Product

If $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are vectors, and c is a scalar, then

1. $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$
2. $(c\mathbf{v}) \cdot \mathbf{w} = c(\mathbf{v} \cdot \mathbf{w})$
3. $\mathbf{v} \cdot (\mathbf{w} + \mathbf{u}) = \mathbf{v} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{u}$
4. $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$
5. $\mathbf{0} \cdot \mathbf{v} = 0$
6. $c(\mathbf{v} \cdot \mathbf{w}) = (c\mathbf{v}) \cdot \mathbf{w} = \mathbf{v} \cdot (c\mathbf{w})$

2. Find the Angle Between Two Vectors

Given two vectors $\mathbf{v}$ and $\mathbf{w}$ in standard position, the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is the angle formed by the two line segments representing $\mathbf{v}$ and $\mathbf{w}$, where $0° \le \theta \le 180°$ (Figure 8-46). The vectors $\mathbf{v}$, $\mathbf{w}$, and $\mathbf{v} - \mathbf{w}$ form a triangle. Furthermore, by applying the law of cosines, θ can be expressed in terms of the dot product of $\mathbf{v}$ and $\mathbf{w}$ and the magnitudes of $\mathbf{v}$ and $\mathbf{w}$.

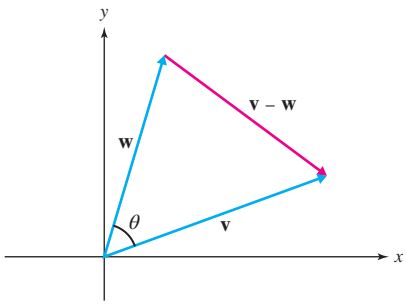


Figure 8-46

Angle Between Two Vectors

If θ is the angle between two nonzero vectors $\mathbf{v}$ and $\mathbf{w}$, then

$$\cos\theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \, \|\mathbf{w}\|} \text{ and } \theta = \cos^{-1}\left(\frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \, \|\mathbf{w}\|}\right)$$

ISTUDY

Proof:
Draw vectors $\mathbf{v}$ and $\mathbf{w}$ in standard position with angle θ between $\mathbf{v}$ and $\mathbf{w}$ (Figure 8-46). Applying the law of cosines on the triangle formed by $\mathbf{v}$, $\mathbf{w}$, and $\mathbf{v} - \mathbf{w}$ we have,

$$\|\mathbf{v} - \mathbf{w}\|^2 = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta \quad \text{Apply the law of cosines.}$$

$$(\mathbf{v} - \mathbf{w}) \cdot (\mathbf{v} - \mathbf{w}) = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta \quad \text{Apply property 4.}$$

$$\mathbf{v} \cdot (\mathbf{v} - \mathbf{w}) - \mathbf{w} \cdot (\mathbf{v} - \mathbf{w}) = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta \quad \text{Apply property 3.}$$

$$\mathbf{v} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{w} - \mathbf{w} \cdot \mathbf{v} + \mathbf{w} \cdot \mathbf{w} = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta \quad \text{Apply property 3.}$$

$$\|\mathbf{v}\|^2 - 2(\mathbf{v} \cdot \mathbf{w}) + \|\mathbf{w}\|^2 = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta \quad \text{Apply properties 1 and 4.}$$

$$\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos\theta \quad \text{Simplify the equation.}$$

$$\cos\theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\,\|\mathbf{w}\|} \quad \text{Solve for } \cos\theta.$$

EXAMPLE 2 Finding the Angle Between Two Vectors

Find the angle between $\mathbf{v} = \langle -4, 3\rangle$ and $\mathbf{w} = \langle -6, -2\rangle$. Round to the nearest tenth of a degree.

Solution:

$$\mathbf{v} \cdot \mathbf{w} = -4(-6) + 3(-2) = 24 - 6 = 18$$

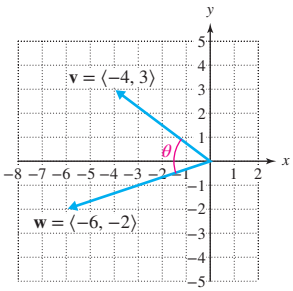
$$\|\mathbf{v}\| = \sqrt{(-4)^2 + (3)^2} = \sqrt{16 + 9} = \sqrt{25} = 5$$

$$\|\mathbf{w}\| = \sqrt{(-6)^2 + (-2)^2} = \sqrt{36 + 4}$$

$$= \sqrt{40} = 2\sqrt{10}$$

$$\cos\theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|} = \frac{18}{5(2\sqrt{10})} = \frac{9}{5\sqrt{10}}$$

$$\theta = \cos^{-1}\left(\frac{9}{5\sqrt{10}}\right) \approx 55.3°$$



The angle between $\mathbf{v}$ and $\mathbf{w}$ is approximately 55.3°.

Skill Practice 2 Find the angle between $\mathbf{v} = \langle 5, -1\rangle$ and $\mathbf{w} = \langle -5, 12\rangle$. Round to the nearest tenth of a degree.

The relationship $\cos\theta = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}$ can be written as $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\,\|\mathbf{w}\|\cos\theta$. This gives us an alternative method to compute the dot product of two vectors if their magnitudes and angle between them are known. Furthermore, since $\|\mathbf{v}\|$ and $\|\mathbf{w}\|$ are both positive, $\mathbf{v} \cdot \mathbf{w}$ and $\cos\theta$ must have the same sign. Therefore, the sign of $\mathbf{v} \cdot \mathbf{w}$ gives us information about the measure of θ.

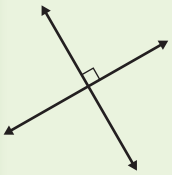
- If $\mathbf{v} \cdot \mathbf{w} > 0$, then $\cos\theta > 0$, which implies that $0° \le \theta < 90°$.
- If $\mathbf{v} \cdot \mathbf{w} < 0$, then $\cos\theta < 0$, which implies that $90° < \theta \le 180°$.
- If $\mathbf{v} \cdot \mathbf{w} = 0$, then $\cos\theta = 0$, which implies that $\theta = 90°$.

If $\mathbf{v} \cdot \mathbf{w} = 0$, then $\theta = 90°$ and we say that $\mathbf{v}$ and $\mathbf{w}$ are **orthogonal.** Orthogonal vectors drawn "tail-to-tail" will form a right angle.

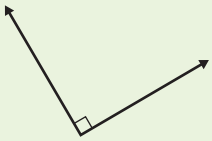
Answer
2. 123.9°

ISTUDY

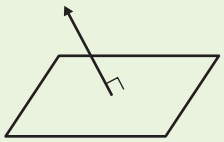
TIP The terms **orthogonal, perpendicular,** and **normal** all refer to objects where the measure of the angle between them is 90°. By convention, we say that two lines in a plane are perpendicular, two vectors in a plane are orthogonal, and a line or vector is normal to a plane.



Perpendicular lines



Orthogonal vectors



Vector normal to a plane

Orthogonal Vectors

Two vectors $\mathbf{v}$ and $\mathbf{w}$ are orthogonal if and only if $\mathbf{v} \cdot \mathbf{w} = 0$.

EXAMPLE 3 Determining if Two Vectors Are Orthogonal

Determine if the given vectors are orthogonal.

a. $\mathbf{v} = 3\mathbf{i} - 6\mathbf{j}$ and $\mathbf{w} = 8\mathbf{i} + 4\mathbf{j}$ **b.** $\mathbf{s} = -2\mathbf{i} - 5\mathbf{j}$ and $\mathbf{r} = -4\mathbf{i} + 8\mathbf{j}$

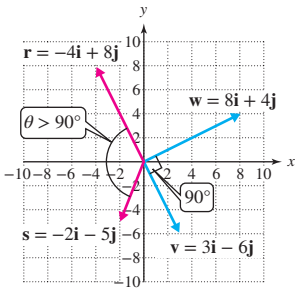
Solution:

a. $\mathbf{v} \cdot \mathbf{w} = 3(8) + (-6)(4) = 24 - 24 = 0$

Since $\mathbf{v} \cdot \mathbf{w} = 0$, $\mathbf{v}$ and $\mathbf{w}$ are orthogonal.

b. $\mathbf{s} \cdot \mathbf{r} = (-2)(-4) + (-5)(8) = 8 - 40 = -32$

Since $\mathbf{s} \cdot \mathbf{r} < 0$, we have $90° < \theta \leq 180°$ and $\mathbf{s}$ and $\mathbf{r}$ are *not* orthogonal.



Skill Practice 3 Determine if the given vectors are orthogonal.

a. $\mathbf{v} = 4\mathbf{i} + 3\mathbf{j}$ and $\mathbf{w} = 6\mathbf{i} - 10\mathbf{j}$ **b.** $\mathbf{s} = -2\mathbf{i} + \mathbf{j}$ and $\mathbf{t} = 11\mathbf{i} + 22\mathbf{j}$

Recall that two vectors $\mathbf{v}$ and $\mathbf{w}$ are parallel if $\mathbf{v} = c\mathbf{w}$ for some real number c. Likewise, if the angle θ between $\mathbf{v}$ and $\mathbf{w}$ is either 0° or 180°, then the vectors are parallel. If $\theta = 0°$, the vectors have the same direction, and if $\theta = 180°$ the vectors have opposite directions. Furthermore,

If $\theta = 0°$, $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos 0°$
$= \|\mathbf{v}\|\|\mathbf{w}\|(1)$
$= \|\mathbf{v}\|\|\mathbf{w}\|$

If $\theta = 180°$, $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos 180°$
$= \|\mathbf{v}\|\|\mathbf{w}\|(-1)$
$= -\|\mathbf{v}\|\|\mathbf{w}\|$

This tells us that if $\mathbf{v}$ and $\mathbf{w}$ are parallel, then their dot product equals the product of their magnitudes or the opposite of the product of their magnitudes.

3. Decompose Vectors into Two Orthogonal Vectors

In many physical applications, it is important to find the contribution of a vector in a particular direction. For example, consider a car parked on a hill with angle of inclination θ. The force of gravity $\mathbf{F}$ pulls straight downward. However, $\mathbf{F}$ can be

Answers

3. a. Not orthogonal
b. Orthogonal

ISTUDY

decomposed into two forces $\mathbf{F}_1$ and $\mathbf{F}_2$ acting parallel to the hill and orthogonal to the hill, respectively (Figure 8-47). $\mathbf{F}_1$ and $\mathbf{F}_2$ are called vector components of $\mathbf{F}$, and their sum is the original force vector ($\mathbf{F}_1 + \mathbf{F}_2 = \mathbf{F}$). The vector components of $\mathbf{F}$ are important because they determine the opposing forces needed to keep the car in place. The vector $-\mathbf{F}_1$ is the minimum amount of force needed by the brakes to keep the car from rolling down the hill. Force $\mathbf{F}_2$ tells us the amount of force that the tires must withstand against the ground.

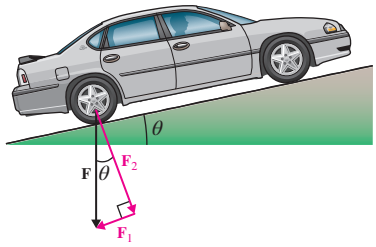


Figure 8-47

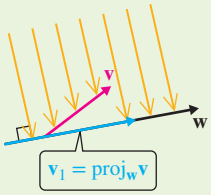
To decompose a vector into two orthogonal vectors, we use the idea of a vector projection. Consider two vectors $\mathbf{v}$ and $\mathbf{w}$ drawn with a common initial point A (Figures 8-48 and 8-49). Suppose we want to decompose $\mathbf{v}$ into vectors $\mathbf{v}_1$ and $\mathbf{v}_2$, parallel to $\mathbf{w}$ and orthogonal to $\mathbf{w}$, respectively. We call vector $\mathbf{v}_1$ the projection of $\mathbf{v}$ onto $\mathbf{w}$ and denote this by $\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v}$.

TIP To visualize the projection of $\mathbf{v}$ onto $\mathbf{w}$, think of sunlight shining onto vector $\mathbf{w}$ at a right angle. The directed shadow cast by $\mathbf{v}$ onto $\mathbf{w}$ is the vector projection of $\mathbf{v}$ onto $\mathbf{w}$.



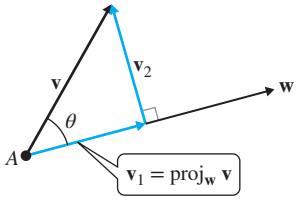


Figure 8-48

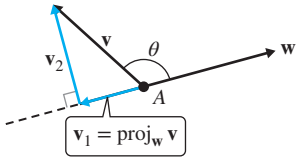

Figure 8-49

We want to find the decomposition of $\mathbf{v}$ into two orthogonal vectors $\mathbf{v}_1$ and $\mathbf{v}_2$, where $\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v}$, $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$ (Figure 8-50). We first make two observations.

- $\mathbf{v}_1$ and $\mathbf{w}$ are parallel, so $\mathbf{v}_1 = c\mathbf{w}$ for some scalar c.
- $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$, which means that $\mathbf{v}_2 \cdot \mathbf{w} = 0$.

Then since $\mathbf{v} = \mathbf{v}_1 + \mathbf{v}_2$,

$$\begin{aligned}\mathbf{v} \cdot \mathbf{w} &= (\mathbf{v}_1 + \mathbf{v}_2) \cdot \mathbf{w} \\ &= \mathbf{v}_1 \cdot \mathbf{w} + \mathbf{v}_2 \cdot \mathbf{w} \\ &= (c\mathbf{w}) \cdot \mathbf{w} + 0 \\ &= c\|\mathbf{w}\|^2.\end{aligned}$$

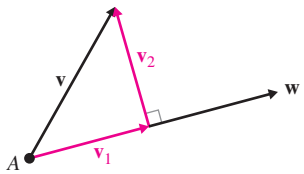

Figure 8-50

Solving the equation $\mathbf{v} \cdot \mathbf{w} = c\|\mathbf{w}\|^2$ for c gives $c = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}$. Therefore,

$$\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v} = c\mathbf{w} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w}.$$

ISTUDY

These results are summarized as follows.

Decomposition of a Vector into Orthogonal Vectors

If $\mathbf{v}$ and $\mathbf{w}$ are two nonzero vectors, then

1. The vector projection of $\mathbf{v}$ onto $\mathbf{w}$ is given by $\text{proj}_{\mathbf{w}}\mathbf{v} = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w}$.
2. To decompose $\mathbf{v}$ into vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ parallel to $\mathbf{w}$ and orthogonal to $\mathbf{w}$, respectively, we have

$$\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w} \quad \text{and} \quad \mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1$$

EXAMPLE 4 Decomposing a Vector into Orthogonal Vectors

Given $\mathbf{v} = \langle -5, 4\rangle$ and $\mathbf{w} = \langle 2, 4\rangle$,

a. Find $\text{proj}_{\mathbf{w}}\mathbf{v}$.

b. Find vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ such that $\mathbf{v}_1$ is parallel to $\mathbf{w}$, $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.

Solution:

a. $$\text{proj}_{\mathbf{w}}\mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w} = \frac{(-5)(2) + (4)(4)}{(2)^2 + (4)^2}\langle 2, 4\rangle$$

$$= \frac{6}{20}\langle 2, 4\rangle$$

$$= \left\langle \frac{3}{5}, \frac{6}{5}\right\rangle$$

$\mathbf{v}_1$ is the projection of $\mathbf{v}$ onto $\mathbf{w}$. Recall that for vector $\mathbf{w} = \langle b_1, b_2\rangle$,

$\|\mathbf{w}\|^2 = \left(\sqrt{{b_1}^2 + {b_2}^2}\right)^2 = {b_1}^2 + {b_2}^2$

or equivalently

$\|\mathbf{w}\|^2 = \mathbf{w} \cdot \mathbf{w} = {b_1}^2 + {b_2}^2$.

b. $$\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v} = \left\langle \frac{3}{5}, \frac{6}{5}\right\rangle$$

$$\mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1 = \langle -5, 4\rangle - \left\langle \frac{3}{5}, \frac{6}{5}\right\rangle$$

$$= \left\langle -\frac{25}{5}, \frac{20}{5}\right\rangle - \left\langle \frac{3}{5}, \frac{6}{5}\right\rangle$$

$$= \left\langle -\frac{28}{5}, \frac{14}{5}\right\rangle$$

Use the relationship $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$ to solve for $\mathbf{v}_2$.

Skill Practice 4 Repeat Example 4 with $\mathbf{v} = \langle 7, -3\rangle$ and $\mathbf{w} = \langle -2, -6\rangle$.

We can check the solution to Example 4 by showing that vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ meet all the necessary conditions.

1. $\mathbf{v}_1$ is parallel to $\mathbf{w}$ because $\mathbf{v}_1 = c\mathbf{w}$ for a constant c.

$$\mathbf{v}_1 = \left\langle \frac{3}{5}, \frac{6}{5}\right\rangle = \frac{3}{10}\langle 2, 4\rangle = \frac{3}{10}\mathbf{w} \checkmark$$

Answers

4. a. $\text{proj}_{\mathbf{w}}\mathbf{v} = \left\langle -\frac{1}{5}, -\frac{3}{5}\right\rangle$

b. $\mathbf{v}_1 = \left\langle -\frac{1}{5}, -\frac{3}{5}\right\rangle$,

$\mathbf{v}_2 = \left\langle \frac{36}{5}, -\frac{12}{5}\right\rangle$

ISTUDY

2. $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$ because $\mathbf{v}_2 \cdot \mathbf{w} = 0$.

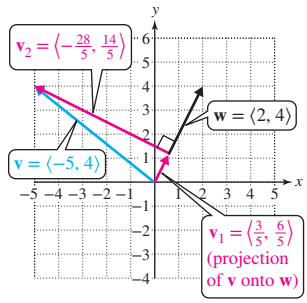
$$\mathbf{v}_2 \cdot \mathbf{w} = \left\langle -\frac{28}{5}, \frac{14}{5} \right\rangle \cdot \langle 2, 4 \rangle$$

$$= \left(-\frac{28}{5}\right)(2) + \left(\frac{14}{5}\right)(4) = -\frac{56}{5} + \frac{56}{5} = 0 \checkmark \text{ Thus, } \mathbf{v} \text{ and } \mathbf{w} \text{ are orthogonal.}$$

3. $\mathbf{v}_1 + \mathbf{v}_2 \stackrel{?}{=} \mathbf{v}$

$$\left\langle \frac{3}{5}, \frac{6}{5} \right\rangle + \left\langle -\frac{28}{5}, \frac{14}{5} \right\rangle \stackrel{?}{=} \langle -5, 4 \rangle$$

$$\left\langle -\frac{25}{5}, \frac{20}{5} \right\rangle \stackrel{?}{=} \langle -5, 4 \rangle \checkmark$$



EXAMPLE 5 Finding a Component of Force in a Given Direction

A truck weighing 2000 lb is parked on a hill with a 10° incline.

a. Write the force vector $\mathbf{F}$ representing the weight of the truck through a single tire. Write $\mathbf{F}$ in terms of $\mathbf{i}$ and $\mathbf{j}$ and assume that the weight of the truck is evenly distributed among all four tires.

b. Find the component vector of $\mathbf{F}$ parallel to the hill. Round to 1 decimal place.

c. Find the magnitude of the force required by the brakes on each wheel to keep the truck from rolling down the hill.

Solution:

a. The weight of the truck is evenly distributed among all four tires and is a force acting straight downward. The magnitude of $\mathbf{F}$ is (2000 lb)/4. Thus, $\mathbf{F} = -500\mathbf{j}$ represents the force of gravity acting straight downward where a given tire meets the road.

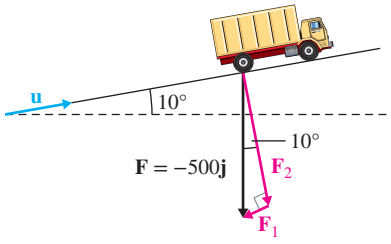


Figure 8-51

b. Let $\mathbf{F}_1$ and $\mathbf{F}_2$ be the components of $\mathbf{F}$ parallel and perpendicular to the hill, respectively. Let $\mathbf{u} = \cos 10°\mathbf{i} + \sin 10°\mathbf{j}$ be the unit vector in the direction up the hill. The vector component of $\mathbf{F}$ parallel to the hill is the projection of $\mathbf{F}$ onto $\mathbf{u}$, and is labeled as $\mathbf{F}_1$ in Figure 8-51.

$$\mathbf{F}_1 = \text{proj}_{\mathbf{u}}\mathbf{F} = \frac{\mathbf{F} \cdot \mathbf{u}}{\|\mathbf{u}\|^2}\mathbf{u} = \frac{(0\mathbf{i} - 500\mathbf{j}) \cdot (\cos 10°\mathbf{i} + \sin 10°\mathbf{j})}{(1)^2}(\cos 10°\mathbf{i} + \sin 10°\mathbf{j})$$

Recall that a unit vector has a magnitude of 1.

$$= \frac{(0)(\cos 10°) + (-500)(\sin 10°)}{1}(\cos 10°\mathbf{i} + \sin 10°\mathbf{j})$$

$$\approx -86.8(\cos 10°\mathbf{i} + \sin 10°\mathbf{j})$$

$$\approx -85.5\mathbf{i} - 15.1\mathbf{j}$$

TIP As an alternative approach to part (c), use the right triangle formed by $\mathbf{F}$, $\mathbf{F}_1$, and $\mathbf{F}_2$ in Figure 8-51.

$\|\mathbf{B}\| = \|\mathbf{F}_1\| = \|\mathbf{F}\|\sin 10°$

$= 500 \sin 10° \approx 86.8$ lb

c. The brakes on each wheel represent the *opposing* force to $\mathbf{F}_1$. That is, the brakes provide a force $\mathbf{B} = -\mathbf{F}_1 = -(-85.5\mathbf{i} - 15.1\mathbf{j}) = 85.5\mathbf{i} + 15.1\mathbf{j}$.

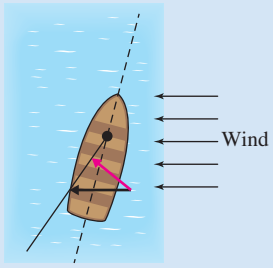
$$\|\mathbf{B}\| = \sqrt{(85.5)^2 + (15.1)^2} \approx 86.8 \text{ lb}$$

The brakes on each wheel must exert a force of approximately 86.8 lb to keep the truck from rolling down the hill.

Skill Practice 5 Repeat Example 5 with a 1400-lb SUV parked on a hill with an incline of 12°.

Point of Interest

A sailboat is propelled forward by the force of wind on the sail and by the force of water against the keel ("fin" that extends below the boat to prevent sideways "slippage"). The force of wind on the sail can be broken down into two vectors: one acting parallel to the sail and one acting perpendicular to the sail. The component acting parallel to the sail (called the drag component) "slips" by and does not contribute to the forward motion. The component force of the wind acting perpendicular to the sail (shown in red) contributes to the forward motion of the boat.



4. Use Vectors to Compute Work

Suppose a person lifts a 30-lb weight straight upward 4 ft. To quantify the amount of effort for this task, we can compute the amount of work done. In physics, the work W done by a constant force $\mathbf{F}$ in moving an object from point A to point B along the line of motion is given by

$$W = \begin{pmatrix}\text{Magnitude of force in}\\ \text{the direction of motion}\end{pmatrix}\begin{pmatrix}\text{Distance the}\\ \text{object is moved}\end{pmatrix}$$

John Lund/Marc Romanelli/Blend Images

Since a force of 30 lb is required to lift the weight, the work done raising it 4 ft is

$$W = (30 \text{ lb})(4 \text{ ft}) = 120 \text{ ft·lb}$$

Notice that work is a scalar quantity. In the U.S. customary units of measurement, the common unit for work is the foot-pound (ft·lb). In the metric system, the Newton (N) is a common unit of force, and the Newton·meter (N·m) is the associated unit of work.

It is important to note that if a force vector $\mathbf{F}$ is *not* directed along the line of motion, then only the component of force in the direction of motion is applied to the work done (Figure 8-52). Therefore, if $\mathbf{D}$ is the displacement vector of an object moved in a straight line from point A to point B by a force $\mathbf{F}$, the work done is given by

Magnitude of force in the direction of $\mathbf{D}$ — Distance moved

$$W = \|\text{proj}_{\mathbf{D}}\mathbf{F}\|\|\mathbf{D}\| = \left(\frac{\mathbf{F}\cdot\mathbf{D}}{\|\mathbf{D}\|^2}\|\mathbf{D}\|\right)\|\mathbf{D}\|$$

$$= \mathbf{F}\cdot\mathbf{D}$$

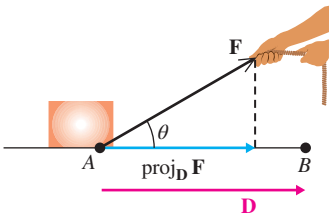


Figure 8-52

Answers

5. a. $\mathbf{F} = -350\mathbf{j}$

b. $\mathbf{F}_1 = -71.2\mathbf{i} - 15.1\mathbf{j}$

c. $\|\mathbf{B}\| = 72.8$ lb

Definition of Work

If $\mathbf{D}$ is the displacement vector of an object in moving the object in a straight line from points A to B under a constant force $\mathbf{F}$, then the work W done is computed by

1. $W = \mathbf{F} \cdot \mathbf{D}$.
2. $W = \|\text{proj}_{\mathbf{D}}\mathbf{F}\|\|\mathbf{D}\|$ or $W = \|\mathbf{F}\|\|\mathbf{D}\|\cos\theta$, where θ is the angle between $\mathbf{F}$ and $\mathbf{D}$.

EXAMPLE 6 Computing Work

Find the work done by a force $\mathbf{F} = 4\mathbf{i} + 9\mathbf{j}$ (in N) in moving an object in a straight line from point $A(1, 3)$ to point $B(4, 8)$. Assume that the units in the coordinate plane are in meters.

Solution:

The displacement vector for the object is $\mathbf{D} = \overrightarrow{AB} = (4 - 1)\mathbf{i} + (8 - 3)\mathbf{j} = 3\mathbf{i} + 5\mathbf{j}$.

The work done is the dot product of the force vector and displacement vector.

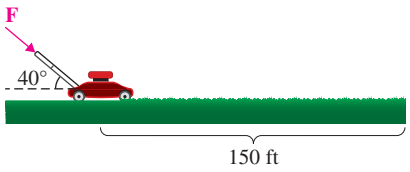
$W = \mathbf{F} \cdot \mathbf{D} = (4\mathbf{i} + 9\mathbf{j}) \cdot (3\mathbf{i} + 5\mathbf{j}) = (4)(3) + (9)(5) = 12 + 45 = 57$

The amount of work is 57 N·m.

Skill Practice 6 Find the work done by a force $\mathbf{F} = 2\mathbf{i} + 7\mathbf{j}$ (in N) in moving an object in a straight line from point $A(-1, 5)$ to point $B(9, 11)$. Assume that the units in the coordinate plane are in meters.

EXAMPLE 7 Computing Work

A teenager pushes a lawn mower 150 ft across a yard on a horizontal path and exerts a constant force of 30 lb directed downward at an angle of 40° with the horizontal. Find the work done. Round to the nearest ft·lb.



Solution:

Let A and B designate the initial and final positions of the lawn mower. Let $\mathbf{D}$ represent the displacement vector from A to B. In Figure 8-53, we have drawn the force vector $\mathbf{F}$ with initial point at A. The angle θ between the vectors is 40°.

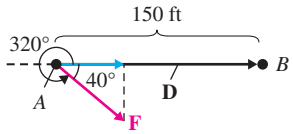


Figure 8-53

Using the projection of $\mathbf{F}$ onto $\mathbf{D}$ (shown in blue), we have

$$\begin{aligned} W &= \|\text{proj}_{\mathbf{D}}\mathbf{F}\|\|\mathbf{D}\| \\ &= \|\mathbf{F}\|\|\mathbf{D}\|\cos\theta \\ &= (30 \text{ lb})(150 \text{ ft})(\cos 40°) \\ &= 4500\cos 40° \\ &\approx 3447 \text{ ft·lb} \end{aligned}$$

TIP As an alternative approach, in Example 7 we can write

$\mathbf{F} = 30\cos 320°\mathbf{i} + 30\sin 320°\mathbf{j}$ and

$\mathbf{D} = 150\mathbf{i} + 0\mathbf{j}$

Then $W = \mathbf{F} \cdot \mathbf{D}$

$= (30\cos 320°)(150) + (30\sin 320°)(0)$

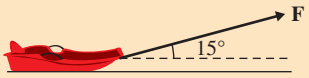
≈ 3447 ft·lb

Answer

6. 62 N·m

ISTUDY

Skill Practice 7 A dog pulls a sled 200 ft across a yard on a horizontal path. The dog exerts a constant force of 25 lb directed upward 15° from the horizontal. Find the work done. Round to the nearest ft·lb.



When the force and displacement vectors are in the same direction, the work done in moving the object is positive. If a force is applied in the opposite direction to a moving object (such as the force applied to brake a skidding car), the work done by the force is negative. In this section, we only address situations with positive work.

Answer
7. 4830 ft·lb

SECTION 8.5 Practice Exercises

Prerequisite Review

R.1. Simplify. $\sqrt{5^2 + 12^2}$

For Exercises R.2–R.3, use a calculator to approximate the degree measure of θ to 1 decimal place.

R.2. $\cos\theta = \frac{5}{6}$ and $0° \le \theta \le 90°$

R.3. $\cos\theta = -\frac{8}{11}$ and $90° \le \theta \le 180°$

Concept Connections

1. The dot product of $\mathbf{v} = \langle a_1, b_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2 \rangle$ equals _____, and the result is a (scalar/vector).

2. If θ is the angle between two nonzero vectors $\mathbf{v}$ and $\mathbf{w}$, then the cosine of θ can be found from the dot product of $\mathbf{v}$ and $\mathbf{w}$ as $\cos\theta =$ _____.

3. If θ is the angle between two nonzero vectors $\mathbf{v}$ and $\mathbf{w}$, and $\mathbf{v} \cdot \mathbf{w} = 0$, then $\theta =$ _____°.

4. Two vectors are said to be _____ if and only if they meet at a right angle.

5. The projection of a nonzero vector $\mathbf{v}$ onto a nonzero vector $\mathbf{w}$ is given by $\text{proj}_{\mathbf{w}}\mathbf{v} =$ _____.

6. Suppose that $\mathbf{D}$ is the displacement vector of an object when the object is moved in a straight line from points A to B under a constant force $\mathbf{F}$. Then the work done is given by $W =$ _____.

Objective 1: Compute Dot Product

For Exercises 7–14, for the given vectors, find

a. $\mathbf{v} \cdot \mathbf{w}$ **b.** $\mathbf{v} \cdot \mathbf{v}$ **c.** $\mathbf{w} \cdot \mathbf{w}$ **(See Example 1)**

7. $\mathbf{v} = \langle -3, 5 \rangle$, $\mathbf{w} = \langle 10, -8 \rangle$

8. $\mathbf{v} = \langle 6, -7 \rangle$, $\mathbf{w} = \langle -1, -4 \rangle$

9. $\mathbf{v} = \left\langle \frac{3}{8}, \frac{2}{3} \right\rangle$, $\mathbf{w} = \left\langle -\frac{1}{6}, -\frac{3}{4} \right\rangle$

10. $\mathbf{v} = \left\langle -\frac{1}{3}, -\frac{4}{5} \right\rangle$, $\mathbf{w} = \left\langle \frac{1}{3}, -\frac{5}{8} \right\rangle$

11. $\mathbf{v} = 6\mathbf{i}$, $\mathbf{w} = -3\mathbf{j}$

12. $\mathbf{v} = 2\mathbf{j}$, $\mathbf{w} = 14\mathbf{i}$

13. $\mathbf{v} = 2.1\mathbf{i} - 6.8\mathbf{j}$, $\mathbf{w} = 0.4\mathbf{i} - 0.3\mathbf{j}$

14. $\mathbf{v} = -0.5\mathbf{i} + 1.6\mathbf{j}$, $\mathbf{w} = -0.1\mathbf{i} + 2.3\mathbf{j}$

For Exercises 15–18, use the dot product to find the magnitude of the vector.

15. $\mathbf{v} = 4\mathbf{i} - 8\mathbf{j}$

16. $\mathbf{w} = -18\mathbf{i} + 3\mathbf{j}$

17. $\mathbf{r} = \langle 5, -3 \rangle$

18. $\mathbf{s} = \langle 7, -4 \rangle$

ISTUDY

For Exercises 19–28, use vectors $\mathbf{u} = \langle -4, 1\rangle$, $\mathbf{v} = \langle 5, -2\rangle$, and $\mathbf{w} = \langle 0, 6\rangle$ to perform the indicated operation. Then determine whether the result is a scalar or a vector.

19. $4\mathbf{v} \cdot \mathbf{w}$

20. $3(\mathbf{u} \cdot \mathbf{v})$

21. $\mathbf{v} \cdot \mathbf{v}$

22. $\mathbf{w} \cdot \mathbf{w}$

23. $(\mathbf{v} \cdot \mathbf{u})\mathbf{w}$

24. $(\mathbf{u} \cdot \mathbf{w})\mathbf{v}$

25. $\|\mathbf{w}\|\mathbf{u}$

26. $\|\mathbf{u}\|\mathbf{w}$

27. $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w})$

28. $\mathbf{v} \cdot (\mathbf{w} + \mathbf{u})$

For Exercises 29–32, let $\mathbf{v} = \langle a_1, b_1\rangle$, $\mathbf{w} = \langle a_2, b_2\rangle$, $\mathbf{u} = \langle a_3, b_3\rangle$, and c be a real number. Prove the given statement.

29. $(c\mathbf{v}) \cdot \mathbf{w} = c(\mathbf{v} \cdot \mathbf{w})$

30. $\mathbf{0} \cdot \mathbf{v} = 0$

31. $c(\mathbf{v} \cdot \mathbf{w}) = c\mathbf{v} \cdot \mathbf{w}$

32. $\mathbf{v} \cdot (\mathbf{w} + \mathbf{u}) = \mathbf{v} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{u}$

Objective 2: Find the Angle Between Two Vectors

33. If θ is the angle between two nonzero vectors $\mathbf{v}$ and $\mathbf{w}$, and $\mathbf{v} \cdot \mathbf{w} < 0$, what is the range of θ? Give the answer in degree measure.

34. If θ is the angle between two nonzero vectors $\mathbf{v}$ and $\mathbf{w}$, and $\mathbf{v} \cdot \mathbf{w} > 0$, what is the range of θ? Give the answer in degree measure.

For Exercises 35–40, find the angle θ between $\mathbf{v}$ and $\mathbf{w}$. If necessary, round to the nearest tenth of a degree. (See Example 2)

35. $\mathbf{v} = -8\mathbf{i} + 6\mathbf{j}$, $\mathbf{w} = 4\mathbf{i} + 18\mathbf{j}$

36. $\mathbf{v} = 12\mathbf{i} - 5\mathbf{j}$, $\mathbf{w} = -3\mathbf{i} - 4\mathbf{j}$

37. $\mathbf{v} = \langle 1, 7\rangle$, $\mathbf{w} = \langle -12, -8\rangle$

38. $\mathbf{v} = \langle 8, 3\rangle$, $\mathbf{w} = \langle 4, -3\rangle$

39. $\mathbf{v} = \cos 45°\mathbf{i} + \sin 45°\mathbf{j}$ and $\mathbf{w} = \cos 60°\mathbf{i} + \sin 60°\mathbf{j}$

40. $\mathbf{v} = \cos 150°\mathbf{i} + \sin 150°\mathbf{j}$ and $\mathbf{w} = \cos 225°\mathbf{i} + \sin 225°\mathbf{j}$

41. If $\|\mathbf{v}\| = 10$ and $\|\mathbf{w}\| = 6$ and the angle between $\mathbf{v}$ and $\mathbf{w}$ is 30°, find $\mathbf{v} \cdot \mathbf{w}$.

42. If $\|\mathbf{v}\| = 2.6$ and $\|\mathbf{w}\| = 8$ and the angle between $\mathbf{v}$ and $\mathbf{w}$ is 60°, find $\mathbf{v} \cdot \mathbf{w}$.

For Exercises 43–50, determine if the given vectors are orthogonal, parallel, or neither. (See Example 3)

43. $\mathbf{r} = \langle -12, 6\rangle$, $\mathbf{s} = \langle -8, -16\rangle$

44. $\mathbf{t} = \langle -6, 18\rangle$, $\mathbf{s} = \langle 9, 3\rangle$

45. $\mathbf{w} = \frac{1}{5}\mathbf{i} - \frac{1}{4}\mathbf{j}$, $\mathbf{v} = \frac{15}{4}\mathbf{i} + 3\mathbf{j}$

46. $\mathbf{b} = \frac{5}{2}\mathbf{i} + \frac{25}{6}\mathbf{j}$, $\mathbf{a} = -\frac{10}{9}\mathbf{i} + \frac{2}{3}\mathbf{j}$

47. $\mathbf{p} = \langle 2, 6\rangle$, $\mathbf{q} = \langle -1, -3\rangle$

48. $\mathbf{k} = \left\langle -\frac{3}{2}, 2\right\rangle$, $\mathbf{s} = \langle 6, -8\rangle$

49. $\mathbf{v} = 3\mathbf{i} - \mathbf{j}$, $\mathbf{w} = \mathbf{i} - 3\mathbf{j}$

50. $\mathbf{z} = 14\mathbf{i} + 7\mathbf{j}$, $\mathbf{t} = -7\mathbf{i} - 14\mathbf{j}$

Objective 3: Decompose Vectors into Two Orthogonal Vectors

51. Given $\mathbf{v} = \langle -3, 6\rangle$ and $\mathbf{w} = \langle 1, 3\rangle$,

- **a.** Find $\text{proj}_{\mathbf{w}}\mathbf{v}$. (**See Example 4**)
- **b.** Find vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ such that $\mathbf{v}_1$ is parallel to $\mathbf{w}$, $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.
- **c.** Using the results from part (b), show that $\mathbf{v}_1$ is parallel to $\mathbf{w}$ by finding a constant c such that $\mathbf{v}_1 = c\mathbf{w}$.
- **d.** Show that $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$.
- **e.** Show that $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.

52. Given $\mathbf{v} = \langle 4, -3\rangle$ and $\mathbf{w} = \langle 2, -2\rangle$,

- **a.** Find $\text{proj}_{\mathbf{w}}\mathbf{v}$.
- **b.** Find vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ such that $\mathbf{v}_1$ is parallel to $\mathbf{w}$, $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.
- **c.** Using the results from part (b) show that $\mathbf{v}_1$ is parallel to $\mathbf{w}$ by finding a constant c such that $\mathbf{v}_1 = c\mathbf{w}$.
- **d.** Show that $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$.
- **e.** Show that $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.

53. Given $\mathbf{v} = 4\mathbf{i} + 9\mathbf{j}$ and $\mathbf{w} = 2\mathbf{i} - \mathbf{j}$,

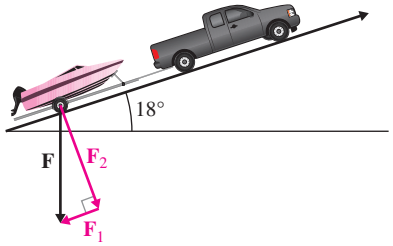
- **a.** Find $\text{proj}_{\mathbf{w}}\mathbf{v}$.
- **b.** Find vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ such that $\mathbf{v}_1$ is parallel to $\mathbf{w}$, $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.

54. Given $\mathbf{v} = -8\mathbf{i} - 4\mathbf{j}$ and $\mathbf{w} = -6\mathbf{i} + 4\mathbf{j}$,

- **a.** Find $\text{proj}_{\mathbf{w}}\mathbf{v}$.
- **b.** Find vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ such that $\mathbf{v}_1$ is parallel to $\mathbf{w}$, $\mathbf{v}_2$ is orthogonal to $\mathbf{w}$, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.

ISTUDY

55. A boat and trailer weighing a total of 450 lb are parked on a boat ramp with an 18° angle of inclination. Assume that the weight of the boat and trailer is evenly distributed between two wheels. (**See Example 5**)

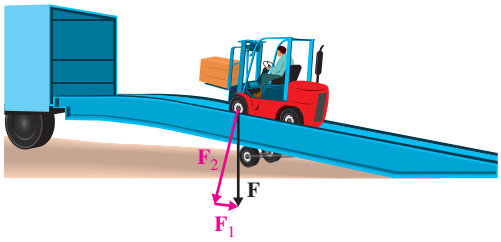


a. Write the force vector **F** in terms of **i** and **j** representing the weight of the boat and trailer for a single tire.

b. Find the component vector of **F** parallel to the ramp. Round values to 1 decimal place.

c. Find the magnitude of the force needed to keep the trailer from moving down the ramp. Round to the nearest pound.

56. A forklift is used to offload freight from a delivery truck. Together the forklift and its contents weigh 800 lb, and the weight is evenly distributed among four wheels. The ramp is inclined 14° from the horizontal.



a. Write the force vector **F** in terms of **i** and **j** representing the weight against a single tire.

b. Find the component vector of **F** parallel to the ramp. Round values to 1 decimal place.

c. Find the magnitude of the force needed to keep the forklift from rolling down the ramp. Round to the nearest pound.

57. Refer to Exercise 55.

a. Find the component vector of **F** perpendicular to the ramp. Round values to 1 decimal place.

b. Find the magnitude of the force that the ramp makes against each tire. Round to the nearest pound.

58. Refer to Exercise 56.

a. Find the component vector of **F** perpendicular to the ramp. Round values to 1 decimal place.

b. Find the magnitude of the force that the ramp makes against each tire. Round to the nearest pound.

Objective 4: Use Vectors to Compute Work

59. a. Find the amount of work done in lifting a 50-lb weight upward 5 ft.

b. If 200 N of force is applied in the direction of motion in moving an object 10 m, how much work is done?

60. a. Find the amount of work done pulling an object horizontally 10 ft using a force of 40 lb in the direction of motion.

b. If 2250 N of force is applied in the direction of motion in moving an object 50 m, how much work is done?

For Exercises 61–64, find the work done by the given force F acting in the direction from point *A* to point *B*. Assume that the units in the coordinate plane are in meters.

61. $A(3, -1)$, $B(8, 11)$; $\|\mathbf{F}\| = 400$ N

62. $A(-3, -2)$, $B(5, 4)$; $\|\mathbf{F}\| = 250$ N

63. $A(12, 5)$, $B(-3, 10)$; $\|\mathbf{F}\| = 38$ N

64. $A(17, -7)$, $B(27, 1)$; $\|\mathbf{F}\| = 18$ N

For Exercises 65–68, find the work *W* done by a force F in moving an object in a straight line given by the displacement vector D. (See Example 6)

65. $\mathbf{F} = (40\mathbf{i} - 15\mathbf{j})$ lb; $\mathbf{D} = (30\mathbf{i} + 10\mathbf{j})$ ft

66. $\mathbf{F} = (220\mathbf{i} + 350\mathbf{j})$ lb; $\mathbf{D} = (-12\mathbf{i} + 16\mathbf{j})$ ft

67. $\mathbf{F} = (-26\mathbf{i} + 32\mathbf{j})$ N; $\mathbf{D} = (100\mathbf{i} + 120\mathbf{j})$ m

68. $\mathbf{F} = (6\mathbf{i} + 3\mathbf{j})$ N; $\mathbf{D} = (14\mathbf{i} - 8\mathbf{j})$ m

For Exercises 69–72, find the work done by a force F (in lb) in moving an object in a straight line from point *A* to point *B*. Assume that the units in the coordinate plane are in feet. (See Example 6)

69. $A(0, 0)$, $B(2, 6)$; $\mathbf{F} = 3\mathbf{i} + 7\mathbf{j}$

70. $A(0, 0)$, $B(-5, 4)$; $\mathbf{F} = -2\mathbf{i} + 10\mathbf{j}$

71. $A(20, 35)$, $B(32, 57)$; $\mathbf{F} = 150\mathbf{i} + 200\mathbf{j}$

72. $A(-14, -20)$, $B(8, -35)$; $\mathbf{F} = 40\mathbf{i} + 26\mathbf{j}$

73. Find the amount of work done pulling an object horizontally 50 ft if a force of 60 lb is directed 30° above the horizontal.

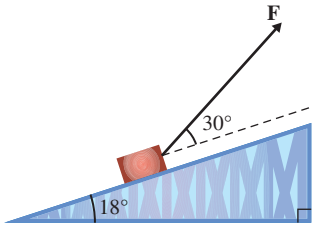
74. Find the amount of work done if an object is pushed horizontally 70 m by a force of 25 N directed 60° above the horizontal.

ISTUDY

75. A tree removal service hooks a chain around the stump of a tree and attaches the other end of the chain to a pickup truck. The truck drags the stump horizontally 40 m to a wood chipper. The chain is directed upward 32° from the horizontal, and the tension in the chain is 15,000 N. Find the amount of work done. Round to the nearest N·m. (**See Example 7**)

76. A child exerts a force of 28 N on the handle of a small wagon. If the handle of the wagon is directed upward 18° from the horizontal, find the amount of work done in moving the wagon 20 m horizontally. Round to the nearest N·m.

77. A force of 16 lb is used to pull a block up a ramp. If the ramp is inclined 18° above the horizontal, and the force is directed 30° above the ramp, find the work done moving the block 15 ft along the ramp.



78. A force of 28 lb is used to pull a block up a ramp. If the ramp is inclined 10° above the horizontal, and the force is directed 45° above the ramp, find the work done moving the block 20 ft along the ramp.

Mixed Exercises

79. Given $\mathbf{v} = 22\mathbf{i} - 55\mathbf{j}$ and $\mathbf{w} = -4\mathbf{i} + 10\mathbf{j}$,

a. Find the angle between $\mathbf{v}$ and $\mathbf{w}$.

b. Are the vectors parallel? If yes, find a real number c such that $\mathbf{v} = c\mathbf{w}$.

80. Given $\mathbf{v} = -21\mathbf{i} + 33.6\mathbf{j}$ and $\mathbf{w} = 5\mathbf{i} - 8\mathbf{j}$,

a. Find the angle between $\mathbf{v}$ and $\mathbf{w}$.

b. Are the vectors parallel? If yes, find a real number c such that $\mathbf{v} = c\mathbf{w}$.

81. Given $r = \langle -3, 4\rangle$ and $s = \langle 9, -12\rangle$,

a. Find the product $\|\mathbf{r}\|\|\mathbf{s}\|$.

b. Find $\mathbf{r} \cdot \mathbf{s}$.

c. Based on the results of parts (a) and (b), what do you know about the two vectors?

82. Given $c = \langle 5, -12\rangle$ and $d = \langle 10, -24\rangle$,

a. Find the product $\|\mathbf{c}\|\|\mathbf{d}\|$.

b. Find $\mathbf{c} \cdot \mathbf{d}$.

c. Based on the results of parts (a) and (b), what do you know about the two vectors?

83. If $\text{proj}_{\mathbf{w}}\mathbf{v} = \mathbf{v}$, what do you know about $\mathbf{v}$ and $\mathbf{w}$?

84. If $\text{proj}_{\mathbf{w}}\mathbf{v} = 0$, what do you know about $\mathbf{v}$ and $\mathbf{w}$?

85. Given $\mathbf{v} = 4\mathbf{i} - 10\mathbf{j}$,

a. Find two vectors parallel to $\mathbf{v}$, one in the same direction as $\mathbf{v}$ and one in the opposite direction as $\mathbf{v}$. Answers will vary.

b. Find two vectors orthogonal to $\mathbf{v}$. Answers will vary.

86. Given $\mathbf{v} = -3\mathbf{i} - 9\mathbf{j}$,

a. Find two vectors parallel to $\mathbf{v}$, one in the same direction as $\mathbf{v}$ and one in the opposite direction as $\mathbf{v}$. Answers will vary.

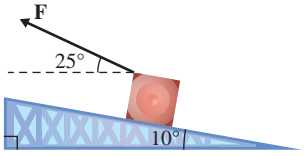
b. Find two vectors orthogonal to $\mathbf{v}$. Answers will vary.

The dot product of vectors can be used in business applications. For Exercises 87–88, find the dot product and interpret the results.

87. The components of $\mathbf{n} = \langle 500, 330\rangle$ represent the number of T-shirts and hats, respectively, in the inventory of a surf shop. The components of $\mathbf{p} = \langle 15, 9\rangle$ represent the price (in $) per T-shirt and hat, respectively. Find $\mathbf{n} \cdot \mathbf{p}$ and interpret the result.

88. The components of $\mathbf{n} = \langle 4, 2\rangle$ represent the number of tacos and drinks, respectively, that a restaurant patron had for lunch. The components of $\mathbf{c} = \langle 120, 90\rangle$ represent the number of calories per taco and number of calories per drink, respectively. Find $\mathbf{n} \cdot \mathbf{c}$ and interpret the result.

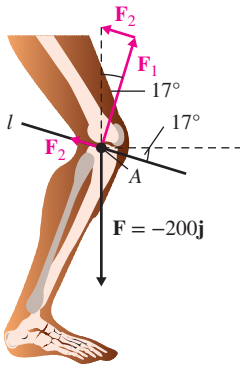
89. A force of 40 lb is used to pull a block up a ramp. If the ramp is inclined 10° above the horizontal, and the force is directed 25° from the horizontal, find the work done moving the block 25 ft along the ramp. Round to the nearest unit.



90. A force of 65 lb is used to pull a block up a ramp. If the ramp is inclined 18° above the horizontal, and the force is directed 38° from the horizontal, find the work done moving the block 12 ft along the ramp. Round to the nearest unit.

ISTUDY

91. Suppose that the contact point between the femur (large bone in the thigh) and tibia (supporting bone from lower leg) meet at point A. The planar surface l between the two bones is directed 17° downward from the horizontal, and the individual's body weight is 200 lb directed downward. Rounding to the nearest tenth of a pound,



a. Find the magnitude of the force $\mathbf{F}_1$ that the tibia must exert normal to l to oppose the weight.

b. Find the magnitude of force $\mathbf{F}_2$ within the knee joint that prevents the bones from slipping.

92. The individual in Exercise 91 is directed to lose weight by a physician. After 6 months of exercise and dietary changes, the individual's new weight is 175 lb. Recalculate parts (a) and (b) with the new body weight.

Write About It

93. Explain how the dot product can be used to determine whether the angle between two nonzero vectors is less than 90° or greater than 90°.

94. Explain what is meant by decomposing a nonzero vector $\mathbf{v}$ into orthogonal vectors.

Expanding Your Skills

95. Prove that $\|\mathbf{v} - \mathbf{w}\|^2 = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\mathbf{v} \cdot \mathbf{w}$.

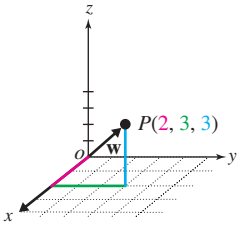
96. Prove that $\|\mathbf{v} + \mathbf{w}\|^2 - \|\mathbf{v} - \mathbf{w}\|^2 = 4(\mathbf{v} \cdot \mathbf{w})$.

97. Prove that $\|\mathbf{v} + \mathbf{w}\|^2 + \|\mathbf{v} - \mathbf{w}\|^2 = 2\left(\|\mathbf{v}\|^2 + \|\mathbf{w}\|^2\right)$.

98. If $\mathbf{v}$ and $\mathbf{w}$ are vectors with the same magnitude, show that $\mathbf{v} + \mathbf{w}$ and $\mathbf{v} - \mathbf{w}$ are orthogonal.

A vector $\mathbf{v}$ in a plane is a line segment with a specified direction, where the component form is given by two coordinates $\langle a, b \rangle$. Similarly, we may define a vector $\mathbf{w}$ in three-dimensional space as a line segment in space with a specified direction where the component form is given by three coordinates $\langle a, b, c \rangle$.

For example, a vector $\mathbf{w}$ from the origin to a point P (2, 3, 3) is given in component form as $\mathbf{w} = \langle 2, 3, 3 \rangle$ or, in terms of the unit vectors $\mathbf{i} = \langle 1, 0, 0 \rangle$, $\mathbf{j} = \langle 0, 1, 0 \rangle$, and $\mathbf{k} = \langle 0, 0, 1 \rangle$, as $\mathbf{w} = 2\mathbf{i} + 3\mathbf{j} + 3\mathbf{k}$. Use this convention for Exercises 99–100.



99. If $\mathbf{v} = \langle a_1, b_1, c_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2, c_2 \rangle$, the **dot product** $\mathbf{v} \cdot \mathbf{w}$ is defined as $\mathbf{v} \cdot \mathbf{w} = a_1a_2 + b_1b_2 + c_1c_2$. Evaluate $\mathbf{v} \cdot \mathbf{w}$ for

a. $\mathbf{v} = \langle -2, 1, 4 \rangle$, $\mathbf{w} = \langle 3, -1, 5 \rangle$

b. $\mathbf{v} = -6\mathbf{j} + 3\mathbf{k}$, $\mathbf{w} = 10\mathbf{i} + 12\mathbf{k}$

100. The magnitude of $\mathbf{v} = \langle a, b, c \rangle$ is given by $\|\mathbf{v}\| = \sqrt{a^2 + b^2 + c^2}$. Find the magnitude of each vector.

a. $\mathbf{v} = \langle -8, 2, 12 \rangle$

b. $\mathbf{w} = 3\mathbf{i} - 9\mathbf{j} + 12\mathbf{k}$

ISTUDY

CHAPTER 8 KEY CONCEPTS

SECTION 8.1 Polar Coordinates

	Reference
A **polar coordinate system** consists of a fixed point O called the **pole** (or origin), and a ray called the **polar axis,** with endpoint at the pole. Each point P in the plane is defined by an ordered pair of the form (r, θ), where r is the directed distance from the pole to P, and θ is a directed angle from the polar axis to line $\overleftrightarrow{OP}$.	p. 762
A point in a plane can be described by an ordered pair (x, y) in rectangular coordinates or by an ordered pair (r, θ) in polar coordinates. $x = r\cos\theta \qquad r^2 = x^2 + y^2$ $y = r\sin\theta \qquad \tan\theta = \frac{y}{x}$ for $x \neq 0$ 	p. 764
A **polar equation** is an equation described in a polar coordinate system with variables r and θ. Convert between rectangular coordinates and polar coordinates by using the relationships $x = r\cos\theta$, $y = r\sin\theta$, $r^2 = x^2 + y^2$, and $\tan\theta = \frac{y}{x}$ for $x \neq 0$.	p. 766

SECTION 8.2 Graphs of Polar Equations

	Reference
A **solution** to a polar equation is an ordered pair (r, θ) that satisfies the equation. The graph of a polar equation is the graph of all solutions to the equation.	p. 773
The graphs of polar equations may be symmetric with respect to the polar axis, the line $\theta = \frac{\pi}{2}$, or the pole. For an equation in polar coordinates, if the given substitution produces an equivalent equation, then the graph has the indicated type of symmetry. (1) Symmetry with respect to the polar axis: Replace (r, θ) by $(r, -\theta)$. (2) Symmetry with respect to the line $\theta = \frac{\pi}{2}$: Replace (r, θ) by $(r, \pi - \theta)$. (3) Symmetry with respect to the pole: Replace (r, θ) by $(-r, \theta)$.	p. 774
Polar equations and their graphs may be members of specific categories of polar equations representing lines, circles, spirals, limaçons, roses, or lemniscates.	pp. 780–781

SECTION 8.3 Complex Numbers in Polar Form

	Reference
In the **complex plane,** the horizontal axis (called the **real axis**) represents the real part of a complex number, and the vertical axis (called the **imaginary axis**) represents the imaginary part. The complex number $z = a + bi$ is written as an ordered pair (a, b) and can then be graphed as such in the complex plane.	p. 790
The absolute value or **modulus** of a complex number is its distance from the origin in the complex plane. If $z = a + bi$ is a complex number, then $\lvert z\rvert = \sqrt{a^2 + b^2}$.	p. 791
The **polar form** (or **trigonometric form**) of a complex number $z = a + bi$ is $z = r(\cos\theta + i\sin\theta)$, where $a = r\cos\theta$, $b = r\sin\theta$, $r = \sqrt{a^2 + b^2}$, and $\tan\theta = \frac{b}{a}$ $(a \neq 0)$. There are infinitely many choices for θ, but normally θ is taken on the interval $0 \leq \theta < 2\pi$.	p. 791

ISTUDY

The product and quotient of complex numbers can be found using their polar forms. If $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$ and $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$, then $z_1z_2 = r_1r_2[\cos(\theta_1 + \theta_2) + i\sin(\theta_1 + \theta_2)]$ and $\frac{z_1}{z_2} = \frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i\sin(\theta_1 - \theta_2)]$ for $(z_2 \neq 0)$	p. 793
De Moivre's theorem enables us to raise a complex number to an integer power and to find its nth roots. Let $z = r(\cos\theta + i\sin\theta)$. If n is a positive integer, then $z^n = [r(\cos\theta + i\sin\theta)]^n = r^n(\cos n\theta + i\sin n\theta)$ For an integer $n \geq 2$, z has n distinct nth roots of the form $w_k = \sqrt[n]{r}\left[\cos\left(\frac{\theta + 2\pi k}{n}\right) + i\sin\left(\frac{\theta + 2\pi k}{n}\right)\right]$ for $k = 0, 1, 2, \ldots, n - 1$	pp. 794–795

SECTION 8.4 Vectors

	Reference
A **scalar** is a quantity that has magnitude only (such as speed). A **vector quantity** (such as velocity) has both magnitude *and* direction. A **vector** in the plane is a line segment with a specified direction. We denote a vector pointing from point P to point Q as $\overrightarrow{PQ}$. Point P is called the **initial point** of the vector and Q is called the **terminal point** of the vector. The **magnitude** of $\overrightarrow{PQ}$, denoted $\|\overrightarrow{PQ}\|$, is the length of the line segment. Two vectors are equal if they have the same magnitude and direction. A vector drawn in **standard position** has its initial point at the origin.	p. 804
Let $P(x_1, y_1)$ and $Q(x_2, y_2)$ be points in the plane, and let $\mathbf{v} = \overrightarrow{PQ}$. The component form of $\mathbf{v}$ is given by $\mathbf{v} = \langle x_2 - x_1, y_2 - y_1\rangle$ 	p. 806
Two vectors may be added or subtracted geometrically, or by adding or subtracting the corresponding components. Multiplying a vector $\mathbf{v}$ by a scalar c results in a parallel vector $c\mathbf{v}$, and the length of $c\mathbf{v}$ is the length of $\mathbf{v}$ scaled by a factor of $\lvert c\rvert$.	p. 807
Several properties of vectors follow directly from the definition of vector addition, vector subtraction, and multiplication of a vector by a scalar.	p. 808
A unit vector has a length of 1 unit. If $\mathbf{v} = \langle a, b\rangle$, then a unit vector $\mathbf{u}_\mathbf{v}$ in the direction of $\mathbf{v}$ is given by $\mathbf{u}_\mathbf{v} = \frac{1}{\|\mathbf{v}\|}\mathbf{v} = \frac{1}{\|\mathbf{v}\|}\langle a, b\rangle = \left\langle \frac{a}{\|\mathbf{v}\|}, \frac{b}{\|\mathbf{v}\|}\right\rangle$.	p. 809
Two important unit vectors are $\mathbf{i} = \langle 1, 0\rangle$ and $\mathbf{j} = \langle 0, 1\rangle$ because they are unit vectors in the direction of the positive x- and y-axes, respectively. The representation of $\mathbf{v} = \langle a, b\rangle$ in terms of $\mathbf{i}$ and $\mathbf{j}$ is $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$. The values a and b are called the **scalar horizontal and vertical components** of $\mathbf{v}$, respectively.	p. 810
It is often important to find the component form of a vector $\mathbf{v}$ given its magnitude $\|\mathbf{v}\|$ and direction θ: $\mathbf{v} = \langle\|\mathbf{v}\|\cos\theta, \|\mathbf{v}\|\sin\theta\rangle$. Likewise, given the component form $\mathbf{v} = \langle a, b\rangle$, the magnitude and direction of a vector are given by $\|\mathbf{v}\| = \sqrt{a^2 + b^2}$ and $\tan\theta = \frac{b}{a}$ $(a \neq 0)$.	p. 811
Vectors have many useful applications in physics, navigation, and engineering such as finding the true direction and speed of a boat or ship under the influence of a current or wind.	p. 812
Suppose that forces $\mathbf{F}_1, \mathbf{F}_2, \mathbf{F}_3, \ldots, \mathbf{F}_n$ act on an object. The sum of these forces is called the **resultant force.** The object is said to be in **static equilibrium** if the resultant force $\mathbf{R}$ is the zero vector, that is, if $\mathbf{R} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 + \cdots + \mathbf{F}_n = \mathbf{0}$.	p. 814

SECTION 8.5 Dot Product	Reference
If $\mathbf{v} = \langle a_1, b_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2 \rangle$, the **dot product** $\mathbf{v} \cdot \mathbf{w}$ is defined as the scalar quantity $\mathbf{v} \cdot \mathbf{w} = a_1a_2 + b_1b_2$.	p. 821
The following are important properties of the dot product. If **u, v,** and **w** are vectors, and c is a scalar, then **1.** $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$ **2.** $(c\mathbf{v}) \cdot \mathbf{w} = c(\mathbf{v} \cdot \mathbf{w})$ **3.** $\mathbf{v} \cdot (\mathbf{w} + \mathbf{u}) = \mathbf{v} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{u}$ **4.** $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$ **5.** $\mathbf{0} \cdot \mathbf{v} = 0$ **6.** $c(\mathbf{v} \cdot \mathbf{w}) = (c\mathbf{v}) \cdot \mathbf{w} = \mathbf{v} \cdot (c\mathbf{w})$	p. 822
If θ is the angle between two nonzero vectors **v** and **w,** then $\cos\theta = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}$ and $\theta = \cos^{-1}\left(\dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}\right)$.	p. 822
Two vectors **v** and **w** are orthogonal if and only if $\mathbf{v} \cdot \mathbf{w} = 0$.	p. 824
In many applications it is important to decompose a vector into orthogonal vectors. If **v** and **w** are two nonzero vectors, then 1. The vector projection of **v** onto **w** is given by $\text{proj}_{\mathbf{w}}\mathbf{v} = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w}$. 2. To decompose **v** into vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ parallel to **w** and orthogonal to **w**, respectively, we have $\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v} = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w}$ and $\mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1$.	p. 826
In physics, the work W done by a constant force **F** in moving an object from point A to point B along the line of motion is given by $W = \begin{pmatrix}\text{Magnitude of force in}\\ \text{the direction of motion}\end{pmatrix}\begin{pmatrix}\text{Distance the}\\ \text{object is moved}\end{pmatrix}$	p. 828
If a force vector **F** is *not* directed along the line of motion, then only the component of force in the direction of motion is applied to the work done. Therefore, if **D** is the displacement vector of an object moved in a straight line from point A to point B by a force **F**, the work done is given by 1. $W = \|\text{proj}_{\mathbf{D}}\mathbf{F}\|\|\mathbf{D}\|$ 2. $W = \|\mathbf{F}\|\|\mathbf{D}\|\cos\theta$, where θ is the angle between **F** and **D** 3. $W = \mathbf{F} \cdot \mathbf{D}$	p. 829

Detailed Chapter Summaries are available with the online resources.

CHAPTER 8 Review Exercises

SECTION 8.1

For Exercises 1–2, given a point in polar coordinates, find two other polar coordinate representations,

a. with $r > 0$. **b.** with $r < 0$.

1. $\left(4, \frac{2\pi}{3}\right)$ **2.** $\left(-5, \frac{\pi}{6}\right)$

For Exercises 3–4, convert the ordered pair in polar coordinates to rectangular coordinates.

3. $\left(6, \frac{\pi}{4}\right)$ **4.** $\left(-12, -\frac{\pi}{2}\right)$

For Exercises 5–6, convert the ordered pair in rectangular coordinates to polar coordinates with $r > 0$ and $0 \le \theta < 2\pi$.

5. $(-9, 9\sqrt{3})$ **6.** $\left(\frac{5\sqrt{3}}{2}, -\frac{5}{2}\right)$

For Exercises 7–12, write an equivalent equation using polar coordinates.

7. $x + 5y = 12$ **8.** $x = 12$

9. $x^2 + (y - 3)^2 = 9$ **10.** $x^2 + y^2 = 100$

11. $y = -4$ **12.** $y = x^2$

ISTUDY

For Exercises 13–16, convert the polar equation to rectangular form and identify the type of curve represented.

13. $r = 16$

14. $r = 16\cos\theta$

15. $\theta = -\frac{\pi}{3}$

16. $r = -\frac{10}{\sin\theta}$

SECTION 8.2

For Exercises 17–28, graph the polar equation and identify the type of curve.

17. $\theta = \frac{5\pi}{4}$

18. $r\cos\theta = -3$

19. $r = -1 - \cos\theta$

20. $r = 4 + 4\sin\theta$

21. $r = 3 + 2\sin\theta$

22. $r = 2 + 3\cos\theta$

23. $r = 2\sin 3\theta$

24. $r = 4\cos 7\theta$

25. $r^2 = 16\cos 2\theta$

26. $r = 0.3\theta$ for $\theta \geq 0$

For Exercises 27–30, determine whether the tests for symmetry in Table 8-2 detect symmetry with respect to

a. The polar axis. Replace (r, θ) by $(r, -\theta)$.

b. The line $\theta = \frac{\pi}{2}$. Replace (r, θ) by $(r, \pi - \theta)$.

c. The pole. Replace (r, θ) by $(-r, \theta)$.

Otherwise, indicate that the test is inconclusive.

27. $r = -4\cos 2\theta$

28. $r = 12$

29. $r = -8\cos\theta$

30. $r = 8\sin\theta$

SECTION 8.3

For Exercises 31–32, find the modulus of each complex number and write the number in polar form with $0 \leq \theta < 2\pi$.

31. $6 - 6\sqrt{3}i$

32. $-7 - 7i$

For Exercises 33–34, convert the complex number from polar form to rectangular form, $a + bi$.

33. $17\sqrt{5}\left(\cos\frac{3\pi}{2} + i\sin\frac{3\pi}{2}\right)$

34. $18(\cos 330° + i\sin 330°)$

For Exercises 35–36, given complex numbers z_1 and z_2,

a. Find $z_1 z_2$ and write the product in polar form.

b. Find $\frac{z_1}{z_2}$ and write the quotient in polar form.

35. $z_1 = 8(\cos 60° + i\sin 60°)$, $z_2 = 4(\cos 140° + i\sin 140°)$

36. $z_1 = 10\left(\cos\frac{5\pi}{12} + i\sin\frac{5\pi}{12}\right)$, $z_2 = 15\left(\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right)$

For Exercises 37–38, use De Moivre's theorem to find the indicated power. Write the result in rectangular form $a + bi$.

37. $\left[2\left(\cos\frac{\pi}{12} + i\sin\frac{\pi}{12}\right)\right]^4$

38. $(3 + 3i)^5$

For Exercises 39–40, find the indicated complex roots by first writing the number in polar form. Write the results in rectangular form $a + bi$.

39. The four roots of 2401.

40. The six roots of 4096.

For Exercises 41–42, find the indicated complex roots. Write the results in polar form using degree measure for the argument.

41. The square roots of $25(\cos 120° + i\sin 120°)$.

42. The cube roots of $32 - 32\sqrt{3}i$.

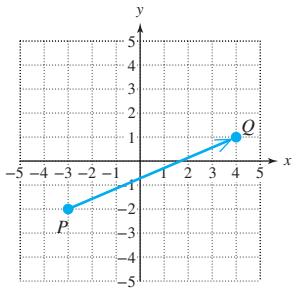
SECTION 8.4

For Exercises 43–44, write the component form of a vector $\mathbf{v}$ with initial point P and terminal point Q.

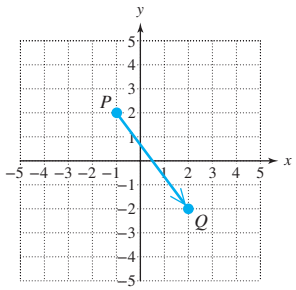
43. $P(-4, 6)$, $Q(2, -10)$

44. $P(-4, 6)$, $Q(-4, -10)$

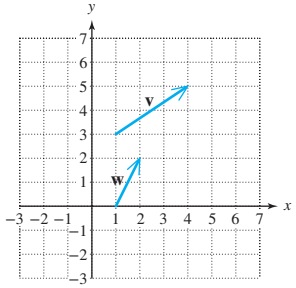
45.



46.



For Exercises 47–48, refer to vectors $\mathbf{v}$ and $\mathbf{w}$ in the figure.



47. Sketch $\mathbf{v} + \mathbf{w}$ by placing the initial point of $\mathbf{w}$ at the terminal point of $\mathbf{v}$.

48. Sketch $\mathbf{v} - \mathbf{w}$ by drawing $\mathbf{v}$ and $\mathbf{w}$ with the same initial point.

For Exercises 49–54, perform the indicated operations for the given vectors.

$\mathbf{v} = \langle 3, 5\rangle$ $\mathbf{w} = \langle -3, -2\rangle$ $\mathbf{s} = 10\mathbf{i} - 6\mathbf{j}$ $\mathbf{r} = 5\mathbf{i} + 3\mathbf{j}$

49. $2\mathbf{v} + \mathbf{w}$

50. $-8\mathbf{s} + \mathbf{r}$

51. $\frac{1}{2}\mathbf{s} + 3\mathbf{r}$

52. $\mathbf{w} - \frac{1}{3}\mathbf{v}$

53. $\|\mathbf{v} + \mathbf{w}\|$

54. $\|\mathbf{s} + \mathbf{r}\|$

ISTUDY

For Exercises 55–56, find a unit vector in the direction of v.

55. $\mathbf{v} = -8\mathbf{i} + 15\mathbf{j}$ **56.** $\mathbf{v} = -9\mathbf{i} - 40\mathbf{j}$

For Exercises 57–58, write the vector v in the form $a\mathbf{i} + b\mathbf{j}$, where v has the given magnitude and direction angle.

57. $\|\mathbf{v}\| = 20, \theta = 120°$ **58.** $\|\mathbf{v}\| = 18, \theta = \frac{\pi}{4}$

For Exercises 59–60, find the magnitude and direction angle ($0° \le \theta < 360°$) for the given vector. Round to 1 decimal place.

59. $\mathbf{v} = -5\mathbf{i} + 6\mathbf{j}$ **60.** $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j}$

For Exercises 61–62, the given forces (in units of pounds) act on an object.

a. Find the resultant force, **R**.

b. What additional force **F** is needed for the object to be in static equilibrium?

61. $\mathbf{F}_1 = \langle 7, -3\rangle$ and $\mathbf{F}_2 = \langle -10, -4\rangle$

62. $\mathbf{F}_1 = 8\mathbf{i} - 2\mathbf{j}$, $\mathbf{F}_2 = \mathbf{i} - \mathbf{j}$, $\mathbf{F}_3 = -3\mathbf{i} + 10\mathbf{j}$

63. A plane flies at a speed of 420 mph with a bearing of S45°E. Write the velocity vector in terms of **i** and **j**.

64. During a penalty kick, a soccer ball is kicked at an angle of 8° from the horizontal with a speed of 53 mph. Write the velocity vector **v** at the instant of the kick in terms of **i** and **j**. Round the components to the nearest tenth of a mph.

65. A small plane travels 120 mph on a bearing of N40°E and encounters a wind of 20 mph acting in the direction of N45°W. Rounding to 1 decimal place,

a. Express the velocity of the plane **v** relative to the air in terms of **i** and **j**.

b. Express the velocity of the wind $\mathbf{v}_w$ in terms of **i** and **j**.

c. Find the true velocity $\mathbf{v}_T$ and true speed of the plane. Round the speed to the nearest mph.

SECTION 8.5

For Exercises 66–68, find the indicated value.

a. $\mathbf{v} \cdot \mathbf{w}$ **b.** $\mathbf{v} \cdot \mathbf{v}$

66. $\mathbf{v} = \langle 12, 8\rangle$, $\mathbf{w} = \langle -3, -5\rangle$

67. $\mathbf{v} = \frac{1}{2}\mathbf{i} + \frac{8}{3}\mathbf{j}$, $\mathbf{w} = -8\mathbf{i} - \frac{3}{4}\mathbf{j}$

68. $\mathbf{v} = -14\mathbf{i} + \mathbf{j}$, $\mathbf{w} = 80\mathbf{i} - 30\mathbf{j}$

For Exercises 69–72, use the dot product to determine if v and w are orthogonal. If the vectors are not orthogonal, find the angle between them. Round to the nearest tenth of a degree.

69. $\mathbf{v} = \langle -0.2, -0.3\rangle$, $\mathbf{w} = \langle 0.6, -0.4\rangle$

70. $\mathbf{v} = 20\mathbf{i} + 4\mathbf{j}$, $\mathbf{w} = -\mathbf{i} + 5\mathbf{j}$

71. $\mathbf{v} = -3\mathbf{i} + 10\mathbf{j}$, $\mathbf{w} = 6\mathbf{i} - 4\mathbf{j}$

72. $\mathbf{v} = \langle 2, 12\rangle$, $\mathbf{w} = \langle 18, 2\rangle$

73. Given $\mathbf{v} = -\mathbf{i} + 3\mathbf{j}$ and $\mathbf{w} = 2\mathbf{i} - \mathbf{j}$,

a. Find $\text{proj}_{\mathbf{w}}\mathbf{v}$.

b. Find vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ such that $\mathbf{v}_1$ is parallel to **w**, $\mathbf{v}_2$ is orthogonal to **w**, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.

74. Given $\mathbf{v} = 10\mathbf{j}$ and $\mathbf{w} = 9\mathbf{i} + 12\mathbf{j}$,

a. Find $\text{proj}_{\mathbf{w}}\mathbf{v}$.

b. Find vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ such that $\mathbf{v}_1$ is parallel to **w**, $\mathbf{v}_2$ is orthogonal to **w**, and $\mathbf{v}_1 + \mathbf{v}_2 = \mathbf{v}$.

75. A van weighing 2200 lb is parked on a street with an 8° incline.

a. Write the force vector **F** representing the weight against a single tire. Write **F** in terms of **i** and **j** and assume that the weight of the van is evenly distributed among all four tires.

b. Find the component vector, $\mathbf{F}_1$, of **F** parallel to the street. Round to 1 decimal place.

c. Find the magnitude of the force required by the brakes on each wheel to keep the truck from rolling down the street. Round to the nearest tenth of a pound.

76. Refer to Exercise 75.

a. Find the component vector, $\mathbf{F}_2$, of **F** perpendicular to the street. Round values to 1 decimal place.

b. Find the magnitude of the force that the street makes against each tire. Round to the nearest pound.

77. Find the work *W* done by a force $\mathbf{F} = (-4\mathbf{i} + 6\mathbf{j})$ lb in moving an object in a straight line given by the displacement vector $\mathbf{D} = (-8\mathbf{i} + 12\mathbf{j})$ ft.

78. Find the work *W* done by a force $\mathbf{F} = (14\mathbf{i} - 5\mathbf{j})$ N in moving an object in a straight line from point $A(14, -5)$ to point $B(26, -7)$. Assume that the units in the coordinate plane are in meters.

79. A gardener pulls on the handle of a cart with a force of 45 lb. If the handle of the cart is directed upward 38° from the horizontal, find the amount of work done in moving the wagon 15 ft horizontally. Round to the nearest ft·lb.

80. Find the amount of work done by a person pushing an object horizontally 42 ft using a force of 520 lb in the direction of motion.

CHAPTER 8 Test

1. Convert $\left(-5, \frac{5\pi}{4}\right)$ in polar coordinates to rectangular coordinates.
2. Convert $(-6\sqrt{3}, -6)$ in rectangular coordinates to polar coordinates with $r > 0$ and $0 \le \theta < 2\pi$.

For Exercises 3–4, write an equivalent equation using polar coordinates.

3. $(x + 2)^2 + y^2 = 4$
4. $y = x$

For Exercises 5–6, write an equivalent equation using rectangular coordinates.

5. $r = 8$
6. $r = 5\sec\theta$

For Exercises 7–10, graph the polar equation and identify the type of curve.

7. $r = 2\cos 3\theta$
8. $r = 2 - 6\cos\theta$
9. $r = 5 + 5\sin\theta$
10. $r = -5\sin 2\theta$

For Exercises 11–12, determine whether the tests for symmetry in Table 8-2 detect symmetry with respect to

a. The polar axis. Replace (r, θ) by $(r, -\theta)$.

b. The line $\theta = \frac{\pi}{2}$. Replace (r, θ) by $(r, \pi - \theta)$.

c. The pole. Replace (r, θ) by $(-r, \theta)$.

Otherwise, indicate that the test is inconclusive.

11. $r = 5\cos 3\theta$
12. $r = -7\sin\theta$
13. Find the modulus of $5 - 5i$ and write the number in polar form with $0 \le \theta < 2\pi$.
14. Convert $24\left(\cos\frac{4\pi}{3} + i\sin\frac{4\pi}{3}\right)$ from polar form to rectangular form, $a + bi$.
15. Find $[12(\cos 143° + i\sin 143°)][8(\cos 220° + i\sin 220°)]$ and write the product in polar form.
16. Find $\dfrac{18(\cos 100° + i\sin 100°)}{16(\cos 55° + i\sin 55°)}$ and write the quotient in polar form.
17. Use De Moivre's theorem to find $[3(\cos 210° + i\sin 210°)]^4$ and write the result in rectangular form $a + bi$.
18. Find the cube roots of $8\left(\cos\frac{5\pi}{6} + i\sin\frac{5\pi}{6}\right)$.

For Exercises 19–24, perform the indicated operations for $\mathbf{v} = \langle -8, 0\rangle$ and $\mathbf{w} = \langle 5, -3\rangle$.

19. $\mathbf{v} + 3\mathbf{w}$
20. $\|\mathbf{v} + \mathbf{w}\|$
21. $-\frac{6}{5}\mathbf{w}$
22. $8\mathbf{v} - 10\mathbf{w}$
23. $\mathbf{v} \cdot \mathbf{w}$
24. $(\mathbf{v} \cdot \mathbf{v})\mathbf{w}$
25. Given $\mathbf{v} = \langle 3, -10\rangle$,
    a. Find $\|\mathbf{v}\|^2$.
    b. Find $\mathbf{v} \cdot \mathbf{v}$.
    c. How are $\|\mathbf{v}\|^2$ and $\mathbf{v} \cdot \mathbf{v}$ related?
26. Find a unit vector in the direction of $\mathbf{v} = -8\mathbf{i} + 6\mathbf{j}$.
27. Write the vector $\mathbf{v}$ in the form $a\mathbf{i} + b\mathbf{j}$, where $\|\mathbf{v}\| = 12$ and $\mathbf{v}$ has direction angle $\theta = 225°$.
28. Find the magnitude and direction angle $(0° \le \theta < 360°)$ for the vector $\mathbf{v} = -2\mathbf{i} + 7\mathbf{j}$. Round to 1 decimal place.
29. Find the angle θ between $\mathbf{v} = -12\mathbf{i}$ and $\mathbf{w} = 4\mathbf{i} + 6\mathbf{j}$. Round to the nearest tenth of a degree.
30. The forces $\mathbf{F}_1 = \langle -8, 1\rangle$ and $\mathbf{F}_2 = \langle 5, 6\rangle$ act on an object. Find the resultant force, $\mathbf{R}$.
31. The forces $\mathbf{F}_1 = 6\mathbf{i} - \mathbf{j}$, $\mathbf{F}_2 = -7\mathbf{i} - 2\mathbf{j}$, and $\mathbf{F}_3 = 9\mathbf{i} + 3\mathbf{j}$ act on an object. What additional force $\mathbf{F}$ is needed for the object to be in static equilibrium?
32. Given $\mathbf{v} = \langle 7, -5\rangle$ and $\mathbf{w} = \langle 10, 12\rangle$, find $\text{proj}_{\mathbf{w}}\mathbf{v}$.
33. A plane heading S21°E with an an air speed of 375 mph encounters a wind blowing due east at 28 mph.
    a. Express the velocity of the plane $\mathbf{v}_p$ relative to the air and the velocity of the wind $\mathbf{v}_w$ in terms of $\mathbf{i}$ and $\mathbf{j}$. Round components to 1 decimal place.
    b. Find the velocity of the plane relative to the ground $\mathbf{v}_g$ and the speed of the plane relative to the ground. Round the speed to the nearest mph.
    c. Find the bearing of the plane relative to the ground. Round to the nearest tenth of a degree.
34. Find the magnitude of the force needed to keep a 250-lb crate from sliding down a ramp inclined 28° from the horizontal. Round to the nearest pound.
35. During a field goal kick, a football is kicked at an angle of 45° from the horizontal with a speed of 86 mph. Write the velocity vector $\mathbf{v}$ at the instant of the kick in terms of $\mathbf{i}$ and $\mathbf{j}$.
36. Find the work done by a force $\mathbf{F} = -7\mathbf{i} + 3\mathbf{j}$ (in N) in moving an object in a straight line from point $A(6, 1)$ to point $B(-5, 4)$. Assume that the units in the coordinate plane are in meters.
37. Find the amount of work done if an object is pushed horizontally 120 m by a force of 15 N directed 40° above the horizontal. Round to the nearest N·m.

CHAPTER 8 Cumulative Review Exercises

For Exercises 1–7, solve for y. Write solutions to inequalities in interval notation.

1. $A = \frac{x}{2}(x + y)$

2. $z = 10 - \sqrt{x^2 + y^2}$

3. $sy^2 + 2ty = r$

4. $A = A_0 e^{-ky}$

5. $R = 10\log\left(\frac{y}{y_0}\right)$

6. $\frac{y^2 - 3y - 4}{y + 2} \le 0$

7. $3 - |y - 10| \le 0$

8. Write an equation of a circle in rectangular coordinates and in standard form with center at $(-8, 5)$ and radius 8.

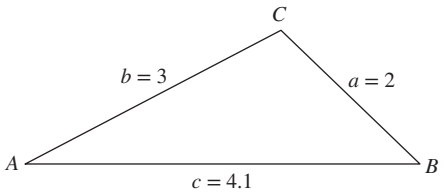
9. Write an equation of a circle in polar coordinates with center at $(-8, 0)$ and radius 8.

10. Write an equation of a line in slope-intercept form in rectangular coordinates that passes through the points $(-8, 5)$ and $(5, -8)$.

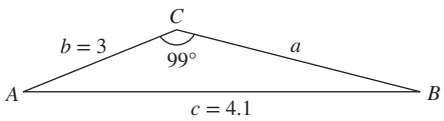
11. Write an equation of a line in polar coordinates that passes through the points $(-8, 8)$ and $(8, -8)$.

For Exercises 12–14, solve each triangle. Round to the nearest tenth.

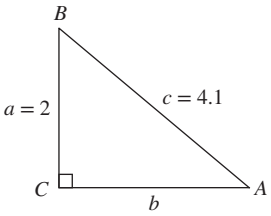
12.



13.



14.



15. Evaluate the difference quotient $\frac{f(x + h) - f(x)}{h}$ for $f(x) = \frac{3}{x}$.

16. Give the domain and range of $f(x) = \frac{3}{x}$.

17. Find the period and phase shift of each function.

a. $y = \tan\left(2x + \frac{\pi}{3}\right)$ **b.** $y = \sin\left(2x + \frac{\pi}{3}\right)$

18. The height h (in feet) of a swing above ground level at time t (in sec) is modeled by

$$h(t) = -2\cos\left(\frac{2\pi}{3}t\right) + 3$$

a. Find the maximum and minimum height of the swing.

b. When is the first time after $t = 0$ that the swing is at a height of 4 ft?

c. What is the period of the swing?

d. What is the frequency of the swing?

19. Given $\mathbf{v} = \langle 8, -3\rangle$ and $\mathbf{w} = \langle 12, -4\rangle$, find the vector projection of $\mathbf{v}$ onto $\mathbf{w}$.

20. Find the amount of work done pulling an object horizontally 25 ft if a force of 120 lb is directed 38° above the horizontal. Round to the nearest ft · lb.

The economy influences how people spend their money, but it also impacts how people save. When comparing options for investments such as stocks, bonds, and mutual funds, an individual can easily become overwhelmed by the possible scenarios. Collecting data on the rates of return on different investments is helpful in making an informed decision. In some scenarios, we turn to systems of linear equations to analyze such data.

In this chapter, we will solve systems involving both linear and nonlinear equations. In addition, we will use systems of linear inequalities in manufacturing applications. In such applications, the goal is to determine constraints on the production process (such as limits on the amount of material, labor, and equipment) and then maximize profit or minimize cost subject to these constraints.

SECTION 9.1 Systems of Linear Equations in Two Variables and Applications

OBJECTIVES

1. Identify Solutions to Systems of Linear Equations in Two Variables
2. Solve Systems of Linear Equations in Two Variables
3. Use Systems of Linear Equations in Applications

1. Identify Solutions to Systems of Linear Equations in Two Variables

The point of intersection between two curves is important in the analysis of supply and demand. For example, suppose that a small theater company wants to set an optimal price for tickets to a show. If the theater sells tickets for \$1 each, there would be a high demand and many people would buy tickets. However, the revenue brought in would not cover the expense of the show. Therefore, the theater is not willing to offer (supply) tickets at this low price. If the theater sells tickets for \$100 each, chances are that few people would buy tickets (demand would be low).

In an open market, the price y of an item is dependent on the number of items x supplied by the producer and demanded by the consumers. Competition between buyers and sellers steers the price toward an equilibrium price. This is the point where the supply curve and demand curve intersect (Figure 9-1).

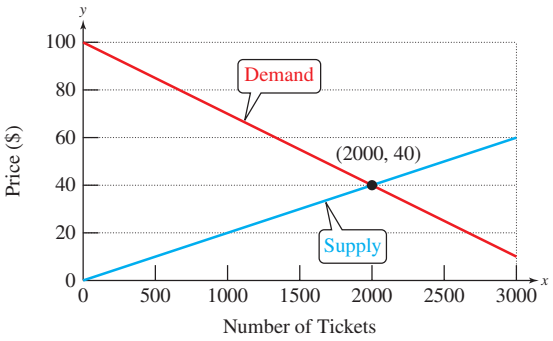

Figure 9-1

Suppose that the following linear equations represent the supply and demand curves for theater tickets. Taken together these equations form a *system* of linear equations.

$$\left.\begin{aligned}\text{Supply: } y &= 0.02x\\ \text{Demand: } y &= -0.03x + 100\end{aligned}\right\}$$ System of linear equations

TIP A solution to a system of linear equations in two variables is an ordered pair. To express the solution set, we enclose the solution(s) within set brackets.

Two or more linear equations make up a **system of linear equations.** A **solution** to a system of equations in two variables is an ordered pair that is a solution to each individual equation. Graphically, this is a point of intersection of the graphs of the equations. For the system given here, the solution is (2000, 40). This means that 2000 tickets are bought and sold at the equilibrium price of \$40. The **solution set** to a system of equations is the set of all solutions to the system. In this case, the solution set is $\{(2000, 40)\}$.

EXAMPLE 1 Determining if an Ordered Pair Is a Solution to a System of Equations

Determine if the ordered pair is a solution to the system.

$$\begin{aligned}6x + y &= -2\\ 4x - 3y &= 17\end{aligned}$$

a. $\left(\frac{1}{2}, -5\right)$ **b.** $(0, -2)$

Solution:

a. First equation

$6x + y = -2$

$6\left(\frac{1}{2}\right) + (-5) \stackrel{?}{=} -2$

$3 + (-5) \stackrel{?}{=} -2$ ✓ true

Second equation

$4x - 3y = 17$

$4\left(\frac{1}{2}\right) - 3(-5) \stackrel{?}{=} 17$

$2 + 15 \stackrel{?}{=} 17$ ✓ true

The ordered pair $\left(\frac{1}{2}, -5\right)$ is a solution to the system.

Test the ordered pair $\left(\frac{1}{2}, -5\right)$ in each equation.

The ordered pair is a solution to both equations.

Avoiding Mistakes

For an ordered pair to be a solution to a system of equations, it must satisfy *both* equations. If it fails in either equation, it is *not* a solution.

b. First equation

$6x + y = -2$

$6(0) + (-2) \stackrel{?}{=} -2$

$0 + (-2) \stackrel{?}{=} -2$

$-2 \stackrel{?}{=} -2$ ✓ true

Second equation

$4x - 3y = 17$

$4(0) - 3(-2) \stackrel{?}{=} 17$

$0 + 6 \stackrel{?}{=} 17$

$6 \stackrel{?}{=} 17$ false

Test the ordered pair $(0, -2)$ in each equation.

The ordered pair is *not* a solution to the second equation.

The ordered pair $(0, -2)$ is *not* a solution to the system.

Skill Practice 1

Determine if the ordered pair is a solution to the system.

$$3x - y = 10$$
$$x + \frac{1}{4}y = 1$$

a. $(2, -4)$ **b.** $\left(\frac{1}{3}, -9\right)$

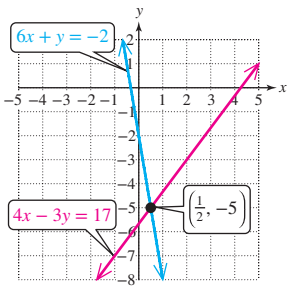

Figure 9-2

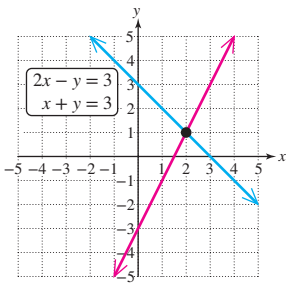
The lines from Example 1 are shown in Figure 9-2. From the graph, we can verify that $\left(\frac{1}{2}, -5\right)$ is the only solution to the system of equations.

There are three different possibilities regarding the number of solutions to a system of linear equations.

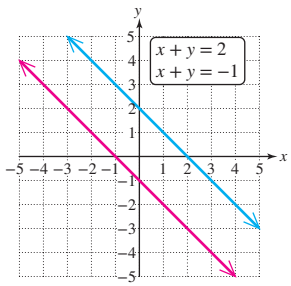
Solutions to Systems of Linear Equations in Two Variables

One Unique Solution



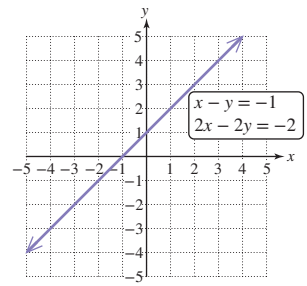
If a system of linear equations represents intersecting lines, then it has exactly one solution.

No Solution



If a system of linear equations represents parallel lines, then the lines do not intersect, and the system has no solution. In such a case, we say that the system is **inconsistent.**

Infinitely Many Solutions



If a system of linear equations represents the same line, then all points on the common line satisfy each equation. Therefore, the system has infinitely many solutions. In such a case, we say that the equations are **dependent.**

2. Solve Systems of Linear Equations in Two Variables

Graphing a system of equations is one method to find the solution(s) to the system. However, sometimes it is difficult to determine the solution(s) using this method because of limitations in the accuracy of the graph. Instead we often use algebraic methods to solve a system of equations. The first method we present is called the **substitution method.**

Answers

1. a. Yes **b.** No

ISTUDY

Solving a System of Equations by Using the Substitution Method

Step 1 Isolate one of the variables from one equation.
Step 2 Substitute the expression found in step 1 into the *other* equation.
Step 3 Solve the resulting equation.
Step 4 Substitute the value found in step 3 back into the equation in step 1 to find the value of the remaining variable.
Step 5 Check the ordered pair in each equation and write the solution as an ordered pair in set notation.

EXAMPLE 2 Solving a System of Equations by the Substitution Method

Solve the system by using the substitution method.

$$\begin{aligned} -5x - 4y &= 2 \\ 4x + y &= 5 \end{aligned}$$

Solution:

$$\begin{aligned} &-5x - 4y = 2 \\ &4x + y = 5 \longrightarrow y = -4x + 5 \end{aligned}$$

Step 1: Isolate one of the variables from one of the equations. A variable with coefficient 1 or −1 is easily isolated.

$$-5x - 4(-4x + 5) = 2$$

Step 2: Substitute the expression from step 1 into the other equation.

$$\begin{aligned} -5x + 16x - 20 &= 2 \\ 11x &= 22 \\ x &= 2 \end{aligned}$$

Step 3: Solve for the remaining variable.

$$\begin{aligned} y &= -4x + 5 \\ y &= -4(2) + 5 \\ y &= -3 \end{aligned}$$

Step 4: Substitute the known value of x into the equation where y is isolated. From step 1, this is $y = -4x + 5$.

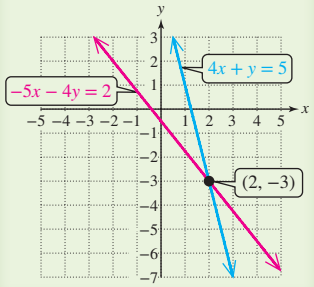
Step 5: Check the ordered pair $(2, -3)$ in each original equation.

Check $(2, -3)$.

$$\begin{aligned} -5x - 4y &= 2 \\ -5(2) - 4(-3) &\stackrel{?}{=} 2 \\ -10 + 12 &\stackrel{?}{=} 2 \quad \checkmark \text{ true} \end{aligned} \qquad \begin{aligned} 4x + y &= 5 \\ 4(2) + (-3) &\stackrel{?}{=} 5 \\ 8 - 3 &\stackrel{?}{=} 5 \quad \checkmark \text{ true} \end{aligned}$$

The solution set is $\{(2, -3)\}$.

TIP The lines from Example 2 are shown here. The graph shows the point of intersection at (2, −3).



Skill Practice 2 Solve the system by using the substitution method.

$$\begin{aligned} 3x + 4y &= 5 \\ x - 3y &= 6 \end{aligned}$$

Now consider the following system of equations.

$$\begin{aligned} 5x - 4y &= 6 \\ -3x + 7y &= 1 \end{aligned}$$

None of the variable terms has a coefficient of 1 or −1. Therefore, if we isolate x or y from either equation, the resulting equation will have one or more terms with fractional coefficients. To avoid this scenario, we can use another method called the **addition method** (also called the elimination method).

Answer
2. {(3, −1)}

TIP The addition method is sometimes called the *elimination method*. However, since both the substitution method and addition method eliminate a variable, we use the name addition method to emphasize the technique used.

Solving a System of Equations by Using the Addition Method

Step 1 Write both equations in standard form: $Ax + By = C$.
Step 2 Clear fractions or decimals (optional).
Step 3 Multiply one or both equations by nonzero constants to create opposite coefficients for one of the variables.
Step 4 Add the equations from step 3 to eliminate one variable.
Step 5 Solve for the remaining variable.
Step 6 Substitute the known value found in step 5 into one of the original equations to solve for the other variable.
Step 7 Check the ordered pair in each equation and write the solution set.

EXAMPLE 3 Solving a System of Equations by the Addition Method

Solve the system by using the addition method.

$$\begin{aligned} 5x &= 4y + 6 \\ -3x + 7y &= 1 \end{aligned}$$

Solution:

$$\begin{aligned} 5x &= 4y + 6 \\ -3x + 7y &= 1 \end{aligned} \xrightarrow{\text{Subtract } 4y.} \begin{aligned} 5x - 4y &= 6 \\ -3x + 7y &= 1 \end{aligned}$$

Step 1: Write each equation in standard form: $Ax + By = C$.
Step 2: There are no decimals or fractions.

$$\begin{aligned} 5x - 4y &= 6 \\ -3x + 7y &= 1 \end{aligned} \xrightarrow{\text{Multiply by 3.}} \xrightarrow{\text{Multiply by 5.}} \begin{aligned} 15x - 12y &= 18 \\ -15x + 35y &= 5 \\ \hline 23y &= 23 \end{aligned}$$

Step 3: Multiply the first equation by 3. Multiply the second equation by 5.
Step 4: Add the equations to eliminate x.

$$y = 1$$

Step 5: Solve for y.

TIP In Example 3, the variable x was eliminated.

Alternatively, we could have eliminated y by multiplying the first equation by 7 and the second equation by 4. This would create new equations with coefficients of -28 and 28 on the y terms.

$$\begin{aligned} 5x &= 4y + 6 \\ 5x &= 4(1) + 6 \\ 5x &= 10 \\ x &= 2 \end{aligned}$$

Step 6: Substitute $y = 1$ into one of the original equations to solve for x.

Step 7: Check the ordered pair (2, 1) in each original equation.

$5x = 4y + 6$ | $-3x + 7y = 1$
$5(2) \stackrel{?}{=} 4(1) + 6$ | $-3(2) + 7(1) \stackrel{?}{=} 1$
$10 \stackrel{?}{=} 4 + 6$ ✓ true | $-6 + 7 \stackrel{?}{=} 1$ ✓ true

The solution set is $\{(2, 1)\}$.

Skill Practice 3 Solve the system by using the addition method.

$$\begin{aligned} 2x - 9y &= 1 \\ 3x &= 17 - 2y \end{aligned}$$

Answer
3. $\{(5, 1)\}$

ISTUDY

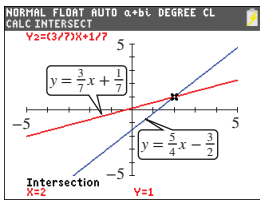
TECHNOLOGY CONNECTIONS

Solving a System of Linear Equations in Two Variables Using Intersect

The solution to a system of linear equations can be checked on a graphing calculator by first writing the equations in slope-intercept form. From Example 3 we have

$$5x = 4y + 6 \longrightarrow y = \frac{5}{4}x - \frac{3}{2}$$

$$-3x + 7y = 1 \longrightarrow y = \frac{3}{7}x + \frac{1}{7}$$



Then graph the equations and use the Intersect feature to approximate the point of intersection. The Intersect feature gives the solution (2, 1).

It is important to write the individual equations in a system of equations in standard form so that the variables line up. Also consider clearing decimals or fractions within an equation to make integer coefficients.

EXAMPLE 4 Solving a System of Equations by the Addition Method

Solve the system by using the addition method.

$$\frac{2}{5}x - y = \frac{19}{10}$$
$$5(x + y) = -7y - 41$$

Solution:

$$\frac{2}{5}x - y = \frac{19}{10} \xrightarrow{\text{Multiply by 10.}} 4x - 10y = 19$$
$$5(x + y) = -7y - 41 \xrightarrow{\text{Simplify.}} 5x + 12y = -41$$

Clear the fractions in the first equation. Write the second equation in standard form.

$$4x - 10y = 19 \xrightarrow{\text{Multiply by } -5.} -20x + 50y = -95$$
$$5x + 12y = -41 \xrightarrow{\text{Multiply by 4.}} 20x + 48y = -164$$
$$98y = -259$$

The LCM of the x coefficients, 4 and 5, is 20. Create opposite coefficients on x of 20 and -20.

$$y = \frac{-259}{98}$$

Solve for y.

$$y = -\frac{37}{14}$$

Simplify to lowest terms.

ISTUDY

Substituting $y = -\frac{37}{14}$ back into one of the original equations to solve for x would be cumbersome. Alternatively, we can solve for x by repeating the addition method. This time we will eliminate y by creating opposite coefficients on the y terms and then solving for x.

$$\begin{array}{rl} 4x - 10y = 19 & \xrightarrow{\text{Multiply by 6.}} \quad 24x - 60y = 114 \\ 5x + 12y = -41 & \xrightarrow{\text{Multiply by 5.}} \quad 25x + 60y = -205 \\ & \hline 49x = -91 \end{array}$$

The LCM of 10 and 12 is 60. Create opposite coefficients of −60 and 60 on the y terms.

$$x = \frac{-91}{49}$$

Solve for y.

$$x = -\frac{13}{7}$$

Simplify.

The ordered pair $\left(-\frac{13}{7}, -\frac{37}{14}\right)$ checks in both original equations.
The solution set is $\left\{\left(-\frac{13}{7}, -\frac{37}{14}\right)\right\}$.

Point of Interest

The study of systems of linear equations is a topic in a broader branch of mathematics called linear algebra.

Skill Practice 4 Solve the system by using the addition method.

$$2(x - 2y) = y + 14$$
$$\frac{1}{2}x + \frac{7}{6}y = -\frac{13}{3}$$

The systems in Examples 1–4 each have one unique solution. That is, the lines represented by the two equations intersect in exactly one point. In Examples 5 and 6, we investigate systems with no solution or infinitely many solutions.

EXAMPLE 5 Identifying a System of Equations with No Solution

Solve the system.

$$\begin{aligned} 2x + y &= 4 \\ 6x + 3y &= 6 \end{aligned}$$

Solution:

$$\begin{array}{rl} 2x + y = 4 & \xrightarrow{\text{Multiply by } -3.} \quad -6x - 3y = -12 \\ 6x + 3y = 6 & \longrightarrow \quad 6x + 3y = 6 \\ & \hline 0 = -6 \end{array}$$

We can eliminate either the x terms or y terms by multiplying the first equation by −3.

Both the x and y terms are eliminated, leading to the contradiction $0 = -6$.

The system of equations reduces to a contradiction. This indicates that there is no solution and the system is inconsistent. The equations represent parallel lines, and two parallel lines do not intersect.

The solution set is { }.

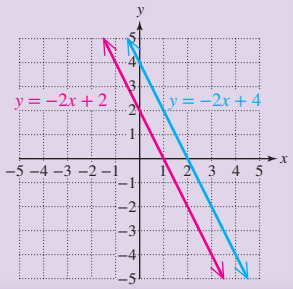
Avoiding Mistakes

To verify that the system in Example 5 has no solution, write the equations in slope-intercept form.

$2x + y = 4 \Rightarrow y = -2x + 4$

$6x + 3y = 6 \Rightarrow y = -2x + 2$

The equations have the same slope, but different y-intercepts. Therefore, the lines are parallel and do not intersect.



Skill Practice 5 Solve the system.

$$\begin{aligned} 3x - y &= 2 \\ -9x + 3y &= 4 \end{aligned}$$

Answers

4. $\left\{\left(-\frac{32}{29}, -\frac{94}{29}\right)\right\}$ 5. { }

EXAMPLE 6 Solving a System of Dependent Equations

Solve the system. $y = 2x - 1$
$8x - 4y = 4$

Solution:

$y = 2x - 1$
$8x - 4y = 4$

$8x - 4(2x - 1) = 4$ — With y already isolated in the first equation, apply the substitution method.

$8x - 8x + 4 = 4$ — Solve the resulting equation.

$4 = 4$ — Identity.

Notice that both the variable terms and the constant terms were eliminated. The system of equations is reduced to the identity $4 = 4$. Therefore, the two original equations are dependent and represent the same line. The solution set consists of an infinite number of ordered pairs (x, y) that fall on the common line of intersection, $y = 2x - 1$. Therefore, the solutions are ordered pairs of the form $(x, 2x - 1)$.

The solution set is $\{(x, 2x - 1) \mid x \text{ is any real number}\}$.

Avoiding Mistakes

To verify the solution to Example 6, write the two equations in slope-intercept form.

$y = 2x - 1 \Rightarrow y = 2x - 1$
$8x - 4y = 4 \Rightarrow y = 2x - 1$

The equations have the same slope-intercept form and define the same line.

Skill Practice 6 Solve the system. $x = 5 - 3y$
$2x + 6y = 10$

TIP Sometimes the solution to a system of dependent equations is written with an arbitrary variable called a **parameter.** For example, letting t represent any real number, then the solution set to Example 6 can be written as $\{(t, 2t - 1) \mid t \text{ is a real number}\}$.

The solution set $\{(x, 2x - 1) \mid x \text{ is any real number})\}$ is called the **general solution** to the system in Example 6. By varying the value of x, we can produce any number of specific solutions to the system of equations. For example:

	$(x, 2x - 1)$	Solution
If $x = 1$	$(1, 2(1) - 1)$	$(1, 1)$
If $x = 2$	$(2, 2(2) - 1)$	$(2, 3)$
If $x = 3$	$(3, 2(3) - 1)$	$(3, 5)$
If $x = -1$	$(-1, 2(-1) - 1)$	$(-1, -3)$

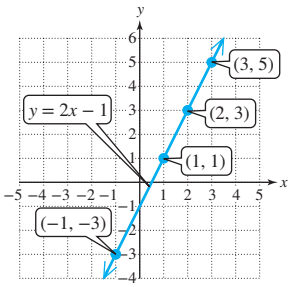


Figure 9-3

Notice that the solutions fall on the common line of intersection as expected (Figure 9-3).

TIP The equations $y = 2x - 1$ and $8x - 4y = 4$ represent the same relationship between x and y. Therefore, we have only one unique equation, but two variables. As a result, y *depends* on the choice of x and vice versa.

We should also note that the general solution to a system of dependent equations can be written in a variety of forms. For instance, the solutions to the system in Example 6 fall on the line $y = 2x - 1$. By solving the equation for x, we have $x = \frac{y + 1}{2}$. Thus, the solution set can also be written as $\left\{\left(\frac{y + 1}{2}, y\right) \middle| y \text{ is any real number}\right\}$.

3. Use Systems of Linear Equations in Applications

When solving an application involving two unknowns, sometimes it is convenient to use a system of two independent equations as demonstrated in Examples 7–9.

EXAMPLE 7 Solving an Application Involving Mixtures

A hospital uses a 15% bleach solution to disinfect a quarantine area. How much 6% bleach solution must be mixed with an 18% bleach solution to make 50 L of a 15% bleach solution?

Answer

6. $\left\{\left(x, \frac{-x + 5}{3}\right) \middle| x \text{ is any real number}\right\}$
or $\{(5 - 3y, y) \mid y \text{ is any real number}\}$

Solution:

Let x represent the amount of 6% bleach solution.

Let y represent the amount of 18% bleach solution.

The amount of pure bleach in each mixture is found by multiplying the amount of solution by the concentration rate. This information can be organized in a table.

	6% Solution	18% Solution	15% Solution
Amount of mixture	x	y	50
Amount of pure bleach	$0.06x$	$0.18y$	$0.15(50)$

There are two unknown quantities. We will set up a system of two independent equations relating x and y.

$$\begin{pmatrix}\text{Amount of}\\ \text{6\% mixture}\end{pmatrix} + \begin{pmatrix}\text{Amount of}\\ \text{18\% mixture}\end{pmatrix} = \begin{pmatrix}\text{Amount of}\\ \text{15\% mixture}\end{pmatrix}$$

$$\begin{pmatrix}\text{Amount of}\\ \text{pure bleach in}\\ \text{6\% mixture}\end{pmatrix} + \begin{pmatrix}\text{Amount of}\\ \text{pure bleach in}\\ \text{18\% mixture}\end{pmatrix} = \begin{pmatrix}\text{Amount of}\\ \text{pure bleach in}\\ \text{15\% mixture}\end{pmatrix}$$

$$x + y = 50$$

$$0.06x + 0.18y = 0.15(50)$$

$$\begin{aligned} x + y &= 50 \\ 0.06x + 0.18y &= 7.5 \end{aligned} \xrightarrow[\text{Multiply by 100.}]{} \begin{aligned} x + y &= 50 \\ 6x + 18y &= 750 \end{aligned} \xrightarrow[\text{Divide by } -6.]{} \begin{aligned} x + y &= 50 \\ -x - 3y &= -125 \\ \hline -2y &= -75 \\ y &= 37.5 \end{aligned}$$

Substitute $y = 37.5$ back into the equation $x + y = 50$.

$$\begin{aligned} x + y &= 50 \\ x + 37.5 &= 50 \\ x &= 12.5 \end{aligned}$$

Therefore, 12.5 L of the 6% bleach solution should be mixed with 37.5 L of the 18% bleach solution to make 50 L of 15% bleach solution.

Avoiding Mistakes

Check that the answer is reasonable. The total amount of the resulting solution is 12.5 L + 37.5 L, which is 50 L.

Amount of pure bleach:
0.06(12.5 L) = 0.75 L
0.18(37.5 L) = 6.75 L
0.15(50 L) = 7.5 L ✓

Skill Practice 7 How many ounces of 20% and 35% acid solution should be mixed to produce 15 oz of 30% acid solution?

Answer

7. Mix 5 oz of 20% acid solution with 10 oz of 35% acid solution to make 15 oz of 30% acid solution.

EXAMPLE 8 Solving an Application Involving Uniform Motion

A riverboat traveling upstream against the current on the Mississippi River takes 3 hr to travel 24 mi. The return trip downstream with the current takes only 2 hr. Find the speed of the boat in still water and the speed of the current.

Solution:

Let b represent the speed of the boat in still water.

Let c represent the speed of the current.

The given information can be organized in a table.

	Distance (mi)	Rate (mph)	Time (hr)
Upstream	24	$b - c$	3
Downstream	24	$b + c$	2

ISTUDY

Use the relationship $d = rt$; that is, distance = (rate)(time).

$$\begin{pmatrix}\text{Distance}\\ \text{upstream}\end{pmatrix} = \begin{pmatrix}\text{Rate}\\ \text{upstream}\end{pmatrix}\begin{pmatrix}\text{Time}\\ \text{upstream}\end{pmatrix} \longrightarrow 24 = (b - c) \cdot 3$$

$$\begin{pmatrix}\text{Distance}\\ \text{downstream}\end{pmatrix} = \begin{pmatrix}\text{Rate}\\ \text{downstream}\end{pmatrix}\begin{pmatrix}\text{Time}\\ \text{downstream}\end{pmatrix} \longrightarrow 24 = (b + c) \cdot 2$$

$$\begin{aligned} 24 &= 3b - 3c \xrightarrow{\text{Divide by 3.}} 8 = b - c \\ 24 &= 2b + 2c \xrightarrow{\text{Divide by 2.}} \underline{12 = b + c} \\ & \qquad\qquad 20 = 2b \\ & \qquad\qquad 10 = b \end{aligned}$$

Substitute $b = 10$ into the equation $12 = b + c$, which gives $c = 2$.
The boat's speed in still water is 10 mph and the speed of the current is 2 mph.

Avoiding Mistakes

Check that the answer is reasonable.

Speed upstream
(10 − 2) mph is 8 mph

Speed downstream
(10 + 2) mph is 12 mph

Distance upstream
24 mi = (8 mph)(3 hr) ✓

Distance downstream
24 mi = (12 mph)(2 hr) ✓

Skill Practice 8 A boat takes 3 hr to go 24 mi upstream against the current. It can go downstream with the current a distance of 48 mi in the same amount of time. Determine the speed of the boat in still water and the speed of the current.

EXAMPLE 9 Applying a System of Equations in Business

A lawn service company has fixed monthly costs of $500 and variable costs (labor, gasoline, and depreciation) of $40 per lawn. If the service charges $60 per lawn,

a. Write a cost function representing the cost $C(x)$ to the company to service x lawns per month.

b. Write a revenue function representing the revenue $R(x)$ to service x lawns per month.

c. Determine the number of lawns that must be serviced in a month for the company to break even.

TIP Notice that the result of Example 9(c) is found by solving the system of equations found in parts (a) and (b).

$$y = 500 + 40x$$
$$y = 60x$$

Solution:

Let x represent the number of lawns serviced for a given month.

a. $$\begin{pmatrix}\text{Monthly}\\ \text{cost}\end{pmatrix} = \begin{pmatrix}\text{Fixed}\\ \text{cost}\end{pmatrix} + \begin{pmatrix}\text{Variable}\\ \text{cost}\end{pmatrix} \longrightarrow C(x) = 500 + 40x$$

b. $$\begin{pmatrix}\text{Monthly}\\ \text{Revenue}\end{pmatrix} = \begin{pmatrix}\text{Revenue}\\ \text{per lawn}\end{pmatrix}\begin{pmatrix}\text{Number}\\ \text{of lawns}\end{pmatrix} \longrightarrow R(x) = 60x$$

c. To break even, the cost must equal revenue, $C(x) = R(x)$.

$$\begin{aligned} 500 + 40x &= 60x \\ 500 &= 20x \\ x &= 25 \end{aligned}$$

To break even, the company must service 25 lawns.

Avoiding Mistakes

Check that the answer is reasonable.

$$C(25) = 500 + 40(25)$$
$$= \$1500$$
$$R(25) = 60(25)$$
$$= \$1500$$

Cost and revenue are the same for 25 lawns serviced.

Skill Practice 9 A storage company rents its units for $120 per month. The company has fixed monthly costs of $2100 and variable costs (air-conditioning and service) of $50 per unit.

a. Write a cost function representing the monthly cost $C(x)$ to the company for x units.

b. Write a revenue function representing the revenue $R(x)$ when x units per month are rented.

c. Determine the number of units that must be rented in a month for the company to break even.

Answers

8. The boat's speed in still water is 12 mph and the speed of the current is 4 mph.

9. a. $C(x) = 2100 + 50x$
b. $R(x) = 120x$
c. 30 units

ISTUDY

SECTION 9.1 Practice Exercises

Prerequisite Review

For Exercises R.1–R.4, solve the equation.

R.1. $4 = 3 + 3(3x + 1)$

R.2. $0.65(x - 6) + 0.35(x + 4) = 0.5$

R.3. $3(7 - 4n) + 2 = -2n - 3 - 10n$

R.4. $-4 + 3x = 3(x - 3) + 5$

R.5. Graph the equation and identify the x- and y-intercepts. $4x + y = 4$

R.6. Graph the equation and identify the slope and y-intercept. $-x + 5y = -5$

Concept Connections

1. Two or more linear equations taken together make up a _____ of linear equations.

2. A _____ to a system of equations in two variables is an ordered pair that is a solution to each individual equation in the system.

3. Two algebraic methods to solve a system of linear equations in two variables are the _____ method and the _____ method.

4. A system of linear equations in two variables may have no solution. In such a case, the equations represent _____ lines.

5. A system of equations that has no solution is called an _____ system.

6. A system of linear equations in two variables may have infinitely many solutions. In such a case, the equations are said to be _____.

Objective 1: Identify Solutions to Systems of Linear Equations in Two Variables

For Exercises 7–10, determine if the ordered pair is a solution to the system of equations. (See Example 1)

7. $3x - 5y = -7$
$x - 4y = -7$

a. $(1, 2)$

b. $\left(-\frac{2}{3}, 1\right)$

8. $-11x + 6y = -4$
$7x + 3y = 23$

a. $\left(1, \frac{7}{6}\right)$

b. $(2, 3)$

9. $y = \frac{3}{2}x - 5$
$6x - 4y = 20$

a. $(2, -2)$

b. $(-4, -11)$

10. $y = -\frac{1}{5}x + 2$
$2x + 10y = 10$

a. $(5, 1)$

b. $(-10, 4)$

For Exercises 11–14, a system of equations is given in which each equation is written in slope-intercept form. Determine the number of solutions. If the system does not have one unique solution, state whether the system is inconsistent or whether the equations are dependent.

11. $y = \frac{2}{5}x - 7$
$y = \frac{1}{4}x + 7$

12. $y = 6x - \frac{2}{3}$
$y = 6x + 4$

13. $y = 8x - \frac{1}{2}$
$y = 8x - \frac{1}{2}$

14. $y = \frac{1}{2}x + 3$
$y = 2x + \frac{1}{3}$

Objective 2: Solve Systems of Linear Equations in Two Variables

For Exercises 15–20, solve the system of equations by using the substitution method. (See Example 2)

15. $x + 3y = 5$
$3x - 2y = -18$

16. $2x + y = 2$
$5x + 3y = 9$

17. $2x + 7y = 1$
$3y - 7 = 2$

18. $3x = 2y - 11$
$6 + 5x = 1$

19. $2(x + y) = 2 - y$
$4x - 1 = 2 - 5y$

20. $5(x + y) = 9 + 2y$
$6y - 2 = 10 - 7x$

ISTUDY

For Exercises 21–28, solve the system of equations by using the addition method. (See Examples 3–4)

21. $3x - 7y = 1$
$6x + 5y = -17$

22. $5x - 2y = -2$
$3x + 4y = 30$

23. $11x = -5 - 4y$
$2(x - 2y) = 22 + y$

24. $-3(x - y) = y - 14$
$2x + 2 = 7y$

25. $0.6x + 0.1y = 0.4$
$2x - 0.7y = 0.3$

26. $0.25x - 0.04y = 0.24$
$0.15x - 0.12y = 0.12$

27. $2x + 11y = 4$
$3x - 6y = 5$

28. $3x - 4y = 9$
$2x + 9y = 2$

For Exercises 29–34, solve the system by using any method. If a system does not have one unique solution, state whether the system is inconsistent or whether the equations are dependent. (See Examples 9–6)

29. $3x - 4y = 6$
$9x = 12y + 4$

30. $-4x - 8y = 2$
$2x = 8 - 4y$

31. $3x + y = 6$
$x + \frac{1}{3}y = 2$

32. $2x - y = 8$
$x - \frac{1}{2}y = 4$

33. $2x + 4 = 4 - 5y$
$2 + 4(x + y) = 7y + 2$

34. $3(x - 3y) = 2y$
$2x + 5 = 5 - 7y$

For Exercises 35–36,

a. Write the general solution.

b. Find three individual solutions. Answers will vary.

35. $-5x - y = 6$
$10x = -2(y + 6)$

36. $2y = 6 - 4x$
$8x = 12 - 4y$

Mixed Exercises

For Exercises 37–50, solve the system using any method.

37. $3x - 10y = 1900$
$5y + 800 = x$

38. $2x - 7y = 2400$
$-4x + 1800 = y$

39. $5(2x + y) = y - x - 8$
$x - \frac{3}{2}y = \frac{5}{2}$

40. $3(2x - y) = 2 - x$
$x + \frac{5}{4}y = \frac{3}{2}$

41. $y = \frac{2}{3}x - 1$
$y = \frac{1}{6}x + 2$

42. $y = -\frac{1}{4}x + 7$
$y = -\frac{3}{2}x + 17$

43. $4(x - 2) = 6y + 3$
$\frac{1}{4}x - \frac{3}{8}y = -\frac{1}{2}$

44. $\frac{1}{14}x - \frac{1}{7}y = \frac{1}{2}$
$2(x - 2y) + 3 = 20$

45. $2x = \frac{y}{2} + 1$
$0.04x - 0.01y = 0.02$

46. $0.05x + 0.01y = 0.03$
$x + \frac{y}{5} = \frac{3}{5}$

47. $y = 2.4x - 1.54$
$y = -3.5x + 7.9$

48. $y = -0.18x + 0.129$
$y = -0.15x + 0.1275$

49. $\frac{x - 2}{8} + \frac{y + 1}{2} = -6$
$\frac{x - 2}{2} - \frac{y + 1}{4} = 12$

50. $\frac{x + 1}{2} - \frac{y - 2}{10} = -1$
$\frac{x + 1}{6} + \frac{y - 2}{2} = 21$

Objective 3: Use Systems of Linear Equations in Applications

51. One antifreeze solution is 36% alcohol and another is 20% alcohol. How much of each mixture should be added to make 40 L of a solution that is 30% alcohol? (**See Example 7**)

52. A pharmacist wants to mix a 30% saline solution with a 10% saline solution to get 200 mL of a 12% saline solution. How much of each solution should be used?

ISTUDY

53. A radiator has 16 L of a 36% antifreeze solution. How much must be drained and replaced by pure antifreeze to bring the concentration level up to 50%?

54. A student performed an experiment for a science fair project and learned that rinsing lettuce in vinegar kills more bacteria than rinsing with water or with a popular commercial product. As a follow-up to the project, the student wants to determine the percentage of bacteria killed by rinsing with a diluted solution of vinegar.

a. How much water and how much vinegar should be mixed to produce 10 cups of a mixture that is 40% vinegar?

b. How much pure vinegar and how much 40% vinegar solution should be mixed to produce 10 cups of a mixture that is 60% vinegar?

55. Michelle borrows a total of $5000 in student loans from two lenders. One charges 4.6% simple interest and the other charges 6.2% simple interest. She is not required to pay off the principal or interest for 3 yr. However, at the end of 3 yr, she will owe a total of $762 for the interest from both loans. How much did she borrow from each lender?

56. Juan borrows $100,000 to pay for medical school. Part of the money is borrowed at 4.5% simple interest. The rest is borrowed through a government loan at 6% interest. In both cases Juan is not required to pay off the principal or interest while in medical school. However, at the end of 4 yr, Juan will owe a total of $19,200 for the interest from both loans. How much was borrowed from each source?

57. Hakeem pays back two student loans over a 4-yr period. One loan charges the equivalent of 3% simple interest and the other charges the equivalent of 5.5% simple interest. If the total amount borrowed was $24,000 and the total amount of interest paid after 4 yr is $3280, find the amount borrowed from each loan.

58. A total of $6000 is invested for 5 yr with a total return of $1080. Part of the money is invested in a fund that returns the equivalent of 2% simple interest. The rest of the money is invested at 4% simple interest. Determine the amount invested in each account.

59. Monique and Tara each make an ice cream sundae. Monique gets 2 scoops of Cherry ice cream and 1 scoop of Mint Chocolate Chunk ice cream for a total of 43 g of fat. Tara has 1 scoop of Cherry and 2 scoops of Mint Chocolate Chunk for a total of 47 g of fat. How many grams of fat does 1 scoop of each type of ice cream have?

60. Bryan and Jadyn had barbeque potato chips and soda at a football party. Bryan ate 3 oz of chips and drank 2 cups of soda for a total of 700 mg of sodium. Jadyn ate 1 oz of chips and drank 3 cups of soda for a total of 350 mg of sodium. How much sodium is in 1 oz of chips and how much is in 1 cup of soda?

61. The average weekly salary of two employees is $1350. One makes $300 more than the other. Find their salaries.

62. The average of an electrician's hourly wage and a plumber's hourly wage is $33. One day a contractor hires the electrician for 8 hr of work and the plumber for 5 hr of work and pays a total of $438 in wages. Find the hourly wage for the electrician and for the plumber.

63. A moving sidewalk in an airport moves people between gates. It takes Jason's 9-year-old daughter Josie 40 sec to travel 200 ft walking with the sidewalk. It takes 30 sec to walk 90 ft against the moving sidewalk (in the opposite direction). Find the speed of the sidewalk and find Josie's speed walking on non-moving ground. (**See Example 8**)

64. A fishing boat travels along the east coast of the United States and encounters the Gulf Stream current. It travels 44 mi north with the current in 2 hr. It travels 56 mi south against the current in 4 hr. Find the speed of the current and the speed of the boat in still water.

65. Two runners begin at the same point on a 390-m circular track and run at different speeds. If they run in opposite directions, they pass each other in 30 sec. If they run in the same direction, they meet each other in 130 sec. Find the speed of each runner.

66. Two particles begin at the same point and move at different speeds along a circular path of circumference 280 ft. Moving in opposite directions, they pass in 10 sec. Moving in the same direction, they pass in 70 sec. Find the speed of each particle.

67. A cleaning company charges $100 for each office it cleans. The fixed monthly cost of $480 for the company includes telephone service and the depreciation on cleaning equipment and a van. The variable cost is $52 per office and includes labor, gasoline, and cleaning supplies. **(See Example 9)**

a. Write a linear cost function representing the cost $C(x)$ (in $) to the company to clean x offices per month.

b. Write a linear revenue function representing the revenue $R(x)$ (in $) for cleaning x offices per month.

c. Determine the number of offices to be cleaned per month for the company to break even.

d. If 28 offices are cleaned, will the company make money or lose money?

ISTUDY

68. A vendor at a carnival sells cotton candy and caramel apples for \$2.00 each. The vendor is charged \$100 to set up the booth. Furthermore, the vendor's average cost for each product produced is approximately \$0.75.

a. Write a linear cost function representing the cost $C(x)$ (in \$) to the vendor to produce x products.

b. Write a linear revenue function representing the revenue $R(x)$ (in \$) for selling x products.

c. Determine the number of products to be produced and sold for the vendor to break even.

d. If 60 products are sold, will the vendor make money or lose money?

For Exercises 69–70, refer to Figure 9-1 and the narrative on page 844.

69. Suppose that the price p (in \$) of theater tickets is influenced by the number of tickets x offered by the theater and demanded by consumers.

Supply: $p = 0.025x$

Demand: $p = -0.04x + 104$

a. Solve the system of equations defined by the supply and demand models.

b. What is the equilibrium price?

c. What is the equilibrium quantity?

70. The price p (in \$) of a cookbook is determined by the number of cookbooks x demanded by consumers and supplied by the publisher.

Supply: $p = 0.002x$

Demand: $p = -0.005x + 70$

a. Solve the system of equations defined by the supply and demand models.

b. What is the equilibrium price?

c. What is the equilibrium quantity?

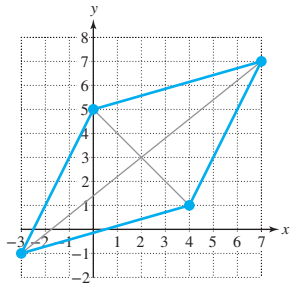
71. a. Sketch the lines defined by $y = 2x$ and $y = -\frac{1}{2}x + 5$.

b. Find the area of the triangle bounded by the lines in part (a) and the x-axis.

72. a. Sketch the lines defined by $y = x + 2$ and $y = -\frac{1}{2}x + 2$.

b. Find the area of the triangle bounded by the lines in part (a) and the x-axis.

73. The **centroid** of a region is the geometric center. For the region shown, the centroid is the point of intersection of the diagonals of the parallelogram.

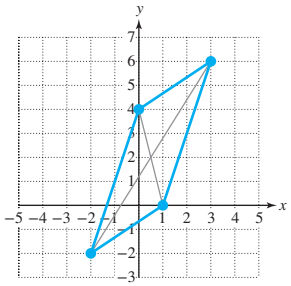


a. Find an equation of the line through the points $(-3, -1)$ and $(7, 7)$.

b. Find an equation of the line through the points $(0, 5)$ and $(4, 1)$.

c. Find the centroid of the region.

74. The centroid of the region shown is the point of intersection of the diagonals of the parallelogram.



a. Find an equation of the line through the points $(-2, -2)$ and $(3, 6)$.

b. Find an equation of the line through the points $(1, 0)$ and $(0, 4)$.

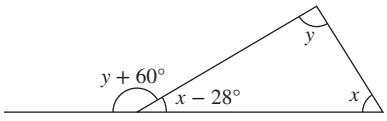
c. Find the centroid of the region.

75. Two angles are complementary. The measure of one angle is 6° less than twice the measure of the other angle. Find the measure of each angle.

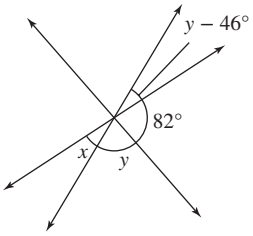
76. Two angles are supplementary. The measure of one angle is 12° more than 5 times the measure of the other angle. Find the measure of each angle.

For Exercises 77–78, find the measure of angles x and y.

77.



78.



Mixed Exercises

79. Write a system of linear equations with solution set $\{(-3, 5)\}$.

80. Write a system of linear equations with solution set $\{(4, -3)\}$.

81. Find C and D so that the solution set to the system is $\{(4, 1)\}$.

$$Cx + 5y = 13$$
$$-2x + Dy = -5$$

82. Find A and B so that the solution set to the system is $\{(-5, 2)\}$.

$$3x + Ay = -3$$
$$Bx - y = -12$$

ISTUDY

83. Given $f(x) = mx + b$, find m and b if $f(3) = -3$ and $f(-12) = -8$.

84. Given $g(x) = mx + b$, find m and b if $g(2) = 1$ and $g(-4) = 10$.

For Exercises 85–86, find an equation of the form $y = ax^2 + b$ for a parabola that passes through the given points.

85. $(1, -1)$ and $(2, -7)$

86. $(3, 9)$ and $\left(1, \frac{11}{3}\right)$

For Exercises 87–88, use the substitution $u = \frac{1}{x}$ and $v = \frac{1}{y}$ to rewrite the equations in the system in terms of the variables u and v. Solve the system in terms of u and v. Then back substitute to determine the solution set to the original system in terms of x and y.

87.
$$\frac{1}{x} + \frac{2}{y} = 1$$
$$-\frac{1}{x} + \frac{4}{y} = -7$$

88.
$$-\frac{3}{x} + \frac{4}{y} = 11$$
$$\frac{1}{x} - \frac{2}{y} = -5$$

89. During a race, Marta bicycled 12 mi and ran 4 mi in a total of 1 hr 20 min $\left(\frac{4}{3}\text{ hr.}\right)$ In another race, she bicycled 21 mi and ran 3 mi in 1 hr 40 min $\left(\frac{5}{3}\text{ hr}\right)$. Determine the speed at which she bicycles and the speed at which she runs. Assume that her bicycling speed was the same in each race and that her running speed was the same in each race.

90. Shelia swam 1 mi and ran 6 mi in a total of 1 hr 15 min $\left(\frac{5}{4}\text{ hr}\right)$. In another training session she swam 2 mi and ran 8 mi in a total of 2 hr. Determine the speed at which she swims and the speed at which she runs. Assume that her swimming speed was the same each day and that her running speed was the same each day.

91. A certain pickup truck gets 16 mpg in the city and 22 mpg on the highway. If a driver drives 254 mi on 14 gal of gas, determine the number of city miles and highway miles that the truck was driven.

92. A sedan gets 12 mpg in the city and 18 mpg on the highway. If a driver drives a total of 420 mi on 26 gal of gas, how many miles in the city and how many miles on the highway did he drive?

Write About It

93. A system of linear equations in x and y can represent two intersecting lines, two parallel lines, or a single line. Describe the solution set to the system in each case.

94. When solving a system of linear equations in two variables using the substitution or addition method, explain how you can detect whether the equations are dependent.

95. When solving a system of linear equations in two variables using the substitution or addition method, explain how you can detect whether the system is inconsistent.

96. Consider a system of linear equations in two variables in which the solution set is $\{(x, x + 2) | x \text{ is any real number}\}$. Why do we say that the equations in the system are dependent?

Expanding Your Skills

For Exercises 97–102, solve for x and y. Assume that a and b are constant real numbers.

97.
$$\frac{2}{x+y} + \frac{3}{x-y} = 16a$$
$$\frac{5}{x+y} - \frac{1}{x-y} = 23a$$
where $a \neq 0$

98.
$$3(x + y) + 4(x - y) = 8a + 7b - 1$$
$$5(x - y) - 4(x + y) = 10a + b - 9$$

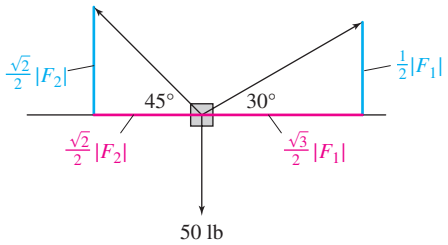
99.
$$3x - 4y = -a - 7b$$
$$\frac{x - y}{2} = -b$$

100.
$$5x + 6y = ab + 11$$
$$\frac{x + y}{2} - \frac{x}{2} = \frac{1 + ab}{2}$$

101.
$$2(x - y) + 3(x + y) = 5a + 2ab$$
$$ax - \frac{b}{2a}y = a^2 - b^2$$
where $a \neq 0$ and $2a^2 + 5b \neq 0$

102.
$$6(x + y) + 3(x - y) = 18a$$
$$x - 2y = 16a$$

103. A 50-lb weight is supported from two cables and the system is in equilibrium. The magnitudes of the forces on the cables are denoted by $|F_1|$ and $|F_2|$, respectively. An engineering student knows that the horizontal components of the two forces (shown in red) must be equal in magnitude. Furthermore, the sum of the magnitudes of the vertical components of the forces (shown in blue) must be equal to 50 lb to offset the downward force of the weight. Find the values of $|F_1|$ and $|F_2|$. Write the answers in exact form with no radical in the denominator. Also give approximations to 1 decimal place.



ISTUDY

Technology Connections

For Exercises 104–107, use a graphing utility to approximate the solution to the system of equations. Round the x and y values to 3 decimal places.

104. $y = -3.729x + 6.958$
$y = 2.615x - 8.713$

105. $y = -0.041x + 0.068$
$y = 0.019x - 0.053$

106. $-0.25x + 0.04y = -0.42$
$6.775x + 2.5y = -38.1$

107. $0.36x - 0.075y = -0.813$
$0.066x + 0.008y = 0.194$

SECTION 9.2 Systems of Linear Equations in Three Variables and Applications

OBJECTIVES

1. Identify Solutions to a System of Linear Equations in Three Variables
2. Solve Systems of Linear Equations in Three Variables
3. Use Systems of Linear Equations in Applications
4. Modeling with Linear Equations in Three Variables

1. Identify Solutions to a System of Linear Equations in Three Variables

In Section 9.1 we solved systems of linear equations in two variables. In this section, we expand the discussion to solving systems involving three variables. A **linear equation in three variables** is an equation that can be written in the form

$$Ax + By + Cz = D, \text{ where } A, B, \text{ and } C \text{ are not all zero.}$$

For example, $x + 2y + z = 4$ is a linear equation in three variables. A solution to a linear equation in three variables is an ordered triple (x, y, z) that satisfies the equation. For example, several solutions to $x + 2y + z = 4$ are given here.

Solution	Check: $x + 2y + z = 4$
(1, 1, 1)	$(1) + 2(1) + (1) \stackrel{?}{=} 4$ ✓ true
(4, 0, 0)	$(4) + 2(0) + (0) \stackrel{?}{=} 4$ ✓ true
(0, 2, 0)	$(0) + 2(2) + (0) \stackrel{?}{=} 4$ ✓ true
(0, 0, 4)	$(0) + 2(0) + (4) \stackrel{?}{=} 4$ ✓ true

There are infinitely many solutions to the equation $x + 2y + z = 4$. The set of all solutions to a linear equation in three variables can be represented graphically by a plane in space. Figure 9-4 shows a portion of the plane defined by $x + 2y + z = 4$.

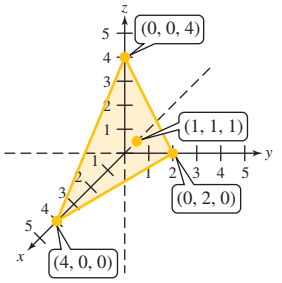


Figure 9-4

In many applications, we are interested in determining the point or points of intersection of two or more planes. This is given by the solutions to a system of linear equations in three variables. For example:

$$\begin{aligned} 2x + y - 3z &= -2 \\ x - 4y + z &= 24 \\ -3x - y + 4z &= 0 \end{aligned}$$

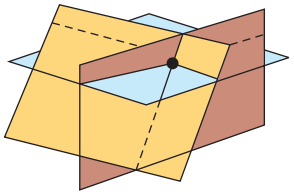

Figure 9-5

A solution to a system of linear equations in three variables is an **ordered triple** (x, y, z) that satisfies each equation in the system. Geometrically, a solution is a point of intersection of the planes represented by the equations in the system (Figure 9-5).

Point of Interest

Beautiful planar surfaces are seen in both art and architecture. For example, the great pyramid of Khufu outside Cairo, Egypt, has four triangular sides. The planes representing the sides form an angle of 52° with the ground.

Richard Nowitz/Digital Vision/Getty Images

EXAMPLE 1 Determining if an Ordered Triple Is a Solution to a System of Equations

Determine if the ordered triple is a solution to the system.

$$\begin{aligned} 2x + y - 3z &= -2 \\ x - 4y + z &= 24 \\ -3x - y + 4z &= 0 \end{aligned}$$

a. (3, −5, 1) **b.** (2, −3, 1)

Solution:

Test the ordered triple in each equation.

a.

First equation	Second equation	Third equation
$2x + y - 3z = -2$	$x - 4y + z = 24$	$-3x - y + 4z = 0$
$2(3) + (-5) - 3(1) \stackrel{?}{=} -2$	$(3) - 4(-5) + (1) \stackrel{?}{=} 24$	$-3(3) - (-5) + 4(1) \stackrel{?}{=} 0$
$-2 \stackrel{?}{=} -2$ ✓ true	$24 \stackrel{?}{=} 24$ ✓ true	$0 \stackrel{?}{=} 0$ ✓ true

The ordered triple $(3, -5, 1)$ is a solution to the system of equations.

b.

First equation	Second equation	Third equation
$2x + y - 3z = -2$	$x - 4y + z = 24$	$-3x - y + 4z = 0$
$2(2) + (-3) - 3(1) \stackrel{?}{=} -2$	$(2) - 4(-3) + (1) \stackrel{?}{=} 24$	$-3(2) - (-3) + 4(1) \stackrel{?}{=} 0$
$-2 \stackrel{?}{=} -2$ ✓ true	$15 \stackrel{?}{=} 24$ false	$1 \stackrel{?}{=} 0$ false

If an ordered triple fails to be a solution to any of the equations in the system, then it is not a solution to the system. The ordered triple $(2, -3, 1)$ is *not* a solution to the second or third equation. Therefore, $(2, -3, 1)$ is *not* a solution to the system of equations.

Skill Practice 1 Determine if the ordered triple is a solution to the system.

$$\begin{aligned} 5x - y + 3z &= -7 \\ 3x + 4y - z &= 5 \\ 9x + 5y + 7z &= 1 \end{aligned}$$

a. $(-2, -6, 3)$ **b.** $(-1, 2, 0)$

2. Solve Systems of Linear Equations in Three Variables

To solve a system of three linear equations in three variables, we first eliminate one variable. The system is then reduced to a two-variable system that can be solved by the techniques learned in Section 9.1.

Solving a System of Three Linear Equations in Three Variables

Step 1 Write each equation in standard form $Ax + By + Cz = D$.

Step 2 Choose a pair of equations and eliminate one of the variables by using the addition method.

Step 3 Choose a different pair of equations and eliminate the *same* variable.

Step 4 Once steps 2 and 3 are complete, the resulting system has two equations in two variables. Solve this system by using the substitution or addition method.

Step 5 Substitute the values of the variables found in step 4 into any of the three original equations that contain the third variable. Solve for the third variable.

Step 6 Check the ordered triple in each original equation. Then write the solution as an ordered triple in set notation.

EXAMPLE 2 Solving a System of Equations in Three Variables

Solve the system.

$$\begin{aligned} 3x - 2y + z &= 2 \\ 5x + y - 2z &= 1 \\ 4x - 3y + 3z &= 7 \end{aligned}$$

Answers

1. a. No **b.** Yes

ISTUDY

TIP In Example 2, the y terms can also be eliminated easily because the coefficient on y in equation [B] is 1. Therefore, y can be eliminated from equations [A] and [B] by multiplying equation [B] by 2. Likewise y can be eliminated from equations [B] and [C] by multiplying equation [B] by 3.

Solution:

[A] $3x - 2y + z = 2$
[B] $5x + y - 2z = 1$
[C] $4x - 3y + 3z = 7$

Step 1: The equations are already in standard form.
- It is helpful to label the equations [A], [B], and [C].
- The z variable can easily be eliminated from equations [A] and [B] and from equations [A] and [C]. This is accomplished by creating opposite coefficients for the z terms and then adding the equations.

Step 2: Eliminate z from equations [A] and [B].

[A] $3x - 2y + z = 2$
[B] $5x + y - 2z = 1$ —Multiply by 2.→ $6x - 4y + 2z = 4$

$$\begin{array}{r} 5x + y - 2z = 1 \\ \hline 11x - 3y = 5 \end{array}$$ [D]

Step 3: Eliminate z from equations [A] and [C].

[A] $3x - 2y + z = 2$
[C] $4x - 3y + 3z = 7$ —Multiply by −3.→ $-9x + 6y - 3z = -6$

$$\begin{array}{r} 4x - 3y + 3z = 7 \\ \hline -5x + 3y = 1 \end{array}$$ [E]

Step 4:

$$\begin{array}{rl} \text{[D]} & 11x - 3y = 5 \\ \text{[E]} & -5x + 3y = 1 \\ \hline & 6x = 6 \\ & x = 1 \end{array}$$

[D] $11(1) - 3y = 5$
$11 - 3y = 5$
$-3y = -6$
$y = 2$

Solve the system of equations [D] and [E].

[A] $3x - 2y + z = 2$
$3(1) - 2(2) + z = 2$
$3 - 4 + z = 2$
$-1 + z = 2$
$z = 3$

Step 5: Substitute the values of the known variables x and y back into one of the original equations. We have chosen equation [A].

Step 6: Check the ordered triple (1, 2, 3) in the three original equations.

[A] $3x - 2y + z = 2$
$3(1) - 2(2) + (3) \stackrel{?}{=} 2$
$2 \stackrel{?}{=} 2$ ✓ true

[B] $5x + y - 2z = 1$
$5(1) + (2) - 2(3) \stackrel{?}{=} 1$
$1 \stackrel{?}{=} 1$ ✓ true

[C] $4x - 3y + 3z = 7$
$4(1) - 3(2) + 3(3) \stackrel{?}{=} 7$
$7 \stackrel{?}{=} 7$ ✓ true

The solution set is $\{(1, 2, 3)\}$.

Skill Practice 2 Solve the system.

$$\begin{array}{r} 2x - y + 5z = -7 \\ x + 4y - 2z = 1 \\ 3x + 2y + z = -7 \end{array}$$

In Example 3, we solve a system of linear equations in which one or more equations has a missing term.

EXAMPLE 3 Solving a System of Equations in Three Variables

Solve the system.

$$\begin{array}{r} 2x + y = -2 \\ 3y = 5z - 12 \\ 5(x + z) = 2z + 5 \end{array}$$

Solution:

Step 1: Write the equations in standard form.

[A] $2x + y = -2$ ⟶ $2x + y = -2$
[B] $3y = 5z - 12$ ⟶ $3y - 5z = -12$
[C] $5(x + z) = 2z + 5$ ⟶ $5x + 3z = 5$

Notice that the equations already have missing variable terms.

Answer
2. $\{(-3, 1, 0)\}$

Steps 2 and 3: This system of equations has several missing terms. For example, equation C is missing the variable y. If we eliminate y from equations A and B, then we will have a second equation with variable y missing.

$$\begin{array}{ll} \text{A} & 2x + y \quad = -2 \\ \text{B} & \quad 3y - 5z = -12 \end{array} \xrightarrow{\text{Multiply by } -3.} \begin{array}{r} -6x - 3y \quad = 6 \\ 3y - 5z = -12 \\ \hline -6x \quad - 5z = -6 \quad \text{D} \end{array}$$

Step 4: Pair up equations C and D. These equations form a system of linear equations in two variables. To solve the system with equations C and D we have chosen to eliminate the z variable.

$$\begin{array}{ll} \text{C} & 5x + 3z = 5 \\ \text{D} & -6x - 5z = -6 \end{array} \begin{array}{l} \xrightarrow{\text{Multiply by 5.}} \\ \xrightarrow{\text{Multiply by 3.}} \end{array} \begin{array}{r} 25x + 15z = 25 \\ -18x - 15z = -18 \\ \hline 7x \quad = 7 \\ x = 1 \end{array}$$

$$\begin{array}{ll} \text{C} & 5x + 3z = 5 \\ & 5(1) + 3z = 5 \\ & 3z = 0 \\ & z = 0 \end{array}$$

$$\begin{array}{ll} \text{B} & 3y = 5z - 12 \\ & 3y = 5(0) - 12 \\ & 3y = -12 \\ & y = -4 \end{array}$$

Step 5: Substitute the values of the known variables x and z back into one of the original equations containing y. We have chosen equation B.

Step 6: The ordered triple $(1, -4, 0)$ checks in each original equation.

The solution set is $\{(1, -4, 0)\}$.

Skill Practice 3 Solve the system.

$$\begin{array}{r} a \quad + 3c = 4 \\ b + 2c = -1 \\ 2a - 4b \quad = 14 \end{array}$$

A system of linear equations in three variables may have no solution. This occurs if the equations represent planes that do not all intersect (Figure 9-6). In such a case, we say that the system is **inconsistent.**

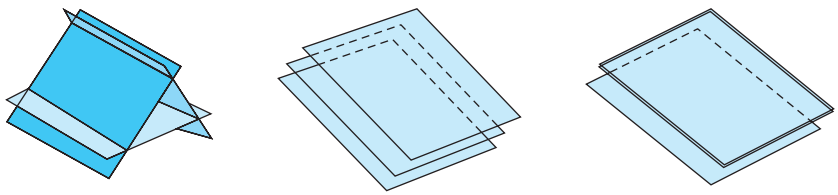

Figure 9-6

A system of linear equations in three variables may also have infinitely many solutions. This occurs if the equations represent planes that intersect in a common line or common plane (Figure 9-7). In such a case, we say that the equations are **dependent.**

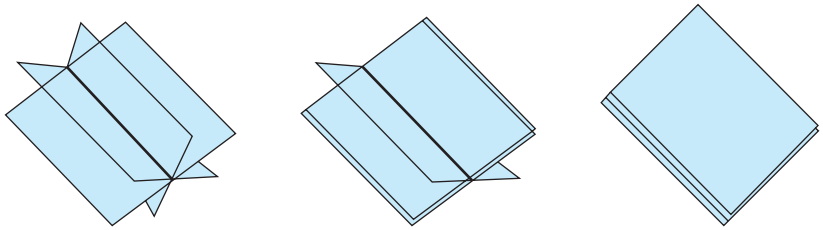

Figure 9-7

Answer
3. $\{(1, -3, 1)\}$

ISTUDY

EXAMPLE 4 Determining the Number of Solutions to a System

a. Determine the number of solutions to the system.
b. State whether the system is inconsistent or the equations are dependent.
c. Write the solution set.

$$\begin{aligned} -x + 6y - 3z &= -8 \\ x - 2y + 2z &= 3 \\ 3x + 2y + 4z &= -6 \end{aligned}$$

Solution:

Begin by eliminating a variable from two different pairs of equations. We will eliminate x from A and B and from A and C.

$$\begin{array}{ll} \text{A} & -x + 6y - 3z = -8 \\ \text{B} & x - 2y + 2z = 3 \\ \text{C} & 3x + 2y + 4z = -6 \end{array} \longrightarrow \begin{array}{r} -x + 6y - 3z = -8 \\ x - 2y + 2z = 3 \\ \hline 4y - z = -5 \quad \text{D} \end{array}$$

Add equations A and B to eliminate x.

$$\begin{array}{ll} \text{A} & -x + 6y - 3z = -8 \\ \text{C} & 3x + 2y + 4z = -6 \end{array} \xrightarrow[\text{by 3.}]{\text{Multiply}} \begin{array}{r} -3x + 18y - 9z = -24 \\ 3x + 2y + 4z = -6 \\ \hline 20y - 5z = -30 \quad \text{E} \end{array}$$

Multiply equation A by 3 and add the result to C.

$$\begin{array}{ll} \text{D} & 4y - z = -5 \\ \text{E} & 20y - 5z = -30 \end{array} \xrightarrow{\text{Multiply by } -5.} \begin{array}{r} -20y + 5z = 25 \\ 20y - 5z = -30 \\ \hline 0 = -5 \end{array}$$

Solving the system of equations D and E results in a contradiction.

The system of equations reduces to a contradiction.

a. There is no solution.
b. The system is inconsistent.
c. The solution set is { }.

Skill Practice 4 Repeat Example 4 with the given system.

$$\begin{aligned} x + y + 4z &= -1 \\ 3x + y - 4z &= 3 \\ -4x - y + 8z &= -2 \end{aligned}$$

In Example 5, we investigate the case in which a system of equations has infinitely many solutions.

EXAMPLE 5 Determining the Number of Solutions to a System

a. Determine the number of solutions to the system.
b. State whether the system is inconsistent, or the equations are dependent.
c. Write the solution set.

$$\begin{aligned} 2x + y &= -3 \\ 2y + 16z &= -10 \\ -7x - 3y + 4z &= 8 \end{aligned}$$

Solution:

Eliminate variable z from equations B and C.

$$\begin{array}{ll} \text{A} & 2x + y = -3 \\ \text{B} & 2y + 16z = -10 \\ \text{C} & -7x - 3y + 4z = 8 \end{array} \xrightarrow[\text{by } -4.]{\text{Multiply}} \begin{array}{r} 2y + 16z = -10 \\ 28x + 12y - 16z = -32 \\ \hline 28x + 14y = -42 \quad \text{D} \end{array}$$

Answers
4. **a.** There is no solution.
b. The system is inconsistent.
c. The solution set is { }.

ISTUDY

Pair up equations A and D to solve for x and y.

$$\begin{array}{ll} \text{A} & 2x + y = -3 \\ \text{D} & 28x + 14y = -42 \end{array} \xrightarrow[\text{Divide by } -14.]{} \begin{array}{r} 2x + y = -3 \\ -2x - y = 3 \\ \hline 0 = 0 \end{array}$$

The system reduces to the identity $0 = 0$. This implies that

a. There are infinitely many solutions.

b. The equations are dependent.

c. To find the general solution, we need to express the dependency among the variables as an ordered triple. Note that from equation A, we can solve for x in terms of y, and from equation B, we can solve for z in terms of y. Thus,

Equation A: $2x = -y - 3 \Rightarrow x = \dfrac{-y-3}{2} \Rightarrow x = -\dfrac{y+3}{2}$

Equation B: $16z = -2y - 10 \Rightarrow z = \dfrac{-2y-10}{16} \Rightarrow z = -\dfrac{y+5}{8}$

Therefore, the solution set is $\left\{\left(-\dfrac{y+3}{2}, y, -\dfrac{y+5}{8}\right) \middle| y \text{ is any real number}\right\}$.

Skill Practice 5 Repeat Example 5 with the given system.

$$\begin{array}{r} 5y + z = 0 \\ -x + 4z = 0 \\ -x + 5y + 5z = 0 \end{array}$$

The general solution to the system in Example 5 can be written in a number of forms.

Solve for x and z in terms of y: $\left\{\left(-\dfrac{y+3}{2}, y, -\dfrac{y+5}{8}\right) \middle| y \text{ is any real number}\right\}$

Solve for y and z in terms of x: $\left\{\left(x, -2x-3, \dfrac{x-1}{4}\right) \middle| x \text{ is any real number}\right\}$

Solve for x and y in terms of z: $\{(4z+1, -8z-5, z) | z \text{ is any real number}\}$

TIP Any form of the general solution can be checked by substitution in the original three equations.

Check: $\left\{\left(-\dfrac{y+3}{2}, y, -\dfrac{y+5}{8}\right) \middle| y \text{ is any real number}\right\}$

A $2x + y = -3$

$2\left(-\dfrac{y+3}{2}\right) + y \stackrel{?}{=} -3$

$-y - 3 + y = -3$ ✓

B $2y + 16z = -10$

$2y + 16\left(-\dfrac{y+5}{8}\right) \stackrel{?}{=} -10$

$2y - 2y - 10 = -10$ ✓

C $-7x - 3y + 4z = 8$

$-7\left(-\dfrac{y+3}{2}\right) - 3y + 4\left(-\dfrac{y+5}{8}\right) \stackrel{?}{=} 8$

$\dfrac{7}{2}y + \dfrac{21}{2} - 3y - \dfrac{1}{2}y - \dfrac{5}{2} \stackrel{?}{=} 8$

$\dfrac{6}{2}y - 3y + \dfrac{16}{2} = 8$ ✓

Answers

5. a. There are infinitely many solutions.

b. The equations are dependent.

c. $\left\{\left(4z, -\frac{1}{5}z, z\right) \middle| z \text{ is any real number}\right\}$ or $\left\{\left(x, -\frac{x}{20}, \frac{x}{4}\right) \middle| x \text{ is any real number}\right\}$ or $\{(-20y, y, -5y) | y \text{ is any real number}\}$

The topic of dependent equations will be discussed in more detail when we learn matrix methods to solve systems of linear equations. With additional tools available, we can investigate whether the dependent equations represent planes that intersect in a line or whether the equations all represent the same plane (Figure 9-7).

3. Use Systems of Linear Equations in Applications

When solving an application involving three unknowns, sometimes it is convenient to use a system of three independent equations, as demonstrated in Examples 6 and 7.

EXAMPLE 6 Solving an Application Involving Finance

Janette invested a total of $18,000 in three different mutual funds. A bond fund returned 4% the first year. An aggressive growth fund lost 8% for the year, and an international fund returned 2%. Janette invested $2000 more in the growth fund than in the other two funds combined. If the net loss was $540 for the year, how much did Janette invest in each fund?

Solution:

Let x represent the amount invested in the bond fund.
Let y represent the amount invested in the growth fund.
Let z represent the amount invested in the international fund.

Label the variables. With three unknowns, we need three independent equations.

$x + y + z = 18{,}000$ → The total amount invested was $18,000.

$y = (x + z) + 2000$ → The amount invested in the growth fund was $2000 more than the combined amount in the other two funds.

$0.04x - 0.08y + 0.02z = -540$ → The sum of the gain and loss from each fund equals −$540.

$$\begin{array}{ll} \boxed{A} & x + y + z = 18{,}000 \\ \boxed{B} & y = (x + z) + 2000 \\ \boxed{C} & 0.04x - 0.08y + 0.02z = -540 \end{array} \xrightarrow[\text{Multiply by 100.}]{\text{Standard form}} \begin{array}{ll} \boxed{A} & x + y + z = 18{,}000 \\ \boxed{B} & -x + y - z = 2000 \\ \boxed{C} & 4x - 8y + 2z = -54{,}000 \end{array}$$

Eliminate x from equations A and B and equations B and C.

$$\begin{array}{ll} \boxed{A} & x + y + z = 18{,}000 \\ \boxed{B} & -x + y - z = 2000 \\ \hline & 2y = 20{,}000 \\ & y = 10{,}000 \end{array} \qquad \begin{array}{ll} 4 \cdot \boxed{B} & -4x + 4y - 4z = 8000 \\ \boxed{C} & 4x - 8y + 2z = -54{,}000 \\ \hline & -4y - 2z = -46{,}000 \quad \boxed{D} \end{array}$$

Back substitute.

$$\begin{array}{ll} \boxed{D} & -4y - 2z = -46{,}000 \\ & -4(10{,}000) - 2z = -46{,}000 \\ & -2z = -6000 \\ & z = 3000 \end{array} \qquad \begin{array}{ll} \boxed{A} & x + y + z = 18{,}000 \\ & x + (10{,}000) + (3000) = 18{,}000 \\ & x + 13{,}000 = 18{,}000 \\ & x = 5000 \end{array}$$

Janette invested $5000 in the bond fund, $10,000 in the aggressive growth fund, and $3000 in the international fund.

Skill Practice 6 Javier mixes three solutions of acid with concentrations of 10%, 15%, and 5%. Javier wants to make 30 L of a mixture that is 12% acid and uses four times as much of the 15% solution as the 5% solution. How much of each of the three solutions must be used?

Avoiding Mistakes

For Example 6, verify that the conditions of the problem have been met.

Principal:
$5000 + $10,000 + $3000
= $18,000 ✓

Return:
0.04($5000)
−0.08($10,000)
+0.02($3000)
−$540 ✓

More invested in growth:
($5000 + $3000) + $2000
= $10,000 ✓

Answer

6. Javier mixes 10 L of the 10% solution, 16 L of the 15% solution, and 4 L of the 5% solution.

4. Modeling with Linear Equations in Three Variables

In Section 3.1, we used regression to find a quadratic model $y = ax^2 + bx + c$ from observed data points. We will now learn how to find a quadratic model by using a system of linear equations in three variables. The premise is that any three noncollinear points (points that do not all fall on the same line) define a unique parabola given by $y = ax^2 + bx + c$ $(a \neq 0)$.

EXAMPLE 7 Using a System of Linear Equations to Create a Quadratic Model

Given the noncollinear points (4, 2), (1, −1), and (−1, 7), find an equation of the form $y = ax^2 + bx + c$ that defines the parabola through the points.

Solution:

$$y = ax^2 + bx + c$$

Substitute (4, 2): $2 = a(4)^2 + b(4) + c \longrightarrow$ A $\quad 16a + 4b + c = 2$

Substitute (1, −1): $-1 = a(1)^2 + b(1) + c \longrightarrow$ B $\quad a + b + c = -1$

Substitute (−1, 7): $7 = a(-1)^2 + b(-1) + c \longrightarrow$ C $\quad a - b + c = 7$

Eliminate variable b from equations A and C and from equations B and C.

$$\begin{array}{rl} & \text{A}\quad 16a + 4b + c = 2 \\ 4 \cdot & \text{C}\quad 4a - 4b + 4c = 28 \\ \hline & 20a + 5c = 30 \quad \text{D} \end{array} \qquad \begin{array}{rl} & \text{B}\quad a + b + c = -1 \\ & \text{C}\quad a - b + c = 7 \\ \hline & 2a + 2c = 6 \quad \text{E} \end{array}$$

D $20a + 5c = 30$ → (Divide by 5.) $4a + c = 6$

E $2a + 2c = 6$ → (Divide by −2.) $-a - c = -3$

$3a = 3$

$a = 1$

Back substitute.

E $2a + 2c = 6$

$2(1) + 2c = 6$

$c = 2$

B $a + b + c = -1$

$(1) + b + (2) = -1$

$b = -4$

Substituting $a = 1$, $b = -4$, and $c = 2$ into the equation $y = ax^2 + bx + c$ gives

$$y = x^2 - 4x + 2$$

The graph of $y = x^2 - 4x + 2$ passes through the points (4, 2), (1, −1), and (−1, 7) as shown in Figure 9-8.

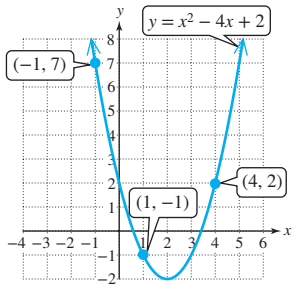

Figure 9-8

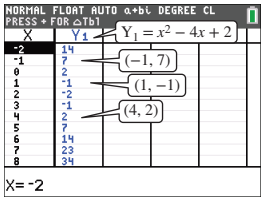
The results can also be verified by using the Table feature of a graphing utility. Enter $Y_1 = x^2 - 4x + 2$.



Skill Practice 7 Given the noncollinear points (−3, 2), (−4, 1), and (−6, −7), find an equation of the form $y = ax^2 + bx + c$ that defines the parabola through the points.

TIP We can verify that the three points given in Example 7 are *not* collinear by showing that the slopes between two pairs of points are different.

For (4, 2) and (1, −1),

$$m = \frac{-1 - 2}{1 - 4} = 1$$

For (4, 2) and (−1, 7),

$$m = \frac{7 - 2}{-1 - 4} = -1$$

Answer

7. $y = -x^2 - 6x - 7$

R.1. How much interest will a student have to pay if the student borrows \$2000 for 2 yr at a simple interest rate of 3%?

R.2. Fatima needs to have a toilet repaired. The cost of the new plumbing fixtures is \$110 and labor is \$70/hr. Write a model that represents the cost of the repair C (in \$) in terms of the number of hours of labor x.

R.3. Solve the equation. $\frac{y-4}{5}+\frac{y}{8}=\frac{y-2}{5}-7$

Concept Connections

1. The graph of a linear equation in two variables is a line in a two-dimensional coordinate system. The graph of a linear equation in three variables is a _____ in a three-dimensional coordinate system.

2. A solution to a system of linear equations in three variables is an ordered _____ that satisfies each equation in the system. Graphically, this is a point of _____ of three planes.

Objective 1: Identify Solutions to a System of Linear Equations in Three Variables

For Exercises 3–4, find three ordered triples that are solutions to the linear equation in three variables.

3. $2x+4y-6z=12$

4. $3x-5y+z=15$

For Exercises 5–8, determine if the ordered triple is a solution to the system of equations. (See Example 1)

5.
$-x+3y-7z=7$
$2x+4y+z=16$
$3x-5y+6z=-9$

a. $(2,3,0)$
b. $(-2,4,1)$

6.
$2x-3y+z=-12$
$x+y-2z=9$
$-3x+2y-z=7$

a. $(2,5,-1)$
b. $(1,4,-2)$

7.
$x+y+z=2$
$x+2y-z=2$
$3x+5y-z=6$

a. $(2,0,0)$
b. $(-1,2,1)$

8.
$-x-y+z=3$
$3x+4y-z=1$
$5x+7y-z=-1$

a. $(1,2,6)$
b. $(3,-1,5)$

Objective 2: Solve Systems of Linear Equations in Three Variables

For Exercises 9–32, solve the system. If a system has one unique solution, write the solution set. Otherwise, determine the number of solutions to the system, and determine whether the system is inconsistent, or the equations are dependent. (See Examples 2–5)

9.
$x-2y+z=-9$
$3x+4y+5z=9$
$-2x+3y-z=12$

10.
$2x-y+z=6$
$-x+5y-z=10$
$3x+y-3z=12$

11.
$4x=3y-2z-5$
$2(x+y)=y+z-6$
$6(x-y)+z=x-5y-8$

12.
$3x=5y-z+13$
$-(x-y)-z=x-3$
$5(x+y)=3y-3z-4$

13.
$2x+5z=2$
$3y-7z=9$
$-5x+9y=22$

14.
$3x-2y=-8$
$5y+6z=2$
$7x+11z=-33$

15.
$-4x-3y=0$
$3y+z=-1$
$4x-z=12$

16.
$4x-y+2z=1$
$3x+5y-z=-2$
$-9x-15y+3z=0$

17.
$2x=3y-6z-1$
$6y=12z-10x+9$
$3z=6y-3x-1$

18.
$5x=2y-3z-3$
$4y=-1-10x-5z$
$2z=5x-6y$

19.
$x+2y+4z=3$
$y+3z=5$
$x-2z=-7$

20.
$3x+2y+5z=6$
$3y-z=4$
$3x+17y=26$

21.
$0.2x=0.1y-0.6z$
$0.004x+0.005y-0.001z=0$
$30x=50z-20y$

22.
$0.3x=0.5y-1.2z$
$0.05x+0.1y=0.04z$
$100x=300y-700z$

23.
$\frac{1}{12}x+\frac{1}{4}y+\frac{1}{3}z=\frac{7}{12}$
$-\frac{1}{10}x+\frac{1}{2}y-\frac{1}{5}z=-\frac{17}{10}$
$\frac{1}{2}x+\frac{1}{4}y+z=3$

ISTUDY

24. $x + \frac{7}{2}y + \frac{1}{2}z = 4$
$\frac{3}{4}x + y + \frac{1}{2}z = -1$
$\frac{1}{10}x - \frac{2}{5}y - \frac{3}{10}z = 1$

25. $3x + 2y + 5z = 12$
$3y + 8z = -8$
$10z = 20$

26. $-4x + 6y + z = -4$
$-2y - 4z = -24$
$6z = 48$

27. $\frac{x+2}{3} + \frac{y-4}{2} + \frac{z+1}{6} = 8$
$-\frac{x+2}{3} + \frac{z+1}{2} = 8$
$\frac{y-4}{4} - \frac{z+1}{6} = -1$

28. $\frac{x-1}{7} + \frac{y-2}{3} + \frac{z+2}{4} = 13$
$\frac{y-2}{9} - \frac{z+2}{8} = 3$
$\frac{x-1}{7} + \frac{z+2}{2} = 3$

29. $3(x + y) = 6 - 4z + y$
$4 = 6y + 5z$
$-3x + 4y + z = 0$

30. $4(x - y) = 8 - z - y$
$3 = 3x + 4z$
$-x + 3y + 3z = 1$

31. $-3x + 4y - z = -4$
$x + 2y + z = 4$
$-12x + 16y - 4z = -16$

32. $x + 2y - 3z = 5$
$-2x - 5y + 4z = -6$
$3x + 6y - 9z = 15$

For Exercises 33–36, solve the system from the indicated exercise and write the general solution. (See Example 5)

33. Exercise 19 **34.** Exercise 20 **35.** Exercise 31 **36.** Exercise 32

For Exercises 37–38, the general solution is given for a system of linear equations. Find three individual solutions to the system.

37. $-x + 4y + 2z = 4$
$x - 3y - z = -2$
$-x + y - z = -2$
Solution: $\{(-2z + 4, -z + 2, z) | z \text{ is any real number}\}$

38. $2x - 3y + z = 1$
$x + 4y - z = 3$
$5x - 2y + z = 5$
Solution: $\{(x, -3x + 4, -11x + 13) | x \text{ is any real number}\}$

Objective 3: Use Systems of Linear Equations in Applications

39. Devon invested \$8000 in three different mutual funds. A fund containing large cap stocks made 6.2% return in 1 yr. A real estate fund lost 13.5% in 1 yr, and a bond fund made 4.4% in 1 yr. The amount invested in the large cap stock fund was twice the amount invested in the real estate fund. If Devon had a net return of \$66 across all investments, how much was invested in each fund? (**See Example 6**)

40. Melek inherited \$120,000 from his uncle and decided to invest the money. Part of the money was put in a money market account that earns 2.2% simple interest. The remaining money was invested in a stock that returned 6% in the first year and a mutual fund that lost 2% in the first year. Melek invested \$10,000 more in the stock than in the mutual fund, and the net gain for 1 yr was \$2820. Determine the amount invested in each account.

41. A basketball player scored 26 points in one game. In basketball, some baskets are worth 3 points, some are worth 2 points, and free-throws are worth 1 point. The player scored four more 2-point baskets than 3-point baskets. The number of free-throws equaled the sum of the number of 2-point and 3-point shots made. How many free-throws, 2-point shots, and 3-point shots did the player make?

42. A sawmill cuts boards for a lumber supplier. When saws A, B, and C all work for 6 hr, they cut 7200 linear board-ft of lumber. It would take saws A and B working together 9.6 hr to cut 7200 ft of lumber. Saws B and C can cut 7200 ft of lumber in 9 hr. Find the rate (in ft/hr) that each saw can cut lumber.

43. Plant fertilizers are categorized by the percentage of nitrogen (N), phosphorus (P), and potassium (K) they contain, by weight. For example, a fertilizer that has N-P-K numbers of 8-5-5 has 8% nitrogen, 5% phosphorus, and 5% potassium by weight. Suppose that a fertilizer has twice as much potassium by weight as phosphorus. The percentage of nitrogen equals the sum of the percentages of phosphorus and potassium. If nitrogen, phosphorus, and potassium make up 42% of the fertilizer, determine the proper N-P-K label on the fertilizer.

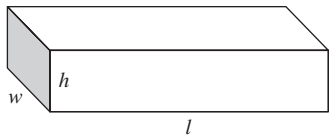
a. 14-7-14 **b.** 21-7-14 **c.** 14-7-21 **d.** 14-21-21

44. A theater charges \$50 per ticket for seats in Section A, \$30 per ticket for seats in Section B, and \$20 per ticket for seats in Section C. For one play, 4000 tickets were sold for a total of \$120,000 in revenue. If 1000 more tickets in Section B were sold than the other two sections combined, how many tickets in each section were sold?

ISTUDY

45. The perimeter of a triangle is 55 in. The shortest side is 7 in. less than the longest side. The middle side is 19 in. less than the combined lengths of the shortest and longest sides. Find the lengths of the three sides.

46. A package in the shape of a rectangular solid is to be mailed. The combination of the girth (perimeter of a cross section defined by w and h) and the length of the package is 48 in. The width is 2 in. greater than the height, and the length is 12 in. greater than the width. Find the dimensions of the package.



47. The measure of the largest angle in a triangle is 100° larger than the sum of the measures of the other two angles. The measure of the smallest angle is two-thirds the measure of the middle angle. Find the measure of each angle.

48. The measure of the largest angle in a triangle is 18° more than the sum of the measures of the other two angles. The measure of the smallest angle is one-half the measure of the middle angle. Find the measure of each angle.

Objective 4: Modeling with Linear Equations in Three Variables

49. a. Show that the points (1, 0), (3, 10), and (−2, 15) are not collinear by finding the slope between (1, 0) and (3, 10), and the slope between (3, 10) and (−2, 15). **(See Example 7)**

b. Find an equation of the form $y = ax^2 + bx + c$ that defines the parabola through the points.

c. Use a graphing utility to verify that the graph of the equation in part (b) passes through the given points.

50. a. Show that the points (2, 9), (−1, −6), and (−4, −3) are not collinear by finding the slope between (2, 9) and (−1, −6), and the slope between (2, 9) and (−4, −3).

b. Find an equation of the form $y = ax^2 + bx + c$ that defines the parabola through the points.

c. Use a graphing utility to verify that the graph of the equation in part (b) passes through the given points.

For Exercises 51–52, find an equation of the form $y = ax^2 + bx + c$ that defines the parabola through the three noncollinear points given.

51. (0, 6), (2, −6), (−1, 9)

52. (0, −4), (2, −6), (−3, −31)

The motion of an object traveling along a straight path is given by $s(t) = \frac{1}{2}at^2 + v_0t + s_0$, where $s(t)$ is the position relative to the origin at time t. For Exercises 53–54, three observed data points are given. Find the values of a, v_0, and s_0.

53. $s(1) = 30$, $s(2) = 54$, $s(3) = 82$

54. $s(1) = -7$, $s(2) = 12$, $s(3) = 37$

Many statistics courses cover a topic called *multiple regression*. This provides a means to predict the value of a dependent variable y based on two or more independent variables $x_1, x_2, \ldots, x_n$. The model $y = ax_1 + bx_2 + c$ is a linear model that predicts y based on two independent variables x_1 and x_2. While statistical techniques may be used to find the values of a, b, and c based on a large number of data points, we can form a crude model given three data values (x_1, x_2, y). Use the information given in Exercises 55–56 to form a system of three equations and three variables to solve for a, b, and c.

55. The selling price of a home y (in \$1000) is given based on the living area x_1 (in 100 ft^2) and on the lot size x_2 (in acres).

Living Area (100 ft^2) x_1	Lot Size (acres) x_2	Selling Price (\$1000) y
28	0.5	225
25	0.8	207
18	0.4	154

a. Use the data to create a model of the form $y = ax_1 + bx_2 + c$.

b. Use the model from part (a) to predict the selling price of a home that is 2000 ft^2 on a 0.4-acre lot.

56. The gas mileage y (in mpg) for city driving is given based on the weight of the vehicle x_1 (in lb) and on the number of cylinders.

Weight (lb) x_1	Cylinders x_2	Mileage (mpg) y
3500	6	20
3200	4	26
4100	8	18

a. Use the data to create a model of the form $y = ax_1 + bx_2 + c$.

b. Use the model from part (a) to predict the gas mileage of a vehicle that is 3800 lb and has 6 cylinders.

Write About It

57. Give a geometric description of the solution set to a linear equation in three variables.

58. If a system of linear equations in three variables has no solution, then what can be said about the three planes represented by the equations in the system?

59. Explain the procedure presented in this section to solve a system of linear equations in three variables.

60. Explain how to check a solution to a system of linear equations in three variables.

Expanding Your Skills

For Exercises 61–62, find all solutions of the form (a, b, c, d).

61.
$$\begin{aligned} 2a + b - c + d &= 7 \\ 3b + 2c - 2d &= -11 \\ a + 3c + 3d &= 14 \\ 4a + 2b - 5c &= 6 \end{aligned}$$

62.
$$\begin{aligned} 3a - 4b + 2c + d &= 8 \\ 2a + 3b + 2d &= 7 \\ 5b - 3c + 4d &= -4 \\ -a + b - 2c &= -7 \end{aligned}$$

For Exercises 63–64, find all solutions of the form (u, v, w).

63.
$$\begin{aligned} \frac{u-3}{4} + \frac{v+1}{3} + \frac{w-2}{8} &= 1 \\ \frac{u-3}{2} + \frac{v+1}{2} + \frac{w-2}{4} &= 0 \\ \frac{u-3}{4} - \frac{v+1}{2} + \frac{w-2}{2} &= -6 \end{aligned}$$

64.
$$\begin{aligned} \frac{u+1}{6} + \frac{v-1}{6} + \frac{w+3}{4} &= 11 \\ \frac{u+1}{3} - \frac{v-1}{2} + \frac{w+3}{4} &= 7 \\ \frac{u+1}{2} - \frac{v-1}{6} + \frac{w+3}{2} &= 20 \end{aligned}$$

For Exercises 65–66, solve for x, y, and z. Assume that a, b, and c are constant real numbers.

65.
$$\begin{aligned} \frac{a}{x} + \frac{b}{y} + \frac{c}{z} &= a \\ \frac{a}{x} + \frac{b}{y} - \frac{c}{z} &= b \quad \text{where } a \neq -c,\ b \neq c,\ a \neq b,\ abc \neq 0 \\ \frac{a}{x} - \frac{b}{y} - \frac{c}{z} &= c \end{aligned}$$

66.
$$\begin{aligned} \frac{a}{x} + \frac{b}{y} + \frac{2c}{z} &= 4 \\ \frac{a}{x} + \frac{2b}{y} - \frac{c}{z} &= 2 \quad \text{where } abc \neq 0 \\ \frac{2a}{x} - \frac{b}{y} - \frac{c}{z} &= 0 \end{aligned}$$

Recall that an equation of a circle can be written in the form $(x-h)^2 + (y-k)^2 = r^2$, where (h, k) is the center and r is the radius. Expanding terms, the equation can also be written in the form $x^2 + y^2 + Ax + By + C = 0$. For Exercises 67–68,

a. Find an equation of the form $x^2 + y^2 + Ax + By + C = 0$ that represents the circle that passes through the given points.

b. Find the center and radius of the circle.

67. $(2, 2)$, $(6, 0)$, $(7, -3)$

68. $(-1, 12)$, $(5, 10)$, $(9, 2)$

For Exercises 69–74, find constants A, B, and C, so that the expressions on the left and right side of the equation are equal. (*Hint*: Create a system of linear equations by equating the constant terms and by equating the coefficients on the variables.)

69. $4x + 5 = (A + B)x + (2A - B)$

70. $5x + 13 = Ax + Bx + 2A + B$

71. $9x^2 - 3x - 9 = (A + B + C)x^2 + (2A - B + C)x + (A + B - 2C)$

72. $x^2 + 4x + 10 = (2A + 3B - C)x^2 + (4A - 6B + 3C)x + (3B + 4C)$

73. $11x^2 + 26x - 5 = 2Ax^2 + 5Ax + 3A + Bx^2 - 2Bx - 8B + 2Cx^2 - 7Cx - 4C$

74. $3x^2 + 37x - 82 = Ax^2 + Ax - 12A + 3Bx^2 - 10Bx + 3B + 3Cx^2 + 11Cx - 4C$

Point of Interest

Dr. Valerie L. Thomas (1943–present) is a physicist, mathematician, and inventor who worked on numerous projects for NASA between 1964 and 1995. In the 1970s, Dr. Thomas worked on the Landsat satellite program in the area of image processing to enable satellites to transmit images from space. But Dr. Thomas is perhaps best known for her invention of the *illusion transmitter*, a device that enables three-dimensional images to be sent from one location to another. Dr. Thomas recognized that an object placed in front of a flat mirror produces an image that appears to be *behind* the mirror, but a concave mirror creates an image that appears to be in *front*. The illusion transmitter uses one parabolic mirror to create an optical illusion of a three-dimensional object. A camera then records the image and sends the video signal to a receiver at a different location, which in turn projects the image onto a second parabolic mirror, where it can be observed.

This technology behind the illusion transmitter has been adapted for television and video production, surgery, and magnetic resonance imaging (MRI). Furthermore, assigning a three-dimensional coordinate system to a three-dimensional object, such as a human heart, enables the object to be mapped and studied mathematically. Key points on the surface are defined by ordered triples that, when taken collectively, create the "form" or "map" of the object.

NASA/Interim Archives/ Archive Photos/Getty Images

ISTUDY

75. a. Plot the ordered triples on a three-dimensional coordinate system. You can do this by hand on paper or by using an online graphing utility that accommodates 3-D. If you use a graphing utility, you can view the points from different directions by holding down the left mouse key and dragging the cursor over the image. Move the coordinate system so that the positive x-axis is oriented toward the front of the monitor, the positive y-axis is to the right, and the positive z-axis is upward.

$$A(1, 2, 4),\ B(-1, 2, 4),\ C(1, -2, 4),\ D(-1, -2, 4),$$
$$E(1, 2, -4),\ F(-1, 2, -4),\ G(1, -2, -4),\ H(-1, -2, -4)$$

b. Draw the line segments on the graph.

$$\overline{AB},\ \overline{BD},\ \overline{DC},\ \overline{CA},\ \overline{EF},\ \overline{FH},\ \overline{HG},\ \overline{GE},\ \overline{BF},\ \overline{AE},\ \overline{DH}, \text{ and } \overline{CG}.$$

c. As drawn in part (b), what type of shape do the eight points define?

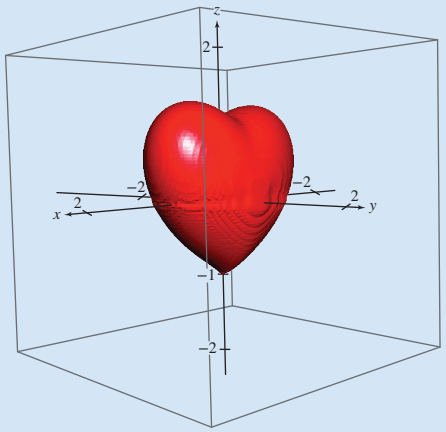
d. Shapes of more complexity can be formed by using a large number of points to define an object such as a character in a computer game. Then the object can be moved (shifted), stretched, and rotated in much the same way we perform transformations on two-dimensional graphs. Explain how a three-dimensional computerized rendering of an object such as a human heart might be helpful to a medical doctor.

e. Three-dimensional surfaces can also be made from equations using three variables in much the same way that curves in a plane can be rendered from equations in two variables. For example, the equation

$$\left(x^2 + \frac{9}{4}y^2 + z^2 - 1\right)^3 - x^2z^3 - \frac{9}{80}y^2z^3 = 0$$

represents a "Valentine's heart." Use an online three-dimensional graphing utility to determine the shape of the graph formed by the equations

$$z = \sqrt{4 - x^2 - y^2} \text{ and } z = -\sqrt{4 - x^2 - y^2}.$$



$$\left(x^2 + \frac{9}{4}y^2 + z^2 - 1\right)^3 - x^2z^3 - \frac{9}{80}y^2z^3 = 0$$

SECTION 9.3 Partial Fraction Decomposition

OBJECTIVES

1. Set Up a Partial Fraction Decomposition
2. Decompose $\frac{f(x)}{g(x)}$, Where $g(x)$ Is a Product of Linear Factors
3. Decompose $\frac{f(x)}{g(x)}$, Where $g(x)$ Has Irreducible Quadratic Factors

1. Set Up a Partial Fraction Decomposition

In Section R.6 we learned how to add and subtract rational expressions. For example:

$$\frac{5}{x+2} + \frac{3}{x-5} = \frac{5(x-5)}{(x+2)(x-5)} + \frac{3(x+2)}{(x-5)(x+2)}$$

$$= \frac{5(x-5) + 3(x+2)}{(x+2)(x-5)}$$

$$= \frac{8x - 19}{(x+2)(x-5)}$$

The fraction $\frac{8x - 19}{(x + 2)(x - 5)}$ is the result of adding two simpler fractions, $\frac{5}{x + 2}$ and $\frac{3}{x - 5}$. The sum $\frac{5}{x + 2} + \frac{3}{x - 5}$ is called the **partial fraction decomposition** of $\frac{8x - 19}{(x + 2)(x - 5)}$. In some applications in higher mathematics, it is more convenient

to work with the partial fraction decomposition than the more complicated single fraction. Therefore, in this section, we will learn the technique of partial fraction decomposition to write a rational expression as a sum of simpler fractions. That is, we will reverse the process of adding two or more fractions. There are two parts to this process.

I. First we set up the "form" or "structure" for the partial fraction decomposition into simpler fractions. For example, the denominator of $\frac{8x - 19}{(x + 2)(x - 5)}$ consists of the distinct linear factors $(x + 2)$ and $(x - 5)$. From the preceding discussion, the partial fraction decomposition must be of the form:

$$\frac{8x - 19}{(x + 2)(x - 5)} = \frac{A}{x + 2} + \frac{B}{x - 5}$$

The expression on the right is the "form" or "structure" for the partial fraction decomposition of $\frac{8x - 19}{(x + 2)(x - 5)}$.

II. Next, we solve for the constants A and B. To do so, multiply both sides of the equation by the LCD, and set up a system of linear equations.

$$(x + 2)(x - 5) \cdot \left[\frac{8x - 19}{(x + 2)(x - 5)}\right] = (x + 2)(x - 5) \cdot \left[\frac{A}{x + 2} + \frac{B}{x - 5}\right]$$

Multiply by the LCD to clear fractions.

$$8x - 19 = A(x - 5) + B(x + 2)$$

$$8x - 19 = Ax - 5A + Bx + 2B \quad \text{Apply the distributive property.}$$

$$8x - 19 = (A + B)x + (-5A + 2B) \quad \text{Simplify and combine like terms.}$$

x coefficients are equal.

$$8x - 19 = (A + B)x + (-5A + 2B)$$

Constants are equal.

Two polynomials are equal if and only if the coefficients on like terms are equal.

$$A + B = 8 \quad \text{Equate the coefficients on } x.$$

$$-5A + 2B = -19 \quad \text{Equate the constant terms.}$$

Solve the system of linear equations. Then substitute the values of A and B into the partial fraction decomposition.

$$\begin{array}{ll} \boxed{1} & A + B = 8 \\ \boxed{2} & -5A + 2B = -19 \end{array} \xrightarrow{\text{Multiply by 5.}} \begin{array}{r} 5A + 5B = 40 \\ -5A + 2B = -19 \\ \hline 7B = 21 \\ B = 3 \end{array}$$

$$\begin{array}{ll} \boxed{1} & A + B = 8 \\ & A + 3 = 8 \\ & A = 5 \end{array}$$

$A = 5$ and $B = 3$

$$\frac{8x - 19}{(x + 2)(x - 5)} = \frac{A}{x + 2} + \frac{B}{x - 5} = \frac{5}{x + 2} + \frac{3}{x - 5}$$

TIP To illustrate why two polynomials are equal if and only if their coefficients are equal, consider the statement:

$$2x^2 + 5x = Ax^2 + Bx.$$

By inspection, we can see that the two polynomials will be equal only for $A = 2$ and $B = 5$.

We begin partial fraction decomposition by factoring the denominator into linear factors $(ax + b)$ and quadratic factors $(ax^2 + bx + c)$ that are irreducible over the integers. A quadratic factor that is irreducible over the integers cannot be factored as a product of binomials with integer coefficients. From the factorization of the denominator, we then determine the proper form for the partial fraction decomposition using the following guidelines.

ISTUDY

Avoiding Mistakes

It is important to note that to perform partial fraction decomposition on a rational expression, the degree of the numerator must be less than the degree of the denominator.

Decomposition of $\frac{f(x)}{g(x)}$ into Partial Fractions

Consider a rational expression $\frac{f(x)}{g(x)}$, where $f(x)$ and $g(x)$ are polynomials with real coefficients, $g(x) \neq 0$, and the degree of $f(x)$ is less than the degree of $g(x)$.

PART I:

Step 1 Factor the denominator $g(x)$ completely into linear factors of the form $(ax + b)^m$ and quadratic factors of the form $(ax^2 + bx + c)^n$ that are not further factorible over the integers (irreducible over the integers).

Step 2 Set up the form for the decomposition. That is, write the original rational expression $\frac{f(x)}{g(x)}$ as a sum of simpler fractions using these guidelines. Note that $A_1, A_2, \ldots, A_m, B_1, B_2, \ldots, B_n$, and $C_1, C_2, \ldots, C_n$ are constants.

- **Linear factors of $g(x)$:** For each linear factor of $g(x)$, the partial fraction decomposition must include the sum:

$$\frac{A_1}{(ax+b)^1} + \frac{A_2}{(ax+b)^2} + \cdots + \frac{A_m}{(ax+b)^m}$$

TIP The constants $A_1, A_2, \ldots, A_m$ are often replaced by A, B, C, and so on to avoid confusion with subscript notation.

- **Quadratic factors of $g(x)$:** For each quadratic factor of $g(x)$, the partial fraction decomposition must include the sum:

$$\frac{B_1x + C_1}{(ax^2+bx+c)^1} + \frac{B_2x + C_2}{(ax^2+bx+c)^2} + \cdots + \frac{B_nx + C_n}{(ax^2+bx+c)^n}$$

TIP The constants $B_1, B_2, \ldots, B_n$ and $C_1, C_2, \ldots, C_n$ are often replaced by A, B, C, D, E, and so on to avoid confusion with subscript notation.

PART II:

Step 3 With the form of the partial fraction decomposition set up, multiply both sides of the equation by the LCD to clear fractions.

Step 4 Using the equation from step 3, set up a system of linear equations by equating the constant terms and equating the coefficients of like powers of x.

Step 5 Solve the system of equations from step 4 and substitute the solutions to the system into the partial fraction decomposition.

In Examples 1 and 2, we focus on setting up the proper form for a partial fraction decomposition (Part I). In each example, note that the factors of the denominator will fall into one of the following categories:

Linear factors:	$ax + b$
Repeated linear factors:	$(ax + b)^m$ $(m \geq 2$, an integer$)$
Quadratic factors (irreducible over the integers):	$ax^2 + bx + c$
Repeated quadratic factors (irreducible over the integers):	$(ax^2 + bx + c)^n$ $(n \geq 2$, an integer$)$

EXAMPLE 1 Setting Up the Form for a Partial Fraction Decomposition

Set up the form for the partial fraction decomposition for the given rational expressions.

a. $\frac{4x - 15}{(2x + 3)(x - 2)}$ **b.** $\frac{4x^2 + 10x + 9}{x^3 + 6x^2 + 9x}$

ISTUDY

Solution:

a. $\dfrac{4x - 15}{(2x + 3)^1(x - 2)^1} = \dfrac{A}{(2x + 3)^1} + \dfrac{B}{(x - 2)^1}$

The denominator has distinct linear factors of the form $(2x + 3)^1$ and $(x - 2)^1$. Since each linear factor is raised to the first power, only one fraction is needed for each factor.

b. $\dfrac{4x^2 + 10x + 9}{x^3 + 6x^2 + 9x} = \dfrac{4x^2 + 10x + 9}{x(x^2 + 6x + 9)}$

Factor the denominator completely. The denominator has a linear factor of x^1 and a *repeated* linear factor $(x + 3)^2$.

$= \dfrac{4x^2 + 10x + 9}{x^1(x + 3)^2} = \dfrac{A}{x^1} + \dfrac{B}{(x + 3)^1} + \dfrac{C}{(x + 3)^2}$

For a repeated factor that occurs m times, one fraction must be given for each power less than or equal to m.

Include one fraction with $(x + 3)$ raised to each positive integer up to and including 2.

Skill Practice 1 Set up the form for the partial fraction decomposition for the given rational expressions.

a. $\dfrac{-x + 18}{(3x + 1)(x + 4)}$ **b.** $\dfrac{-x^2 + 3x + 8}{x^3 + 4x^2 + 4x}$

In Example 2, we practice setting up the form for the partial decomposition of a rational expression that contains irreducible quadratic factors in the denominator.

EXAMPLE 2 Setting Up the Form for a Partial Fraction Decomposition

Set up the form for the partial fraction decomposition for the given rational expressions.

a. $\dfrac{2x^2 - 3x + 4}{x^3 + 4x}$ **b.** $\dfrac{3x^2 + 8x + 14}{(x^2 + 2x + 5)^2}$

Solution:

a. $\dfrac{2x^2 - 3x + 4}{x^3 + 4x} = \dfrac{2x^2 - 3x + 4}{x(x^2 + 4)}$

Factor the denominator completely. The denominator has one linear factor x^1 and one irreducible quadratic factor $(x^2 + 4)^1$.

$= \dfrac{2x^2 - 3x + 4}{x^1(x^2 + 4)^1} = \dfrac{A}{x^1} + \dfrac{Bx + C}{(x^2 + 4)^1}$

Since each factor is raised to the first power, only one fraction is needed for each factor.

$= \dfrac{2x^2 - 3x + 4}{x(x^2 + 4)} = \dfrac{A}{x} + \dfrac{Bx + C}{(x^2 + 4)}$

TIP For a first-degree (linear) denominator, the numerator is constant (degree 0).
For a second-degree (quadratic) denominator, the numerator is linear (degree 1).

b. $\dfrac{3x^2 + 8x + 14}{(x^2 + 2x + 5)^2}$

The quadratic factor $x^2 + 2x + 5$ does not factor further over the integers.

$= \dfrac{Ax + B}{(x^2 + 2x + 5)^1} + \dfrac{Cx + D}{(x^2 + 2x + 5)^2}$

The factor $(x^2 + 2x + 5)$ appears to the *second* power in the denominator. Therefore, in the partial fraction composition, one fraction must have $(x^2 + 2x + 5)^1$ in the denominator, and one fraction must have $(x^2 + 2x + 5)^2$ in the denominator.

Answers

1. **a.** $\dfrac{A}{3x + 1} + \dfrac{B}{x + 4}$
   b. $\dfrac{A}{x} + \dfrac{B}{x + 2} + \dfrac{C}{(x + 2)^2}$

ISTUDY

Skill Practice 2 Set up the form for the partial fraction decomposition for the given rational expressions.

a. $\dfrac{7x^2 + 2x + 12}{x^3 + 3x}$ **b.** $\dfrac{-3x^2 - 5x - 19}{(x^2 + 3x + 6)^2}$

2. Decompose $\dfrac{f(x)}{g(x)}$, Where $g(x)$ Is a Product of Linear Factors

In Example 3, we find the partial fraction decomposition of a rational expression in which the denominator is a product of distinct linear factors.

EXAMPLE 3 Decomposing $\dfrac{f(x)}{g(x)}$, Where $g(x)$ Has Distinct Linear Factors

Find the partial fraction decomposition. $\dfrac{4x - 15}{(2x + 3)(x - 2)}$

Solution:

$$\frac{4x - 15}{(2x + 3)(x - 2)} = \frac{A}{2x + 3} + \frac{B}{x - 2}$$

From Example 1(a), we have the form for the partial fraction decomposition.

$$(2x + 3)(x - 2)\left[\frac{4x - 15}{(2x + 3)(x - 2)}\right] = (2x + 3)(x - 2)\left[\frac{A}{2x + 3} + \frac{B}{x - 2}\right]$$

To solve for A and B, first multiply both sides by the LCD to clear fractions.

$4x - 15 = A(x - 2) + B(2x + 3)$ Apply the distributive property.

$4x - 15 = Ax - 2A + 2Bx + 3B$

$4x - 15 = (A + 2B)x + (-2A + 3B)$ Combine like terms.

$\boxed{1}$ $4 = A + 2B$ Equate the x term coefficients.

$\boxed{2}$ $-15 = -2A + 3B$ Equate the constant terms.

Solve the system of linear equations by using the substitution method or addition method.

$\boxed{1}$ $4 = A + 2B$ $\xrightarrow{\text{Multiply by 2.}}$ $2A + 4B = 8$

$\boxed{2}$ $-15 = -2A + 3B$ $\quad -2A + 3B = -15$

$7B = -7$

$B = -1$

$\boxed{1}$ $4 = A + 2B$

$4 = A + 2(-1)$

$A = 6$

$A = 6$ and $B = -1$.

$$\frac{4x - 15}{(2x + 3)(x - 2)} = \frac{A}{2x + 3} + \frac{B}{x - 2}$$

Substitute $A = 6$ and $B = -1$ into the partial fraction decomposition.

$$\frac{4x - 15}{(2x + 3)(x - 2)} = \frac{6}{2x + 3} + \frac{-1}{x - 2}$$

or equivalently $\dfrac{6}{2x + 3} - \dfrac{1}{x - 2}$

Skill Practice 3 Find the partial fraction decomposition. $\dfrac{-x + 18}{(3x + 1)(x + 4)}$

Answers

2. a. $\dfrac{A}{x} + \dfrac{Bx + C}{x^2 + 3}$

b. $\dfrac{Ax + B}{x^2 + 3x + 6} + \dfrac{Cx + D}{(x^2 + 3x + 6)^2}$

3. $\dfrac{5}{3x + 1} + \dfrac{-2}{x + 4}$

ISTUDY

TIP Always remember that the result of a partial fraction decomposition can be checked by adding the partial fractions and verifying that the sum equals the original rational expression.

To verify the result of Example 3, we can add the rational expressions.

$$\frac{6}{2x+3}+\frac{-1}{x-2}=\frac{6(x-2)}{(2x+3)(x-2)}+\frac{-1(2x+3)}{(x-2)(2x+3)}$$
$$=\frac{6(x-2)-1(2x+3)}{(2x+3)(x-2)}$$
$$=\frac{4x-15}{(2x+3)(x-2)}\ \checkmark$$

In Example 4, we perform partial fraction decomposition with a rational expression that has repeated linear factors in the denominator.

EXAMPLE 4 Decomposing $\frac{f(x)}{g(x)}$, Where $g(x)$ Has Repeated Linear Factors

Find the partial fraction decomposition. $\dfrac{4x^2+10x+9}{x^3+6x^2+9x}$

Solution:

$$\frac{4x^2+10x+9}{x(x+3)^2}=\frac{A}{x}+\frac{B}{(x+3)^1}+\frac{C}{(x+3)^2}$$

From Example 1(b), we have the form for the partial fraction decomposition.

$$x(x+3)^2\left[\frac{4x^2+10x+9}{x(x+3)^2}\right]=x(x+3)^2\left[\frac{A}{x}+\frac{B}{(x+3)^1}+\frac{C}{(x+3)^2}\right]$$

$$4x^2+10x+9=A(x+3)^2+Bx(x+3)+Cx$$
$$4x^2+10x+9=A(x^2+6x+9)+Bx^2+3Bx+Cx$$
$$4x^2+10x+9=Ax^2+6Ax+9A+Bx^2+3Bx+Cx$$
$$4x^2+10x+9=(A+B)x^2+(6A+3B+C)x+9A$$

$4 = A + B$ — Equate the x^2 term coefficients.

$10 = 6A + 3B + C$ — Equate the x term coefficients.

$9 = 9A$ — Equate the constant terms.

$A = 1$, $B = 3$, and $C = -5$ — Solve the system of linear equations.

$$\frac{4x^2+10x+9}{x(x+3)^2}=\frac{A}{x}+\frac{B}{(x+3)^1}+\frac{C}{(x+3)^2}$$

Substitute $A = 1$, $B = 3$, and $C = -5$ into the partial fraction decomposition.

$$\frac{4x^2+10x+9}{x(x+3)^2}=\frac{1}{x}+\frac{3}{(x+3)^1}+\frac{-5}{(x+3)^2}=\frac{1}{x}+\frac{3}{x+3}-\frac{5}{(x+3)^2}$$

TIP Consider the system:

$4 = A + B$
$10 = 6A + 3B + C$
$9 = 9A$

From the third equation $A = 1$.

Substituting 1 for A in the first equation gives us $B = 3$.

Substituting 1 for A and 3 for B in the second equation gives us

$10 = 6(1) + 3(3) + C$
$10 = 6 + 9 + C$
$-5 = C$

Skill Practice 4 Find the partial fraction decomposition. $\dfrac{-x^2+3x+8}{x^3+4x^2+4x}$

Answer

4. $\frac{2}{x}+\frac{-3}{x+2}+\frac{1}{(x+2)^2}$

3. Decompose $\frac{f(x)}{g(x)}$, Where $g(x)$ Has Irreducible Quadratic Factors

We now turn our attention to performing partial fraction decomposition where the denominator of a rational expression contains quadratic factors irreducible over the integers. In Example 5, we also address the situation in which the given rational expression is an **improper rational expression;** that is, the degree of the numerator

is greater than or equal to the degree of the denominator. In such a case, we use long division to write the expression in the form:

(polynomial) + (proper rational expression)

where a **proper rational expression** is one in which the degree of the numerator is less than the degree of the denominator.

EXAMPLE 5 Decomposing $\frac{f(x)}{g(x)}$, Where $g(x)$ Has an Irreducible Quadratic Factor

Find the partial fraction decomposition. $\dfrac{x^4 + 3x^3 + 6x^2 + 9x + 4}{x^3 + 4x}$

Solution:

First note that the degree of the numerator is not less than the degree of the denominator. Therefore, perform long division first.

$$\frac{x^4 + 3x^3 + 6x^2 + 9x + 4}{x^3 + 4x} \xrightarrow{\text{Long division}} x^3 + 4x \overline{)\, x^4 + 3x^3 + 6x^2 + 9x + 4}$$

$$\begin{array}{r} x + 3 \\ -(x^4 \qquad + 4x^2) \\ \hline 3x^3 + 2x^2 + 9x \\ -(3x^3 \qquad + 12x) \\ \hline 2x^2 - 3x + 4 \end{array}$$

$$= x + 3 + \frac{2x^2 - 3x + 4}{x^3 + 4x} \xleftarrow{\text{Equivalent form}}$$

$$= \underbrace{x + 3}_{\text{polynomial}} + \underbrace{\frac{2x^2 - 3x + 4}{x(x^2 + 4)}}_{\text{proper rational expression}} \qquad \text{Factor the denominator.}$$

$$\frac{2x^2 - 3x + 4}{x(x^2 + 4)} = \frac{A}{x} + \frac{Bx + C}{(x^2 + 4)}$$

Perform partial fraction decomposition on the proper fraction. From Example 2(a), we have the form for the partial fraction decomposition.

$$x(x^2 + 4)\left[\frac{2x^2 - 3x + 4}{x(x^2 + 4)}\right] = x(x^2 + 4)\left[\frac{A}{x} + \frac{Bx + C}{(x^2 + 4)}\right]$$

To solve for A, B, and C, multiply both sides by the LCD to clear fractions.

$$2x^2 - 3x + 4 = A(x^2 + 4) + (Bx + C)x$$

Apply the distributive property.

$$2x^2 - 3x + 4 = Ax^2 + 4A + Bx^2 + Cx$$

$$2x^2 - 3x + 4 = (A + B)x^2 + Cx + 4A$$

Combine like terms.

$$\left.\begin{array}{l} 2 = A + B \\ -3 = C \\ 4 = 4A \end{array}\right\} \quad A = 1,\ B = 1, \text{ and } C = -3$$

Equate the x^2 term coefficients.
Equate the x term coefficients.
Equate the constant terms.
Solve the system of linear equations.

Substitute $A = 1$, $B = 1$, and $C = -3$.

$$\frac{2x^2 - 3x + 4}{x(x^2 + 4)} = \frac{A}{x} + \frac{Bx + C}{(x^2 + 4)}$$

$$\frac{2x^2 - 3x + 4}{x(x^2 + 4)} = \frac{1}{x} + \frac{1x + (-3)}{x^2 + 4} \quad \text{or} \quad \frac{1}{x} + \frac{x - 3}{x^2 + 4}$$

Therefore, $\dfrac{x^4 + 3x^3 + 6x^2 + 9x + 4}{x^3 + 4x} = x + 3 + \dfrac{1}{x} + \dfrac{x - 3}{x^2 + 4}$.

TIP Consider the system:

$$2 = A + B$$
$$-3 = C$$
$$4 = 4A$$

From the second equation, $C = -3$.

From the third equation, $A = 1$.

Substituting 1 for A in the first equation gives us $B = 1$.

Skill Practice 5 Find the partial fraction decomposition.

$$\frac{x^4 + 2x^3 + 10x^2 + 8x + 12}{x^3 + 3x}$$

Answer

5. $x + 2 + \dfrac{4}{x} + \dfrac{3x + 2}{x^2 + 3}$

In Example 6, we demonstrate the case in which a rational expression contains a repeated quadratic factor.

EXAMPLE 6 Decomposing $\frac{f(x)}{g(x)}$, Where $g(x)$ Has a Repeated Irreducible Quadratic Factor

Find the partial fraction decomposition. $\dfrac{3x^2 + 8x + 14}{(x^2 + 2x + 5)^2}$

Solution:

$$\frac{3x^2 + 8x + 14}{(x^2 + 2x + 5)^2} = \frac{Ax + B}{(x^2 + 2x + 5)^1} + \frac{Cx + D}{(x^2 + 2x + 5)^2}$$

From Example 2(b), we have the form for the partial fraction decomposition.

To solve for A, B, C, and D, multiply both sides by the LCD to clear fractions.

$$(x^2 + 2x + 5)^2\left[\frac{3x^2 + 8x + 14}{(x^2 + 2x + 5)^2}\right] = (x^2 + 2x + 5)^2\left[\frac{Ax + B}{x^2 + 2x + 5} + \frac{Cx + D}{(x^2 + 2x + 5)^2}\right]$$

$$3x^2 + 8x + 14 = (Ax + B)(x^2 + 2x + 5) + (Cx + D)$$

$$3x^2 + 8x + 14 = Ax^3 + 2Ax^2 + 5Ax + Bx^2 + 2Bx + 5B + Cx + D$$

$$3x^2 + 8x + 14 = Ax^3 + (2A + B)x^2 + (5A + 2B + C)x + 5B + D$$

Combine like terms.

$$0 = A$$ Equate the x^3 term coefficients.

$$3 = 2A + B$$ Equate the x^2 term coefficients.

$$8 = 5A + 2B + C$$ Equate the x term coefficients.

$$14 = 5B + D$$ Equate the constant terms.

$A = 0$, $B = 3$, $C = 2$, and $D = -1$ Solve the system of linear equations.

$$\frac{3x^2 + 8x + 14}{(x^2 + 2x + 5)^2} = \frac{Ax + B}{x^2 + 2x + 5} + \frac{Cx + D}{(x^2 + 2x + 5)^2}$$

Substitute $A = 0$, $B = 3$, $C = 2$, and $D = -1$ into the partial fraction decomposition.

$$\frac{3x^2 + 8x + 14}{(x^2 + 2x + 5)^2} = \frac{(0)x + (3)}{x^2 + 2x + 5} + \frac{(2)x + (-1)}{(x^2 + 2x + 5)^2} \quad \text{or} \quad \frac{3}{x^2 + 2x + 5} + \frac{2x - 1}{(x^2 + 2x + 5)^2}$$

TIP Consider the system:

$0 = A$
$3 = 2A + B$
$8 = 5A + 2B + C$
$14 = 5B + D$

From the first equation, $A = 0$, and substituting 0 for A in the second equation gives us $B = 3$.

Substituting 0 for A and 3 for B in the third equation gives us $C = 2$.

Substituting 3 for B in the fourth equation gives us $D = -1$.

Skill Practice 6 Find the partial fraction decomposition.

$$\frac{-3x^2 - 5x - 19}{(x^2 + 3x + 6)^2}$$

Answer

6. $\dfrac{-3}{x^2 + 3x + 6} + \dfrac{4x - 1}{(x^2 + 3x + 6)^2}$

SECTION 9.3 Practice Exercises

Prerequisite Review

For Exercises R.1–R.2, factor completely.

R.1. $12y^3 - 16y - 9y^2 + 12$

R.2. $64u^2 + 80u + 25$

R.3. Add. $\dfrac{4}{4a + 3} + \dfrac{4}{a - 3}$

R.4. Use long division to divide.

$$\frac{25x^4 - 5x^3 + 15x^2 + 4x - 2}{5x^2 - x + 4}$$

R.5. Solve. $\dfrac{16}{x} - \dfrac{16}{x - 2} = \dfrac{4}{x}$

Concept Connections

1. The process of decomposing a rational expression into two or more simpler fractions is called partial _____.

2. When setting up a partial fraction decomposition, if a fraction has a linear denominator, then the numerator should be (constant/linear). That is, should the numerator be set up as A or $Ax + B$?

3. When setting up a partial fraction decomposition, if the denominator of a fraction is a quadratic polynomial irreducible over the integers, then the numerator should be (constant/linear). That is, should the numerator be set up as A or $Ax + B$?

4. In what situation should long division be used before attempting to decompose a rational expression into partial fractions?

Objective 1: Set Up a Partial Fraction Decomposition

For Exercises 5–20, set up the form for the partial fraction decomposition. Do not solve for A, B, C, and so on. (See Examples 1–2)

5. $\dfrac{-x - 37}{(x + 4)(2x - 3)}$

6. $\dfrac{20x - 4}{(x - 5)(3x + 1)}$

7. $\dfrac{8x - 10}{x^2 - 2x}$

8. $\dfrac{y - 12}{y^2 + 3y}$

9. $\dfrac{6w - 7}{w^2 + w - 6}$

10. $\dfrac{-10t - 11}{t^2 + 5t - 6}$

11. $\dfrac{x^2 + 26x + 100}{x^3 + 10x^2 + 25x}$

12. $\dfrac{-3x^2 + 2x + 8}{x^3 + 4x^2 + 4x}$

13. $\dfrac{13x^2 + 2x + 45}{2x^3 + 18x}$

14. $\dfrac{17x^2 - 7x + 18}{7x^3 + 42x}$

15. $\dfrac{2x^3 - x^2 + 13x - 5}{x^4 + 10x^2 + 25}$

16. $\dfrac{3x^3 - 4x^2 + 11x - 12}{x^4 + 6x^2 + 9}$

17. $\dfrac{5x^2 - 4x + 8}{(x - 4)(x^2 + x + 4)}$

18. $\dfrac{x^2 + 15x - 6}{(x + 6)(x^2 + 2x + 6)}$

19. $\dfrac{2x^5 + 3x^3 + 4x^2 + 5}{x(x + 2)^3(x^2 + 2x + 7)^2}$

20. $\dfrac{6x^4 - 5x^3 + 2x^2 - 5}{(x - 3)(2x + 9)^2(x^2 + 1)^2}$

Objectives 2 and 3: Decompose $\dfrac{f(x)}{g(x)}$ into Partial Fractions

For Exercises 21–42, find the partial fraction decomposition. (See Examples 3–6)

21. $\dfrac{-x - 37}{(x + 4)(2x - 3)}$

22. $\dfrac{20x - 4}{(x - 5)(3x + 1)}$

23. $\dfrac{8x - 10}{x^2 - 2x}$

24. $\dfrac{y - 12}{y^2 + 3y}$

25. $\dfrac{6w - 7}{w^2 + w - 6}$

26. $\dfrac{-10t - 11}{t^2 + 5t - 6}$

27. $\dfrac{x^2 + 26x + 100}{x^3 + 10x^2 + 25x}$

28. $\dfrac{-3x^2 + 2x + 8}{x^3 + 4x^2 + 4x}$

29. $\dfrac{13x^2 + 2x + 45}{2x^3 + 18x}$

30. $\dfrac{17x^2 - 7x + 18}{7x^3 + 42x}$

31. $\dfrac{x^4 - 3x^3 + 13x^2 - 28x + 28}{x^3 + 7x}$

32. $\dfrac{x^4 - 4x^3 + 11x^2 - 13x + 12}{x^3 + 2x}$

43. a. Factor. $x^3 - x^2 - 21x + 45$
(*Hint*: Use the rational zero theorem.)

b. Find the partial fraction decomposition for $\dfrac{-3x^2 + 35x - 70}{x^3 - x^2 - 21x + 45}$.

44. a. Factor. $x^3 + 2x^2 - 7x + 4$

b. Find the partial fraction decomposition for $\dfrac{10x^2 + 17x - 17}{x^3 + 2x^2 - 7x + 4}$.

45. a. Factor. $x^3 + 6x^2 + 12x + 8$

b. Find the partial fraction decomposition for $\dfrac{3x^2 + 8x + 5}{x^3 + 6x^2 + 12x + 8}$.

46. a. Factor. $x^3 - 9x^2 + 27x - 27$

b. Find the partial fraction decomposition for $\dfrac{2x^2 - 17x + 37}{x^3 - 9x^2 + 27x - 27}$.

Write About It

47. Write an informal explanation of partial fraction decomposition.

48. Suppose that a proper rational expression has a single repeated linear factor $(ax + b)^3$ in the denominator. Explain how to set up the partial fraction decomposition.

49. What is meant by a *proper* rational expression?

50. Given an improper rational expression, what must be done first before the technique of partial fraction decomposition may be performed?

Expanding Your Skills

51. a. Determine the partial fraction decomposition for $\dfrac{2}{n(n + 2)}$.

b. Use the partial fraction decomposition for $\dfrac{2}{n(n + 2)}$ to rewrite the infinite sum

$$\frac{2}{1(3)} + \frac{2}{2(4)} + \frac{2}{3(5)} + \frac{2}{4(6)} + \frac{2}{5(7)} \cdots$$

c. Determine the value of $\dfrac{1}{n + 2}$ as $n \to \infty$.

d. Find the value of the sum from part (b).

52. a. Determine the partial fraction decomposition for $\dfrac{3}{n(n + 3)}$.

b. Use the partial fraction decomposition for $\dfrac{3}{n(n + 3)}$ to rewrite the infinite sum

$$\frac{3}{1(4)} + \frac{3}{2(5)} + \frac{3}{3(6)} + \frac{3}{4(7)} + \frac{3}{5(8)} \cdots$$

c. Determine the value of $\dfrac{1}{n + 3}$ as $n \to \infty$.

d. Find the value of the sum from part (b).

For Exercises 53–54, find the partial fraction decomposition. Assume that a and b are nonzero constants.

53. $\dfrac{1}{x(a + bx)}$

54. $\dfrac{1}{a^2 - x^2}$

For Exercises 55–56, find the partial fraction decomposition for the given expression. [*Hint*: Use the substitution $u = e^x$ and recall that $e^{2x} = (e^x)^2$.]

55. $\dfrac{5e^x + 7}{e^{2x} + 3e^x + 2}$

56. $\dfrac{-3e^x - 22}{e^{2x} + 3e^x - 4}$

SECTION 9.4 Systems of Nonlinear Equations in Two Variables

OBJECTIVES

1. Solve Nonlinear Systems of Equations by the Substitution Method
2. Solve Nonlinear Systems of Equations by the Addition Method
3. Use Nonlinear Systems of Equations to Solve Applications

1. Solve Nonlinear Systems of Equations by the Substitution Method

MBI/Alamy Stock Photo

The attending physician in an emergency room treats an unconscious patient suspected of a drug overdose. The physician needs to know the concentration of the drug in the bloodstream at the time the drug was taken to determine the extent of damage to the kidneys. The patient's family does not know the original amount of the drug taken, but believes that the drug was taken by injection 3 hr before arriving at the hospital. Blood work at the time of arrival ($t = 3$ hr after the patient had taken the drug) showed that the drug concentration in the bloodstream was 0.69 μg/dL. One hour later ($t = 4$ hr), the level had dropped to 0.655 μg/dL.

The physician can solve the following system of nonlinear equations to determine the concentration of the drug in the bloodstream at the time of injection. The value A_0 represents the initial concentration of the drug, and the value k is related to the rate at which the kidneys can remove the drug.

$$0.69 = A_0 e^{-3k}$$
$$0.655 = A_0 e^{-4k}$$

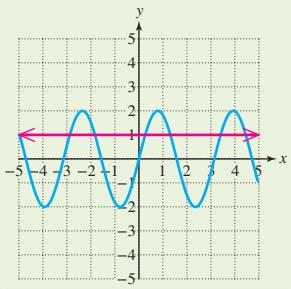
The solution to this problem is discussed in Exercise 59.

A **nonlinear system of equations** is a system in which one or more equations is nonlinear. For example:

$$\begin{aligned} -x + 7y &= 50 \\ x^2 + y^2 &= 100 \end{aligned}$$ Second equation nonlinear

$$\left.\begin{aligned} 2x^2 + y^2 &= 17 \\ x^2 + 2y^2 &= 22 \end{aligned}\right\}$$ Both equations nonlinear

TIP A nonlinear system of equations may also have infinitely many solutions. In the graph shown, the "wave" pattern extends infinitely far in both directions.



A **solution** to a nonlinear system of equations in two variables is an ordered pair with real-valued coordinates that satisfies each equation in the system. Graphically, these are the points of intersection of the graphs of the equations. A nonlinear system of equations may have no solution or one or more solutions. See Figure 9-9 through Figure 9-11.

Two solutions

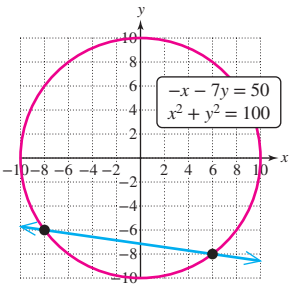


Figure 9-9

Four solutions

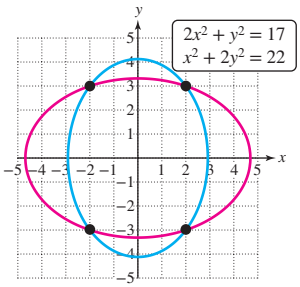

Figure 9-10

No solution

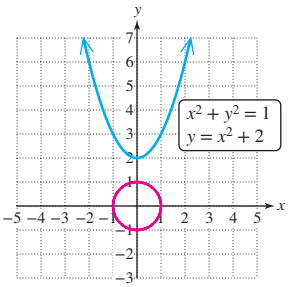

Figure 9-11

We will solve nonlinear systems of equations by the substitution method and by the addition method. In Example 1, we begin with the substitution method.

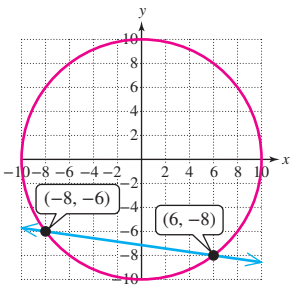

Figure 9-12

EXAMPLE 1 Solving a System of Nonlinear Equations by Using the Substitution Method

Solve the system by using the substitution method. $-x - 7y = 50$, $x^2 + y^2 = 100$

Solution:

A $-x - 7y = 50$
B $x^2 + y^2 = 100$

Equation A is a line and can be written in slope-intercept form as $y = -\frac{1}{7}x - \frac{50}{7}$.

Equation B represents a circle centered at (0, 0) with radius 10.

A sketch of the two equations suggests that the curves intersect at (−8, −6) and (6, −8). See Figure 9-12.

A $-x - 7y = 50 \longrightarrow x = -7y - 50$
B $x^2 + y^2 = 100$

To solve the system algebraically by the substitution method, first solve for x or y from either equation.

B $(-7y - 50)^2 + y^2 = 100$

Substitute $x = -7y - 50$ from equation A into equation B.

$49y^2 + 700y + 2500 + y^2 = 100$
$50y^2 + 700y + 2400 = 0$

Solve the resulting equation for y.

$50(y^2 + 14y + 48) = 0$

Factor out the GCF of 50.

$50(y + 6)(y + 8) = 0$
$y = -6$ or $y = -8$

For each value of y, find the corresponding x value by substituting y into the equation in which x is isolated: $x = -7y - 50$

$y = -6$: $x = -7(-6) - 50 = -8$ The solution is (−8, −6).
$y = -8$: $x = -7(-8) - 50 = 6$ The solution is (6, −8).

Check: (−8, −6)
A $-(-8) - 7(-6) = 50$ ✓
B $(-8)^2 + (-6)^2 = 100$ ✓

Check: (6, −8)
A $-(6) - 7(-8) = 50$ ✓
B $(6)^2 + (-8)^2 = 100$ ✓

The solutions both check in each equation.

The solution set is $\{(-8, -6), (6, -8)\}$.

Skill Practice 1 Solve the system by using the substitution method.

$2x + y = 5$
$x^2 + y^2 = 50$

As we solve systems of equations, we will consider only solutions with real coordinates. In Example 2, we have a system of equations in which one equation is $y = 3\sqrt{x - 8}$. The expression $\sqrt{x - 8}$ is a real number for values of x on the interval $[8, \infty)$. Therefore, any ordered pair with an x-coordinate less than 8 must be rejected as a potential solution.

EXAMPLE 2 Solving a System of Nonlinear Equations by Using the Substitution Method

Solve the system by using the substitution method. $(x - 5)^2 + y^2 = 25$, $y = 3\sqrt{x - 8}$

Answer
1. {(5, −5), (−1, 7)}

ISTUDY

Solution:

A $(x-5)^2+y^2=25$
B $y=3\sqrt{x-8}$

Label the equations. The graphs of the equations are shown in Figure 9-13. The graph suggests that there is only one solution: (9, 3).

A $(x-5)^2+(3\sqrt{x-8})^2=25$

Substitute $3\sqrt{x-8}$ for y in equation A.

$x^2-10x+25+9(x-8)=25$

Square each term.

$x^2-x-72=0$
$(x-9)(x+8)=0$
$x=9$ or ~~$x=-8$~~

Reject $x=-8$ because $3\sqrt{x-8}$ is not a real number for $x=-8$.

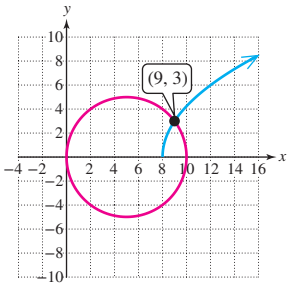

Figure 9-13

Given $x=9$, solve for y:

B $y=3\sqrt{x-8}$
$y=3\sqrt{9-8}=3$

The solution is (9, 3) and checks in each original equation.

The solution set is $\{(9,3)\}$.

Skill Practice 2 Solve the system by using the substitution method.

$x^2+y^2=90$
$y=\sqrt{x}$

2. Solve Nonlinear Systems of Equations by the Addition Method

The substitution method is used most often to solve a system of nonlinear equations. In some situations, however, the addition method is an efficient way to find a solution. Examples 3 and 4 demonstrate that we can eliminate a variable from both equations in a system provided the terms containing the corresponding variables are like terms.

EXAMPLE 3 Solving a System of Nonlinear Equations by Using the Addition Method

Solve the system by using the addition method.

$2x^2+y^2=17$
$x^2+2y^2=22$

Solution:

Using the addition method, the goal is to create opposite coefficients on either the x^2 terms or the y^2 terms. In this case, we have chosen to eliminate the x^2 terms.

A $2x^2+y^2=17$
B $x^2+2y^2=22$ $\xrightarrow{\text{Multiply by } -2.}$ $-2x^2-4y^2=-44$

$2x^2+y^2=17$
$-3y^2=-27$
$y^2=9$
$y=\pm 3$

$y=3$: B $x^2+2(3)^2=22$
$x^2=4$
$x=\pm 2$

The solutions are (2, 3), (−2, 3).

Substitute $y=\pm 3$ into either equation A or B to solve for the corresponding values of x.

Answer
2. {(9, 3)}

ISTUDY

$y = -3$: B $x^2 + 2(-3)^2 = 22$

$x^2 = 4$

$x = \pm 2$ The solutions are $(2, -3), (-2, -3)$.

The solutions all check in the original equations.

The solution set is $\{(2, 3), (-2, 3), (2, -3), (-2, -3)\}$.

Skill Practice 3 Solve the system by using the addition method.

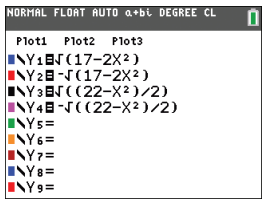
$x^2 + y^2 = 17$

$x^2 - 2y^2 = -31$

TECHNOLOGY CONNECTIONS

Solving a System of Nonlinear Equations Using Intersect

The equations in Example 3 each represent a curve called an ellipse. We do not yet know how to graph an ellipse; however, we can graph the curves on a graphing calculator. First solve each equation for y. Enter the resulting functions in the calculator and use the Intersect feature to approximate the points of intersection (Figure 9-14).



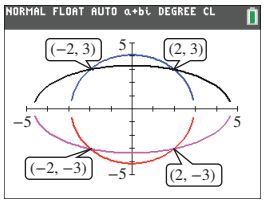


Figure 9-14

$2x^2 + y^2 = 17 \xrightarrow{\text{Solve for } y.} y = \pm\sqrt{17 - 2x^2}$

$x^2 + 2y^2 = 22 \longrightarrow y = \pm\sqrt{\dfrac{22 - x^2}{2}}$

TIP The image produced by a graphing calculator in Figure 9-14 does not show the curves touching the x-axis, when indeed they do.

Example 4 illustrates that a nonlinear system of equations may have no solution.

EXAMPLE 4 Solving an Inconsistent System by Using the Addition Method

Solve the system by using the addition method.

$x^2 + 4y^2 = 4$

$x^2 - y^2 = 9$

Solution:

$x^2 + 4y^2 = 4$

$x^2 - y^2 = 9 \xrightarrow{\text{Multiply by } -1.}$

$x^2 + 4y^2 = 4$

$-x^2 + y^2 = -9$

$5y^2 = -5$

$y^2 = -1$

$y = \pm i$

We use the addition method because like terms are aligned vertically.

The values for y are not real numbers. Therefore, there is no solution to the system of equations over the set of real numbers.

The solution set is $\{\ \}$.

TIP Solutions to a system of equations are limited to ordered pairs with real-valued coordinates because we are interested in the points of intersection of the graphs of the equations.

Skill Practice 4 Solve the system by using the addition method.

$x^2 + y^2 = 16$

$4x^2 + 9y^2 = 36$

Answers

3. $\{(1, 4), (-1, 4), (1, -4), (-1, -4)\}$

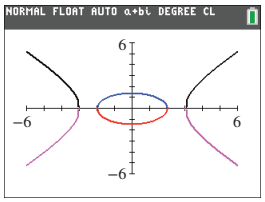
4. $\{\ \}$

ISTUDY

TECHNOLOGY CONNECTIONS

Solving a Nonlinear System of Equations

The equations in Example 4 represent two curves that have not yet been studied: an ellipse and a hyperbola. However, we can graph the curves on a graphing calculator by solving for y and entering the functions into the calculator.



$x^2 + 4y^2 = 4 \xrightarrow[\text{Solve for } y.]{} y = \pm\sqrt{\dfrac{4 - x^2}{4}}$

$x^2 - y^2 = 9 \longrightarrow y = \pm\sqrt{x^2 - 9}$

From the graph, we see that the curves do not intersect.

3. Use Nonlinear Systems of Equations to Solve Applications

In Example 5, we set up a system of nonlinear equations to model an application involving two independent relationships between two variables.

EXAMPLE 5 Solving an Application of a Nonlinear System

The perimeter of a television screen is 140 in. The area is 1200 in.^{2}.

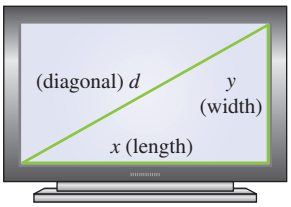
a. Find the length and width of the screen.

b. Find the length of the diagonal.

Solution:

Let x represent the length of the screen.

Let y represent the width of the screen.



The statement of the problem gives two independent relationships between the length and width of the screen.

The perimeter of a television screen is 140 in. $\longrightarrow 2x + 2y = 140$

The area is 1200 in.^{2}. $\longrightarrow xy = 1200$

a. Solve the nonlinear system of equations for x and y.

A $2x + 2y = 140$

B $xy = 1200 \xrightarrow{\text{Solve for } y.} y = \dfrac{1200}{x}$ Using the substitution method, solve for x or y in either equation.

A $2x + 2\left(\dfrac{1200}{x}\right) = 140$ Substitute $y = \frac{1200}{x}$ from equation B into equation A.

$2x + \dfrac{2400}{x} = 140$

$x \cdot \left(2x + \dfrac{2400}{x}\right) = x \cdot (140)$ Multiply both sides by the LCD to clear fractions.

$2x^2 + 2400 = 140x$ The resulting equation is quadratic.

$2x^2 - 140x + 2400 = 0$

$2(x^2 - 70x + 1200) = 0$ Factor the left side.

$2(x - 40)(x - 30) = 0$

$x = 40 \quad \text{or} \quad x = 30$ There are two possible values for the length x.

Avoiding Mistakes

Check the solution to Example 5(a) by computing the perimeter and area.

Perimeter:
$2(40 \text{ in.}) + 2(30 \text{ in.})$
$= 140 \text{ in.}$ ✓

Area:
$(40 \text{ in.})(30 \text{ in.})$
$= 1200 \text{ in.}^2$ ✓

Substitute $x = 40$ and $x = 30$ into the equation $y = \frac{1200}{x}$.

$x = 40$: $y = \frac{1200}{40} = 30$ If the length x is 40 in., then the width y is 30 in.

$x = 30$: $y = \frac{1200}{30} = 40$ If the length x is 30 in., then the width y is 40 in.

Taking the length to be the longer side, we have that the length is 40 in. and the width is 30 in.

b. $x^2 + y^2 = d^2$
$(40)^2 + (30)^2 = d^2$
$1600 + 900 = d^2$
$2500 = d^2$
$d = \pm 50$

Use the Pythagorean theorem to determine the measure of the diagonal of the screen.

Excluding the negative solution for d, the diagonal is 50 in.

Skill Practice 5 The perimeter of a rectangular rug is 40 ft and the area is 96 ft^2. Find the dimensions of the rug.

Answer

5. The length of the rug is 12 ft and the width is 8 ft.

SECTION 9.4 Practice Exercises

Prerequisite Review

For Exercises R.1–R.3, graph the equation.

R.1. $y = x^2 + 4x + 3$

R.2. $(x + 4)^2 + (y - 1)^2 = 4$

R.3. $y = \sqrt{x + 2}$

For Exercises R.4–R.5, solve the equation.

R.4. $\ln x = 17$

R.5. $3^x = 81$

Concept Connections

1. A _____ system of equations in two variables is a system in which one or more equations in the system is nonlinear.

2. A solution to a nonlinear system of equations in two variables is an _____ pair with real-valued coordinates that satisfies each equation in the system. Graphically, a solution is a point of _____ of the graphs of the equations.

Objective 1: Solve Nonlinear Systems of Equations by the Substitution Method

For Exercises 3–14,

a. Graph the equations in the system.

b. Solve the system by using the substitution method. (**See Examples 1–2**)

3. $y = x^2 - 2$
$2x - y = 2$

4. $y = -x^2 + 3$
$y - 2x = 0$

5. $x^2 + y^2 = 25$
$x + y = 1$

6. $x^2 + y^2 = 25$
$3y = 4x$

7. $y = \sqrt{x}$
$x^2 + y^2 = 20$

8. $x^2 + y^2 = 10$
$y = \sqrt{x - 2}$

9. $(x + 2)^2 + y^2 = 9$
$y = 2x - 4$

10. $x^2 + (y - 3)^2 = 4$
$y = -x - 4$

11. $y = x^3$
$y = x$

12. $y = \sqrt[3]{x}$
$y = x$

13. $y = -(x - 2)^2 + 5$
$y = 2x + 1$

14. $y = (x + 3)^2 - 1$
$y = 2x + 5$

ISTUDY

Objective 2: Solve Nonlinear Systems of Equations by the Addition Method

For Exercises 15–22, solve the system by using the addition method. (See Examples 3–4)

15. $2x^2 + 3y^2 = 11$
$x^2 + 4y^2 = 8$

16. $3x^2 + y^2 = 21$
$4x^2 - 2y^2 = -2$

17. $x^2 - xy = 20$
$-2x^2 + 3xy = -44$

18. $4xy + 3y^2 = -9$
$2xy + y^2 = -5$

19. $5x^2 - 2y^2 = 1$
$2x^2 - 3y^2 = -4$

20. $6x^2 + 5y^2 = 38$
$7x^2 - 3y^2 = 9$

21. $x^2 = 1 - y^2$
$9x^2 - 4y^2 = 36$

22. $4x^2 = 4 - y^2$
$16y^2 = 144 + 9x^2$

Mixed Exercises

For Exercises 23–34, solve the system by using any method.

23. $x^2 - 4xy + 4y^2 = 1$
$x + y = 4$

24. $x^2 - 6xy + 9y^2 = 0$
$x - y = 2$

25. $y = x^2 + 4x + 5$
$y = 4x + 5$

26. $y = x^2 - 6x + 9$
$y = -2x + 5$

27. $y = x^2$
$y = \frac{1}{x}$

28. $y = \frac{1}{x}$
$y = \sqrt{x}$

29. $x^2 + (y - 4)^2 = 25$
$y = -x^2 + 9$

30. $(x - 10)^2 + y^2 = 100$
$x = y^2$

31. $y = -x^2 + 6x - 7$
$y = x^2 - 10x + 23$

32. $y = -x^2 + 6x - 9$
$y = x^2 - 2x - 3$

33. $\frac{x^2}{4} + \frac{y^2}{16} = 1$
$x^2 + y = 4$

34. $\frac{x^2}{4} + y^2 = 1$
$x = -2y^2 + 2$

For Exercises 35–36, use the substitutions $u = \frac{1}{x^2}$ and $v = \frac{1}{y^2}$ to solve the system of equations.

35. $\frac{4}{x^2} - \frac{3}{y^2} = -23$
$\frac{5}{x^2} + \frac{1}{y^2} = 14$

36. $-\frac{3}{x^2} + \frac{1}{y^2} = 13$
$\frac{5}{x^2} - \frac{1}{y^2} = -5$

Objective 3: Use Nonlinear Systems of Equations to Solve Applications

37. Find two numbers whose sum is 12 and whose product is 35.

38. Find two numbers whose sum is 9 and whose product is −36.

39. The sum of the squares of two positive numbers is 29 and the difference of the squares of the numbers is 21. Find the numbers.

40. The sum of the squares of two negative numbers is 145 and the difference of the squares of the numbers is 17. Find the numbers.

41. The difference of two positive numbers is 2 and the difference of their squares is 44. Find the numbers.

42. The sum of two numbers is 4 and the difference of their squares is 64. Find the numbers.

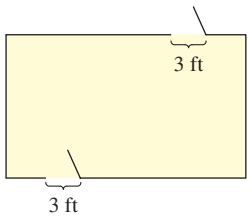
43. The ratio of two numbers is 3 to 4 and the sum of their squares is 225. Find the numbers.

44. The ratio of two numbers is 5 to 12 and the sum of their squares is 676. Find the numbers.

45. Find the dimensions of a rectangle whose perimeter is 36 m and whose area is 80 m^2.

46. Find the dimensions of a rectangle whose perimeter is 56 cm and whose area is 192 cm^2.

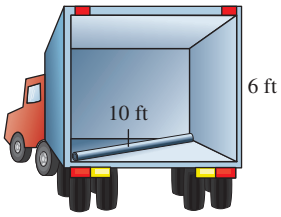
47. The floor of a rectangular bedroom requires 240 ft^2 of carpeting. Molding is placed around the base of the floor except at two 3-ft doorways. If 58 ft of molding is required around the base of the floor, determine the dimensions of the floor. (**See Example 5**)



48. An electronic sign for a grocery store is in the shape of a rectangle. The perimeter of the sign is 72 ft and the area is 320 ft^2. Find the length and width of the sign.

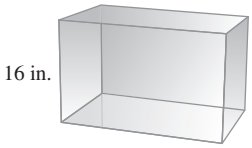
ISTUDY

49. A rental truck has a cargo capacity of 288 ft^3. A 10-ft pipe just fits resting diagonally on the floor of the truck. If the cargo space is 6 ft high, find the dimensions of the truck.



50. A rectangular window has a 15-yd diagonal and an area of 108 yd^2. Find the dimensions of the window.

51. An aquarium is 16 in. high with volume of 4608 $in.^3$ (approximately 20 gal). If the amount of glass used for the bottom and four sides is 1440 $in.^2$, determine the dimensions of the aquarium.



52. A closed box is in the shape of a rectangular solid with height 3 m. Its surface area is 268 m^2. If the volume is 240 m^3, find the dimensions of the box.

53. The hypotenuse of a right triangle is $\sqrt{65}$ ft. The sum of the lengths of the legs is 11 ft. Find the lengths of the legs.

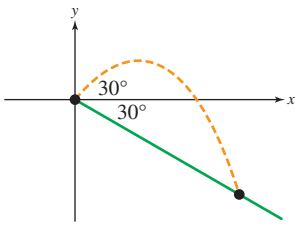
54. The hypotenuse of a right triangle is $\sqrt{73}$ in. The sum of the lengths of the legs is 11 in. Find the lengths of the legs.

55. A ball is kicked off the side of a hill at an angle of elevation of 30°. The hill slopes downward 30° from the horizontal. Consider a coordinate system in which the origin is the point on the edge of the hill from which the ball is kicked. The path of the ball and the line of declination of the hill can be approximated by

$y = -\frac{x^2}{192} + \frac{\sqrt{3}}{3}x$ Path of the ball

$y = -\frac{\sqrt{3}}{3}x$ Line of declination of the hill

Solve the system to determine where the ball will hit the ground.



56. A child kicks a rock off the side of a hill at an angle of elevation of 60°. The hill slopes downward 30° from the horizontal. Consider a coordinate system in which the origin is the point on the edge of the hill from which the rock is kicked. The path of the rock and the line of declination of the hill can be approximated by

$y = -\frac{x^2}{36} + \sqrt{3}x$ Path of the rock

$y = -\frac{\sqrt{3}}{3}x$ Line of declination of the hill

Solve the system to determine where the rock will hit the ground.

Write About It

57. What is the difference between a system of linear equations and a system of nonlinear equations?

58. Describe a situation in which the addition method is an efficient technique to solve a system of nonlinear equations.

Expanding Your Skills

59. The attending physician in an emergency room treats an unconscious patient suspected of a drug overdose. The physician does not know the initial concentration A_0 of the drug in the bloodstream at the time of injection. However, the physician knows that after 3 hr, the drug concentration in the blood is 0.69 μg/dL and after 4 hr, the concentration is 0.655 μg/dL. The model $A(t) = A_0e^{-kt}$ represents the drug concentration $A(t)$ (in μg/dL) in the bloodstream t hours after injection. The value of k is a constant related to the rate at which the drug is removed by the body.

a. Substitute 0.69 for $A(t)$ and 3 for t in the model and write the resulting equation.

b. Substitute 0.655 for $A(t)$ and 4 for t in the model and write the resulting equation.

c. Use the system of equations from parts (a) and (b) to solve for k. Round to 3 decimal places.

d. Use the system of equations from parts (a) and (b) to approximate the initial concentration A_0 (in μg/dL) at the time of injection. Round to 2 decimal places.

e. Determine the concentration of the drug after 12 hr. Round to 2 decimal places.

ISTUDY

60. A patient undergoing a heart scan is given a sample of fluorine-18 (^{18}F). After 4 hr, the radioactivity level in the patient is 44.1 MBq (megabecquerel). After 5 hr, the radioactivity level drops to 30.2 MBq. The radioactivity level $Q(t)$ can be approximated by $Q(t) = Q_0e^{-kt}$, where t is the time in hours after the initial dose Q_0 is administered.

a. Determine the value of k. Round to 4 decimal places.

b. Determine the initial dose, Q_0. Round to the nearest whole unit.

c. Determine the radioactivity level after 12 hr. Round to 1 decimal place.

61. The population $P(t)$ of a culture of bacteria grows exponentially for the first 72 hr according to the model $P(t) = P_0e^{kt}$. The variable t is the time in hours since the culture is started. The population of bacteria is 60,000 after 7 hr. The population grows to 80,000 after 12 hr.

a. Determine the constant k to 3 decimal places.

b. Determine the original population P_0. Round to the nearest thousand.

c. Determine the time required for the population to reach 300,000. Round to the nearest hour.

62. An investment grows exponentially under continuous compounding. After 2 yr, the amount in the account is \$7328.70. After 5 yr, the amount in the account is \$8774.10. Use the model $A(t) = Pe^{rt}$ to

a. Find the interest rate r. Round to the nearest percent.

b. Find the original principal P. Round to the nearest dollar.

c. Determine the amount of time required for the account to reach a value of \$15,000. Round to the nearest year.

For Exercises 63–66, find the number of solutions by graphing the system of equations. (*Hint*: Rewrite the system of equations into familiar forms to graph.)

63.
$$\log_2 y - \log_2 x = 2$$
$$x^2 - 6x + y^2 - 4y = -9$$

64.
$$\log(y + 4) - 2\log x = \log 3$$
$$x^2 + y^2 = 9$$

65.
$$\ln 4 + \ln y = 2\ln x$$
$$x^2 + y^2 - 6y - 7 = 0$$

66.
$$\ln 4 = 2\ln x - \ln y$$
$$x^2 + y^2 - 6y + 5 = 0$$

For Exercises 67–68, determine the number of solutions to the system of equations.

67.
$$y = 2^{x+1}$$
$$-1 + \log_2 y = x$$

68.
$$x^2 - y^2 = 0$$
$$|x| = |y|$$

For Exercises 69–74, solve the system.

69.
$$\log x + 2\log y = 5$$
$$2\log x - \log y = 0$$

70.
$$\log_2 x + 3\log_2 y = 6$$
$$\log_2 x - \log_2 y = 2$$

71.
$$2^x + 2^y = 6$$
$$4^x - 2^y = 14$$

72.
$$3^x - 9^y = 18$$
$$3^x + 3^y = 30$$

73.
$$(x - 1)^2 + (y + 1)^2 = 5$$
$$x^2 + (y + 4)^2 = 29$$

74.
$$(x + 3)^2 + (y - 2)^2 = 4$$
$$(x - 1)^2 + y^2 = 8$$

For Exercises 75–76, use substitution to solve the system for the set of ordered triples (x, y, λ) that satisfy the system.

75.
$$2 = 2\lambda x$$
$$6 = 2\lambda y$$
$$x^2 + y^2 = 10$$

76.
$$8 = 4\lambda x$$
$$2 = 2\lambda y$$
$$2x^2 + y^2 = 9$$

ISTUDY

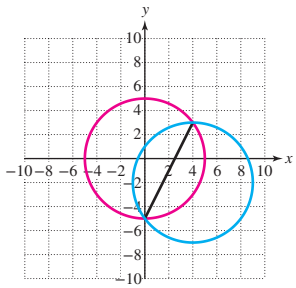
77. Two circles intersect as shown.

a. Find the points of intersection.

$x^2 + y^2 = 25$

$(x - 4)^2 + (y + 2)^2 = 25$

b. Find an equation of the chord common to both circles (shown in black). (*Hint*: A chord is a line segment on the interior of a circle with both endpoints on the circle.)



78. The minimum and maximum distances from a point P to a circle are found using the line determined by the given point and the center of the circle. Given the circle defined by $x^2 + y^2 = 9$ and the point $P(4, 5)$,

a. Find the point on the circle closest to the point (4, 5).

b. Find the point on the circle farthest from the point (4, 5).

Technology Connections

For Exercises 79–84, use a graphing utility to approximate the solution(s) to the system of equations. Round the coordinates to 3 decimal places.

79. $y = -0.6x + 7$
$y = e^x - 5$

80. $y = -0.7x + 4$
$y = \ln x$

81. $x^2 + y^2 = 40$
$y = -x^2 + 8.5$

82. $x^2 + y^2 = 32$
$y = 0.8x^2 - 9.2$

83. $y = x^2 - 8x + 20$
$y = 4 \log x$

84. $y = 0.2e^x$
$y = -0.6x^2 - 2x - 3$

SECTION 9.5 Inequalities and Systems of Inequalities in Two Variables

OBJECTIVES

1. Solve Linear Inequalities in Two Variables
2. Solve Nonlinear Inequalities in Two Variables
3. Solve Systems of Inequalities in Two Variables

1. Solve Linear Inequalities in Two Variables

Adriana has 12 hr of available study time before taking tests in algebra and biology in back-to-back classes. Suppose that x represents the time spent studying algebra and y represents the time spent studying biology. Then the inequality $x + y \leq 12$, where $x \geq 0$ and $y \geq 0$ represents the distribution of time that can be allocated for studying for each subject.

XiXinXing/iStock/Image Source/Getty Images

An inequality of the form $Ax + By < C$, where A and B are not both zero, is called a **linear inequality in two variables.** (Note that the symbols $>$, $\leq$, and $\geq$ can be used in place of $<$ in the definition.) A **solution** to an inequality in two variables is an ordered pair that satisfies the inequality. The set of all such ordered pairs is called the **solution set** to the inequality. Graphically, the solution set is a region in the xy-plane.

To graph the solution set to a linear inequality in two variables, follow these guidelines.

TIP To graph the line in step 1, we can
- Use the slope-intercept form of the equation of the line.
- Graph the x- and y-intercepts.
- Create a table of points.

Graphing a Linear Inequality in Two Variables

Step 1 Graph the related equation. That is, replace the inequality sign with an $=$ sign and graph the line represented by the equation.
- If the inequality is strict (stated with the symbols $<$ or $>$), then draw the line as a dashed line to indicate that the line *is not* part of the solution set.
- If the inequality is stated with the symbols $\leq$ or $\geq$, then draw the line as a solid line to indicate that the line *is* part of the solution set.

Step 2 Choose a test point from either side of the line (not a point on the line itself) and substitute the ordered pair into the inequality.
- If a true statement results, then shade the region (half-plane) from which the test point was taken.
- If a false statement results, then shade the region (half-plane) on the opposite side of the line from which the test point was taken.

EXAMPLE 1 Graphing a Linear Inequality in Two Variables

Graph the solution set. $3x - 2y < 6$

Solution:

$3x - 2y < 6 \xrightarrow[\text{related equation}]{} 3x - 2y = 6$

Step 1: Graph the related equation $3x - 2y = 6$ using any technique for graphing. In this case, we have chosen to find the x- and y-intercepts.

x-intercept:
$3x - 2(0) = 6$
$x = 2$

y-intercept:
$3(0) - 2y = 6$
$y = -3$

The x- and y-intercepts are $(2, 0)$ and $(0, -3)$. Graph the line through the intercepts (Figure 9-15). Because the inequality is strict, draw the line as a dashed line.

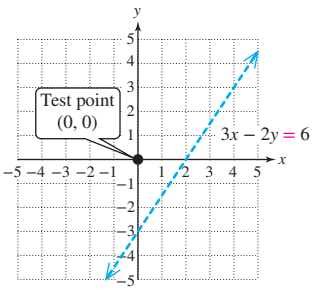


Figure 9-15

Test (0, 0):
$3x - 2y < 6$
$3(0) - 2(0) \stackrel{?}{<} 6$
$0 \stackrel{?}{<} 6$ ✓ true

Step 2: Select a test point either above or below the line and test the ordered pair in the original inequality. In Figure 9-16, we have chosen (0, 0) as a test point.

The test point (0, 0) is a representative point above the line. Since (0, 0) satisfies the original inequality, then it and all other points above the line are solutions.

The solution set is the set of ordered pairs in the region (half-plane) above the line (Figure 9-16).

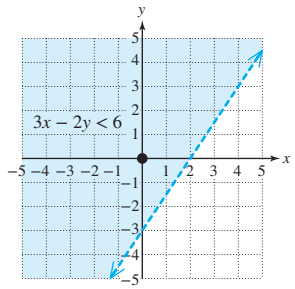

Figure 9-16

Skill Practice 1 Graph the solution set. $4x - y > 3$

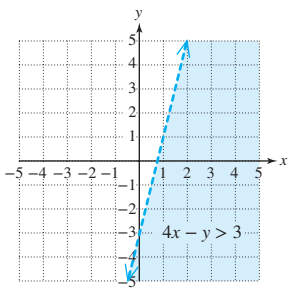
TIP We can also graph the inequality from Example 1 by solving the inequality for y.

$3x - 2y < 6$
$-2y < -3x + 6$
$y > \frac{3}{2}x - 3$

Then shade the half-plane *above* the bounding line because this region contains points with y-coordinates greater than those on the bounding line.

Answer

1.



TECHNOLOGY CONNECTIONS

Graphing a System of Inequalities in Two Variables

A graphing utility can be used to graph an inequality in two variables. In most cases, we solve for y first and enter the related equation in the graphing editor. Place the cursor to the left of Y_1 and press ENTER two times. This will set the graph style to shade the region above the line ◥. Notice that the calculator image does not differentiate between a solid and dashed bounding line (Figure 9-17).

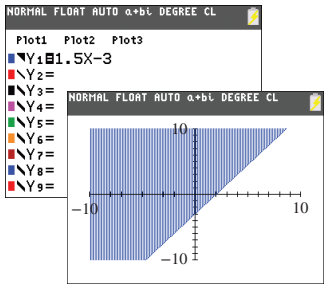


Figure 9-17

Note: With the cursor placed to the left of Y_1,

- Select the upper right triangle ◥ for inequalities of the form $Y_1 > f(x)$ and $Y_1 \geq f(x)$.
- Select the lower left triangle ◣ for inequalities of the form $Y_1 < f(x)$ and $Y_1 \leq f(x)$.

In Example 2, we graph the solutions to an inequality in which the bounding line passes through the origin.

EXAMPLE 2 Graphing a Linear Inequality

Graph the solution set. $4y \leq 3x$

Solution:

$4y \leq 3x \xrightarrow[\text{equation}]{\text{related}} 4y = 3x$

Step 1: Graph the related equation $4y = 3x$. In this case, we have chosen to find the slope-intercept form of the equation and then graph the line using the slope and y-intercept.

$$y = \frac{3}{4}x + 0$$

Graph the line having y-intercept $(0, 0)$ and slope $\frac{3}{4}$ (Figure 9-18). Because the inequality symbol $\leq$ allows for equality, draw the line as a solid line.

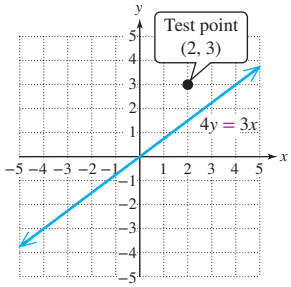

Figure 9-18

Step 2: Select a test point.
We have chosen (2, 3).

Test (2, 3):
$4y \leq 3x$
$4(3) \overset{?}{\leq} 3(2)$
$12 \overset{?}{\leq} 6$ false

The test point (2, 3) is a representative point above the line. Since (2, 3) does *not* satisfy the original inequality, then points on the other side of the line are solutions. Shade below the line.

The solution set is the set of ordered pairs on and below the line (Figure 9-19).

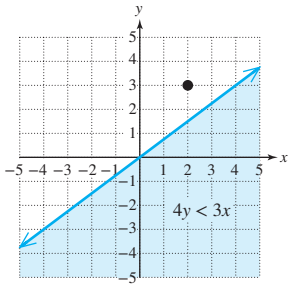

Figure 9-19

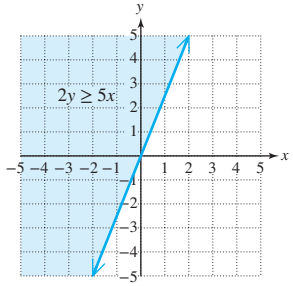
Skill Practice 2 Graph the solution set. $2y \geq 5x$

TIP As a check, we can select a test point *below* the line, such as (1, −1), and verify that it does indeed satisfy the original inequality.

Test (1, −1):
$4(-1) \overset{?}{\leq} 3(1)$
$-4 \overset{?}{\leq} 3$ ✓ true

Answer
2.



Recall that for a constant k, the equation $x = k$ represents a vertical line in the xy-plane. The inequalities $x < k$ and $x > k$ represent half-planes to the left or right of the vertical line $x = k$ (Figure 9-20). Likewise, $y = k$ represents a horizontal line in the xy-plane. The inequalities $y < k$ and $y > k$ represent half-planes below or above the line $y = k$ (Figure 9-21).

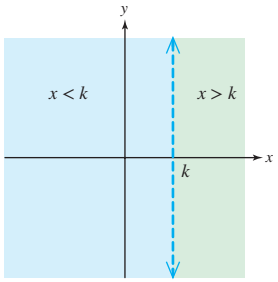


Figure 9-20

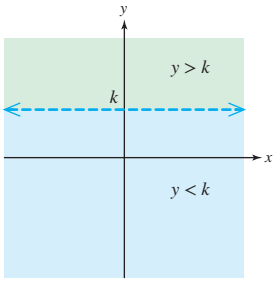

Figure 9-21

EXAMPLE 3 Graphing Linear Inequalities with a Horizontal or Vertical Bounding Line

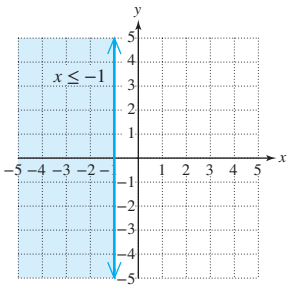
Graph the solution set.

a. $x \leq -1$ **b.** $3y > 5$

Solution:

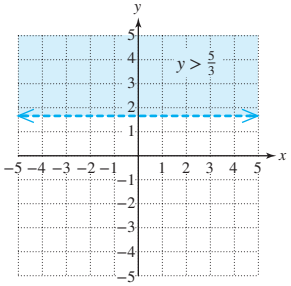
a. $x \leq -1$

- The related equation $x = -1$ is a vertical line.
- The inequality $x \leq -1$ represents all points to the *left* of or on the line $x = -1$.



b. $3y > 5$

- The inequality is equivalent to $y > \frac{5}{3}$. The related equation $y = \frac{5}{3}$ is a horizontal line.
- The inequality $y > \frac{5}{3}$ represents all points strictly above the line $y = \frac{5}{3}$.

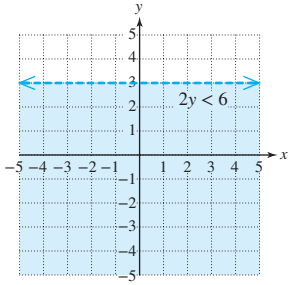


Skill Practice 3 Graph the solution set.

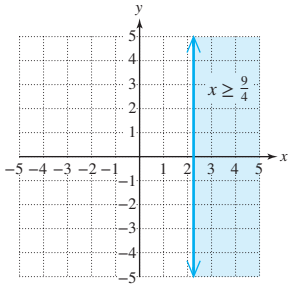
a. $2y < 6$ **b.** $x \geq \frac{9}{4}$

Answers

3. a.



b.



2. Solve Nonlinear Inequalities in Two Variables

The same approach used to graph a linear inequality in two variables is used to graph a *nonlinear* inequality in two variables. This is demonstrated in Example 4.

ISTUDY

EXAMPLE 4 Graphing a Nonlinear Inequality

Graph the solution set. $(x - 2)^2 + y^2 > 9$

Solution:

$(x - 2)^2 + y^2 > 9 \xrightarrow[\text{equation}]{\text{related}} (x - 2)^2 + y^2 = 9$

Step 1: Graph the related equation. The equation represents a circle centered at (2, 0) with radius 3. Because the inequality is strict, draw the circle as a dashed curve (Figure 9-22).

Center: (2, 0)
Radius: 3

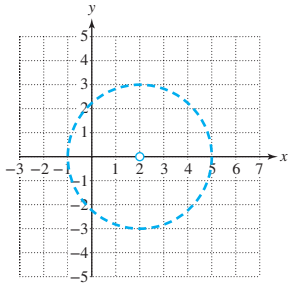


Figure 9-22

Test (2, 0):

$(x - 2)^2 + y^2 > 9$
$(2 - 2)^2 + (0)^2 \stackrel{?}{>} 9$
$0 \stackrel{?}{>} 9$ false

Step 2: Select a test point. We have chosen the center (2, 0).

The test point inside the circle does not satisfy the original inequality. Therefore, the solution set consists of the points strictly outside the circle (Figure 9-23).

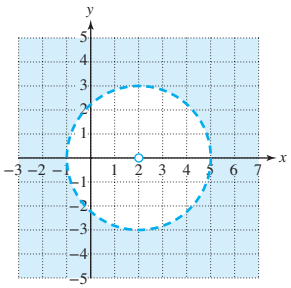

Figure 9-23

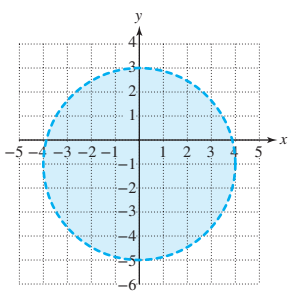
Skill Practice 4 Graph the solution set. $x^2 + (y + 1)^2 < 16$

3. Solve Systems of Inequalities in Two Variables

Two or more inequalities in two variables make up a system of inequalities in two variables. The solution set is the set of ordered pairs that satisfy each inequality in the system. To graph the solution set to a system of inequalities, graph the solution sets to the individual inequalities first. The solution to the system of inequalities is the *intersection* of the graphs. This is demonstrated in Example 5.

Answer
4.



EXAMPLE 5 Graphing the Solution Set to a System of Linear Inequalities

Graph the solution set to the system of inequalities. $y \le \frac{1}{2}x + 2$
$3x - y < 3$

Solution:

$y \le \frac{1}{2}x + 2$
$3x - y < 3$

First graph the solutions to the individual inequalities (Figures 9-24 and 9-25). Next, find the intersection (area of overlap) of the solution sets shown in purple in Figure 9-26.

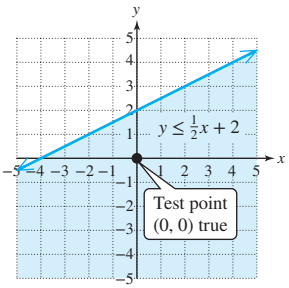


Figure 9-24

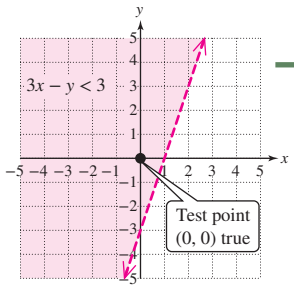

Figure 9-25

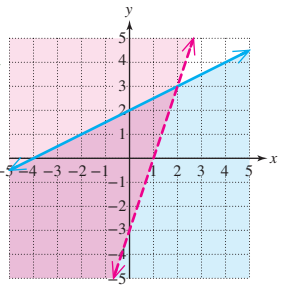

Figure 9-26

Avoiding Mistakes

For points on the line $y = \frac{1}{2}x + 2$ *not* adjacent to the shaded region, the line is drawn as a dashed line. This indicates that points on the line outside the shaded region are *not* part of the solution set.

Notice that the point of intersection between the two bounding lines is graphed as an open dot (Figure 9-27). This indicates that it is *not* part of the solution set. The reason is that it is not a solution to the strict inequality $3x - y < 3$.

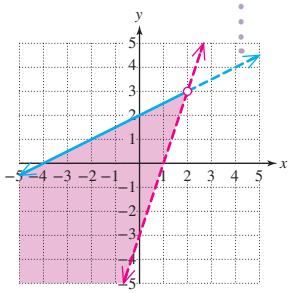

Figure 9-27

The point of intersection can be found by solving the system of related equations. We have used the substitution method.

$$\begin{aligned} y &= \tfrac{1}{2}x + 2 \\ 3x - y &= 3 \end{aligned}$$

$$\begin{aligned} 3x - \left(\tfrac{1}{2}x + 2\right) &= 3 \\ 3x - \tfrac{1}{2}x - 2 &= 3 \\ \tfrac{5}{2}x &= 5 \\ x &= 2 \end{aligned}$$

$$\begin{aligned} y &= \tfrac{1}{2}(2) + 2 \\ y &= 3 \end{aligned}$$

The point of intersection is (2, 3) and is excluded from the solution set.

Skill Practice 5 Graph the solution set to the system of inequalities.

$y < -\frac{1}{3}x + 1$

$-2x + y \le 1$

TECHNOLOGY CONNECTIONS

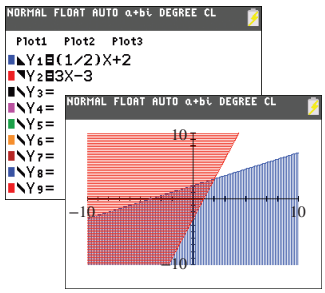
Graphing a System of Inequalities in Two Variables

To graph the system of inequalities from Example 5 on a graphing calculator, solve each inequality for y.

$y \le \frac{1}{2}x + 2$

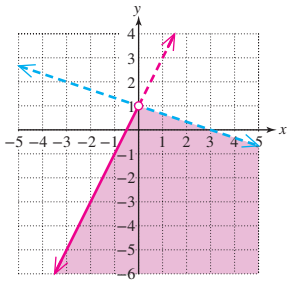
$3x - y < 3 \rightarrow -y < -3x + 3 \rightarrow y > 3x - 3$

Then enter the related equations in the graphing editor. Choose the appropriate graphing style ◥ or ◣. For $Y_1 \le \frac{1}{2}x + 2$, choose ◣. For $Y_2 > 3x - 3$, choose ◥.



Answer

5.



In Example 6, we graph a system of nonlinear inequalities in two variables. This is a system of inequalities in which one or more of the individual inequalities is nonlinear.

EXAMPLE 6 Solving a System of Nonlinear Inequalities

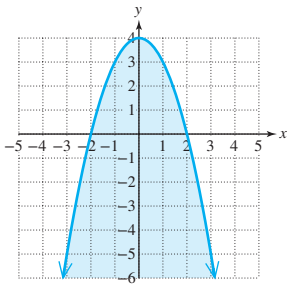
Graph the solution set to the system of inequalities.

$$\begin{aligned} y &\le -x^2 + 4 \\ x - y &\ge -2 \\ y &> -5 \end{aligned}$$

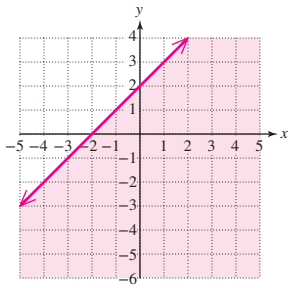
Solution:

To graph the solution set to the given system, first graph each individual inequality.

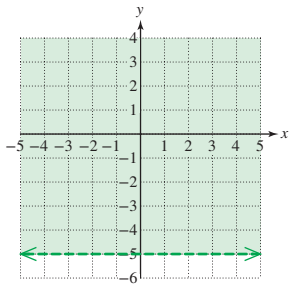
$y \le -x^2 + 4$



$x - y \ge -2$



$y > -5$



The solution set to the system is the intersection of the three shaded regions (Figure 9-28). The points of intersection are found by pairing up the related equations and solving the system of equations. The inequalities $y \le -x^2 + 4$ and $x - y \ge -2$ include equality. Therefore, the intersection points between the parabola and slanted line are solutions to the system. These points are plotted as closed dots.

On the other hand, because the inequality $y > -5$ is strict, the intersection points between the parabola and horizontal line are *not* solutions to the system. These points are plotted as open dots.

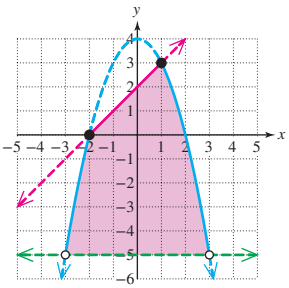


Figure 9-28

To find the points of intersection between the parabola $y = -x^2 + 4$ and the line $x - y = -2$, solve the system:

$$\begin{aligned} y &= -x^2 + 4 \\ x - y &= -2 \end{aligned}$$

The solutions are $(-2, 0)$ and $(1, 3)$.

To find the points of intersection between the parabola $y = -x^2 + 4$ and the line $y = -5$, solve the system:

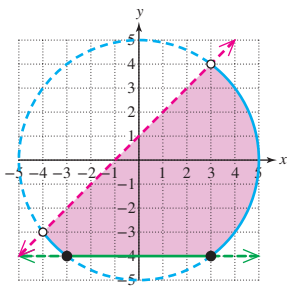
$$\begin{aligned} y &= -x^2 + 4 \\ y &= -5 \end{aligned}$$

The solutions are $(-3, -5)$ and $(3, -5)$.

Skill Practice 6 Graph the solution set to the system of inequalities.

$$\begin{aligned} x^2 + y^2 &\le 25 \\ -x + y &< 1 \\ y &\ge -4 \end{aligned}$$

Answer
6.



In Example 7, we refer to the problem addressed at the beginning of this section and set up a system of linear inequalities to model the allocation of time studying algebra and biology.

EXAMPLE 7 Solving a System of Inequalities in an Application

Adriana has 12 available study hours for algebra and biology.

- Let x represent the number of hours Adriana spends studying algebra.
- Let y represent the number of hours that Adriana studies biology.

a. Set up an inequality that indicates that the number of hours spent studying algebra cannot be negative.

b. Set up an inequality that indicates that the number of hours spent studying biology cannot be negative.

c. Set up an inequality that indicates that the combined number of hours spent studying for these two classes is at most 12 hr.

d. Graph the solution set to the system of inequalities from parts (a)–(c).

Solution:

a. $x \geq 0$ The number of hours spent studying algebra is 0 or more.

b. $y \geq 0$ The number of hours spent studying biology is 0 or more.

c. $x + y \leq 12$ The sum of time spent studying algebra and the time spent studying biology cannot exceed the maximum number of study hours available. Therefore, the sum is less than or equal to 12 hr.

d. $x \geq 0$
$y \geq 0$
$x + y \leq 12$

The inequalities $x \geq 0$ and $y \geq 0$ together represent the set of points in the first quadrant, including the bounding axes.

To graph the inequality $x + y \leq 12$, we graph the related equation $x + y = 12$. A test point (0, 0) taken below the line results in a true statement. Therefore, the inequality $x + y \leq 12$ represents the set of points on and below the line $x + y = 12$.

The solution to the system of inequalities is shown in Figure 9-29.

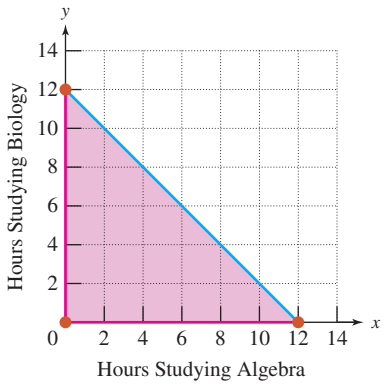


Figure 9-29

TIP The points of intersection of the bounding lines are closed dots because they are part of the solution set.

Skill Practice 7 A family plans to spend two 8-hr days at Disney World and will split time between the Magic Kingdom and Epcot Center. Let x represent the number of hours spent at the Magic Kingdom and let y represent the number of hours spent at Epcot Center.

a. Set up two inequalities that indicate that the number of hours spent at the Magic Kingdom and the number of hours spent at Epcot cannot be negative.

b. Set up an inequality that indicates that the combined number of hours spent at the two parks is at most 16 hr.

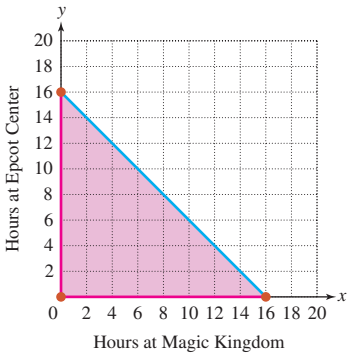
c. Graph the solution set to the system of inequalities.

Answers

7. a. $x \geq 0; y \geq 0$

b. $x + y \leq 16$

c.



SECTION 9.5 Practice Exercises

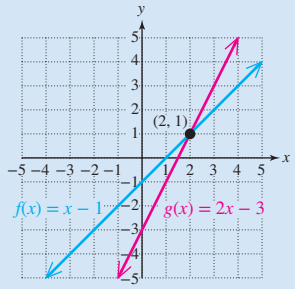
Prerequisite Review

R.1. Use the graph to solve the equation and inequalities. Write the solutions to the inequalities in interval notation.

a. $x - 1 = 2x - 3$

b. $x - 1 < 2x - 3$

c. $x - 1 \geq 2x - 3$



Concept Connections

1. An inequality that can be written in the form $Ax + By < C$ (where A and B are not both zero) is called a _____ inequality in two variables.

2. For a constant real number k, the inequality $x < k$ represents the half-plane to the (left/right) of the (horizontal/vertical) line $x = k$.

3. For a constant real number k, the inequality $y > k$ represents the half-plane (above/below) the (horizontal/vertical) line $y = k$.

4. Given the inequality $y \leq 2x + 1$, the bounding line $y = 2x + 1$ is drawn as a (dashed/solid) line.

5. The solution set to the system of inequalities $x < 0$, $y > 0$ represents the points in quadrant (I, II, III, IV).

6. The equation $x^2 + y^2 = 4$ is a circle centered at _____ with radius _____. The solution set to the inequality $x^2 + y^2 < 4$ represents the set of points (inside/outside) the circle $x^2 + y^2 = 4$.

Objective 1: Solve Linear Inequalities in Two Variables

For Exercises 7–10, determine whether the ordered pair is a solution to the inequality.

7. $3x + 4y < 12$

a. $(-1, 3)$

b. $(5, 1)$

c. $(4, 0)$

8. $2x + 3y > 6$

a. $(-3, 3)$

b. $(5, -1)$

c. $(0, 2)$

9. $y \geq (x - 3)^2$

a. $(-3, 30)$

b. $(1, 4)$

c. $(5, 5)$

10. $y \leq x^3 - 1$

a. $(-1, -2)$

b. $(2, 6)$

c. $(-4, -50)$

11. a. Graph the solution set. $4x - 5y \leq 20$ **(See Example 1)**

b. Explain how the graph would differ for the inequality $4x - 5y < 20$.

c. Explain how the graph would differ for the inequality $4x - 5y > 20$.

12. a. Graph the solution set. $2x + 5y > 10$

b. Explain how the graph would differ for the inequality $2x + 5y \geq 10$.

c. Explain how the graph would differ for the inequality $2x + 5y < 10$.

For Exercises 13–24, graph the solution set. (See Examples 1–3)

13. $2x + 5y > 5$

14. $-5x + 4y \leq 8$

15. $-30x \geq 20y + 600$

16. $-400x < 100y + 8000$

17. $5x \leq 6y$

18. $3x > 2y$

19. $3 + 2(x + y) > y + 3$

20. $-4 - 3(x - y) < 2y - 4$

21. $x < 6$

22. $y \leq 5$

23. $-\frac{1}{2}y + 4 \leq 5$

24. $-\frac{1}{3}x + 2 < 4$

Objective 2: Solve Nonlinear Inequalities in Two Variables

25. a. Graph the solution set. $x^2 + y^2 < 4$ **(See Example 4)**

b. Explain how the graph would differ for the inequality $x^2 + y^2 > 4$.

c. Explain how the graph would differ for the inequality $x^2 + y^2 \geq 4$.

26. a. Graph the solution set. $y \geq x^2 - 1$

b. Explain how the graph would differ for the inequality $y \leq x^2 - 1$.

c. Explain how the graph would differ for the inequality $y > x^2 - 1$.

ISTUDY

For Exercises 27–36, graph the solution set. (See Example 4)

27. $y < -x^2$

28. $x^2 + y^2 \geq 16$

29. $y \leq (x - 2)^2 + 1$

30. $y \geq -(x + 1)^2 - 2$

31. $|x| \leq 3$

32. $|y| \leq 2$

33. $2|y| > 2$

34. $|x| + 1 > 3$

35. $y \geq \sqrt{x}$

36. $y < \sqrt{x - 1}$

Objective 3: Solve Systems of Inequalities in Two Variables

37. a. Is the point (2, 1) a solution to the inequality $y < 2x + 3$?

b. Is the point (2, 1) a solution to the inequality $x + y \leq 1$?

c. Is the point (2, 1) a solution to the system of inequalities?

$$y < 2x + 3$$
$$x + y \leq 1$$

38. a. Is the point (3, 2) a solution to the inequality $y < -x + 5$?

b. Is the point (3, 2) a solution to the inequality $3x + y \geq 11$?

c. Is the point (3, 2) a solution to the system of inequalities?

$$y < -x + 5$$
$$3x + y \geq 11$$

For Exercises 39–40, determine whether the ordered pair is a solution to the system of inequalities.

39. $x + y < 4$
$y \leq 2x + 1$

a. (0, 1) **b.** (3, 1) **c.** (2, 0) **d.** (1, 4)

40. $y < -x^2 + 3$
$x + 2y \leq 2$

a. (−2, −1) **b.** (0, −2) **c.** (0, 1) **d.** (3, −6)

For Exercises 41–58, graph the solution set. If there is no solution, indicate that the solution set is the empty set. (See Examples 9–6)

41. $y < \frac{1}{2}x - 4$
$y > -2x + 1$

42. $y \geq \frac{1}{3}x - 2$
$y \leq x - 4$

43. $2x + 5y \leq 5$
$-3x + 4y \geq 4$

44. $4x - 3y > 3$
$x + 4y < -4$

45. $x^2 + y^2 \geq 9$
$x^2 + y^2 \leq 16$

46. $x^2 + y^2 \geq 1$
$x^2 + y^2 < 25$

47. $y \geq 3x + 3$
$-3x + y < 1$

48. $y < 2x - 4$
$-2x + y \geq 2$

49. $|x| < 3$
$|y| < 3$

50. $|x| \geq 2$
$|y| \geq 2$

51. $y \geq x^2 - 2$
$y > x$
$y \leq 4$

52. $y \leq -x^2 + 7$
$y \leq -x + 5$
$y > 1$

53. $x^2 + y^2 \leq 100$
$y < \frac{4}{3}x$
$x \leq 8$

54. $x^2 + y^2 < 100$
$y \geq x$
$y \geq 1$

55. $y < e^x$
$y > 1$
$x < 2$

56. $y \leq \frac{2}{x}$
$y > 0$
$y < x$

57. $(x + 2)^2 + (y - 3)^2 \leq 9$
$x - y > 2$

58. $(x - 4)^2 + (y + 1)^2 < 25$
$2x - y < -4$

Mixed Exercises

For Exercises 59–64, write an inequality to represent the statement.

59. x is at most 6.

60. y is no more than 7.

61. y is at least −2.

62. x is no less than $\frac{1}{2}$.

63. The sum of x and y does not exceed 18.

64. The difference of x and y is not less than 4.

65. Let x represent the number of hours that Trenton spends studying algebra, and let y represent the number of hours he spends studying history. For parts (a)–(e), write an inequality to represent the given statement. (**See Example 7**)

a. Trenton has a total of at most 9 hr to study for both algebra and history combined.

b. Trenton will spend at least 3 hr studying algebra.

c. Trenton will spend no more than 4 hr studying history.

d. The number of hours spent studying algebra cannot be negative.

e. The number of hours spent studying history cannot be negative.

f. Graph the solution set to the system of inequalities from parts (a)–(e).

ISTUDY

66. Let x represent the number of country songs that Sierra puts on a playlist. Let y represent the number of rock songs on the same playlist. For parts (a)–(e), write an inequality to represent the given statement.

a. Sierra will put at least 6 country songs on the playlist.

b. Sierra will put no more than 10 rock songs on the playlist.

c. Sierra wants to limit the length of the playlist to at most 20 songs.

d. The number of country songs cannot be negative.

e. The number of rock songs cannot be negative.

f. Graph the solution set to the system of inequalities from parts (a)–(e).

67. A couple has \$60,000 to invest for retirement. They plan to put x dollars in stocks and y dollars in bonds. For parts (a)–(d), write an inequality to represent the given statement.

a. The total amount invested is at most \$60,000.

b. The couple considers stocks a riskier investment, so they want to invest at least twice as much in bonds as in stocks.

c. The amount invested in stocks cannot be negative.

d. The amount invested in bonds cannot be negative.

e. Graph the solution set to the system of inequalities from parts (a)–(d).

68. A college theater has a seating capacity of 2000. It reserves x tickets for students and y tickets for general admission. For parts (a)–(d) write an inequality to represent the given statement.

a. The total number of seats available is at most 2000.

b. The college wants to reserve at least 3 times as many student tickets as general admission tickets.

c. The number of student tickets cannot be negative.

d. The number of general admission tickets cannot be negative.

e. Graph the solution set to the system of inequalities from parts (a)–(d).

69. A weak earthquake occurred roughly 9 km south and 12 km west of the center of Hawthorne, Nevada. The quake could be felt 16 km away. Suppose that the origin of a map is placed at the center of Hawthorne with the positive x-axis pointing east and the positive y-axis pointing north.

a. Find an inequality that describes the points on the map for which the earthquake could be felt.

b. Could the earthquake be felt at the center of Hawthorne?

70. A coordinate system is placed at the center of a town with the positive x-axis pointing east, and the positive y-axis pointing north. A cell tower is located 4 mi west and 5 mi north of the origin.

a. If the tower has an 8-mi range, write an inequality that represents the points on the map serviced by this tower.

b. Can a resident 5 mi east of the center of town get a signal from this tower?

71. Write a system of inequalities that represents the points in the first quadrant less than 3 units from the origin.

72. Write a system of inequalities that represents the points in the second quadrant more than 4 units from the origin.

73. Write a system of inequalities that represents the points inside the triangle with vertices $(-3, -4)$, $(3, 2)$, and $(-5, 4)$.

74. Write a system of inequalities that represents the points inside the triangle with vertices $(-4, -4)$, $(1, 1)$, and $(5, -1)$.

Write About It

75. Under what circumstances should a dashed line or curve be used when graphing the solution set to an inequality in two variables?

76. Explain how test points are used to determine the region of the plane that represents the solution to an inequality in two variables.

77. Explain how to find the solution set to a system of inequalities in two variables.

78. Describe the solution set to the system of inequalities. $x \geq 0$, $y \geq 0$, $x \leq 1$, $y \leq 1$

$y \leq 0.25x^3 - 4x$

86. $y < \dfrac{4}{x^2 + 1}$
$y > \dfrac{-2}{x^2 + 0.5}$

PROBLEM RECOGNITION EXERCISES

Equations and Inequalities in Two Variables

For Exercises 1–2, for parts (a) and (b), graph the equation. For part (c), solve the system of equations. For parts (d) and (e) graph the solution set to the system of inequalities. If there is no solution, indicate that the solution set is the empty set.

1. a. $y = -3x + 5$ **b.** $-2x + y = 0$ **c.** $y = -3x + 5$, $-2x + y = 0$ **d.** $y > -3x + 5$, $-2x + y < 0$ **e.** $y < -3x + 5$, $-2x + y > 0$

2. a. $y = 2x - 3$ **b.** $4x - 2y = -2$ **c.** $y = 2x - 3$, $4x - 2y = -2$ **d.** $y \geq 2x - 3$, $4x - 2y \geq -2$ **e.** $y \leq 2x - 3$, $4x - 2y \leq -2$

For Exercises 3–4, for part (a), graph the equations in the system and determine the solution set. For parts (b) and (c), graph the solution set to the inequality.

3. a. $y = x^2$, $y = \frac{1}{2}x^2$ **b.** $y \leq x^2$, $y \geq \frac{1}{2}x^2$ **c.** $y \geq x^2$, $y \leq \frac{1}{2}x^2$

4. a. $x - y = 1$, $y = (x - 3)^2$ **b.** $x - y \geq 1$, $y \geq (x - 3)^2$ **c.** $x - y \leq 1$, $y \leq (x - 3)^2$

SECTION 9.6 Linear Programming

OBJECTIVES

1. Write an Objective Function
2. Solve Linear Programming Applications

1. Write an Objective Function

When a company manufactures a product, the goal is to obtain maximum profit at minimum cost. However, the production process is often limited by certain constraints such as the amount of labor available, the capacity of machinery, and the amount of money available for the company to invest in the process. In this section, we will study a process called **linear programming** that enables us to maximize or minimize a function under specified constraints.

The function to be optimized (maximized or minimized) in a linear programming application is called the **objective function.** The objective function often has two independent variables. For example, given $z = f(x, y)$, the variable z is dependent on the two independent variables x and y.

TIP The notation $z = f(x, y)$ is read as "z is a function of x and y."

EXAMPLE 1 Writing an Objective Function

Suppose that a college wants to rent several buses to transport students to a championship college football game. A large bus costs \$1200 to rent and a small bus costs \$800 to rent.

Let x represent the number of large buses.

Let y represent the number of small buses.

Write an objective function that represents the total cost z (in \$) to rent x large buses and y small buses.

TIP An objective function represents a quantity that is to be maximized or minimized. In Example 1, the school will want to minimize the cost to transport the students.

Solution:

$$\begin{pmatrix}\text{Total}\\ \text{cost}\end{pmatrix} = \begin{pmatrix}\text{Cost to rent}\\ x \text{ large buses}\end{pmatrix} + \begin{pmatrix}\text{Cost to rent}\\ y \text{ small buses}\end{pmatrix}$$

$$\text{Cost:} \quad z = 1200x + 800y$$

The objective function is defined by $z = 1200x + 800y$.

Skill Practice 1 An office manager needs to staff the office. Full-time employees are hired at \$36 per hour and part-time employees at \$24 per hour. Write an objective function that represents the total cost (in \$) to staff the office with x full-time employees and y part-time employees for 1 hr.

2. Solve Linear Programming Applications

In Example 2, we identify constraints imposed on the resources that affect the number of buses that the college can rent.

EXAMPLE 2 Writing a System of Constraints

Refer to the scenario from Example 1. We now set several constraints that affect the number of buses that can be rented.

Let x represent the number of large buses.

Let y represent the number of small buses.

Answer

1. $z = 36x + 24y$

ISTUDY

For parts (a)–(d), write an inequality that represents the given statement.

a. The number of large buses cannot be negative.

b. The number of small buses cannot be negative.

c. Large buses can carry 60 people and small buses can carry 45 people. The college must transport at least 3600 students.

d. The number of available bus drivers is at most 75.

Solution:

a. $x \geq 0$ The number of large buses cannot be negative.

b. $y \geq 0$ The number of small buses cannot be negative.

c.

(Number of students carried by large buses)	+	(Number of students carried by small buses)	≥ 3600 (is at least)	
$60x$	+	$45y$	≥ 3600	Large buses hold 60 people and small buses hold 45 people.

d.

(Number of large buses)	+	(Number of small buses)	≤ 75 (is at most)	
x	+	y	≤ 75	Because each bus has only one driver, the total number of buses is the same as the total number of drivers.

Skill Practice 2 Refer to Skill Practice 1. Suppose that the office manager needs at least 20 employees, but not more than 24 full-time employees. Furthermore, to make the office run smoothly, the manager knows that the number of full-time employees must always be greater than or equal to the number of part-time employees. Write a system of inequalities that represents the constraints on the number of full-time employees x and the number of part-time employees y.

The constraints in Example 2 make up a system of linear inequalities.

The number of large buses is nonnegative.	$x \geq 0$
The number of small buses is nonnegative.	$y \geq 0$
The school must transport at least 3600 students.	$60x + 45y \geq 3600$
The number of drivers (and therefore buses) is at most 75.	$x + y \leq 75$

The region in the plane that represents the solution set to the system of constraints is called the **feasible region** (Figure 9-30). The points of intersection of the bounding lines in the feasible region are called the **vertices** of the feasible region.

The vertices in Figure 9-30 are (60, 0), (75, 0), and (15, 60).

TIP The point (15, 60) is the point of intersection of the lines $60x + 45y = 3600$ and $x + y = 75$.

The point (60, 0) is the point of intersection of the line $60x + 45y = 3600$ and $y = 0$.

The point (75, 0) is the point of intersection of the line $x + y = 75$ and $y = 0$.

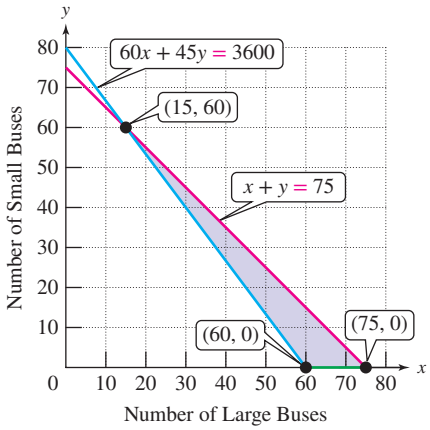

Figure 9-30

Answer

2. $x \geq 0, y \geq 0, x \leq 24, x + y \geq 20, x \geq y$

Points within the shaded region meet all the constraints in the problem. For example, the ordered pair (65, 5) represents 65 large buses and 5 small buses.

65 large buses and 5 small buses ⟶ 70 buses ($\leq$ 75 drivers) ✓
65 large buses and 5 small buses ⟶ transports 4125 students ($\geq$ 3600) ✓

However, points such as (65, 15) and (40, 20) are *outside* the feasible region and do not satisfy all constraints.

65 large buses and 15 small buses ⟶ 80 buses (exceeds the number of drivers)
40 large buses and 20 small buses ⟶ transports only 3300 students

The goal of a linear programming application is to find the maximum or minimum value of the objective function $z = f(x, y)$ when x and y are restricted to the ordered pairs in the feasible region. Fortunately, it has been proven mathematically that if a maximum or minimum value of a function exists, it occurs at one or more of the vertices of the feasible region. This is the basis for the following procedure to solve a linear programming application.

Solving an Application Involving Linear Programming

Step 1 Write an objective function $z = f(x, y)$.
Step 2 Write a system of inequalities defining the constraints on x and y.
Step 3 Graph the feasible region and identify the vertices.
Step 4 Evaluate the objective function at each vertex of the feasible region. Use the results to identify the values of x and y that optimize the objective function. Identify the optimal value of z.

In Example 3, we optimize the objective function found in Example 1 subject to the constraints defined in Example 2.

EXAMPLE 3 Solving a Linear Programming Application

A college wants to rent buses to transport at least 3600 students to a championship college football game. Large buses hold 60 people and small buses hold 45 people. Furthermore, the number of available bus drivers is at most 75. Each large bus costs \$1200 to rent and each small bus costs \$800 to rent. Find the optimal number of large and small buses that will minimize cost.

Solution:

Let x represent the number of large buses. Define the relevant variables.
Let y represent the number of small buses.

Cost: $z = 1200x + 800y$ **Step 1:** Write an objective function. Since cost is to be minimized, write a cost function. (See Example 1.)

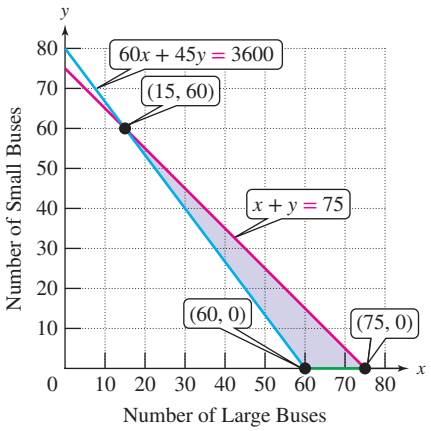
Constraints: **Step 2:** Write a system of constraints on the relevant variables. (See Example 2.)

$x \geq 0$
$y \geq 0$
$60x + 45y \geq 3600$
$x + y \leq 75$

Step 3: Graph the feasible region and identify the vertices.

The vertices are found by identifying the points of intersection between the bounding lines.

ISTUDY



Bounding lines:

$60x + 45y = 3600$
$x + y = 75$ Point of intersection (15, 60)

$60x + 45y = 3600$
$y = 0$ Point of intersection (60, 0)

$x + y = 75$
$y = 0$ Point of intersection (75, 0)

Cost function: $z = 1200x + 800y$

at (15, 60) $z = 1200(15) + 800(60) = \boxed{\$66{,}000}$
at (60, 0) $z = 1200(60) + 800(0) = \$72{,}000$
at (75, 0) $z = 1200(75) + 800(0) = \$90{,}000$

Step 4: Evaluate the objective function $z = 1200x + 800y$ at each vertex.

The cost would be minimized if the college rents 15 large buses and 60 small buses. The minimum cost is $66,000.

Skill Practice 3 Refer to Skill Practices 1 and 2. The office manager needs at least 20 employees, but no more than 24 full-time employees. Furthermore, to make the office run smoothly, the manager knows that the number of full-time employees must always be greater than or equal to the number of part-time employees. If full-time employees are paid $36 per hour and part-time employees $24 per hour, determine the number of full-time and part-time employees the manager should hire to minimize total labor cost per hour.

In Example 4, we investigate a situation in which we maximize profit.

EXAMPLE 4 Solving a Linear Programming Application

A baker produces whole wheat bread and cheese bread to sell at the farmer's market. The whole wheat bread is denser and requires more baking time, whereas the cheese bread requires more labor. The baking times and average amount of labor per loaf are given in the table along with the profit for each loaf.

	Time to Bake	Labor	Profit
Wheat bread	1.5 hr	$\frac{1}{3}$ hr	$1.20
Cheese bread	1 hr	$\frac{1}{2}$ hr	$1.00

The oven space restricts the baker from baking more than 120 loaves. Furthermore, the amount of oven time for baking is no more than 165 hr and the amount of available labor is at most 55 hr. Determine the number of loaves of each type of bread that the baker should bake to maximize profit. Assume that all loaves of bread produced are sold.

Solution:

Let x represent the number of loaves of wheat bread.
Let y represent the number of loaves of cheese bread.

Point of Interest

Linear programming was first introduced by Russian mathematician Leonid Kantorovich. The technique was used in World War II to minimize costs to the army. Later in 1975, Kantorovich won the Nobel Prize in economics for his contributions to the theory of optimum allocation of resources.

Answer

3. The cost would be minimized at $600/hr if the manager hires 10 full-time employees and 10 part-time employees.

$$\text{Profit} = \begin{pmatrix}\text{Profit from}\\ \text{wheat bread}\end{pmatrix} + \begin{pmatrix}\text{Profit from}\\ \text{cheese bread}\end{pmatrix}$$

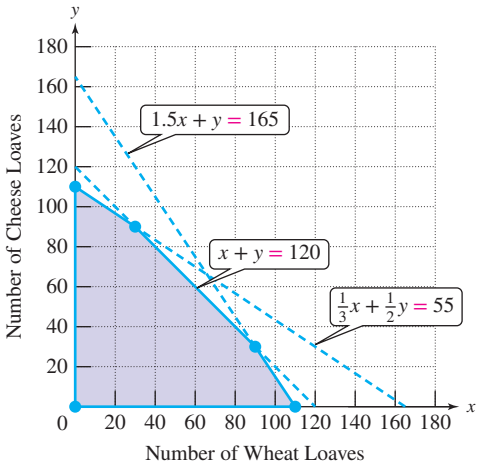
$$z = 1.20x + 1.00y$$

Step 1: Write an objective function. In this example, we need to maximize profit.

Step 2: Write a system of constraints on the independent variables.

$x \geq 0$	Number of loaves of wheat bread cannot be negative.
$y \geq 0$	Number of loaves of cheese bread cannot be negative.
$x + y \leq 120$	Total number of loaves is no more than 120.
$1.5x + y \leq 165$	The total amount of baking time is no more than 165 hr.
$\frac{1}{3}x + \frac{1}{2}y \leq 55$	The total amount of available labor is at most 55 hr.

Step 3: Graph the feasible region and identify the vertices. Find the points of intersection between pairs of bounding lines:



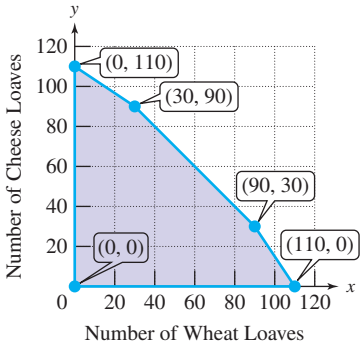
$$\begin{aligned} x + y &= 120 \\ \tfrac{1}{3}x + \tfrac{1}{2}y &= 55 \end{aligned}$$ Point of intersection (30, 90)

$$\begin{aligned} x + y &= 120 \\ 1.5x + y &= 165 \end{aligned}$$ Point of intersection (90, 30)

$$\begin{aligned} 1.5x + y &= 165 \\ y &= 0 \end{aligned}$$ Point of intersection (110, 0)

$$\begin{aligned} \tfrac{1}{3}x + \tfrac{1}{2}y &= 55 \\ x &= 0 \end{aligned}$$ Point of intersection (0, 110)

$$\begin{aligned} x &= 0 \\ y &= 0 \end{aligned}$$ Point of intersection (0, 0)



Step 4: Evaluate the objective function at each vertex.

Profit:	$z = 1.2x + y$
at (0, 0)	$z = 1.2(0) + (0) = \$0$
at (0, 110)	$z = 1.2(0) + (110) = \$110$
at (30, 90)	$z = 1.2(30) + (90) = \$126$
at (90, 30)	$z = 1.2(90) + (30) = \boxed{\$138}$
at (110, 0)	$z = 1.2(110) + (0) = \$132$

The profit will be maximized if the baker bakes 90 whole wheat loaves and 30 cheese loaves. The maximum profit is \$138.

Skill Practice 4 A manufacturer produces two sizes of leather handbags. It takes longer to cut and dye the leather for the smaller bag, but it takes more time sewing the larger bag. The production constraints and profit for each type of bag are given in the table.

	Cutting and Dying	Sewing	Profit
Large bag	0.6 hr	2 hr	\$30
Small bag	1 hr	1.5 hr	\$25

The machinery limits the number of bags produced to at most 1000 per week. If the company has 900 hr per week available for cutting and dying and 1800 hr available per week for sewing, determine the number of each type of bag that should be produced weekly to maximize profit. Assume that all bags produced are also sold.

Answer

4. The maximum profit of \$28,000 is realized when the company produces 600 large bags and 400 small bags.

ISTUDY

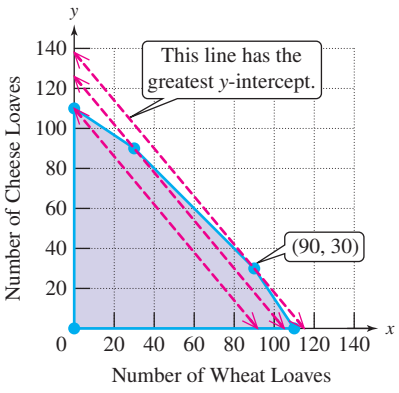


Figure 9-31

To find the maximum or minimum value of an objective function, we evaluate the function at the vertices of the feasible region. It seems reasonable that the profit would be maximized at a point on the upper edge of the feasible region. These are the points in the feasible region where the combined values of x and y are the greatest.

The goal of Example 4 was to find the values of x and y that maximized the profit function $z = 1.2x + y$. To see why the profit z was maximized at a vertex of the feasible region, write the equation in slope-intercept form:

$$y = -1.2x + z$$

In this form, the objective function represents a family of parallel lines with slope -1.2 and y-intercept $(0, z)$. To maximize z, we want the line with the greatest y-intercept that still remains in contact with the feasible region. In Figure 9-31, we see that this occurs for the line passing through the point (90, 30) as expected.

SECTION 9.6 Practice Exercises

Prerequisite Review

R.1. A salesperson makes a base salary of \$500 per week plus 11% commission on sales.

a. Write a linear function to model the salesperson's weekly salary $S(x)$ for x dollars in sales.

b. Evaluate $S(8000)$ and interpret the meaning in the context of this problem.

R.2. A luxury car rental company charges \$123 per day in addition to a flat fee of \$75 for insurance.

a. Write an equation that represents the cost y (in \$) to rent the car for x days.

b. What is the y-intercept and what does it mean in the context of this problem?

Concept Connections

1. The process that maximizes or minimizes a function subject to linear constraints is called _____ programming.

2. The function to be optimized in a linear programming application is called the _____ function.

3. The region in the plane that represents the solution set to a system of constraints is called the _____ region.

4. The points of intersection of a feasible region are called the _____ of the region.

Objective 1: Write an Objective Function

5. A diner makes a profit of \$0.80 for a cup of coffee and \$1.10 for a cup of tea. Write an objective function $z = f(x, y)$ that represents the total profit for selling x cups of coffee and y cups of tea. (**See Example 1**)

6. An athlete burns 10 calories per minute running and 8 calories per minute lifting weights. Write an objective function $z = f(x, y)$ that represents the total number of calories burned by running for x minutes and lifting weights for y minutes.

7. A courier company makes deliveries with two different trucks. Truck A costs \$0.62/mi to operate and truck B costs \$0.50/mi to operate. Write an objective function $z = f(x, y)$ that represents the total cost for driving truck A for x miles and driving truck B for y miles.

8. The cost for an animal shelter to spay a female cat is \$82 and the cost to neuter a male cat is \$55. Write an objective function $z = f(x, y)$ that represents the total cost for spaying x female cats and neutering y male cats.

Courtesy of Julie Miller

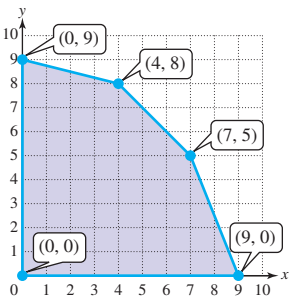
Objective 2: Solve Linear Programming Applications

For Exercises 9–12,

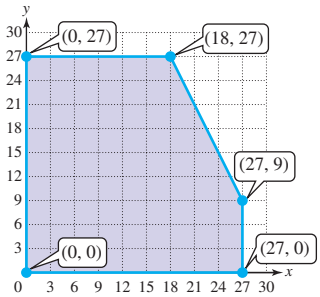
a. Determine the values of x and y that produce the maximum or minimum value of the objective function on the given feasible region.

b. Determine the maximum or minimum value of the objective function on the given feasible region.

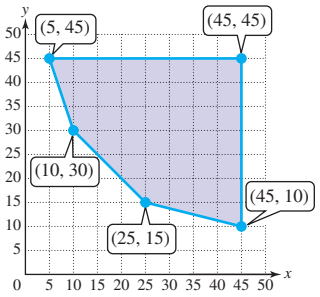
9. Maximize: $z = 3x + 2y$



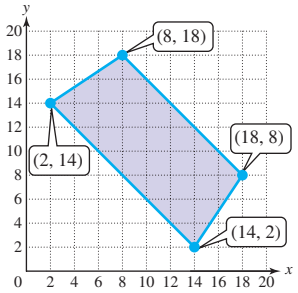
10. Maximize: $z = 1.8x + 2.2y$



11. Minimize: $z = 1000x + 900y$



12. Minimize: $z = 6x + 9y$



For Exercises 13–18,

a. For the given constraints, graph the feasible region and identify the vertices.

b. Determine the values of x and y that produce the maximum or minimum value of the objective function on the feasible region.

c. Determine the maximum or minimum value of the objective function on the feasible region.

13. $x \geq 0,\ y \geq 0$
$x + y \leq 60$
$y \leq 2x$
Maximize: $z = 250x + 150y$

14. $x \geq 0,\ y \geq 0$
$2x + y \leq 40$
$x + 2y \leq 50$
Maximize: $z = 9.2x + 8.1y$

15. $x \geq 0,\ y \geq 0$
$3x + y \geq 50$
$2x + y \geq 40$
Minimize: $z = 3x + 2y$

16. $x \geq 0,\ y \geq 0$
$4x + 3y \geq 60$
$2x + 3y \geq 36$
Minimize: $z = 4.5x + 6y$

17. $x \geq 0,\ y \geq 0$
$x \leq 36$
$y \leq 40$
$x + y \leq 48$
Maximize: $z = 150x + 90y$

18. $x \geq 0,\ y \geq 0$
$x \leq 10$
$y \leq 8$
$x + y \leq 12$
Maximize: $z = 50x + 70y$

For Exercises 19–20, use the given constraints to find the maximum value of the objective function and the ordered pair (x, y) that produces the maximum value.

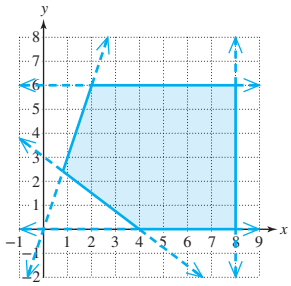
19. $x \geq 0,\ y \geq 0$
$3x + 4y \leq 48$
$2x + y \leq 22$
$y \leq 9$
a. Maximize: $z = 100x + 120y$
b. Maximize: $z = 100x + 140y$

20. $x \geq 0,\ y \geq 0$
$x + y \leq 20$
$x + 2y \leq 36$
$x \leq 14$
a. Maximize: $z = 12x + 15y$
b. Maximize: $z = 15x + 12y$

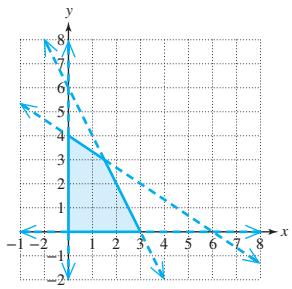
ISTUDY

For Exercises 21–22, write a system of inequalities with the given solution set.

21.



22.



23. A furniture manufacturer builds tables. The cost for materials and labor to build a kitchen table is \$240 and the profit is \$160. The cost to build a dining room table is \$320 and the profit is \$240. (**See Examples 2–3**)

Let x represent the number of kitchen tables produced per month. Let y represent the number of dining room tables produced per month.

a. Write an objective function representing the monthly profit for producing and selling x kitchen tables and y dining room tables.

b. The manufacturing process is subject to the following constraints. Write a system of inequalities representing the constraints.

- The number of each type of table cannot be negative.
- Due to labor and equipment restrictions, the company can build at most 120 kitchen tables.
- The company can build at most 90 dining room tables.
- The company does not want to exceed a monthly cost of \$48,000.

c. Graph the system of inequalities represented by the constraints.

d. Find the vertices of the feasible region.

e. Test the objective function at each vertex.

f. How many kitchen tables and how many dining room tables should be produced to maximize profit? (Assume that all tables produced will be sold.)

g. What is the maximum profit?

24. Youssef makes \$24/hr tutoring chemistry and \$20/hr tutoring math. Let x represent the number of hours per week that Youssef spends tutoring chemistry. Let y represent the number of hours per week that Youssef spends tutoring math.

a. Write an objective function representing Youssef's weekly income for tutoring x hours of chemistry and y hours of math.

b. The time that Youssef devotes to tutoring is limited by the following constraints. Write a system of inequalities representing the constraints.

- The number of hours spent tutoring each subject cannot be negative.
- Due to academic demands, Youssef tutors at most 18 hr per week.
- The tutoring center requires that Youssef tutor math at least 4 hr per week.
- The demand for math tutors is greater than the demand for chemistry tutors. Therefore, the number of hours Youssef spends tutoring math must be at least twice the number of hours spent tutoring chemistry.

c. Graph the system of inequalities represented by the constraints.

d. Find the vertices of the feasible region.

e. Test the objective function at each vertex.

f. How many hours tutoring math and how many hours tutoring chemistry should Youssef work to maximize his income?

g. What is the maximum income?

h. Explain why the maximum income is found at a point on the line $x + y = 18$.

25. A plant nursery sells two sizes of oak trees to landscapers. Large trees cost the nursery \$120 from the grower. Small trees cost the nursery \$80. The profit for each large tree sold is \$35 and the profit for each small tree sold is \$30. The monthly demand is at most 400 oak trees. Furthermore, the nursery does not want to allocate more than \$43,200 each month on inventory for oak trees.

a. Determine the number of large oak trees and the number of small oak trees that the nursery should have in its inventory each month to maximize profit. (Assume that all trees in inventory are sold.)

b. What is the maximum profit?

c. If the profit on large trees were \$50, and the profit on small trees remained the same, then how many of each should the nursery have to maximize profit?

ISTUDY

26. A sporting goods store sells two types of exercise bikes. The deluxe model costs the store $400 from the manufacturer and the standard model costs the store $300 from the manufacturer. The profit that the store makes on the deluxe model is $180 and the profit on the standard model is $120. The monthly demand for exercise bikes is at most 30. Furthermore, the store manager does not want to spend more than $9600 on inventory for exercise bikes.

a. Determine the number of deluxe models and the number of standard models that the store should have in its inventory each month to maximize profit. (Assume that all exercise bikes in inventory are sold.)

b. What is the maximum profit?

c. If the profit on the deluxe bikes were $150 and the profit on the standard bikes remained the same, how many of each should the store have to maximize profit?

27. A paving company delivers gravel for a road construction project. The company has a large truck and a small truck. The large truck has a greater capacity, but costs more for fuel to operate. The load capacity and cost to operate each truck per load are given in the table.

	Load Capacity	Cost per Load
Small truck	18 yd^3	$120
Large truck	24 yd^3	$150

The company must deliver at least 288 yd^3 of gravel to stay on schedule. Furthermore, the large truck takes longer to load and cannot make as many trips as the small truck. As a result, the number of trips made by the large truck is at most $\frac{3}{4}$ times the number of trips made by the small truck.

a. Determine the number of trips that should be made by the large truck and the number of trips that should be made by the small truck to minimize cost.

b. What is the minimum cost to deliver gravel under these constraints?

28. A large department store needs at least 3600 labor hours covered per week. It employs full-time staff 40 hr/wk and part-time staff 25 hr/wk. The cost to employ a full-time staff member is more because the company pays benefits such as health care and life insurance.

	Hours per Week	Cost per Hour
Full time	40 hr	$25
Part time	25 hr	$18

The store manager also knows that to make the store run efficiently, the number of full-time employees must be at least 1.25 times the number of part-time employees.

a. Determine the number of full-time employees and the number of part-time employees that should be used to minimize the weekly labor cost.

b. What is the minimum weekly cost to staff the store under these constraints?

29. A manufacturer produces two models of a gas grill. Grill A requires 1 hr for assembly and 0.4 hr for packaging. Grill B requires 1.2 hr for assembly and 0.6 hr for packaging. The production information and profit for each grill are given in the table. (**See Example 4**)

	Assembly	Packaging	Profit
Grill A	1 hr	0.4 hr	$90
Grill B	1.2 hr	0.6 hr	$120

The manufacturer has 1200 hr of labor available for assembly and 540 hr of labor available for packaging.

a. Determine the number of grill A units and the number of grill B units that should be produced to maximize profit assuming that all grills will be sold.

b. What is the maximum profit under these constraints?

c. If the profit on grill A units is $110 and the profit on grill B units is unchanged, how many of each type of grill unit should the manufacturer produce to maximize profit?

30. A manufacturer produces two models of patio furniture. Model A requires 2 hr for assembly and 1.2 hr for painting. Model B requires 3 hr for assembly and 1.5 hr for painting. The production information and profit for selling each model are given in the table.

	Assembly	Painting	Profit
Model A	2 hr	1.2 hr	$150
Model B	3 hr	1.5 hr	$200

The manufacturer has 1200 hr of labor available for assembly and 660 hr of labor available for painting.

a. Determine the number of model A units and the number of model B units that should be produced to maximize profit assuming that all furniture will be sold.

b. What is the maximum profit under these constraints?

c. If the profit on model A units is $180 and the profit on model B units remains the same, how many of each type should the manufacturer produce to maximize profit?

ISTUDY

31. A farmer has 1200 acres of land and plans to plant corn and soybeans. The input cost (cost of seed, fertilizer, herbicide, and insecticide) for 1 acre for each crop is given in the table along with the cost of machinery and labor. The profit for 1 acre of each crop is given in the last column.

	Input Cost per Acre	Labor/Machinery Cost per Acre	Profit per Acre
Corn	$180	$80	$120
Soybeans	$120	$100	$100

Suppose the farmer has budgeted a maximum of $198,000 for input costs and a maximum of $110,000 for labor and machinery.

a. Determine the number of acres of each crop that the farmer should plant to maximize profit. (Assume that all crops will be sold.)

b. What is the maximum profit?

c. If the profit per acre were reversed between the two crops (that is, $100 per acre for corn and $120 per acre for soybeans), how many acres of each crop should be planted to maximize profit?

32. To protect soil from erosion, some farmers plant winter cover crops such as winter wheat and rye. In addition to conserving soil, cover crops often increase crop yields in the row crops that follow in spring and summer. Suppose that a farmer has 800 acres of land and plans to plant winter wheat and rye. The input cost for 1 acre for each crop is given in the table along with the cost for machinery and labor. The profit for 1 acre of each crop is given in the last column.

	Input Cost per Acre	Labor/Machinery Cost per Acre	Profit per Acre
Wheat	$90	$50	$42
Rye	$120	$40	$35

Suppose the farmer has budgeted a maximum of $90,000 for input costs and a maximum of $36,000 for labor and machinery.

a. Determine the number of acres of each crop that the farmer should plant to maximize profit. (Assume that all crops will be sold.)

b. What is the maximum profit?

c. If the profit per acre for wheat were $40 and the profit per acre for rye were $45, how many acres of each crop should be planted to maximize profit?

Write About It

33. What is the purpose of linear programming?

34. What is an objective function?

35. How is the feasible region determined?

36. If an optimal value exists for an objective function, it exists at one of the vertices of the feasible region. Explain how to find the vertices.

CHAPTER 9 KEY CONCEPTS

SECTION 9.1 Systems of Linear Equations in Two Variables and Applications	Reference
Two or more linear equations taken together form a **system of linear equations.** A **solution** to a system of equations in two variables is an ordered pair that is a solution to each individual equation. Graphically, this is a point of intersection of the graphs of the equations.	p. 844
The substitution method and the addition method are often used to solve a system of linear equations in two variables.	pp. 846–847
A system of linear equations in two variables will have no solution if the equations in the system represent parallel lines. In such a case, we say that the system is **inconsistent.**	p. 845
A system of linear equations in two variables will have infinitely many solutions if the equations represent the same line. In such a case, we say that the equations are **dependent.**	p. 845

SECTION 9.2 Systems of Linear Equations in Three Variables and Applications	Reference
A **linear equation in three variables** is an equation that can be written in the form $Ax + By + Cz = D$ where A, B, and C are not all zero.	p. 858
A solution to a system of linear equations in three variables is an **ordered triple** (x, y, z) that satisfies each equation in the system. Geometrically, a solution is a point of intersection of the planes represented by the equations in the system.	p. 858

SECTION 9.3 Partial Fraction Decomposition	Reference
Partial fraction decomposition is used to write a rational expression as a sum of simpler fractions.	p. 870
There are two basic parts to find the partial fraction decomposition of a rational expression. I. Factor the denominator of the expression into linear factors and quadratic factors that are not further factorable over the integers. Then set up the "form" or "structure" for the partial fraction decomposition into simpler fractions. II. Next, multiply both sides of the equation by the LCD. Then set up a system of linear equations to find the coefficients of the terms in the numerator of each fraction. *Note*: The numerator of the original rational expression must be of lesser degree than the denominator. If this is not the case, first use long division.	p. 872

SECTION 9.4 Systems of Nonlinear Equations in Two Variables	Reference
A **nonlinear system of equations** is a system in which one or more equations is nonlinear.	p. 880
The substitution method is often used to solve a nonlinear system of equations.	p. 881
In some cases, the addition method can be used provided that the terms containing the corresponding variables are like terms.	p. 882

SECTION 9.5 Inequalities and Systems of Inequalities in Two Variables	Reference
An inequality of the form $Ax + By < C$, where A and B are not both zero, is called a **linear inequality in two variables.** (The symbols $>$, $\leq$, and $\geq$ can be used in place of $<$ in the definition.)	p. 889
The basic steps to solve a linear inequality in two variables are as follows: 1. Graph the related equation. The resulting line is drawn as a dashed line if the inequality is strict, and is otherwise drawn as a solid line. 2. Select a test point from either side of the line. If the ordered pair makes the original inequality true, then shade the half-plane from which the point was taken. Otherwise, shade the other half-plane.	p. 890
A nonlinear inequality in two variables is solved using the same basic procedure.	p. 892
Two or more inequalities in two variables make up a system of inequalities in two variables. The solution set to the system is the region of overlap (intersection) of the solution sets of the individual inequalities.	p. 893

SECTION 9.6 Linear Programming	Reference
A process called **linear programming** enables us to maximize or minimize a function under specified constraints. The function to be maximized or minimized is called the **objective function.**	p. 901
The steps to solve a linear programming application are outlined here. **Step 1** Write an objective function, $z = f(x, y)$. **Step 2** Write a system of inequalities defining the constraints on x and y. **Step 3** Graph the feasible region and identify the vertices. **Step 4** Evaluate the objective function at each vertex of the feasible region. Use the results to identify the values of x and y that optimize the objective function and identify the optimal value of z.	p. 903

Detailed Chapter Summaries are available with the online resources.

ISTUDY

CHAPTER 9 Review Exercises

SECTION 9.1

1. Determine if the ordered pair is a solution to the system.

$$2x - 3y = 0$$
$$-5x + 6y = -1$$

a. $\left(1, \frac{2}{3}\right)$ **b.** $(6, 4)$

For Exercises 2–3, based on the slope-intercept form of the equations, determine the number of solutions to the system.

2. $y = -\frac{3}{5}x - 4$
$y = -\frac{3}{5}x + 1$

3. $y = 2x + 6$
$y = \frac{1}{2}x - 6$

For Exercises 4–8, solve the system by using any method. If the system does not have one unique solution, state whether the system is inconsistent, or whether the equations are dependent.

4. $4x - y = 7$
$-2x + 5y = 19$

5. $5(x - y) = 19 - 2y$
$0.2x + 0.7y = -1.7$

6. $9x - 2y = 4$
$2x + 4y = 7$

7. $\frac{1}{10}x - \frac{1}{2}y = 1$
$2x = 10y + 6$

8. $y = \frac{3}{4}x$
$4(y - x) = -x$

9. Shenika wants to monitor daily calcium intake. One day Shenika had 3 cups of milk and 1 cup of cooked spinach for a total of 1140 mg of calcium. The next day's intake was 2 cups of milk and $1\frac{1}{2}$ cups of cooked spinach for a total of 960 mg of calcium. How much calcium is in 1 cup of milk and how much is in 1 cup of cooked spinach?

10. How many liters of a 40% acid mixture and how many liters of a 10% acid mixture should be mixed to obtain 20 L of a 22% acid mixture?

11. A plane can travel 960 mi in 2 hr with a tail wind. The return trip against the wind takes 2 hr and 40 min. Find the speed of the plane in still air and the speed of the wind.

12. A fishing boat captain charges \$250 for an excursion. The fixed monthly expenses are \$1200 for insurance, rent for the dock, and minor office expenses. The captain's cost of \$100 per excursion covers gasoline, bait, and other equipment.

Digital Stock/Corbis

a. Write a linear cost function representing the cost $C(x)$ (in \$) for the fishing boat captain to run x excursions per month.

b. Write a linear revenue function representing the revenue $R(x)$ (in \$) for x excursions per month.

c. Determine the number of excursions per month for the captain to break even.

d. If 18 excursions are run in a given month, how much money will the fishing boat captain earn or lose?

SECTION 9.2

For Exercises 13–16, solve the system. If a system has one unique solution, write the solution set. Otherwise, determine the number of solutions to the system, and determine whether the system is inconsistent, or the equations are dependent.

13. $3a - 4b + 2c = -17$
$2a + 3b + c = 1$
$4a + b - 3c = 7$

14. $6x = 24 - 5y$
$14 = 7z - 3y$
$4x - 3z = 10$

15. $x + 2y + z = 5$
$x + y - z = 1$
$4x + 7y + 2z = 16$

16. $u + v + 2w = 1$
$2v - 5w = 2$
$3u + 5v + w = 1$

17. Solve the system and write the general solution.

$$5x + 2y + z = 0$$
$$-4x + 3y - z = 0$$
$$6x + 7y + z = 0$$

18. An arena that hosts sporting events and concerts has three sections for three levels of seating. For a basketball game, seats in Section A cost \$90, seats in Section B cost \$65, and seats in Section C cost \$40. The number of seats in Section C equals the number of seats in Sections A and B combined. The arena holds 12,000 seats, and the game is sold out. If the total revenue from ticket sales is \$655,000, determine the number of seats in each section.

19. Esra receives an inheritance of \$20,000 and decides to invest the money. Some of the money is put in a savings account that earns 1.5% simple interest per year. The remaining money is invested in a bond fund that returns 4.5% and a stock fund that returns 6.2%. Esra makes a total of \$942 at the end of 1 yr. If Esra invested twice as much in the bond fund as the stock fund, determine the amount invested in each fund.

For Exercises 20–21, use a system of linear equations in three variables to find an equation of the form $y = ax^2 + bx + c$ that defines the parabola through the points.

20. $(-1, -4), (1, 6), (3, 8)$ **21.** $(1, -2), (2, 1), (3, 10)$

SECTION 9.3

For Exercises 22–27, set up the form for the partial fraction decomposition. Do not solve for A, B, C, and so on.

22. $\frac{5x + 22}{x^2 + 8x + 16}$ **23.** $\frac{-x - 11}{(x + 2)(x - 1)}$

ISTUDY

24. $\dfrac{2x^2 + x - 10}{x^3 + 5x}$

25. $\dfrac{7x^2 + 19x + 15}{2x^3 + 3x^2}$

26. $\dfrac{4x^4 - 3x^2 + 2x + 5}{x(2x + 5)^3(x^2 + 2)^2}$

27. $\dfrac{2x^3 - x^2 + 8x - 16}{x^4 + 5x^2 + 4}$

For Exercises 28–32, perform the partial fraction decomposition.

28. $\dfrac{-x - 11}{(x + 2)(x - 1)}$

29. $\dfrac{5x + 22}{x^2 + 8x + 16}$

30. $\dfrac{2x^4 + 7x^3 + 13x^2 + 19x + 15}{2x^3 + 3x^2}$

31. $\dfrac{2x^2 + x - 10}{x^3 + 5x}$

32. $\dfrac{2x^3 - x^2 + 8x - 16}{x^4 + 5x^2 + 4}$

SECTION 9.4

For Exercises 33–34,

a. Graph the equations.

b. Solve the system.

33. $y - x^2 = 1$
$x - y = -3$

34. $y = \sqrt{x - 1}$
$x^2 + y^2 = 5$

For Exercises 35–37, solve the system.

35. $3x^2 - y^2 = -4$
$x^2 + 2y^2 = 36$

36. $2x^2 - xy = 24$
$x^2 + 3xy = -9$

37. $y = \dfrac{8}{x}$
$y = \sqrt{x}$

38. The sum of the squares of two negative numbers is 97 and the difference of their squares is 65. Find the numbers.

39. The ratio of two numbers is 4 to 3. The sum of the squares of the numbers is 100. Find the numbers.

40. The hypotenuse of a right triangle is $\sqrt{74}$ ft and the sum of the lengths of the legs is 12 ft. Find the lengths of the legs.

41. A rectangular billboard has a perimeter of 72 ft and an area of 288 ft^2. Find the dimensions of the billboard.

SECTION 9.5

42. Graph the solution set to the inequality.

a. $3x + 4y \le 8$

b. $3x + 4y > 8$

43. Graph the solution set to the inequality.

a. $y < (x - 4)^2$

b. $y \ge (x - 4)^2$

For Exercises 44–48, graph the solution set.

44. $5(x + y) \ge 8x + 15$

45. $x \le 3.5$

46. $-\dfrac{3}{2}y + 1 < 4$

47. $x^2 + (y + 2)^2 < 4$

48. $|y| > 2$

49. Determine if the given ordered pair is a solution to the system of inequalities.

$$x + 2y < 4$$
$$3x - 4y \ge 6$$

a. (0, 1) **b.** (1, −4)

For Exercises 50–53, graph the solution set. If there is no solution, indicate that the solution set is the empty set.

50. $y > \dfrac{1}{2}x + 1$
$3x + 2y < 4$

51. $x^2 + y^2 \le 9$
$(x - 1)^2 + y^2 \ge 4$

52. $y \ge x^2 - 3$
$y > 1$
$x + y \le 3$

53. $y > e^x$
$y < -x^2 - 1$

54. Let x represent the number of hours that Jameis spends tutoring math, and let y represent the number of hours that Jameis spends tutoring English. For parts (a)–(d), write an inequality to represent the given statement.

a. Jameis has at most 12 hr to tutor per week.

b. The amount of time that Jameis spends tutoring English is at least twice the amount of time spent tutoring math.

c. The number of hours spent tutoring math cannot be negative.

d. The number of hours spent tutoring English cannot be negative.

e. Graph the solution set to the system of inequalities from parts (a)–(d).

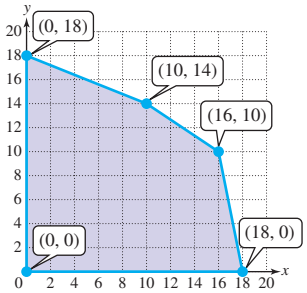
SECTION 9.6

55. At a home store, one sheet of $\frac{3}{8}$-in. sanded pine plywood costs \$24. One sheet of $\frac{1}{4}$-in. sanded pine plywood costs \$20. Write an objective function $z = f(x, y)$ that represents the total cost for x $\frac{3}{8}$-in. sheets and y $\frac{1}{4}$-in. sheets.

56. For the feasible region given in the figure and the objective function $z = 36x + 50y$,

a. Determine the values of x and y that produce the maximum value of the objective function.

b. Determine the maximum value of the objective function.



57. For the given constraints and the objective function, $z = 55x + 40y$,

a. Graph the feasible region and identify the vertices.

$$x \geq 0,\ y \geq 0$$
$$2x + y \geq 18$$
$$5x + 4y \geq 60$$

b. Determine the values of x and y that produce the minimum value of the objective function on the feasible region.

c. Determine the minimum value of the objective function on the feasible region.

58. A fitness instructor wants to mix two brands of protein powder to form a blend that limits the amount of fat and carbohydrate but maximizes the amount of fiber.

The nutritional information is given in the table for a single scoop of protein powder.

	Fat	Carbohydrates	Fiber
Brand A	3 g	3 g	10 g
Brand B	2 g	4 g	8 g

Suppose that the fitness instructor wants to make at most 180 scoops of the mixture. The instructor also wants to limit the amount of fat to 480 g and the amount of carbohydrate to 696 g.

a. Determine the number of scoops of each type of powder that will maximize the amount of fiber.

b. What is the maximum amount of fiber?

c. If the fiber content were reversed between the two brands (that is, 8 g for brand A and 10 g for brand B), then how much of each type of protein powder should be used to maximize the amount of fiber?

CHAPTER 9 Test

For Exercises 1–3, determine if the ordered pair or ordered triple is a solution to the system.

1. $x - 5y = -3$
$y = 2x - 12$
a. $(7, 2)$
b. $(-3, 0)$

2. $2x - 3y + z = -5$
$5x + y - 3z = -18$
$-x + 2y + 5z = 8$
a. $(0, 1, -2)$
b. $(-3, 0, 1)$

3. $2x - 4y < 9$
$-3x + y \geq 4$
a. $(-6, 1)$
b. $(1, 4)$

For Exercises 4–14, solve the system. If the system does not have one unique solution, also state whether the system is inconsistent or whether the equations are dependent.

4. $x = 5 - 4y$
$-3x + 7y = 4$

5. $0.2x = 0.35y - 2.5$
$0.16x + 0.5y = 5.8$

6. $x - \frac{2}{5}y = \frac{3}{10}$
$5x = 2y + \frac{3}{2}$

7. $7(x - y) = 3 - 5y$
$4(3x - y) = -2x$

8. $a + 6b + 3c = -14$
$2a + b - 2c = -8$
$-3a + 2b + c = -8$

9. $x + 4z = 10$
$3y - 2z = 9$
$2x + 5y = 21$

10. $2x - y + z = -3$
$x - 3y = 2$
$x + 2y + z = -7$

11. $(x - 4)^2 + y^2 = 25$
$x - y = 3$

12. $5x^2 + y^2 = 14$
$x^2 - 2y^2 = -17$

13. $2xy - y^2 = -24$
$-3xy + 2y^2 = 38$

14. $\frac{1}{x+3} - \frac{2}{y-1} = -7$
$\frac{3}{x+3} + \frac{1}{y-1} = 7$

15. Solve the system and write the general solution.
$x - 2z = 6$
$y + 3z = 2$
$x + y + z = 8$

16. At a candy and nut shop, the manager wants to make a nut mixture that is 56% peanuts. How many pounds of peanuts must be added to an existing mixture of 45% peanuts to make 20 lb of a mixture that is 56% peanuts?

17. Two runners begin at the same point on a 400-m track. If they run in opposite directions they pass each other in 40 sec. If they run in the same direction, they will meet again in 200 sec. Find the speed of each runner.

18. Dylan invests $15,000 in three different stocks. One stock is very risky and after 1 yr loses 8%. The second stock returns 3.2%, and a third stock returns 5.8%. At the end of 1 yr, the total return is $274. If Dylan invested $2000 more in the second stock than in the third stock, determine the amount Dylan invested in each stock.

19. The difference of two positive numbers is 3 and the difference of their squares is 33. Find the numbers.

20. A rectangular television screen has a perimeter of 154 in. and an area of 1452 in.^{2}. Find the dimensions of the screen.

21. Use a system of linear equations in three variables to find an equation of the form $y = ax^2 + bx + c$ that defines the parabola through the points $(1, -1)$, $(2, 1)$, and $(-1, 7)$.

ISTUDY

For Exercises 22–23, set up the form for the partial fraction decomposition. Do not solve for A, B, C, and so on.

22. $\dfrac{-15x+15}{3x^2+x-2}$

23. $\dfrac{5x^6+3x^5-4x^3+x-3}{x^3(x-3)(x^2+5x+1)^2}$

For Exercises 24–28, perform the partial fraction decomposition.

24. $\dfrac{-12x-29}{2x^2+11x+15}$

25. $\dfrac{6x+8}{x^2+4x+4}$

26. $\dfrac{x^4-6x^3+4x^2+20x-32}{x^3-4x^2}$

27. $\dfrac{x^2-2x-21}{x^3+7x}$

28. $\dfrac{7x^3+4x^2+63x+15}{x^4+11x^2+18}$

For Exercises 29–33, graph the solution set.

29. $2(x+y)>6-y$

30. $(x+3)^2+y^2\geq 9$

31. $|x|<4$

32. $x+y\leq 4$
$2x-y>-2$

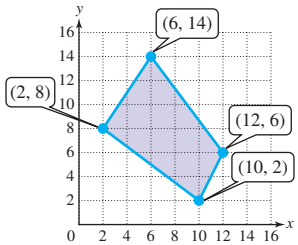
33. $y\leq -x^2+5$
$y>1$
$x+y\leq 3$

34. A donut shop makes a profit of \$2.40 on a dozen donuts and \$0.55 per muffin. Write an objective function $z=f(x,y)$ that represents the total profit for selling x dozen donuts and y muffins.

35. For the feasible region given and the objective function $z=4x+5y$,

a. Determine the values of x and y that produce the minimum value of the objective function on the feasible region.

b. Determine the minimum value of the objective function on the feasible region.



36. For the given constraints and objective function, $z=600x+850y$,

a. Graph the feasible region and identify the vertices.

$$x\geq 0,\ y\geq 0$$
$$x+y\leq 48$$
$$y\leq 3x$$

b. Determine the values of x and y that produce the maximum value of the objective function on the feasible region.

c. Determine the maximum value of the objective function on the feasible region.

37. A weight lifter wants to mix two types of protein powder. One is a whey protein and one is a soy protein. The fat, carbohydrate, and protein content (in grams) for 1 scoop of each powder is given in the table.

	Fat	Carbohydrates	Protein
Whey	3 g	3 g	20 g
Soy	2 g	4 g	18 g

Suppose that the weight lifter wants to make at most 60 scoops of a protein powder mixture, while limiting the total fat content to at most 150 g and the total carbohydrate content to at most 216 g.

a. Determine the number of scoops of each type of powder that will maximize the total protein content under these constraints.

b. What is the maximum total protein content?

c. If the protein content were reversed between the two brands (that is, 18 g for the whey protein and 20 g for the soy protein), then how much of each type of protein powder should be used to maximize the amount of protein?

CHAPTER 9 Cumulative Review Exercises

For Exercises 1–5, solve the equation.

1. $2x(x+2)=5x+7$

2. $\sqrt{2t+8}-t=4$

3. $(x^2-4)^2-7(x^2-4)-60=0$

4. $\log_2(x-4)=\log_2(x+1)+3$

5. $50e^{2x+1}=2000$

For Exercises 6–7, solve the inequality. Write the solution set in interval notation.

6. $\dfrac{x+4}{x-2}\leq 1$

7. $3|x+2|-1>8$

8. Find the partial fraction decomposition. $\dfrac{-5x+17}{x^2-6x+9}$

ISTUDY

9. Given $f(x) = 2x^2 - 3x$ and $g(x) = 5x + 1$,

a. Find $(f \circ g)(x)$.

b. Find $(g \circ f)(x)$.

10. Given $f(x) = \sqrt[3]{x - 2}$, write an equation for $f^{-1}(x)$.

11. Use a calculator to approximate the value of $\log_5 256$. Round to 4 decimal places.

12. Given $f(x) = -\frac{1}{2}x^3 + 4x^2 + 2$, find the average rate of change on the interval $[1, 3]$.

13. Write an equation of the line perpendicular to the line $x + 3y = 6$ and passing through the point $(2, -1)$.

14. Find all zeros of $f(x) = x^4 - 2x^3 + 10x^2 - 18x + 9$ and state the multiplicity of each zero.

For Exercises 15–16,

a. Write the domain in interval notation.

b. Write the range in interval notation.

15. $f(x) = 2|x - 1| - 3$

16. $f(x) = \ln(x - 3)$

For Exercises 17–19, solve the system.

17.
$$3x = 5y + 1$$
$$y = \frac{3}{5}x + 4$$

18.
$$5a - 2b + 3c = 10$$
$$-3a + b - 2c = -7$$
$$a + 4b - 4c = -3$$

19.
$$-2x^2 + 3y^2 = 10$$
$$5x^2 + 2y^2 = 13$$

20. Given $f(x) = -x^2 + 5x + 1$, find the difference quotient.

21. Shen invested \$8000. After 5 yr with interest compounded continuously, the account is worth \$10,907.40.

a. Write a model of the form $A(t) = Pe^{rt}$, where $A(t)$ represents the amount (in \$) in the account if P dollars in principal is invested at interest rate r for t years.

b. How long will it take for the investment to double? Round to the nearest tenth of a year.

22. The variable y varies jointly as x and the square of z. If y is 36 when x is 10 and z is 3, find the value of y when $x = 12$ and z is 4.

Problem Recognition Exercises: Using Multiple Methods to Solve Systems of Linear Equations 981

For matters of security, e-mail messages, websites, and other electronic media often use encryption techniques to encode data into an obscure form. This prevents those who do not know the code from understanding what has been transmitted. A computer program can encrypt words by using a matrix (a two-dimensional array) to encode the message, and then use the inverse of that matrix to decode it.

In this chapter, we will use matrices in a variety of ways. Matrices can be used to model systems of linear equations. Furthermore, a variety of techniques involving the algebra and manipulation of matrices can be used to solve the systems. The first two techniques are called Gaussian elimination and Gauss-Jordan elimination. These methods reduce a system of equations to a simpler system of equations so that the solution can be found by inspection. Next, we use the inverse of a matrix to solve a related matrix equation. Finally, we present Cramer's rule. This method provides convenient formulas to solve a system of linear equations based on the coefficients of the system.

SECTION 10.1 Solving Systems of Linear Equations Using Matrices

OBJECTIVES

1. Write an Augmented Matrix
2. Use Elementary Row Operations
3. Use Gaussian Elimination and Gauss-Jordan Elimination

1. Write an Augmented Matrix

The data in Table 10-1 represent the body mass index (BMI) for people of selected heights and weights. The National Institutes of Health suggests that a BMI should ideally be between 18.5 and 24.9. A table of data values such as Table 10-1 can be represented as a rectangular array of elements called a **matrix.**

Table 10-1 Body Mass Index

Height \ Weight	140 lb	160 lb	180 lb	200 lb
5′7″	21.9	25.1	28.2	31.3
5′10″	20.1	23.0	25.8	28.7
6′1″	18.5	21.1	23.7	26.4

(*Source*: National Institutes of Health, www.nih.gov)

matrix $\longrightarrow \begin{bmatrix} 21.9 & 25.1 & 28.2 & 31.3 \\ 20.1 & 23.0 & 25.8 & 28.7 \\ 18.5 & 21.1 & 23.7 & 26.4 \end{bmatrix}$

A matrix can be used to represent a system of linear equations written in standard form. To do so, we extract the coefficients of each term in the equation to form an **augmented matrix.** For example:

System of Equations	Augmented Matrix
$3x + 2y = 5$	$\left[\begin{array}{ccc\|c} 3 & 2 & 0 & 5 \\ 1 & -1 & 3 & 1 \\ 2 & 1 & 1 & 4 \end{array}\right]$
$x - y + 3z = 1$	
$2x + y + z = 4$	

The vertical bar within the augmented matrix separates the coefficients of the variable terms in the equations from the constant terms.

EXAMPLE 1 Writing and Interpreting an Augmented Matrix

a. Write the augmented matrix for the system.

$$2x = 5y + 5$$
$$3(x + y) = 17 + y$$

b. Write a system of linear equations represented by the augmented matrix.

$$\left[\begin{array}{ccc\|c} 1 & 0 & 0 & 6 \\ 0 & 1 & 0 & -10 \\ 0 & 0 & 1 & 4 \end{array}\right]$$

Solution:

a. Write each equation in standard form.

$$\left.\begin{array}{l} 2x = 5y + 5 \longrightarrow 2x - 5y = 5 \\ 3(x + y) = 17 + y \longrightarrow 3x + 2y = 17 \end{array}\right\} \xrightarrow{\text{augmented matrix}} \left[\begin{array}{cc\|c} 2 & -5 & 5 \\ 3 & 2 & 17 \end{array}\right]$$

b.
$$\left[\begin{array}{ccc\|c} 1 & 0 & 0 & 6 \\ 0 & 1 & 0 & -10 \\ 0 & 0 & 1 & 4 \end{array}\right] \begin{array}{l} \longrightarrow x + 0y + 0z = 6 \\ \longrightarrow 0x + y + 0z = -10 \\ \longrightarrow 0x + 0y + z = 4 \end{array} \quad \text{or simply} \quad \begin{array}{l} x = 6 \\ y = -10 \\ z = 4 \end{array}$$

Skill Practice 1

a. Write the augmented matrix.

$$7x = 9 + 2y$$
$$2(x - y) = 4$$

b. Write a system of linear equations represented by the augmented matrix.

$$\left[\begin{array}{cc\|c} 1 & 0 & -8 \\ 0 & 1 & 3 \end{array}\right]$$

Answers

1. **a.** $\left[\begin{array}{cc\|c} 7 & -2 & 9 \\ 2 & -2 & 4 \end{array}\right]$
   b. $x = -8, y = 3$

2. Use Elementary Row Operations

We can use an augmented matrix to solve a system of linear equations in much the same way as we use the addition method. When using the addition method, notice that the following operations produce an equivalent system of equations. This means that the two systems have the same solution set.

- Interchange two equations.

Example: $\begin{matrix} -3x - 5y = -13 \\ x + 2y = 5 \end{matrix} \xrightarrow[\text{equations.}]{\text{Interchange}} \begin{matrix} x + 2y = 5 \\ -3x - 5y = -13 \end{matrix}$

- Multiply an equation by a nonzero constant.

Example: $\begin{matrix} x + 2y = 5 \\ -3x - 5y = -13 \end{matrix} \xrightarrow{\text{Multiply by 3.}} \begin{matrix} 3x + 6y = 15 \\ -3x - 5y = -13 \end{matrix}$

- Add a nonzero multiple of one equation to another equation.

Example: $\begin{matrix} x + 2y = 5 \\ -3x - 5y = -13 \end{matrix} \xrightarrow{\text{Multiply by 3.}} \begin{matrix} 3x + 6y = 15 \\ -3x - 5y = -13 \\ \hline y = 2 \end{matrix}$ Add the equations.

These same operations performed on a matrix are called **elementary row operations.**

Elementary Row Operations

1. Interchange two rows.

Example: $\left[\begin{array}{cc|c} -3 & -5 & -13 \\ 1 & 2 & 5 \end{array}\right] \xrightarrow[\text{Interchange rows 1 and 2.}]{R_1 \Leftrightarrow R_2} \left[\begin{array}{cc|c} 1 & 2 & 5 \\ -3 & -5 & -13 \end{array}\right]$

2. Multiply a row by a nonzero constant.

Example: $\left[\begin{array}{cc|c} 1 & 2 & 5 \\ -3 & -5 & -13 \end{array}\right] \xrightarrow[\text{Multiply row 1 by 3.}]{3R_1 \to R_1} \left[\begin{array}{cc|c} 3 & 6 & 15 \\ -3 & -5 & -13 \end{array}\right]$

3. Add a nonzero multiple of one row to another row.

Example: $\left[\begin{array}{cc|c} 1 & 2 & 5 \\ -3 & -5 & -13 \end{array}\right] \xrightarrow[\text{Add 3 times row 1 to row 2.}]{3R_1 + R_2 \to R_2} \left[\begin{array}{cc|c} 1 & 2 & 5 \\ 0 & 1 & 2 \end{array}\right]$

$$\begin{array}{r} 3R_1 \\ +\ R_2 \\ \hline \to R_2 \end{array} \left[\begin{array}{cc|c} 3 & 6 & 15 \\ -3 & -5 & -13 \\ \hline 0 & 1 & 2 \end{array}\right]$$

Avoiding Mistakes

When we add a constant multiple of one row to another row, we do not change the row that was multiplied by the constant.

Two matrices are said to be **row equivalent** if one matrix can be transformed into the other matrix through a series of elementary row operations.

EXAMPLE 2 Performing Elementary Row Operations

Given $\left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 1 & 4 & -1 & 9 \\ 2 & 0 & -3 & -8 \end{array}\right]$, perform the following elementary row operations.

a. $R_1 \Leftrightarrow R_2$ **b.** $\frac{1}{4}R_1 \to R_1$ **c.** $-2R_2 + R_3 \to R_3$

ISTUDY

Solution:

a. $\left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 1 & 4 & -1 & 9 \\ 2 & 0 & -3 & -8 \end{array}\right] \xrightarrow[\text{Interchange rows 1 and 2.}]{R_1 \Leftrightarrow R_2} \left[\begin{array}{ccc|c} 1 & 4 & -1 & 9 \\ 4 & 3 & 0 & 5 \\ 2 & 0 & -3 & -8 \end{array}\right]$

b. $\left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 1 & 4 & -1 & 9 \\ 2 & 0 & -3 & -8 \end{array}\right] \xrightarrow[\text{Multiply row 1 by } \frac{1}{4}.]{\frac{1}{4}R_1 \to R_1} \left[\begin{array}{ccc|c} 1 & \frac{3}{4} & 0 & \frac{5}{4} \\ 1 & 4 & -1 & 9 \\ 2 & 0 & -3 & -8 \end{array}\right]$

c. $\left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 1 & 4 & -1 & 9 \\ 2 & 0 & -3 & -8 \end{array}\right]$

$$\begin{array}{r} -2R_2 \\ +\ R_3 \\ \hline \to R_3 \end{array} \quad \left[\begin{array}{ccc|c} -2 & -8 & 2 & -18 \\ 2 & 0 & -3 & -8 \\ \hline 0 & -8 & -1 & -26 \end{array}\right]$$

This now replaces row 3.

$$\left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 1 & 4 & -1 & 9 \\ 2 & 0 & -3 & -8 \end{array}\right] \xrightarrow[\text{Add } -2 \text{ times row 2 to row 3. The result replaces row 3.}]{-2R_2 + R_3 \to R_3} \left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 1 & 4 & -1 & 9 \\ 0 & -8 & -1 & -26 \end{array}\right]$$

TIP The notation $\frac{1}{4}R_1 \to R_1$ means to multiply row 1 by $\frac{1}{4}$ and then *replace* row 1 by the result.

Skill Practice 2 Use the matrix from Example 2 to perform the given row operations.

a. $R_2 \Leftrightarrow R_3$ **b.** $-\frac{1}{2}R_3$ **c.** $-4R_2 + R_1 \to R_1$

3. Use Gaussian Elimination and Gauss-Jordan Elimination

When an elementary row operation is performed on an augmented matrix, a new row-equivalent augmented matrix is obtained that represents an equivalent system of equations. If we perform repeated row operations, we can form an augmented matrix that represents a system of equations that is easier to solve than the original system. In particular, it is easy to solve a system whose augmented matrix is in *row-echelon form* or *reduced row-echelon form.*

Row-Echelon Form and Reduced Row-Echelon Form

A matrix is in **row-echelon form** if it satisfies the following conditions.

1. Any rows consisting entirely of zeros are at the bottom of the matrix.
2. For all other rows, the first nonzero entry is 1. This is called the leading 1.
3. The leading 1 in each nonzero row is to the right of the leading 1 in the row immediately above.

Note: A matrix is in **reduced row-echelon form** if it is in row-echelon form with the added condition that each row with a leading entry of 1 has zeros above the leading 1.

The following matrices illustrate row-echelon form and reduced row-echelon form.

Row-Echelon Form

$$\left[\begin{array}{cc|c} 1 & 5 & 3 \\ 0 & 1 & 6 \end{array}\right] \qquad \left[\begin{array}{ccc|c} 1 & -4 & -\frac{1}{2} & 6 \\ 0 & 1 & 9 & -\frac{1}{3} \\ 0 & 0 & 1 & 2 \end{array}\right] \qquad \left[\begin{array}{ccc|c} 1 & 4.1 & 1.2 & 3.1 \\ 0 & 1 & 0.6 & 4.7 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Answers

2. a. $\left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 2 & 0 & -3 & -8 \\ 1 & 4 & -1 & 9 \end{array}\right]$

b. $\left[\begin{array}{ccc|c} 4 & 3 & 0 & 5 \\ 1 & 4 & -1 & 9 \\ -1 & 0 & \frac{3}{2} & 4 \end{array}\right]$

c. $\left[\begin{array}{ccc|c} 0 & -13 & 4 & -31 \\ 1 & 4 & -1 & 9 \\ 2 & 0 & -3 & -8 \end{array}\right]$

ISTUDY

Reduced Row-Echelon Form

$$\left[\begin{array}{cc|c} 1 & 0 & -27 \\ 0 & 1 & 6 \end{array}\right] \qquad \left[\begin{array}{ccc|c} 1 & 0 & 0 & 150 \\ 0 & 1 & 0 & -85 \\ 0 & 0 & 1 & 12 \end{array}\right] \qquad \left[\begin{array}{ccc|c} 1 & 0 & 2 & 25 \\ 0 & 1 & -3 & -4 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

After writing an augmented matrix in row-echelon form, the corresponding system of linear equations can be solved using back substitution. This method is called **Gaussian elimination.**

Solving a System of Linear Equations Using Gaussian Elimination

1. Write the augmented matrix for the system.
2. Use elementary row operations to write the augmented matrix in row-echelon form.
3. Use back substitution to solve the resulting system of equations.

When writing an augmented matrix in row-echelon form, the goal is to make the elements along the main diagonal 1 and the entries below the main diagonal 0. The **main diagonal** refers to the elements on the diagonal from the upper left to the lower right all to the left of the vertical bar.

The main diagonal stretches from the upper left to the lower right.

$$\left[\begin{array}{ccc|c} 1 & \square & \square & \square \\ 0 & 1 & \square & \square \\ 0 & 0 & 1 & \square \end{array}\right]$$

To write an augmented matrix in row-echelon form, work one column at a time from left to right. This is demonstrated in Example 3.

EXAMPLE 3 Solving a System Using Gaussian Elimination

Solve the system by using Gaussian elimination.

$$\begin{aligned} 3x + 7y - 15z &= -12 \\ x + 2y - 4z &= -3 \\ -4x - 6y + 15z &= 16 \end{aligned}$$

Solution:

$$\begin{aligned} 3x + 7y - 15z &= -12 \\ x + 2y - 4z &= -3 \\ -4x - 6y + 15z &= 16 \end{aligned}$$

Need a 1 here

$$\left[\begin{array}{ccc|c} 3 & 7 & -15 & -12 \\ 1 & 2 & -4 & -3 \\ -4 & -6 & 15 & 16 \end{array}\right]$$

Set up the augmented matrix.

Use elementary row operations to write the augmented matrix in row-echelon form.

$R_1 \Leftrightarrow R_2$

$$\left[\begin{array}{ccc|c} 1 & 2 & -4 & -3 \\ 3 & 7 & -15 & -12 \\ -4 & -6 & 15 & 16 \end{array}\right]$$

Begin working with column 1.

To obtain a leading 1 in the first row, interchange rows 1 and 2.

TIP To obtain a leading entry of 1 in the first row, we have the option of multiplying the first row by $\frac{1}{3}$. However, this would introduce fractions in the first row. Interchanging rows 1 and 2 is "cleaner."

Now we want zeros below the leading 1 in the first row.

- Multiply row 1 by −3 and add the result to row 2.
- Multiply row 1 by 4 and add the result to row 3.

$$\left[\begin{array}{ccc|c} 1 & 2 & -4 & -3 \\ 3 & 7 & -15 & -12 \\ -4 & -6 & 15 & 16 \end{array}\right]$$

Need 0's here

$$\begin{array}{r} -3R_1 \\ +R_2 \\ \hline \to R_2 \end{array} \quad \begin{array}{ccc|c} -3 & -6 & 12 & 9 \\ 3 & 7 & -15 & -12 \\ \hline 0 & 1 & -3 & -3 \end{array} \qquad \begin{array}{r} 4R_1 \\ +R_3 \\ \hline \to R_3 \end{array} \quad \begin{array}{ccc|c} 4 & 8 & -16 & -12 \\ -4 & -6 & 15 & 16 \\ \hline 0 & 2 & -1 & 4 \end{array}$$

$$\begin{aligned} -3R_1 + R_2 &\to R_2 \\ 4R_1 + R_3 &\to R_3 \end{aligned} \longrightarrow \left[\begin{array}{ccc|c} 1 & 2 & -4 & -3 \\ 0 & 1 & -3 & -3 \\ 0 & 2 & -1 & 4 \end{array}\right]$$

ISTUDY

Next, work with column 2.
We already have a leading 1 in row 2.
We need 0 below the leading 1 in row 2.

$$\left[\begin{array}{ccc|c} 1 & 2 & -4 & -3 \\ 0 & 1 & -3 & -3 \\ 0 & 2 & -1 & 4 \end{array}\right]$$

Need 0 here

- Multiply row 2 by -2 and add the result to row 3.

$$\begin{array}{r} -2R_2 \\ +R_3 \\ \hline \to R_3 \end{array}\left[\begin{array}{ccc|c} 0 & -2 & 6 & 6 \\ 0 & 2 & -1 & 4 \\ \hline 0 & 0 & 5 & 10 \end{array}\right]$$

$$-2R_2 + R_3 \to R_3 \longrightarrow \left[\begin{array}{ccc|c} 1 & 2 & -4 & -3 \\ 0 & 1 & -3 & -3 \\ 0 & 0 & 5 & 10 \end{array}\right]$$

$$\tfrac{1}{5}R_3 \to R_3 \longrightarrow \left[\begin{array}{ccc|c} 1 & 2 & -4 & -3 \\ 0 & 1 & -3 & -3 \\ 0 & 0 & 1 & 2 \end{array}\right]$$

Now work with column 3. We need a leading 1 in row 3.
Multiply row 3 by $\frac{1}{5}$.

$$\left[\begin{array}{ccc|c} 1 & 2 & -4 & -3 \\ 0 & 1 & -3 & -3 \\ 0 & 0 & 1 & 2 \end{array}\right] \begin{array}{l} \longrightarrow x + 2y - 4z = -3 \\ \longrightarrow y - 3z = -3 \\ \longrightarrow z = 2 \end{array}$$

We now have row-echelon form.
The corresponding system of equations has z isolated.

Use back substitution to find x and y.

$$\begin{array}{r} y - 3z = -3 \\ y - 3(2) = -3 \\ y = 3 \end{array}$$

Substitute $z = 2$ in the second equation.

$$\begin{array}{r} x + 2y - 4z = -3 \\ x + 2(3) - 4(2) = -3 \\ x + 6 - 8 = -3 \\ x = -1 \end{array}$$

Substitute $z = 2$ and $y = 3$ into the first equation.

The solution set is $\{(-1, 3, 2)\}$.

The solution $(-1, 3, 2)$ checks in each original equation.

Skill Practice 3 Solve the system by using Gaussian elimination.

$$\begin{array}{r} 2x + 7y + z = 14 \\ x + 3y - z = 2 \\ x + 7y + 12z = 45 \end{array}$$

Example 3 illustrates that a system of equations represented by an augmented matrix in row-echelon form is easily solved by using back substitution. If we write an augmented matrix in *reduced* row-echelon form, we can solve the corresponding system of equations by inspection. This is called the Gauss-Jordan elimination method [named after Carl Friedrich Gauss (1777–1855) and German scientist Wilhelm Jordan (1842–1899)].

When writing an augmented matrix in *reduced* row-echelon form, the goal is to make the elements along the main diagonal 1 and the entries above and below the main diagonal 0. This is demonstrated in Examples 4 and 5.

$$\left[\begin{array}{cc|c} 1 & 0 & \square \\ 0 & 1 & \square \end{array}\right] \qquad \left[\begin{array}{ccc|c} 1 & 0 & 0 & \square \\ 0 & 1 & 0 & \square \\ 0 & 0 & 1 & \square \end{array}\right]$$

Answer
3. {(2, 1, 3)}

Order of Row Operations to Obtain Reduced Row-Echelon Form

To write an augmented matrix with n rows in reduced row-echelon form, transform the entries in the matrix in the following order.

Column 1: Obtain a leading element of 1 in row 1. Then obtain 0's below this element.

Column 2: Obtain a leading element of 1 in row 2. Then obtain 0's above and below this element.

Column 3: Obtain a leading element of 1 in row 3. Then obtain 0's above and below this element.

⋮

Column n: Obtain a leading element of 1 in row n. Then obtain 0's above this element.

EXAMPLE 4 Solving a System Using Gauss-Jordan Elimination

Solve the system by using Gauss-Jordan elimination.

$$x = 17 - 2y$$
$$3(x + 2y) = 47 - y$$

Solution:

$$x = 17 - 2y \longrightarrow x + 2y = 17$$
$$3(x + 2y) = 47 - y \longrightarrow 3x + 7y = 47$$

To use Gaussian elimination or Gauss-Jordan elimination, always begin by writing each equation in standard form.

$$x + 2y = 17$$
$$3x + 7y = 47$$

$$\begin{bmatrix} 1 & 2 & 17 \\ 3 & 7 & 47 \end{bmatrix}$$

Need 0 here

Set up the augmented matrix. The leading element in row 1 is already 1. Now we need a zero below the leading 1 in row 1.

Multiply row 1 by -3 and add the result to row 2.

$$\begin{array}{rrrr} -3R_1 & -3 & -6 & -51 \\ +R_2 & 3 & 7 & 47 \\ \hline \to R_2 & 0 & 1 & -4 \end{array}$$

$$-3R_1 + R_2 \to R_2 \longrightarrow \begin{bmatrix} 1 & 2 & 17 \\ 0 & 1 & -4 \end{bmatrix}$$

Need 0 here

$$\begin{bmatrix} 1 & 2 & 17 \\ 0 & 1 & -4 \end{bmatrix}$$

Now work with column 2. The leading element in row 2 is already 1. Now we need a zero above the leading 1 in row 2.

Multiply row 2 by -2 and add the result to row 1.

$$\begin{array}{rrrr} R_1 & 1 & 2 & 17 \\ +-2R_2 & 0 & -2 & 8 \\ \hline \to R_1 & 1 & 0 & 25 \end{array}$$

$$-2R_2 + R_1 \to R_1 \longrightarrow \begin{bmatrix} 1 & 0 & 25 \\ 0 & 1 & -4 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 & 25 \\ 0 & 1 & -4 \end{bmatrix} \longrightarrow x = 25, \quad y = -4$$

From the corresponding system of equations, we can determine the solution $(25, -4)$ by inspection.

The solution set is $\{(25, -4)\}$.

The solution checks in each original equation.

Skill Practice 4 Solve the system by using Gauss-Jordan elimination.

$$\begin{aligned} x - 2y &= -1 \\ 4x - 7y &= 1 \end{aligned}$$

In Example 5, we use the Gauss-Jordan elimination method to solve a three-variable system of linear equations.

EXAMPLE 5 Solving a System Using Gauss-Jordan Elimination

Solve the system by using Gauss-Jordan elimination.

$$\begin{aligned} 2x - 5y - 21z &= 39 \\ x - 3y - 10z &= 22 \\ x + 3y + 2z &= -8 \end{aligned}$$

Solution:

$$\begin{aligned} 2x - 5y - 21z &= 39 \\ x - 3y - 10z &= 22 \\ x + 3y + 2z &= -8 \end{aligned} \qquad \left[\begin{array}{ccc|c} 2 & -5 & -21 & 39 \\ 1 & -3 & -10 & 22 \\ 1 & 3 & 2 & -8 \end{array}\right]$$

Set up the augmented matrix.

$$R_1 \Leftrightarrow R_2 \longrightarrow \left[\begin{array}{ccc|c} 1 & -3 & -10 & 22 \\ 2 & -5 & -21 & 39 \\ 1 & 3 & 2 & -8 \end{array}\right]$$

Use elementary row operations to write the augmented matrix in reduced row-echelon form.

To obtain a leading 1 in the first row, interchange rows 1 and 2.

$$\begin{aligned} -2R_1 + R_2 &\to R_2 \\ -R_1 + R_3 &\to R_3 \end{aligned} \longrightarrow \left[\begin{array}{ccc|c} 1 & -3 & -10 & 22 \\ 0 & 1 & -1 & -5 \\ 0 & 6 & 12 & -30 \end{array}\right]$$

Multiply row 1 by -2 and add the result to row 2. Multiply row 1 by -1 and add the result to row 3.

This results in zeros below the leading 1 in the first row.

$$\begin{aligned} 3R_2 + R_1 &\to R_1 \\ -6R_2 + R_3 &\to R_3 \end{aligned} \longrightarrow \left[\begin{array}{ccc|c} 1 & 0 & -13 & 7 \\ 0 & 1 & -1 & -5 \\ 0 & 0 & 18 & 0 \end{array}\right]$$

Row 2 already has a leading 1.

Multiply row 2 by 3 and add the result to row 1. Multiply row 2 by -6 and add the result to row 3.

$$\frac{1}{18}R_3 \to R_3 \longrightarrow \left[\begin{array}{ccc|c} 1 & 0 & -13 & 7 \\ 0 & 1 & -1 & -5 \\ 0 & 0 & 1 & 0 \end{array}\right]$$

Multiply row 3 by $\frac{1}{18}$ to obtain a leading 1 in row 3.

$$\begin{aligned} 13R_3 + R_1 &\to R_1 \\ R_3 + R_2 &\to R_2 \end{aligned} \longrightarrow \left[\begin{array}{ccc|c} 1 & 0 & 0 & 7 \\ 0 & 1 & 0 & -5 \\ 0 & 0 & 1 & 0 \end{array}\right]$$

Multiply row 3 by 13 and add the result to row 1.

Multiply row 3 by 1 and add the result to row 2.

$$\left[\begin{array}{ccc|c} 1 & 0 & 0 & 7 \\ 0 & 1 & 0 & -5 \\ 0 & 0 & 1 & 0 \end{array}\right] \begin{array}{l} \longrightarrow x = 7 \\ \longrightarrow y = -5 \\ \longrightarrow z = 0 \end{array}$$

The augmented matrix is in reduced row-echelon form.

From the corresponding system of equations, we can determine the solution $(7, -5, 0)$ by inspection.

The solution set is $\{(7, -5, 0)\}$.

The solution checks in each original equation.

Skill Practice 5 Solve the system by using Gauss-Jordan elimination.

$$\begin{aligned} 2x + 7y + 11z &= 11 \\ x + 2y + 8z &= 14 \\ x + 3y + 6z &= 8 \end{aligned}$$

Answers

4. $\{(9, 5)\}$

5. $\{(14, -4, 1)\}$

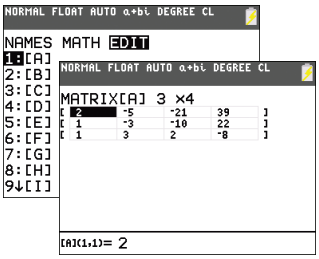
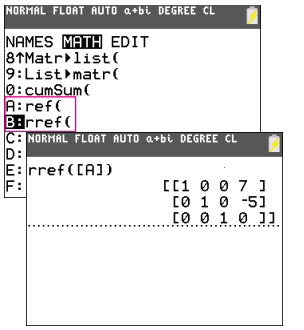
Finding the Row-Echelon Form and Reduced Row-Echelon Form of a Matrix

Many graphing utilities have the capability to enter and manipulate matrices. To enter the augmented matrix from Example 5, select the MATRIX menu and then the EDIT menu. Select a name for the matrix such as A. Then enter the number of rows and columns of the matrix (in this case 3 × 4) followed by the individual elements.

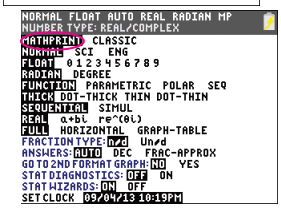


To access the commands for row-echelon form and reduced row-echelon form, select the MATH menu from within the MATRIX menu. Select either *ref* for row-echelon form or *rref* for reduced row-echelon form.

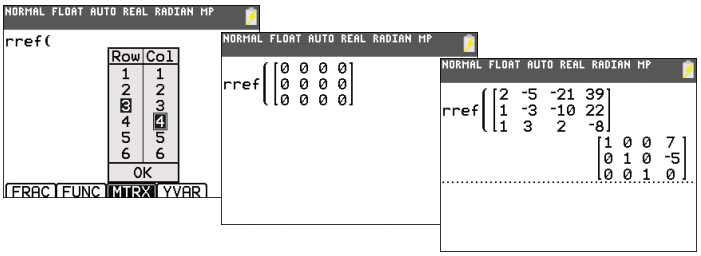


In the home screen, insert the matrix name within the parentheses for the *ref* and *rref* functions.

Alternatively, we can find the row-echelon form or reduced row-echelon form of a matrix if the calculator is in "MATHPRINT" mode. Select MODE, and using the arrow keys to navigate through the menu, highlight "MATHPRINT."



In the home screen, select the MATRIX menu, followed by MATH. Then select either *ref* or *rref*. Next, press the ALPHA key followed by F3. Enter the dimensions of the matrix (in this case, 3 × 4). Then enter the elements of the matrix using the arrow keys to navigate through the matrix. Hit ENTER to complete the calculation.



the calculation.

SECTION 10.1 Practice Exercises

Prerequisite Review

R.1. Solve the equation and check the solution.

$3n + 25 = 73$

R.2. How much interest will Roxanne have to pay if she borrows \$1000 for 2 yr at a simple interest rate of 5%?

For Exercises R.3–R.4, set up the form for the partial fraction decomposition. Do not solve for *A*, *B*, *C*, and so on.

R.3. $\dfrac{-12t - 11}{4t^2 - 16t + 15}$

R.4. $\dfrac{-5x^2 - 10x - 13}{7x^3 + 7x}$

ISTUDY

Concept Connections

1. A rectangular array of elements is called a _____.

2. Identify the elements on the main diagonal. $\left[\begin{array}{ccc|c} -4 & -1 & 1 & 8 \\ 2 & 0 & 5 & 11 \\ 0 & 1 & -7 & -6 \end{array}\right]$

3. Explain the meaning of the notation $R_2 \Leftrightarrow R_3$.

4. Explain the meaning of the notation $-R_2 \rightarrow R_2$.

5. Explain the meaning of the notation $3R_1 \rightarrow R_1$.

6. Explain the meaning of $R_1 \Leftrightarrow R_3$.

7. Explain the meaning of the notation $3R_1 + R_2 \rightarrow R_2$.

8. Explain the meaning of the notation $4R_2 + R_3 \rightarrow R_3$.

Objective 1: Write an Augmented Matrix

For Exercises 9–14, write the augmented matrix for the given system. (See Example 1)

9. $\begin{aligned} -3x + 2y - z &= 4 \\ 8x + 4z &= 12 \\ 2y - 5z &= 1 \end{aligned}$

10. $\begin{aligned} -4x - y + z &= 8 \\ 2x + 5z &= 11 \\ y - 7z &= -6 \end{aligned}$

11. $\begin{aligned} 4(x - 2y) &= 6y + 2 \\ 3x &= 5y + 7 \end{aligned}$

12. $\begin{aligned} 2(y - x) &= 4 - 8x \\ 5y &= 6 - x \end{aligned}$

13. $\begin{aligned} x &= 2 \\ y &= \tfrac{6}{7} \\ z &= 12 \end{aligned}$

14. $\begin{aligned} x &= 4 \\ y &= 2 \\ z &= -\tfrac{1}{2} \end{aligned}$

For Exercises 15–20, write a system of linear equations represented by the augmented matrix. (See Example 1)

15. $\left[\begin{array}{cc|c} -4 & 6 & 11 \\ -3 & 9 & 1 \end{array}\right]$

16. $\left[\begin{array}{cc|c} -3 & 7 & -2 \\ -1 & 1 & 4 \end{array}\right]$

17. $\left[\begin{array}{ccc|c} 1 & 4 & 3 & 8 \\ 0 & 1 & 2 & 12 \\ 0 & 0 & 1 & 6 \end{array}\right]$

18. $\left[\begin{array}{ccc|c} 1 & 1 & -2 & -4 \\ 0 & 1 & 3 & 8 \\ 0 & 0 & 1 & 2 \end{array}\right]$

19. $\left[\begin{array}{ccc|c} 1 & 0 & 0 & 8 \\ 0 & 1 & 0 & -9 \\ 0 & 0 & 1 & \frac{3}{2} \end{array}\right]$

20. $\left[\begin{array}{ccc|c} 1 & 0 & 0 & 2 \\ 0 & 1 & 0 & 6 \\ 0 & 0 & 1 & -\frac{1}{2} \end{array}\right]$

Objective 2: Use Elementary Row Operations

For Exercises 21–26, perform the elementary row operations on $\left[\begin{array}{cc|c} 1 & 4 & 2 \\ -3 & 6 & 6 \end{array}\right]$. (See Example 2)

21. $R_1 \Leftrightarrow R_2$

22. $-\frac{1}{3}R_2 \rightarrow R_2$

23. $3R_1 \rightarrow R_1$

24. $-3R_1 \rightarrow R_1$

25. $\frac{1}{3}R_2 + R_1 \rightarrow R_1$

26. $3R_1 + R_2 \rightarrow R_2$

For Exercises 27–32, perform the elementary row operations on $\left[\begin{array}{ccc|c} 1 & 5 & 6 & 2 \\ 2 & 1 & 5 & 1 \\ 4 & -2 & -3 & 10 \end{array}\right]$. (See Example 2)

27. $R_2 \Leftrightarrow R_3$

28. $R_1 \Leftrightarrow R_2$

29. $\frac{1}{4}R_3 \rightarrow R_3$

30. $\frac{1}{2}R_2 \rightarrow R_2$

31. $-2R_1 + R_2 \rightarrow R_2$

32. $-4R_1 + R_3 \rightarrow R_3$

Objective 3: Use Gaussian Elimination and Gauss-Jordan Elimination

For Exercises 33–36, determine if the matrix is in row-echelon form. If not, explain why.

33. $\left[\begin{array}{cc|c} 1 & 5 & 4 \\ 0 & 2 & 6 \end{array}\right]$

34. $\left[\begin{array}{ccc|c} 1 & 6 & 4 & 2 \\ 0 & 1 & 0 & -1 \\ 0 & 3 & 1 & 3 \end{array}\right]$

35. $\left[\begin{array}{ccc|c} 1 & 3 & 2 & 6 \\ 0 & 1 & 5 & 9 \\ 0 & 0 & 0 & 0 \end{array}\right]$

36. $\left[\begin{array}{ccc|c} 1 & 4 & 2 & -6 \\ 0 & 1 & -3 & 2 \\ 0 & 0 & 1 & 0 \end{array}\right]$

ISTUDY

For Exercises 37–40, determine if the matrix is in reduced row-echelon form. If not, explain why.

37. $\left[\begin{array}{ccc|c} 1 & 0 & 0 & 3 \\ 1 & 0 & 0 & 4 \\ 1 & 0 & 0 & 5 \end{array}\right]$

38. $\left[\begin{array}{ccc|c} 1 & 0 & 2 & 3 \\ 0 & 1 & 0 & 4 \\ 0 & 0 & 1 & 5 \end{array}\right]$

39. $\left[\begin{array}{cccc|c} 1 & 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 & 2 \\ 0 & 0 & 1 & 0 & -7 \\ 0 & 0 & 0 & 1 & 4 \end{array}\right]$

40. $\left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & 5 \\ 0 & 1 & 0 & 0 & 20 \\ 0 & 0 & 1 & 4 & -1 \\ 0 & 0 & 0 & 0 & 0 \end{array}\right]$

For Exercises 41–60, solve the system by using Gaussian elimination or Gauss-Jordan elimination. (See Examples 3–5)

41.
$2x + 3y = -13$
$x + 4y = -14$

42.
$-3x + 11y = 58$
$x - 3y = -16$

43.
$2x - 7y = -41$
$3x - 9y = -51$

44.
$-2x + 15y = 6$
$3x - 12y = -9$

45.
$-3(x - 6y) = -167 - y$
$14y = 2x - 122$

46.
$2(x - y) = 4x + y - 40$
$9y = 105 - 3x$

47.
$3x + 7y + 22z = 83$
$x + 3y + 10z = 37$
$-2x - 5y - 18z = -66$

48.
$3x + 5y + 9z = 3$
$x + 3y + 7z = 5$
$-2x - 8y - 15z = -11$

49.
$-2x + 4y + z = 7$
$4x - 13y + 10z = 17$
$3x - 9y + 6z = 9$

50.
$2x - 8y + 54z = -4$
$x - 2y + 14z = -1$
$x - 3y + 19z = -3$

51.
$-3x + 4y - 15z = -44$
$x - y + 4z = 13$
$x - 3y + 14z = 27$

52.
$-2x + 5y - 4z = -4$
$x - 2y + z = 3$
$x - 5y + 9z = -5$

53.
$2x + 8z = 7y - 46$
$x = 3y - 3z - 18$
$6z = 5y - x - 34$

54.
$2x = 7 - y - 3z$
$x + y = z + 5$
$16z = 2y - x - 4$

55.
$11y + 65 = 3x + 13z$
$x + 3z = 3y + 15$
$-2x + 4y - 7z = -25$

56.
$2(x - 6z) = 3y + x + 17$
$2x - 19 = 3y + 18z$
$-3x + 7y + 36z = -41$

57.
$w + 3x - 3z = -5$
$x - 2z = -6$
$-2w - 4x + y + 2z = 1$
$x + y = 5$

58.
$w - 2x + 5y = 20$
$-x + 2y = 9$
$x - y = -5$
$2w - x + 7y + z = 25$

59.
$x_1 + x_2 + 5x_4 = -4$
$x_2 + 2x_4 = 3$
$-2x_2 + x_3 - 3x_4 = -5$
$3x_1 + 3x_2 + 17x_4 = -10$

60.
$x_1 + x_3 - 5x_4 = 1$
$-2x_1 + x_2 - 2x_3 + 16x_4 = -3$
$x_1 + 2x_3 - 10x_4 = 5$
$x_1 - x_3 + 7x_4 = -7$

Mixed Exercises

For Exercises 61–64, set up a system of linear equations to represent the scenario. Solve the system by using Gaussian elimination or Gauss-Jordan elimination.

61. Andre borrowed $20,000 to buy a truck for his business. He borrowed from his parents who charge him 2% simple interest. He borrowed from a credit union that charges 4% simple interest, and he borrowed from a bank that charges 5% simple interest. He borrowed five times as much from his parents as from the bank, and the amount of interest he paid at the end of 1 yr was $620. How much did he borrow from each source?

62. Sylvia invested a total of $40,000. She invested part of the money in a certificate of deposit (CD) that earns 2% simple interest per year. She invested in a stock that returns the equivalent of 8% simple interest, and she invested in a bond fund that returns 5%. She invested twice as much in the stock as she did in the CD, and earned a total of $2300 at the end of 1 yr. How much principal did she put in each investment?

63. Jemila stayed in three different cities (Washington, D.C., Atlanta, Georgia, and Dallas, Texas) for a total of 14 nights. Twice as many nights were spent in Dallas as in Washington. The total cost for 14 nights (excluding tax) was $2200. Determine the number of nights spent in each city.

City	Cost per Night
Washington	$200
Atlanta	$100
Dallas	$150

64. Three pumps (A, B, and C) work to drain water from a retention pond. Working together, the pumps can pump 1500 gal/hr of water. Pump C works at a rate of 100 gal/hr faster than pump B. In 3 hr, pump C can pump as much water as pumps A and B working together in 2 hr. Find the rate at which each pump works.

ISTUDY

For Exercises 65–66, find the partial fraction decomposition for the given rational expression. Use the technique of Gaussian elimination to find A, B, and C.

65. $\dfrac{5x^2 - 6x - 13}{(x+3)(x-2)^2} = \dfrac{A}{x+3} + \dfrac{B}{x-2} + \dfrac{C}{(x-2)^2}$

66. $\dfrac{2x^2 + 17x + 3}{(x+5)(x+1)^2} = \dfrac{A}{x+5} + \dfrac{B}{x+1} + \dfrac{C}{(x+1)^2}$

Write About It

67. Explain why interchanging two rows of an augmented matrix results in an augmented matrix that represents an equivalent system of equations.

68. Explain why multiplying a row of an augmented matrix by a nonzero constant results in an augmented matrix that represents an equivalent system of equations.

69. Explain the difference between a matrix in row-echelon form and reduced row-echelon form.

70. Consider the matrix $\left[\begin{array}{cc|c} 5 & -9 & -57 \\ 1 & -2 & -12 \end{array}\right]$. Identify two row operations that could be used to obtain a leading entry of 1 in the first row. Also indicate which operation would be less cumbersome as a first step toward writing the matrix in reduced row-echelon form.

Technology Connections

For Exercises 71–72, use a calculator to approximate the reduced row-echelon form of the augmented matrix representing the given system. Give the solution set where x, y, and z are rounded to 2 decimal places.

71.
$$\begin{aligned} 0.52x - 3.71y - 4.68z &= 9.18 \\ 0.02x + 0.06y + 0.11z &= 0.56 \\ 0.972x + 0.816y + 0.417z &= 0.184 \end{aligned}$$

72.
$$\begin{aligned} -3.61x + 8.17y - 5.62z &= 30.2 \\ 8.04x - 3.16y + 9.18z &= 28.4 \\ -0.16x + 0.09y + 0.55z &= 4.6 \end{aligned}$$

73. A small grocer finds that the monthly sales y (in \$) can be approximated as a function of the amount spent advertising on the radio x_1 (in \$) and the amount spent advertising in the newspaper x_2 (in \$) according to $y = ax_1 + bx_2 + c$.

The table gives the amounts spent in advertising and the corresponding monthly sales for 3 months.

Radio Advertising, x_1	Newspaper Advertising, x_2	Monthly sales, y
\$2400	\$800	\$36,000
\$2000	\$500	\$30,000
\$3000	\$1000	\$44,000

a. Use the data to write a system of linear equations to solve for a, b, and c.

b. Use a graphing utility to find the reduced row-echelon form of the augmented matrix.

c. Write the model $y = ax_1 + bx_2 + c$.

d. Predict the monthly sales if the grocer spends \$2500 advertising on the radio and \$500 advertising in the newspaper for a given month.

74. The purchase price of a home y (in \$1000) can be approximated based on the annual income of the buyer x_1 (in \$1000) and on the square footage of the home x_2 (in 100 ft^2) according to $y = ax_1 + bx_2 + c$.

The table gives the incomes of three buyers, the square footages of the home purchased, and the corresponding purchase prices of the home.

Income (\$1000) x_1	Square Footage (100 ft^2) x_2	Price (\$1000) y
80	21	180
150	28	250
75	18	160

a. Use the data to write a system of linear equations to solve for a, b, and c.

b. Use a graphing utility to find the reduced row-echelon form of the augmented matrix.

c. Write the model $y = ax_1 + bx_2 + c$.

d. Predict the purchase price for a buyer who makes \$100,000 per year and wants a 2500 ft^2 home.

For Exercises 75–76, the given function values satisfy a function defined by $f(x) = ax^2 + bx + c$.

a. Set up a system of equations to solve for a, b, and c.

b. Use a graphing utility to find the reduced row-echelon form of the augmented matrix.

c. Write a function of the form $f(x) = ax^2 + bx + c$ that fits the data.

75. $f(-3) = -7.28$
$f(-1) = 3.68$
$f(10) = 18.2$

76. $f(3) = 6.95$
$f(-2) = 20.2$
$f(12) = 39.8$

ISTUDY

SECTION 10.2 Inconsistent Systems and Dependent Equations

OBJECTIVES

1. Identify Inconsistent Systems
2. Solve Systems with Dependent Equations
3. Solve Applications of Systems of Equations

1. Identify Inconsistent Systems

When we studied systems of linear equations in two and three variables in Chapter 9, we learned that a system may have no solution. Such a system is said to be **inconsistent,** and we recognize an inconsistent system if the system reduces to a contradiction.

EXAMPLE 1 Identifying an Inconsistent System

Solve the system.
$$\begin{aligned} x - 3y - 17z &= -59 \\ x - 2y - 12z &= -41 \\ -2y - 10z &= 20 \end{aligned}$$

Solution:

$x - 3y - 17z = -59$
$x - 2y - 12z = -41$
$-2y - 10z = 20$

$$\left[\begin{array}{ccc|c} 1 & -3 & -17 & -59 \\ 1 & -2 & -12 & -41 \\ 0 & -2 & -10 & 20 \end{array}\right]$$

Write the augmented matrix.

The leading entry in row 1 is already 1.

$$-R_1 + R_2 \to R_2 \longrightarrow \left[\begin{array}{ccc|c} 1 & -3 & -17 & -59 \\ 0 & 1 & 5 & 18 \\ 0 & -2 & -10 & 20 \end{array}\right]$$

Multiply row 1 by -1 and add the result to row 2.

$$\begin{aligned} 3R_2 + R_1 &\to R_1 \\ 2R_2 + R_3 &\to R_3 \end{aligned} \longrightarrow \left[\begin{array}{ccc|c} 1 & 0 & -2 & -5 \\ 0 & 1 & 5 & 18 \\ 0 & 0 & 0 & 56 \end{array}\right]$$

Multiply row 2 by 3 and add the result to row 1.

Multiply row 2 by 2 and add the result to row 3.

The last row of the matrix cannot be written with a leading 1 along the main diagonal. The last row represents a contradiction, $0 = 56$.

$$\left[\begin{array}{ccc|c} 1 & 0 & -2 & -5 \\ 0 & 1 & 5 & 18 \\ 0 & 0 & 0 & 56 \end{array}\right] \xrightarrow[\text{system}]{\text{equivalent}} \begin{cases} x - 2z = -5 \\ y + 5z = 18 \\ 0 = 56 \end{cases}$$

The contradiction indicates that the system is inconsistent and that there is no solution. The solution set is $\{\ \}$.

Skill Practice 1 Solve the system.
$$\begin{aligned} 5x - 9y - 33z &= 3 \\ x - 2y - 7z &= 0 \\ -2x + y + 8z &= -12 \end{aligned}$$

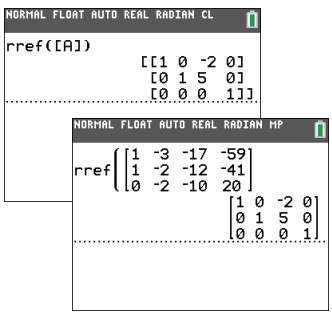
Answer
1. $\{\ \}$

TECHNOLOGY CONNECTIONS

Recognizing an Inconsistent System on a Calculator

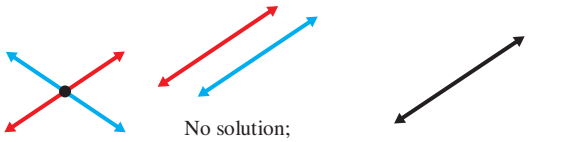
We can verify that the system of equations in Example 1 has no solution by using a calculator to find the reduced row-echelon form of the augmented matrix. Notice that the calculator also displays a contradiction in the third row, $0 = 1$.

In Example 1, once we reached the contradiction $0 = 56$, we stopped manipulating the augmented matrix. However, we have the option of simplifying the augmented matrix to reduced row-echelon form. To match the result given in the calculator, we would multiply row 3 by $\frac{1}{56}$. Then add -18 times row 3 to row 2, and add 5 times row 3 to row 1.



2. Solve Systems with Dependent Equations

Recall that a linear equation in two variables defines a line in a plane. A solution to a system of two linear equations in two variables is a point of intersection of the lines. If the two lines are parallel, the system is inconsistent and has no solution. If the equations in the system represent the same line, we say that the equations are **dependent** and the solution set is the set of all points on the line.



One solution | No solution; Inconsistent system | Infinitely many solutions; Dependent equations

EXAMPLE 2 Solving a System of Dependent Equations with Two Variables

Solve the system. $0.25x - 0.75y = 1$
$3y = x - 4$

Solution:

$0.25x - 0.75y = 1 \xrightarrow{\text{Multiply by 100.}} 25x - 75y = 100$

$3y = x - 4 \xrightarrow[\text{Standard form}]{} -x + 3y = -4$

Write the equations in standard form. As an option, consider clearing decimals in the first equation.

$$\left[\begin{array}{cc|c} 25 & -75 & 100 \\ -1 & 3 & -4 \end{array}\right] \xrightarrow{\frac{1}{25}R_1 \to R_1} \left[\begin{array}{cc|c} 1 & -3 & 4 \\ -1 & 3 & -4 \end{array}\right]$$

To obtain a 1 in the first row, first column, multiply row 1 by $\frac{1}{25}$.

$$\xrightarrow{R_1 + R_2 \to R_2} \left[\begin{array}{cc|c} 1 & -3 & 4 \\ 0 & 0 & 0 \end{array}\right]$$

To obtain a 0 in the second row, first column, add row 1 to row 2.

The second row of the augmented matrix represents the equation $0 = 0$, which is true regardless of the values of x and y. This means that the original system reduces to the single equation $x - 3y = 4$. That is, the two original equations each represent the same line, and all points on the line are solutions to the system. Solving the equation $x - 3y = 4$ for x or y illustrates the dependency between x and y.

Solving the equation $x - 3y = 4$ for x gives: $x = 3y + 4$ (x depends on the choice of y.)

Solving the equation $x - 3y = 4$ for y gives: $y = \dfrac{x - 4}{3}$ (y depends on the choice of x.)

The solution set can be written as

$$\{(3y + 4, y) \mid y \text{ is any real number}\} \text{ or } \left\{\left(x, \frac{x - 4}{3}\right) \middle| \, x \text{ is any real number}\right\}.$$

Skill Practice 2 Solve the system. $0.3x - 0.1y = -2$
$y - 20 = 3x$

TIP In Example 2, we wrote the solution set in two ways: one with an arbitrary value of y and one with an arbitrary value of x. However, when using reduced row-echelon form to find the solution set to a system of dependent equations, we generally let the *last* variable in the ordered pair (ordered triple, etc.) be arbitrary. In Example 2, this is $\{(3y + 4, y) \mid y \text{ is any real number}\}$.

Answer

2. $\left\{\left(\dfrac{y - 20}{3}, y\right) \middle| \, y \text{ is any real number}\right\}$
or $\{(x, 3x + 20) \mid x \text{ is any real number}\}$

A linear equation in three variables represents a plane in space. A solution to a system of equations in three variables is a common point of intersection among all the planes in the system. From Example 1, we have a system with no solution. This means that the planes do not all intersect (Figure 10-1).

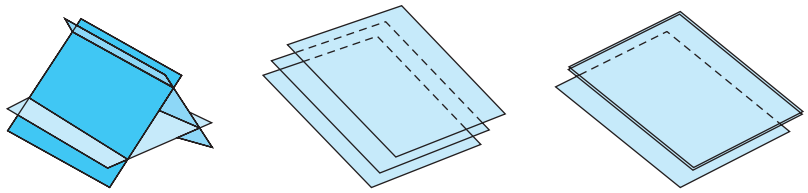


Figure 10-1

A system of linear equations may have infinitely many solutions. In such a case, the equations are dependent. For a system of three equations in three variables, this means that the planes intersect in a common line in space (Figure 10-2 and Figure 10-3), or the three planes all coincide (Figure 10-4).

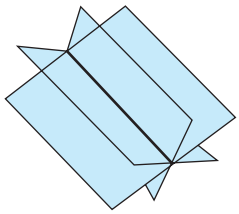

Figure 10-2

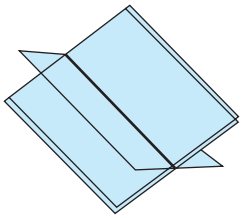

Figure 10-3

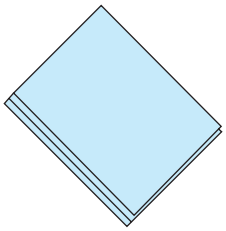

Figure 10-4

EXAMPLE 3 Solving a System of Dependent Equations with Three Variables

Solve the system.
$$\begin{aligned} x - 4y + 7z &= 14 \\ -2x + 9y - 16z &= -31 \\ x - 7y + 13z &= 23 \end{aligned}$$

Solution:

$$\begin{aligned} x - 4y + 7z &= 14 \\ -2x + 9y - 16z &= -31 \\ x - 7y + 13z &= 23 \end{aligned} \qquad \left[\begin{array}{rrr|r} 1 & -4 & 7 & 14 \\ -2 & 9 & -16 & -31 \\ 1 & -7 & 13 & 23 \end{array}\right]$$

Set up the augmented matrix.

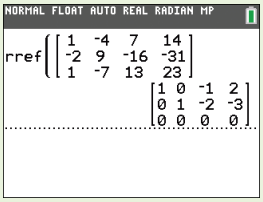
$$\begin{array}{l} 2R_1 + R_2 \to R_2 \\ -R_1 + R_3 \to R_3 \end{array} \left[\begin{array}{rrr|r} 1 & -4 & 7 & 14 \\ 0 & 1 & -2 & -3 \\ 0 & -3 & 6 & 9 \end{array}\right] \begin{array}{l} 4R_2 + R_1 \to R_1 \\ 3R_2 + R_3 \to R_3 \end{array} \left[\begin{array}{rrr|r} 1 & 0 & -1 & 2 \\ 0 & 1 & -2 & -3 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

The last row of the matrix cannot be written with a leading 1 along the main diagonal. The last row represents an identity, $0 = 0$.

$$\left[\begin{array}{rrr|r} 1 & 0 & -1 & 2 \\ 0 & 1 & -2 & -3 \\ 0 & 0 & 0 & 0 \end{array}\right] \xrightarrow[\text{system}]{\text{equivalent}} \begin{cases} x - z = 2 \\ y - 2z = -3 \\ 0 = 0 \end{cases}$$

The system of three equations and three variables reduces to a system of two equations and three variables. The third equation, $0 = 0$, is true regardless of the values of x, y, and z. The top two equations each represent a plane in space. Furthermore, two nonparallel planes intersect in a line. All points on the line are solutions to the system, indicating that there are infinitely many solutions.

TIP A graphing utility can also be used to find the reduced row-echelon form of a system of dependent equations.



TIP In Example 3, we can also write the solution set by using a parameter. By choosing any real number t for z, we have:

$\{(t + 2, 2t - 3, t)\}$

Since the top two equations both contain the variable z, we can express x and y in terms of z.

$$\begin{aligned} x - z &= 2 \xrightarrow{\text{Express } x \text{ in terms of } z.} x = z + 2 \\ y - 2z &= -3 \xrightarrow{\text{Express } y \text{ in terms of } z.} y = 2z - 3 \end{aligned}$$

The solution set can be written as $\{(z + 2, 2z - 3, z) \mid z \text{ is any real number}\}$.

Skill Practice 3 Solve the system.

$$\begin{aligned} -4x - 11y + 3z &= -24 \\ x + 3y - z &= 7 \\ 3x + 11y - 5z &= 29 \end{aligned}$$

We can verify the solution to Example 3, by substituting $(z + 2, 2z - 3, z)$ back into each original equation.

$$\begin{aligned} x - 4y + 7z = 14 &\longrightarrow (z + 2) - 4(2z - 3) + 7z \stackrel{?}{=} 14 \longrightarrow 14 = 14 \checkmark \\ -2x + 9y - 16z = -31 &\longrightarrow -2(z + 2) + 9(2z - 3) - 16z \stackrel{?}{=} -31 \longrightarrow -31 = -31 \checkmark \\ x - 7y + 13z = 23 &\longrightarrow (z + 2) - 7(2z - 3) + 13z \stackrel{?}{=} 23 \longrightarrow 23 = 23 \checkmark \end{aligned}$$

In Example 3, the solution set $\{(z + 2, 2z - 3, z) \mid z \text{ is any real number}\}$ is the general solution representing an infinite number of ordered triples. To find individual solutions, substitute arbitrary real numbers for z, and construct the corresponding ordered triple. For example:

Choose z Arbitrarily	$(z + 2, 2z - 3, z)$	Solution
If $z = 1$	$(1 + 2, 2(1) - 3, 1)$	$(3, -1, 1)$
If $z = 2$	$(2 + 2, 2(2) - 3, 2)$	$(4, 1, 2)$
If $z = 3$	$(3 + 2, 2(3) - 3, 3)$	$(5, 3, 3)$
If $z = -1$	$(-1 + 2, 2(-1) - 3, -1)$	$(1, -5, -1)$

A system of linear equations that has the same number of equations as variables is called a **square system.** In Example 3, we were presented with three equations and three variables in the original system. However, after writing the augmented matrix in row-echelon form, we see that the system reduces to a system of two equations and three variables. A system of linear equations cannot have a unique solution unless there are at least the same number of equations as variables.

In Example 4, we investigate a nonsquare system that has fewer equations than variables.

EXAMPLE 4 Solving a System with Fewer Equations than Variables

Solve the system.

$$\begin{aligned} 3x - 8y + 18z &= 15 \\ x - 3y + 4z &= 6 \end{aligned}$$

Solution:

The two given equations each represent a plane in space. By finding the row-echelon form of the augmented matrix, we can determine the geometrical relationship between the planes.

- If we encounter a contradiction, then the system has no solution and the planes are parallel.
- If we encounter an identity, such as $0 = 0$, then the two equations must represent the same plane.
- Otherwise, the planes must meet in a line.

Answer

3. $\{(-2z - 5, z + 4, z) \mid z \text{ is any real number}\}$

ISTUDY

$$\begin{array}{l} 3x - 8y + 18z = 15 \\ x - 3y + 4z = 6 \end{array} \longrightarrow \left[\begin{array}{ccc|c} 3 & -8 & 18 & 15 \\ 1 & -3 & 4 & 6 \end{array}\right] \qquad R_1 \Leftrightarrow R_2 \longrightarrow \left[\begin{array}{ccc|c} 1 & -3 & 4 & 6 \\ 3 & -8 & 18 & 15 \end{array}\right]$$

$$\xrightarrow{-3R_1 + R_2 \to R_2} \left[\begin{array}{ccc|c} 1 & -3 & 4 & 6 \\ 0 & 1 & 6 & -3 \end{array}\right] \xrightarrow{3R_2 + R_1 \to R_1} \left[\begin{array}{ccc|c} 1 & 0 & 22 & -3 \\ 0 & 1 & 6 & -3 \end{array}\right]$$

The augmented matrix is in reduced row-echelon form. $\left[\begin{array}{ccc|c} 1 & 0 & 22 & -3 \\ 0 & 1 & 6 & -3 \end{array}\right] \longrightarrow \begin{cases} x + 22z = -3 \\ y + 6z = -3 \end{cases}$

The system did not reduce to a contradiction or an identity. Therefore, the two planes must intersect in a line and there must be infinitely many solutions.

To write the general solution, write x and y in terms of z.

$$\begin{array}{l} x + 22z = -3 \xrightarrow{\text{Express } x \text{ in terms of } z.} x = -22z - 3 \\ y + 6z = -3 \xrightarrow[\text{Express } y \text{ in terms of } z.]{} y = -6z - 3 \end{array}$$

The solution set is $\{(-22z - 3, -6z - 3, z) \mid z \text{ is any real number}\}$.

TIP In parametric form, the solution to Example 4 is given by:

$\{(-22t - 3, -6t - 3, t)\}$

Skill Practice 4 Solve the system. $\begin{array}{l} x - 3y - 17z = -17 \\ -2x + 7y + 38z = 40 \end{array}$

In Example 5, we investigate a situation in which the solution set to a system of three variables and three equations consists of all points on a common plane in space.

EXAMPLE 5 Solving a System of Dependent Equations Representing the Same Plane

Solve the system. $\begin{array}{l} x + 2y + 3z = 6 \\ -x - 2y - 3z = -6 \\ 2x + 4y + 6z = 12 \end{array}$

Solution:

$\begin{array}{ll} \boxed{A} & x + 2y + 3z = 6 \\ \boxed{B} & -x - 2y - 3z = -6 \\ \boxed{C} & 2x + 4y + 6z = 12 \end{array}$

Upon inspection, you might notice that each equation is a constant multiple of the others. That is, equation B is –1 times equation A. Equation C is 2 times equation A. This means that equations A, B, and C represent the same plane in space.

$$\left[\begin{array}{ccc|c} 1 & 2 & 3 & 6 \\ -1 & -2 & -3 & -6 \\ 2 & 4 & 6 & 12 \end{array}\right] \begin{array}{l} \xrightarrow{R_1 + R_2 \to R_2} \\ \xrightarrow{-2R_1 + R_3 \to R_3} \end{array} \left[\begin{array}{ccc|c} 1 & 2 & 3 & 6 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

The reduced row-echelon form tells us that the system reduces to an equivalent system of one equation with three variables.

The system is equivalent to the single equation $x + 2y + 3z = 6$ and the solution set is the set of all ordered triples that satisfy this equation. Since we have one unique relationship among three variables, one variable is dependent on the other two variables. Letting two variables be arbitrary real numbers, the common equation defines the value of the third variable. For example, solving the equation $x + 2y + 3z = 6$ for x yields: $x = 6 - 2y - 3z$.

The solution set is $\{(6 - 2y - 3z, y, z) \mid y \text{ and } z \text{ are any real numbers}\}$.

Alternatively, the solution set can be expressed as $\{(x, y, z) \mid x + 2y + 3z = 6\}$.

TIP The solution to Example 5 tells us that $x = 6 - 2y - 3z$. That is, x depends on both y and z. If we write the solution set in parametric form, we would need *two* parameters.

$\{(6 - 2s - 3t, s, t)\}$

Answer

4. $\{(5z + 1, -4z + 6, z) \mid z \text{ is any real number}\}$

ISTUDY

Skill Practice 5 Solve the system.

$$\begin{aligned} 2x - 3y + 5z &= 3 \\ 4x - 6y + 10z &= 6 \\ 20x - 30y + 50z &= 30 \end{aligned}$$

3. Solve Applications of Systems of Equations

A city planner can study the flow of traffic through a network of streets by measuring the flow rates (number of vehicles per unit time) at various points. For traffic to flow freely, we use the principle that the flow rate into an intersection is equal to the flow rate out of the intersection. This must be true for all intersections in the network.

Point of Interest

The principle of equal flow rates into and out of a junction applies to many applications of networks, including communications systems, water systems, and even the circulatory system in the human body.

EXAMPLE 6 Solving an Application Involving Dependent Equations

Consider the network of four one-way streets shown in Figure 10-5. In the figure, x_1, x_2, x_3, and x_4 indicate flow rates (in vehicles per hour) along the stretches of roads AB, BC, CD, and DA, respectively. The other numbers in the figure indicate other flow rates moving into and out of intersections A, B, C, and D.

a. Set up a system of equations that represents traffic flowing freely.

b. Write the augmented matrix for the system of equations in reduced row-echelon form.

c. If the traffic between intersections D and A is 260 vehicles per hour, determine the flow rates x_1, x_2, and x_3.

d. If the traffic between intersections D and A is between 250 and 300 vehicles per hour, inclusive, determine the flow rates x_1, x_2, and x_3.

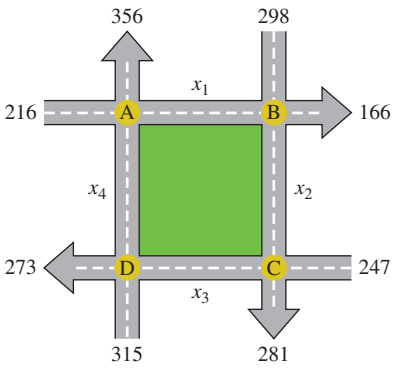


Figure 10-5

Solution:

a.

Intersection	Flow in	=	Flow out
A	$216 + x_4$	=	$356 + x_1$
B	$298 + x_1$	=	$166 + x_2$
C	$x_2 + 247$	=	$281 + x_3$
D	$x_3 + 315$	=	$273 + x_4$

The number of cars flowing into each intersection must equal the number of cars leaving the intersection for traffic to flow freely.

b.

$$\left.\begin{aligned} -x_1 \qquad\quad + x_4 &= 140 \\ x_1 - x_2 \qquad\quad &= -132 \\ x_2 - x_3 \qquad\quad &= 34 \\ x_3 - x_4 &= -42 \end{aligned}\right\} \rightarrow \left[\begin{array}{cccc|c} -1 & 0 & 0 & 1 & 140 \\ 1 & -1 & 0 & 0 & -132 \\ 0 & 1 & -1 & 0 & 34 \\ 0 & 0 & 1 & -1 & -42 \end{array}\right]$$

Write the equations in standard form. Set up the augmented matrix.

Answer

5. $\left\{\left(\frac{3 + 3y - 5z}{2}, y, z\right) \middle| \begin{array}{l} y \text{ and } z \\ \text{are any real numbers} \end{array}\right\}$ or $\{(x, y, z) \mid 2x - 3y + 5z = 3\}$

ISTUDY

$$\xrightarrow{-1R_1 \to R_1} \left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & -140 \\ 1 & -1 & 0 & 0 & -132 \\ 0 & 1 & -1 & 0 & 34 \\ 0 & 0 & 1 & -1 & -42 \end{array}\right] \xrightarrow{-1R_1 + R_2 \to R_2} \left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & -140 \\ 0 & -1 & 0 & 1 & 8 \\ 0 & 1 & -1 & 0 & 34 \\ 0 & 0 & 1 & -1 & -42 \end{array}\right]$$

$$\xrightarrow{-1R_2 \to R_2} \left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & -140 \\ 0 & 1 & 0 & -1 & -8 \\ 0 & 1 & -1 & 0 & 34 \\ 0 & 0 & 1 & -1 & -42 \end{array}\right] \xrightarrow{-1R_2 + R_3 \to R_3} \left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & -140 \\ 0 & 1 & 0 & -1 & -8 \\ 0 & 0 & -1 & 1 & 42 \\ 0 & 0 & 1 & -1 & -42 \end{array}\right]$$

$$\xrightarrow{-1R_3 \to R_3} \left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & -140 \\ 0 & 1 & 0 & -1 & -8 \\ 0 & 0 & 1 & -1 & -42 \\ 0 & 0 & 1 & -1 & -42 \end{array}\right] \xrightarrow{-1R_3 + R_4 \to R_4} \left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & -140 \\ 0 & 1 & 0 & -1 & -8 \\ 0 & 0 & 1 & -1 & -42 \\ 0 & 0 & 0 & 0 & 0 \end{array}\right]$$

c. From the reduced row-echelon form, we see that the flow rates x_1, x_2, and x_3 can all be expressed in terms of the flow rate x_4.

$$\left[\begin{array}{cccc|c} 1 & 0 & 0 & -1 & -140 \\ 0 & 1 & 0 & -1 & -8 \\ 0 & 0 & 1 & -1 & -42 \\ 0 & 0 & 0 & 0 & 0 \end{array}\right] \begin{array}{l} \longrightarrow x_1 - x_4 = -140 \longrightarrow x_1 = x_4 - 140 \\ \longrightarrow x_2 - x_4 = -8 \longrightarrow x_2 = x_4 - 8 \\ \longrightarrow x_3 - x_4 = -42 \longrightarrow x_3 = x_4 - 42 \end{array}$$

If x_4 is 260 vehicles per hour, we have the following values for x_1, x_2, and x_3.

Flow rate between A and B: $x_1 = 260 - 140 \longrightarrow x_1 = 120$ vehicles per hour
Flow rate between B and C: $x_2 = 260 - 8 \longrightarrow x_2 = 252$ vehicles per hour
Flow rate between C and D: $x_3 = 260 - 42 \longrightarrow x_3 = 218$ vehicles per hour

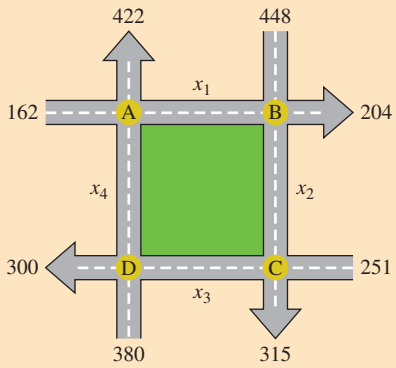
d. If the traffic flow between intersections D and A is given by $250 \le x_4 \le 300$, we can solve the following inequalities to determine the flow rates x_1, x_2, and x_3.

$$\begin{array}{l} 250 \le x_1 + 140 \le 300 \longrightarrow 110 \le x_1 \le 160 \\ 250 \le x_2 + 8 \le 300 \longrightarrow 242 \le x_2 \le 292 \\ 250 \le x_3 + 42 \le 300 \longrightarrow 208 \le x_3 \le 258 \end{array}$$

Skill Practice 6 Refer to the figure. Assume that traffic flows freely with flow rates given in vehicles per hour.

a. If the traffic between intersections D and A is 400 vehicles per hour, determine the flow rates x_1, x_2, and x_3.

b. If the traffic between intersections D and A is between 380 and 420 vehicles per hour, determine the flow rates x_1, x_2, and x_3.



Answers

6. a. $x_1 = 140$, $x_2 = 384$, and $x_3 = 320$
b. $120 \le x_1 \le 160$, $364 \le x_2 \le 404$, $300 \le x_3 \le 340$

SECTION 10.2 Practice Exercises

Prerequisite Review

For Exercises R.1–R.2, solve for the indicated variable.

R.1. $5x + y = -18$ for y

R.2. $3x - y = -8$ for x

For Exercises R.3–R.4, determine whether the graph of the equation is symmetric with respect to the x-axis or y-axis.

R.3. $y = -|x| - 6$

R.4. $x = y^2 + 7$

Concept Connections

1. True or false? A system of linear equations in three variables may have no solution.

2. True or false? A system of linear equations in three variables may have exactly one solution.

3. True or false? A system of linear equations in three variables may have exactly two solutions.

4. True or false? A system of linear equations in three variables may have infinitely many solutions.

5. If a system of linear equations has no solution, then the system is said to be _____.

6. If a system of linear equations has infinitely many solutions, then the equations are said to be _____.

Objectives 1–2: Identify Inconsistent Systems and Solve Systems with Dependent Equations

For Exercises 7–14, an augmented matrix is given. Determine the number of solutions to the corresponding system of equations.

7. $\left[\begin{array}{cc|c} 1 & 2 & 4 \\ 0 & 0 & 5 \end{array}\right]$

8. $\left[\begin{array}{ccc|c} 1 & 0 & 2 & 5 \\ 0 & 1 & 4 & -2 \\ 0 & 0 & 0 & -1 \end{array}\right]$

9. $\left[\begin{array}{ccc|c} 1 & 0 & 4 & 3 \\ 0 & 1 & -1 & 6 \\ 0 & 0 & 0 & 0 \end{array}\right]$

10. $\left[\begin{array}{cc|c} 1 & 3 & 5 \\ 0 & 0 & 0 \end{array}\right]$

11. $\left[\begin{array}{ccc|c} 1 & 0 & 0 & -3 \\ 0 & 1 & 0 & 4 \\ 0 & 0 & 1 & 0 \end{array}\right]$

12. $\left[\begin{array}{cc|c} 1 & 0 & 3 \\ 0 & 1 & 0 \end{array}\right]$

13. $\left[\begin{array}{ccc|c} 1 & 2 & 5 & -1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$

14. $\left[\begin{array}{ccc|c} 1 & 0 & 6 & 7 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$

For Exercises 15–18, determine the solution set for the system represented by each augmented matrix.

15. a. $\left[\begin{array}{cc|c} 1 & 2 & 5 \\ 0 & 1 & 0 \end{array}\right]$ **b.** $\left[\begin{array}{cc|c} 1 & 2 & 5 \\ 0 & 0 & 0 \end{array}\right]$ **c.** $\left[\begin{array}{cc|c} 1 & 2 & 5 \\ 0 & 0 & 1 \end{array}\right]$

16. a. $\left[\begin{array}{cc|c} 1 & 3 & -4 \\ 0 & 1 & 1 \end{array}\right]$ **b.** $\left[\begin{array}{cc|c} 1 & 3 & -4 \\ 0 & 0 & 1 \end{array}\right]$ **c.** $\left[\begin{array}{cc|c} 1 & 3 & -4 \\ 0 & 0 & 0 \end{array}\right]$

17. a. $\left[\begin{array}{ccc|c} 1 & 0 & 6 & 3 \\ 0 & 1 & 4 & 5 \\ 0 & 0 & 1 & 0 \end{array}\right]$ **b.** $\left[\begin{array}{ccc|c} 1 & 0 & 6 & 3 \\ 0 & 1 & 4 & 5 \\ 0 & 0 & 0 & 1 \end{array}\right]$ **c.** $\left[\begin{array}{ccc|c} 1 & 0 & 6 & 3 \\ 0 & 1 & 4 & 5 \\ 0 & 0 & 0 & 0 \end{array}\right]$

18. a. $\left[\begin{array}{ccc|c} 1 & 0 & -2 & 3 \\ 0 & 1 & 3 & 5 \\ 0 & 0 & 1 & 1 \end{array}\right]$ **b.** $\left[\begin{array}{ccc|c} 1 & 0 & -2 & 3 \\ 0 & 1 & 3 & 5 \\ 0 & 0 & 0 & 0 \end{array}\right]$ **c.** $\left[\begin{array}{ccc|c} 1 & 0 & -2 & 3 \\ 0 & 1 & 3 & 5 \\ 0 & 0 & 0 & 1 \end{array}\right]$

For Exercises 19–38, solve the system by using Gaussian elimination or Gauss-Jordan elimination. (See Examples 1–5)

19.
$$\begin{aligned} 2x + 4y &= 5 \\ x + 2y &= 4 \end{aligned}$$

20.
$$\begin{aligned} 4x + 16y &= 21 \\ x + 4y &= -1 \end{aligned}$$

21.
$$\begin{aligned} 2x + 7y &= 10 \\ \tfrac{1}{5}x &= 1 - \tfrac{7}{10}y \end{aligned}$$

22.
$$\begin{aligned} 4x - 3y &= 6 \\ y &= \tfrac{4}{3}x - 2 \end{aligned}$$

23.
$$\begin{aligned} x - 3y + 14z &= -9 \\ -2x + 7y - 31z &= 21 \\ x - 5y + 20z &= -14 \end{aligned}$$

24.
$$\begin{aligned} x - 3y + 17z &= 1 \\ x - y + 7z &= 2 \\ 2x - 5y + 29z &= 5 \end{aligned}$$

ISTUDY

25. $5x + 7y - 11z = 45$
$3x + 5y - 9z = 23$
$x + y - z = 11$

26. $x + 3y + 9z = 12$
$2x + 7y + 22z = 26$
$-5x - 17y - 53z = -64$

27. $2x = 5y - 16z + 40$
$2(x + y) = 4z$
$x - 2y + 7z = 18$

28. $x = 2y + 4z + 5$
$y - 4 = -3z$
$5(x - y) - 9z = 4x - 7$

29. $2x - 5y - 20z = -24$
$x - 3y - 11z = -15$

30. $2x - y - 5z = -3$
$x - 2y - 7z = -12$

31. $2x + 3y + 4z = 12$
$-4x - 6y - 8z = -24$
$x + 1.5y + 2z = 6$

32. $-x + 2y + 7z = 14$
$10x - 20y - 70z = -140$
$-\frac{1}{7}x + \frac{2}{7}y + z = 2$

33. $2x - 3y + 9z = -2$
$x = 5y - 8z - 15$
$3(x - y) + 6z = 2x - 7$

34. $3x + 11y - 3z = -13$
$x + y = z - 15$
$3(x + y) = z + 2x - 7$

35. $-5x + 12y - 20z = -11$
$x + 4z = 3y + 1$

36. $x = 4y + 20z - 1$
$-2x + 5y + 25z = -1$

37. $x_1 - 3x_2 + 9x_3 - 14x_4 = 32$
$x_2 - 3x_3 + 6x_4 = -10$
$x_2 - x_3 + 2x_4 = -4$
$x_1 - 2x_2 + 8x_3 - 12x_4 = 24$

38. $x_1 - 3x_3 - 12x_4 = -15$
$x_2 + x_3 + 6x_4 = 8$
$x_2 - 2x_3 - 6x_4 = -7$
$-2x_1 + 4x_3 + 16x_4 = 22$

For Exercises 39–40, the solution set to a system of dependent equations is given. Write the specific solutions corresponding to the given values of z.

39. $\{(2z + 1, z - 4, z) | z \text{ is any real number}\}$
a. $z = 1$ **b.** $z = 4$ **c.** $z = -2$

40. $\{(z + 5, 3z - 2, z) | z \text{ is any real number}\}$
a. $z = -3$ **b.** $z = 1$ **c.** $z = 0$

For Exercises 41–44, the solution set to a system of dependent equations is given. Write three ordered triples that are solutions to the system. Answers may vary.

41. $\{(4z, 6 - z, z) | z \text{ is any real number}\}$

42. $\{(2z, z - 3, z) | z \text{ is any real number}\}$

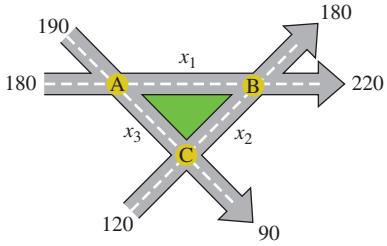
43. $\left\{\left(\frac{6 - 3y - 6z}{2}, y, z\right) \middle| y \text{ and } z \text{ are any real numbers}\right\}$

44. $\{(4y + 2z - 20, y, z) | y \text{ and } z \text{ are any real numbers}\}$

Objective 3: Solve Applications of Systems of Equations

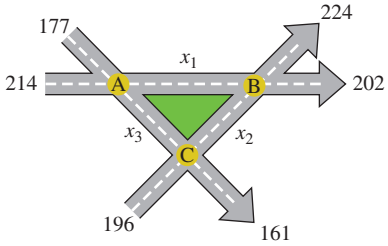
For Exercises 45–48, assume that traffic flows freely through the intersections A, B, C, and D. The values x_1, x_2, x_3, and x_4 and the other numbers in the figures represent flow rates in vehicles per hour. (See Example 6)

45.



a. Write an equation representing equal flow into and out of intersection A.
b. Write an equation representing equal flow into and out of intersection B.
c. Write an equation representing equal flow into and out of intersection C.
d. Write the system of equations from parts (a)–(c) in standard form.
e. Write the reduced row-echelon form of the augmented matrix representing the system of equations from part (d).
f. If the flow rate between intersections A and C is 120 vehicles per hour, determine the flow rates x_1 and x_2.
g. If the flow rate between intersections A and C is between 100 and 150 vehicles per hour, inclusive, determine the flow rates x_1 and x_2.

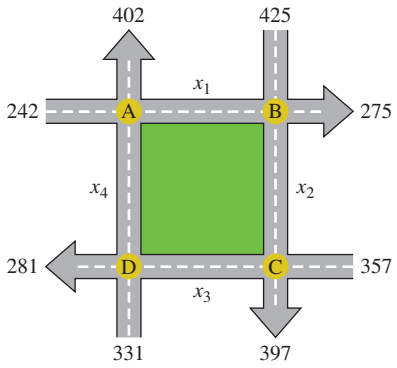
46.



a. Write an equation representing equal flow into and out of intersection A.
b. Write an equation representing equal flow into and out of intersection B.
c. Write an equation representing equal flow into and out of intersection C.
d. Write the system of equations from parts (a)–(c) in standard form.
e. Write the reduced row-echelon form of the augmented matrix representing the system of equations in part (d).
f. If the flow rate between intersections A and C is 156 vehicles per hour, determine the flow rates x_1 and x_2.
g. If the flow rate between intersections A and C is between 100 and 200 vehicles per hour, inclusive, determine the flow rates x_1 and x_2.

ISTUDY

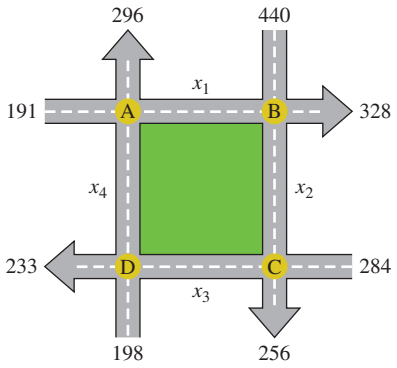
47.



a. Assume that traffic flows at a rate of 220 vehicles per hour on the stretch of road between intersections D and A. Find the flow rates x_1, x_2, and x_3.

b. If traffic flows at a rate of between 200 and 250 vehicles per hour inclusive between intersections D and A, find the flow rates x_1, x_2, and x_3.

48.



a. Assume that traffic flows at a rate of 180 vehicles per hour on the stretch of road between intersections D and A. Find the flow rates x_1, x_2, and x_3.

b. If traffic flows at a rate of between 150 and 200 vehicles per hour inclusive between intersections D and A, find the flow rates x_1, x_2, and x_3.

49. An accountant checks the reported earnings for a theater for three nightly performances against the number of tickets sold.

Night	Children Tickets	Student Tickets	General Admission	Total Revenue
1	80	400	480	$9280
2	50	350	400	$7800
3	75	525	600	$10,500

a. Let x, y, and z represent the cost for children tickets, student tickets, and general admission tickets, respectively. Set up a system of equations to solve for x, y, and z.

b. Set up the augmented matrix for the system and solve the system. (*Hint*: To make the augmented matrix simpler to work with, consider dividing each linear equation by an appropriate constant.)

c. Explain why the auditor knows that there was an error in the record keeping.

50. A concession stand at a city park sells hamburgers, hot dogs, and drinks. Three patrons buy the following food and drink combinations for the following prices.

Patron	Hamburgers	Hot Dogs	Drinks	Total Revenue
1	1	1	5	$11
2	0	1	2	$5
3	3	1	11	$22

a. Let x, y, and z represent the cost for a hamburger, a hot dog, and a drink, respectively. Set up a system of equations to solve for x, y, and z.

b. Set up the augmented matrix for the system and solve the system.

c. Explain why the concession stand manager knows that there was an error in the record keeping.

Mixed Exercises

51. The solution set to Exercise 25 is $\{(-2z + 16, 3z - 5, z) | z \text{ is any real number}\}$. Verify the solution by substituting the ordered triple into each individual equation.

52. The solution set to Exercise 26 is $\{(3z + 6, -4z + 2, z) | z \text{ is any real number}\}$. Verify the solution by substituting the ordered triple into each individual equation.

The systems in Exercises 53–56 are called homogeneous systems because each has (0, 0, 0) as a solution. However, if a system is made up of dependent equations, it will have infinitely many more solutions. For each system, determine whether (0, 0, 0) is the only solution or if the system has infinitely many solutions. If the system has infinitely many solutions, give the solution set.

53.
$$\begin{aligned} x + 2y - 8z &= 0 \\ -5x - 11y + 43z &= 0 \\ x + 5y - 12z &= 0 \end{aligned}$$

54.
$$\begin{aligned} x - 2y - 7z &= 0 \\ -3x + 8y + 31z &= 0 \\ -2x + 5y + 22z &= 0 \end{aligned}$$

55.
$$\begin{aligned} x - 5y + 13z &= 0 \\ -3x + 17y - 45z &= 0 \\ x - 4y + 10z &= 0 \end{aligned}$$

56.
$$\begin{aligned} -2x + 15y - 83z &= 0 \\ x - 7y + 39z &= 0 \\ x - 5y + 29z &= 0 \end{aligned}$$

SECTION 10.3 Operations on Matrices

OBJECTIVES

1. Determine the Order of a Matrix
2. Add and Subtract Matrices
3. Multiply a Matrix by a Scalar
4. Multiply Matrices
5. Apply Operations on Matrices

1. Determine the Order of a Matrix

We have seen how the manipulation of an augmented matrix can be used to solve a system of linear equations. Matrices have many other useful mathematical applications, particularly when manipulating tables or databases. In particular, matrices play a useful role in digital photography, film, and computer animation.

Jeffrey Coolidge/Photodisc/Getty Images; Clark Dunbar/Digital Stock/Corbis

The **order of a matrix** is determined by the number of rows and number of columns. A matrix with m rows and n columns is an $m \times n$ matrix (read as "m by n" matrix).

EXAMPLE 1 Determining the Order of a Matrix

Determine the order of each matrix.

a. $\begin{bmatrix} 3 & \pi & 1.7 \\ -1 & 6 & 10 \end{bmatrix}$ **b.** $\begin{bmatrix} -7 \\ 2 \\ 4 \\ \sqrt{2} \end{bmatrix}$ **c.** $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ **d.** $\begin{bmatrix} x & y & z \end{bmatrix}$

Solution:

a. The matrix has 2 rows and 3 columns. Therefore, it is a 2×3 matrix.

b. The matrix has 4 rows and 1 column. Therefore, it is a 4×1 matrix. A matrix with only 1 column is called a **column matrix.**

c. The matrix has 3 rows and 3 columns. Therefore, it is a 3×3 matrix. A matrix with the same number of rows and columns is called a **square matrix.**

d. The matrix has 1 row and 3 columns. Therefore, it is a 1×3 matrix. A matrix with only 1 row is called a **row matrix.**

Skill Practice 1 Determine the order of each matrix.

a. $\begin{bmatrix} -9 & 2 \\ 4.1 & -3 \\ \sqrt{3} & 4 \end{bmatrix}$ **b.** $\begin{bmatrix} -4 \\ 11 \end{bmatrix}$ **c.** $\begin{bmatrix} -0.1 & 0.4 \\ 0.5 & 0.2 \end{bmatrix}$ **d.** $\begin{bmatrix} 105 & 311 \end{bmatrix}$

TIP The notation $[a_{ij}]$ is a generic way to denote a matrix with elements of the form a_{ij}, where i and j represent generic row and column numbers.

A matrix can be represented generically as follows:

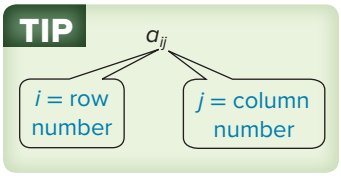
$$[a_{ij}] = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & & & \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix}$$

Using the double subscript notation, a_{43} represents the element in the 4th row, 3rd column. The notation a_{ij} represents the element in the ith row, jth column.

EXAMPLE 2 Using Matrix Notation

Consider $A = \begin{bmatrix} -4 & 5 & \sqrt{2} & -\pi \\ 10 & \frac{1}{2} & 0 & 6 \\ -\frac{7}{6} & 8 & 12 & -9 \end{bmatrix}$, where $A = [a_{ij}]$. Determine the value of each element.

a. a_{32} **b.** a_{23} **c.** a_{14}



Solution:

a. a_{32} represents the element in the 3rd row, 2nd column: 8

b. a_{23} represents the element in the 2nd row, 3rd column: 0

c. a_{14} represents the element in the 1st row, 4th column: $-\pi$

Skill Practice 2 Given matrix A from Example 2, determine the value of each element.

a. a_{13} **b.** a_{31} **c.** a_{34}

Answers

1. a. 3×2 **b.** 2×1 **c.** 2×2 **d.** 1×2

2. a. $\sqrt{2}$ **b.** $-\frac{7}{6}$ **c.** -9

ISTUDY

2. Add and Subtract Matrices

We now consider the conditions under which two matrices are equal.

Equality of Matrices

Two matrices are equal if and only if they have the same order and if their corresponding elements are equal.

Example:

- The statement $\begin{bmatrix} 3 & -4 \\ x & z \end{bmatrix} = \begin{bmatrix} 3 & y \\ 9 & 7 \end{bmatrix}$ implies that $x = 9$, $y = -4$, and $z = 7$.
- Conversely, if $x = 9$, $y = -4$, and $z = 7$, then $\begin{bmatrix} 3 & -4 \\ x & z \end{bmatrix} = \begin{bmatrix} 3 & y \\ 9 & 7 \end{bmatrix}$.

Next, we define addition and subtraction of matrices.

Addition and Subtraction of Matrices

Let $A = [a_{ij}]$ and $B = [b_{ij}]$ be m by n matrices. Then,

$$A + B = [a_{ij} + b_{ij}] \text{ for } i = 1, 2, \ldots, m \text{ and } j = 1, 2, \ldots, n$$
$$A - B = [a_{ij} - b_{ij}] \text{ for } i = 1, 2, \ldots, m \text{ and } j = 1, 2, \ldots, n$$

That is, to add or subtract two matrices, the matrices must have the same order, and the sum or difference is found by adding or subtracting the corresponding elements.

EXAMPLE 3 Adding and Subtracting Matrices

Given $A = \begin{bmatrix} 3 & -7 & 0 \\ 1 & \frac{4}{3} & -6 \end{bmatrix}$, $B = \begin{bmatrix} 8 & -3 & 4 \\ 0 & 1 & -9 \end{bmatrix}$, and $C = \begin{bmatrix} 3 & -5 \\ 4 & 18 \end{bmatrix}$, find the sum or difference if possible.

a. $A + B$ **b.** $B - A$ **c.** $A + C$

Solution:

a. $A + B = \begin{bmatrix} 3 & -7 & 0 \\ 1 & \frac{4}{3} & -6 \end{bmatrix} + \begin{bmatrix} 8 & -3 & 4 \\ 0 & 1 & -9 \end{bmatrix}$

Matrix A and matrix B both have the same order (2×3), so the sum is defined.

$= \begin{bmatrix} 3+8 & -7+(-3) & 0+4 \\ 1+0 & \frac{4}{3}+1 & -6+(-9) \end{bmatrix}$

Add the elements in the corresponding positions.

$= \begin{bmatrix} 11 & -10 & 4 \\ 1 & \frac{7}{3} & -15 \end{bmatrix}$

Simplify.

b. $B - A = \begin{bmatrix} 8 & -3 & 4 \\ 0 & 1 & -9 \end{bmatrix} - \begin{bmatrix} 3 & -7 & 0 \\ 1 & \frac{4}{3} & -6 \end{bmatrix}$

Matrix A and matrix B both have the same order (2×3), so the difference is defined.

$= \begin{bmatrix} 8-3 & -3-(-7) & 4-0 \\ 0-1 & 1-\frac{4}{3} & -9-(-6) \end{bmatrix}$

Subtract the elements in the corresponding positions.

$= \begin{bmatrix} 5 & 4 & 4 \\ -1 & -\frac{1}{3} & -3 \end{bmatrix}$

Simplify.

ISTUDY

c. Matrix A is a 2×3 matrix, whereas matrix C is a 2×2 matrix. The matrices are of different orders and therefore cannot be added or subtracted.

Skill Practice 3 Given $A = \begin{bmatrix} 3 & 4 & -7 \\ 9 & 2 & 0 \end{bmatrix}$, $B = \begin{bmatrix} -8 & 0 \\ 1 & 5 \\ -4 & \frac{1}{2} \end{bmatrix}$, and $C = \begin{bmatrix} 4 & -5 \\ 12 & 3 \\ -2 & 2 \end{bmatrix}$, find the sum or difference if possible.

a. $A + B$ **b.** $B + C$ **c.** $C - B$

The opposite of a real number a is $-a$. The value $-a$ is also called the additive inverse of a. A matrix A also has an additive inverse, denoted by $-A$.

Additive Inverse of a Matrix

Given $A = [a_{ij}]$, the **additive inverse of A,** denoted by $-A$, is $-A = [-a_{ij}]$.

Verbal Interpretation	Example
The additive inverse of a matrix is found by taking the opposite of each element in the matrix.	Given $A = \begin{bmatrix} -4 & 5 & -1 \\ 0 & -3 & 2 \end{bmatrix}$, $-A = \begin{bmatrix} 4 & -5 & 1 \\ 0 & 3 & -2 \end{bmatrix}$.

The number 0 is the identity element under the addition of real numbers because $a + (-a) = 0$. A matrix in which all elements are zero is called a **zero matrix** and is denoted by 0. The sum of a matrix A and its additive inverse $-A$ is the zero matrix of the same order. For example,

$$\begin{matrix} A & + & (-A) & = & 0 \end{matrix}$$

$$\begin{bmatrix} -4 & 5 & -1 \\ 0 & -3 & 2 \end{bmatrix} + \begin{bmatrix} 4 & -5 & 1 \\ 0 & 3 & -2 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

2×3 zero matrix

Properties of Matrix Addition

Let A, B, and C be matrices of order $m \times n$, and let 0 be the zero matrix of order $m \times n$. Then,

1. $A + B = B + A$	Commutative property of matrix addition
2. $A + (B + C) = (A + B) + C$	Associative property of matrix addition
3. $A + (-A) = 0$	Inverse property of matrix addition
4. $A + 0 = 0 + A = A$	Identity property of matrix addition

Answers

3. a. Not possible

b. $\begin{bmatrix} -4 & -5 \\ 13 & 8 \\ -6 & \frac{5}{2} \end{bmatrix}$

c. $\begin{bmatrix} 12 & -5 \\ 11 & -2 \\ 2 & \frac{3}{2} \end{bmatrix}$

3. Multiply a Matrix by a Scalar

Next we look at the product of a real number k and a matrix. This is called **scalar multiplication.** The real number k is called a **scalar** to distinguish it from a matrix.

ISTUDY

Scalar Multiplication

Let $A = [a_{ij}]$ be an $m \times n$ matrix and let k be a real number. Then, $kA = [ka_{ij}]$.

Verbal Interpretation	Example
To multiply a matrix A by a scalar k, multiply each element in the matrix by k.	Given $A = \begin{bmatrix} -4 & 5 & -1 \\ 0 & -3 & 2 \end{bmatrix}$, $5A = \begin{bmatrix} -20 & 25 & -5 \\ 0 & -15 & 10 \end{bmatrix}$.

The following properties of scalar multiplication are similar to those of the multiplication of real numbers.

Properties of Scalar Multiplication

Let A and B be $m \times n$ matrices and let c and d be real numbers. Then,

1. $c(A + B) = cA + cB$ Distributive property of scalar multiplication
2. $(c + d)A = cA + dA$ Distributive property of scalar multiplication
3. $c(dA) = (cd)A$ Associative property of scalar multiplication

EXAMPLE 4 Multiplying a Matrix by a Scalar

Given $A = \begin{bmatrix} 3 & -5 \\ 0 & 1 \\ -4 & 2 \end{bmatrix}$ and $B = \begin{bmatrix} -8 & 9 \\ 4 & -1 \\ 0 & 3 \end{bmatrix}$, find $2A + 4(A + B)$.

Solution:

$$2A + 4(A + B) = 2A + 4A + 4B$$
$$= 6A + 4B$$

Apply the distributive property of scalar multiplication.

$$6A + 4B = 6\begin{bmatrix} 3 & -5 \\ 0 & 1 \\ -4 & 2 \end{bmatrix} + 4\begin{bmatrix} -8 & 9 \\ 4 & -1 \\ 0 & 3 \end{bmatrix} = \begin{bmatrix} 18 & -30 \\ 0 & 6 \\ -24 & 12 \end{bmatrix} + \begin{bmatrix} -32 & 36 \\ 16 & -4 \\ 0 & 12 \end{bmatrix}$$
$$= \begin{bmatrix} -14 & 6 \\ 16 & 2 \\ -24 & 24 \end{bmatrix}$$

Skill Practice 4 Given $A = [4 \quad -3 \quad 9]$ and $B = [-2 \quad 0 \quad 3]$, find $-5A - 2(A + B)$.

Answer

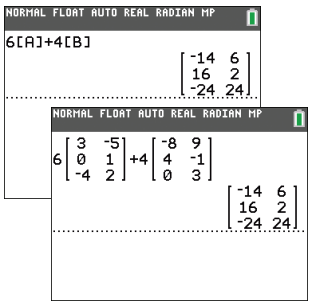
4. $[-24 \quad 21 \quad -69]$

ISTUDY

TECHNOLOGY CONNECTIONS

Adding Matrices and Multiplying a Scalar by a Matrix

Many graphing utilities have the capability to perform operations on matrices. From Example 4, we can enter matrix A and matrix B into the calculator using the EDIT feature under the MATRIX menu. Then on the home screen enter 6[A] + 4[B] and press ENTER.



Alternatively, in "MATHPRINT" mode, enter the matrices on the home screen using ALPHA F3.

As seen, many of the same properties that are true for addition and multiplication of real numbers are true for the addition of matrices and for scalar multiplication. As a result, we can solve a matrix equation involving these operations in the same way as we solve a linear equation.

EXAMPLE 5 Solving a Matrix Equation

Solve the matrix equation for X, given that $A = \begin{bmatrix} 2 & 5 \\ 1 & -4 \end{bmatrix}$ and $B = \begin{bmatrix} 6 & -1 \\ -3 & -8 \end{bmatrix}$.

$4X - A = B$

Solution:

$4X - A = B$

$4X = A + B$ Add matrix A to both sides.

$X = \frac{1}{4}(A + B)$ Perform scalar multiplication by $\frac{1}{4}$ on both sides.

$X = \frac{1}{4}\left(\begin{bmatrix} 2 & 5 \\ 1 & -4 \end{bmatrix} + \begin{bmatrix} 6 & -1 \\ -3 & -8 \end{bmatrix}\right)$ Add the matrices within parentheses.

$X = \frac{1}{4}\begin{bmatrix} 8 & 4 \\ -2 & -12 \end{bmatrix}$ Multiply the matrix by the scalar $\frac{1}{4}$.

$X = \begin{bmatrix} 2 & 1 \\ -\frac{1}{2} & -3 \end{bmatrix}$ Simplify.

TIP We can substitute matrix X back into the equation $4X - A = B$ to verify that it is a solution to the equation.

Skill Practice 5 Given $A = \begin{bmatrix} 4 & -3 \\ 1 & 11 \end{bmatrix}$ and $B = \begin{bmatrix} 2 & -1 \\ 6 & 5 \end{bmatrix}$, solve $2X + A = B$ for X.

Answer

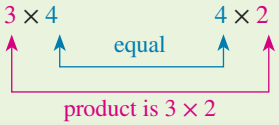
5. $X = \begin{bmatrix} -1 & 1 \\ \frac{5}{2} & -3 \end{bmatrix}$

4. Multiply Matrices

Finding the product of two matrices is more complicated than finding the product of a scalar and a matrix. We will demonstrate the process to multiply two matrices and then offer a formal definition.

Consider $A = \begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix}$ and $B = \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix}$.

TIP For matrix multiplication, the number of rows of the first matrix does not need to be equal to the number of columns of the second matrix. For example, the product of a 3×4 and a 4×2 matrix results in a 3×2 matrix.



- To multiply AB, we require that the number of columns in A be equal to the number of rows in B.
- The resulting matrix will have dimensions equal to the number of rows of A by the number of columns of B.

Matrix A Matrix B

$$\begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix} \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix}$$

2×3 3×2 must be equal

The product AB will be a 2×2 matrix.

The product will be a 2×2 matrix.

$$\begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix} \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix} = \begin{bmatrix} \square & \square \\ \square & \square \end{bmatrix}$$

To find the entry in the first row, first column of the product, multiply the corresponding elements in the first row of A by the elements in the first column of B, and take the sum.

$$\begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix} \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix} = \begin{bmatrix} 2(-1) + (-3)(10) + 1(8) & \square \\ \square & \square \end{bmatrix}$$

To find the entry in the first row, second column of the product, take the sum of the products of the corresponding elements in the first row of A and second column of B.

$$\begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix} \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix} = \begin{bmatrix} 2(-1) + (-3)(10) + 1(8) & 2(-6) + (-3)(5) + 1(-2) \\ \square & \square \end{bmatrix}$$

To find the entry in the second row, first column of the product, take the sum of the products of the corresponding elements in the second row of A and first column of B.

$$\begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix} \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix} = \begin{bmatrix} 2(-1) + (-3)(10) + 1(8) & 2(-6) + (-3)(5) + 1(-2) \\ -4(-1) + 7(10) + 0(8) & \square \end{bmatrix}$$

To find the entry in the second row, second column of the product, take the sum of the products of the corresponding elements in the second row of A and second column of B.

$$\begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix} \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix} = \begin{bmatrix} 2(-1) + (-3)(10) + 1(8) & 2(-6) + (-3)(5) + 1(-2) \\ -4(-1) + 7(10) + 0(8) & -4(-6) + 7(5) + 0(-2) \end{bmatrix}$$

Simplifying, we have

$$AB = \begin{bmatrix} 2 & -3 & 1 \\ -4 & 7 & 0 \end{bmatrix} \begin{bmatrix} -1 & -6 \\ 10 & 5 \\ 8 & -2 \end{bmatrix} = \begin{bmatrix} -24 & -29 \\ 74 & 59 \end{bmatrix}$$

From this example, note that each element in the product AB is of the form $a_1b_1 + a_2b_2 + \ldots + a_nb_n$, where the elements $a_1, a_2, \ldots a_n$ are elements in a row of A and $b_1, b_2, \ldots b_n$ are elements in a column of B. The expression $a_1b_1 + a_2b_2 + \ldots + a_nb_n$ is called an **inner product.**

ISTUDY

Matrix Multiplication

Let A be an $m \times p$ matrix and let B be a $p \times n$ matrix; then the product AB is an $m \times n$ matrix. For the matrix AB, the element in the ith row and jth column is the sum of the products of the corresponding elements in the ith row of A and the jth column of B (the inner product of the ith row and jth column).

Formally, if

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1p} \\ a_{21} & a_{22} & \cdots & a_{2p} \\ \vdots & & & \\ a_{m1} & a_{m2} & \cdots & a_{mp} \end{bmatrix} \text{ and } B = \begin{bmatrix} b_{11} & b_{12} & \cdots & b_{1n} \\ b_{21} & b_{22} & \cdots & b_{2n} \\ \vdots & & & \\ b_{p1} & b_{p2} & \cdots & b_{pn} \end{bmatrix}$$

then the elements in the matrix $C = AB$ are given by

$$c_{ij} = a_{i1} \cdot b_{1j} + a_{i2} \cdot b_{2j} + \cdots + a_{ip} \cdot b_{pj}$$

Note: If the number of columns in A does not equal the number of rows in B, then it is not possible to compute the product AB.

EXAMPLE 6 Multiplying Matrices

Given $A = \begin{bmatrix} 2 & 5 & 6 \\ -3 & 0 & 1 \end{bmatrix}$, $B = \begin{bmatrix} 1 \\ 3 \\ -4 \end{bmatrix}$, and $C = [-2 \quad 10 \quad 1]$,

find the following products if possible.

a. AB **b.** BC **c.** AC

Solution:

a. Matrix A Matrix B

$2 \times 3 \quad 3 \times 1$

equal

The product is a 2×1 matrix.

Matrix A is a 2×3 matrix and matrix B is a 3×1 matrix. The number of columns in A is equal to the number of rows in B. The resulting matrix will be a 2×1 matrix.

$$= \begin{bmatrix} 2 & 5 & 6 \\ -3 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ 3 \\ -4 \end{bmatrix} = \begin{bmatrix} 2(1) + 5(3) + 6(-4) \\ -3(1) + 0(3) + 1(-4) \end{bmatrix}$$

$$= \begin{bmatrix} -7 \\ -7 \end{bmatrix}$$

Multiply the elements in the first row of A by the elements in the first column of B.

Multiply the elements in the second row of A by the elements in the first column of B.

b. Matrix B Matrix C

$3 \times 1 \quad 1 \times 3$

equal

The product is a 3×3 matrix.

Matrix B is a 3×1 matrix and matrix C is a 1×3 matrix. The number of columns in B is equal to the number of rows in C. The resulting matrix will be a 3×3 matrix.

$$BC = \begin{bmatrix} 1 \\ 3 \\ -4 \end{bmatrix} [-2 \quad 10 \quad 1] = \begin{bmatrix} 1(-2) & 1(10) & 1(1) \\ 3(-2) & 3(10) & 3(1) \\ -4(-2) & -4(10) & -4(1) \end{bmatrix}$$

$$= \begin{bmatrix} -2 & 10 & 1 \\ -6 & 30 & 3 \\ 8 & -40 & -4 \end{bmatrix}$$

ISTUDY

c. Matrix A Matrix C

2×3 1×3

not equal

The number of columns in A does not equal the number of rows in C. Therefore, it is not possible to compute the product AC.

Skill Practice 6 Given $A = \begin{bmatrix} 2 & -5 \\ 1 & 0 \end{bmatrix}$, $B = \begin{bmatrix} 3 & 5 & 4 \\ 6 & 0 & -8 \end{bmatrix}$, and $C = \begin{bmatrix} 1 \\ 0 \\ 6 \end{bmatrix}$, find the products if possible. **a.** AB **b.** BC **c.** AC

EXAMPLE 7 Multiplying Matrices

Given $A = \begin{bmatrix} 3 & -4 \\ 1 & 5 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 0 \\ -3 & 6 \end{bmatrix}$, find the following products if possible.

a. AB **b.** BA

Solution:

a. Matrix A Matrix B

2×2 2×2

equal

The product is a 2×2 matrix.

$$AB = \begin{bmatrix} 3 & -4 \\ 1 & 5 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ -3 & 6 \end{bmatrix}$$

$$= \begin{bmatrix} 3(1) + (-4)(-3) & 3(0) + (-4)(6) \\ 1(1) + 5(-3) & 1(0) + 5(6) \end{bmatrix}$$

$$= \begin{bmatrix} 15 & -24 \\ -14 & 30 \end{bmatrix}$$

b. Matrix B Matrix A

2×2 2×2

equal

The product is a 2×2 matrix.

$$BA = \begin{bmatrix} 1 & 0 \\ -3 & 6 \end{bmatrix}\begin{bmatrix} 3 & -4 \\ 1 & 5 \end{bmatrix}$$

$$= \begin{bmatrix} 1(3) + 0(1) & 1(-4) + 0(5) \\ -3(3) + 6(1) & -3(-4) + 6(5) \end{bmatrix}$$

$$= \begin{bmatrix} 3 & -4 \\ -3 & 42 \end{bmatrix}$$

Skill Practice 7 Given $A = \begin{bmatrix} 1 & -3 \\ 0 & 5 \end{bmatrix}$ and $B = \begin{bmatrix} 2 & 4 \\ 6 & 1 \end{bmatrix}$, find the following products if possible. **a.** AB **b.** BA

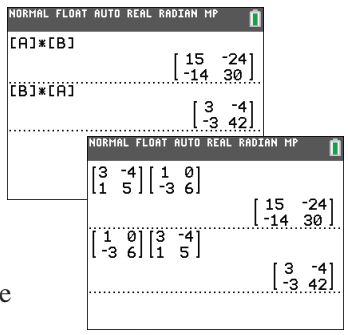
Avoiding Mistakes

Example 7 shows that for two matrices A and B, the product AB does not necessarily equal BA. That is, matrix multiplication is *not* commutative.

TECHNOLOGY CONNECTIONS

Multiplying Matrices

To multiply two matrices on a graphing utility, first enter the matrices into the calculator using the EDIT feature under the MATRIX menu. Then on the home screen, enter the product. The products AB and BA from Example 7 are shown here.



Alternatively, in "MATHPRINT" mode, enter the matrices on the home screen using ALPHA F3. The products AB and BA are shown here.

Answers

6. a. $AB = \begin{bmatrix} -24 & 10 & 48 \\ 3 & 5 & 4 \end{bmatrix}$

b. $BC = \begin{bmatrix} 27 \\ -42 \end{bmatrix}$

c. Not possible

7. a. $AB = \begin{bmatrix} -16 & 1 \\ 30 & 5 \end{bmatrix}$

b. $BA = \begin{bmatrix} 2 & 14 \\ 6 & -13 \end{bmatrix}$

ISTUDY

5. Apply Operations on Matrices

In applications, a matrix gives mathematicians a systematic format in which to represent data. Multiplication of matrices is a tool to manipulate these data sets. For example, in business, we might multiply the number of items sold by the unit price per item to determine total revenue.

$$\begin{bmatrix}\text{Quantity}\\ \text{matrix}\end{bmatrix}\begin{bmatrix}\text{Unit price}\\ \text{matrix}\end{bmatrix}=\begin{bmatrix}\text{Total revenue}\\ \text{matrix}\end{bmatrix}$$

$m \times p$ $\quad p \times n$ (same) $\quad m \times n$

order of product

TIP The number of columns p of the quantity matrix must equal the number of rows p of the unit price matrix for the product to be defined.

EXAMPLE 8 Multiplying Matrices in a Business Application

A company owns two coffee shops. The number of donuts, coffee cakes, hot drinks, and cold drinks sold for each shop is given in matrix Q. The price per item is given in matrix P. Find the product QP and interpret the result.

$$Q=\begin{array}{c}\begin{matrix}\text{Donuts} & \text{Coffee cakes} & \text{Hot drinks} & \text{Cold drinks}\end{matrix}\\ \begin{bmatrix}162 & 34 & 120 & 44\\ 186 & 50 & 145 & 62\end{bmatrix}\end{array}\begin{matrix}\text{Shop 1}\\ \text{Shop 2}\end{matrix}$$

$$P=\begin{bmatrix}\$0.40\\ \$2.50\\ \$3.50\\ \$1.50\end{bmatrix}\begin{matrix}\text{Donuts}\\ \text{Coffee cakes}\\ \text{Hot drinks}\\ \text{Cold drinks}\end{matrix}$$

Solution:

Matrix Q is a 2×4 matrix and matrix P is a 4×1 matrix. Matrix Q has 4 columns, which match the number of rows of P, so the product QP is defined. The product matrix will be a 2×1 matrix. The product QP is

$$\begin{bmatrix}162 & 34 & 120 & 44\\ 186 & 50 & 145 & 62\end{bmatrix}\begin{bmatrix}0.40\\ 2.50\\ 3.50\\ 1.50\end{bmatrix}=\begin{bmatrix}162(0.40)+34(2.50)+120(3.50)+44(1.50)\\ 186(0.40)+50(2.50)+145(3.50)+62(1.50)\end{bmatrix}$$

(162 donuts times \$0.40 per donut (Shop 1).)

$$=\begin{bmatrix}\$635.80\\ \$799.90\end{bmatrix}$$

(Row 1: Revenue for Shop 1; Row 2: Revenue for Shop 2)

The product QP is a matrix representing the total revenue from these four items for each shop.

Skill Practice 8 A farmer sells organic zucchini, yellow squash, and corn in two different roadside stands. Matrix Q represents the number of pounds of each type of vegetable sold at each stand. Matrix P gives the price per pound of each item. Find the product QP and interpret the result.

$$Q=\begin{array}{c}\begin{matrix}\text{Zucchini} & \text{Yellow squash} & \text{Corn}\end{matrix}\\ \begin{bmatrix}42 & 40 & 84\\ 30 & 36 & 90\end{bmatrix}\end{array}\begin{matrix}\text{Stand 1}\\ \text{Stand 2}\end{matrix}$$

$$P=\begin{bmatrix}\$4.00\\ \$3.40\\ \$4.20\end{bmatrix}\begin{matrix}\text{Zucchini}\\ \text{Yellow squash}\\ \text{Corn}\end{matrix}$$

Answer

8. $\begin{bmatrix}\$656.80\\ \$620.40\end{bmatrix}$; The product QP is a matrix representing the total revenue from these three items for each stand.

ISTUDY

In Chapter 2 we learned how to apply transformations to the graphs of functions. In Example 9 we see how matrices can also be used to transform images in a rectangular coordinate system. This is particularly helpful to computer programmers who write software for computer gaming.

EXAMPLE 9 Using Matrix Operations to Transform a Graph

Consider the triangle shown in Figure 10-6. The vertices of the triangle can be represented in a matrix where the first row represents the x-coordinates and the second row represents the corresponding y-coordinates.

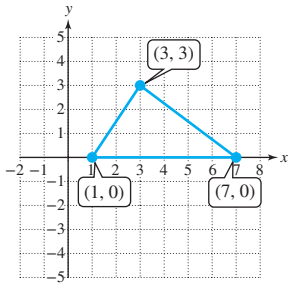


Figure 10-6

$$A = \begin{bmatrix} 1 & 3 & 7 \\ 0 & 3 & 0 \end{bmatrix} \begin{matrix} \leftarrow x\text{-coordinates} \\ \leftarrow y\text{-coordinates} \end{matrix}$$

a. Use addition of matrices to shift the triangle 3 units to the left and 2 units upward.

b. Find the product $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} A$ and determine the effect on the graph.

c. Find the product $\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} A$ and determine the effect on the graph.

Solution:

a. To shift the graph to the left, subtract 3 from each x-coordinate.
To shift the graph upward, add 2 to each y-coordinate.

$$\begin{bmatrix} 1 & 3 & 7 \\ 0 & 3 & 0 \end{bmatrix} + \begin{bmatrix} -3 & -3 & -3 \\ 2 & 2 & 2 \end{bmatrix} \begin{matrix} \leftarrow \text{This row subtracts 3 from each } x\text{-coordinate.} \\ \leftarrow \text{This row adds 2 to each } y\text{-coordinate.} \end{matrix}$$

$$= \begin{bmatrix} -2 & 0 & 4 \\ 2 & 5 & 2 \end{bmatrix}$$

The vertices of the new triangle are $(-2, 2)$, $(0, 5)$, and $(4, 2)$. See Figure 10-7.

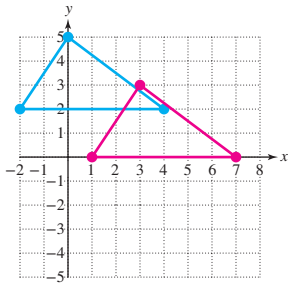

Figure 10-7

b. $$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} A = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 3 & 7 \\ 0 & 3 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} -1(1) + 0(0) & -1(3) + 0(3) & -1(7) + 0(0) \\ 0(1) + 1(0) & 0(3) + 1(3) & 0(7) + 1(0) \end{bmatrix}$$

$$= \begin{bmatrix} -1 & -3 & -7 \\ 0 & 3 & 0 \end{bmatrix}$$ The corresponding points are $(-1, 0)$, $(-3, 3)$, and $(-7, 0)$.

The triangle has been reflected across the y-axis. See Figure 10-8.

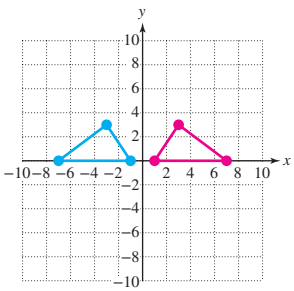

Figure 10-8

c. $$\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} A = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & 3 & 7 \\ 0 & 3 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} 1(1) + 0(0) & 1(3) + 0(3) & 1(7) + 0(0) \\ 0(1) + -1(0) & 0(3) + -1(3) & 0(7) + -1(0) \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 3 & 7 \\ 0 & -3 & 0 \end{bmatrix}$$ The corresponding points are $(1, 0)$, $(3, -3)$, and $(7, 0)$.

The triangle has been reflected across the x-axis. See Figure 10-9.

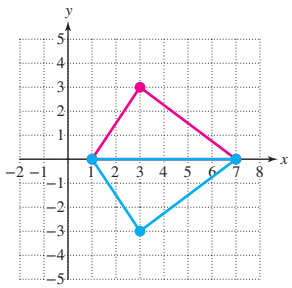

Figure 10-9

Skill Practice 9 Use matrix A from Example 9. Find the product $\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} A$ and determine the effect on the graph of the triangle in Figure 10-6.

Answer

9. $\begin{bmatrix} -1 & -3 & -7 \\ 0 & -3 & 0 \end{bmatrix}$; The triangle is reflected across both the x- and y-axes.

SECTION 10.3 Practice Exercises

Prerequisite Review

R.1. Identify the additive inverse of 9.

R.2. Apply the commutative property of addition.
$-9 + x$

R.3. Solve the equation. $5z - 2 = -22$

Concept Connections

1. If the _____ of a matrix is $p \times q$, then p represents the number of _____ and q represents the number of _____.

2. A matrix with the same number of rows and columns is called a _____ matrix.

3. What are the requirements for two matrices to be equal?

4. An $m \times n$ matrix whose elements are all zero is called a _____ matrix.

5. To multiply two matrices A and B, the number of _____ of A must equal the number of _____ of B.

6. If A is a 5×3 matrix and B is a 3×7 matrix, then the product AB will be a matrix of order _____. The product BA (is/is not) defined.

7. True or false: Matrix multiplication is a commutative operation.

8. True or false: If a row matrix A and a column matrix B have the same number of elements, then the product AB is defined.

Objective 1: Determine the Order of a Matrix

9. What is a row matrix?

10. What is a column matrix?

For Exercises 11–16,

a. Give the order of the matrix.

b. Classify the matrix as a square matrix, row matrix, column matrix, or none of these. (**See Example 1**)

11. $\begin{bmatrix} 3 & 5 & -1 \\ \frac{1}{2} & \sqrt{3} & 1.7 \end{bmatrix}$

12. $\begin{bmatrix} 1 & 5 & 6 & 2 \\ -1 & 3 & -\frac{2}{3} & \pi \\ 0 & 1 & -6.1 & 12 \end{bmatrix}$

13. $\begin{bmatrix} 3 \\ 1 \\ 7 \end{bmatrix}$

14. $\begin{bmatrix} 2.4 & 6.9 \end{bmatrix}$

15. $\begin{bmatrix} 4 & 2 \\ 8 & 4 \end{bmatrix}$

16. $\begin{bmatrix} -4 & 10 & 3 & 0 \\ 0 & 1 & 0 & 0 \\ 7 & 0 & 9 & -1 \\ 0 & 2 & 0 & 1 \end{bmatrix}$

For Exercises 17–22, determine the value of the given element of matrix $A = [a_{ij}]$. (See Example 2)

$$A = \begin{bmatrix} 3 & -6 & \frac{1}{3} \\ 2 & 4 & 0 \\ \sqrt{5} & 11 & 8.6 \\ \frac{1}{2} & 4 & 2 \end{bmatrix}$$

17. a_{31}

18. a_{32}

19. a_{13}

20. a_{23}

21. a_{43}

22. a_{42}

Objective 2: Add and Subtract Matrices

23. Given $A = \begin{bmatrix} 2 & x \\ z & -5 \end{bmatrix}$ and $B = \begin{bmatrix} y & 4 \\ 10 & -5 \end{bmatrix}$, for what values of x, y, and z will $A = B$?

24. Given $A = \begin{bmatrix} 4 & a \\ b & 7 \end{bmatrix}$ and $B = \begin{bmatrix} c & 12 \\ -1 & 6 \end{bmatrix}$, is it possible that $A = B$? Explain.

25. Given $B = \begin{bmatrix} -4 & 6 & 9 \\ \frac{3}{5} & 1 & 7 \end{bmatrix}$, find the additive inverse of B.

26. Given $C = \begin{bmatrix} -1 & 6 \\ \sqrt{3} & 9 \end{bmatrix}$, find the additive inverse of C.

ISTUDY

For Exercises 27–32, add or subtract the given matrices if possible. (See Example 3)

$$A=\begin{bmatrix}6 & -1\\ 7 & \frac{1}{2}\\ 2 & \sqrt{2}\end{bmatrix}\quad B=\begin{bmatrix}-9 & 2\\ 6.2 & 2\\ \frac{1}{3} & \sqrt{8}\end{bmatrix}\quad C=\begin{bmatrix}11 & 4\\ 1 & -\frac{1}{3}\\ 1 & 6\end{bmatrix}\quad D=\begin{bmatrix}2 & 3 & 8\\ -1 & 6 & \frac{1}{6}\end{bmatrix}$$

27. $A+B$ **28.** $A+C$ **29.** $C-A+B$

30. $B-A-C$ **31.** $B+D$ **32.** $C+D$

Objective 3: Multiply a Matrix by a Scalar

33. Explain how to multiply a matrix by a scalar.

34. Given matrix A, explain how to find its additive inverse $-A$.

For Exercises 35–42, use $A=\begin{bmatrix}2 & 4 & -9\\ 1 & \sqrt{3} & \frac{1}{2}\end{bmatrix}$ and $B=\begin{bmatrix}-1 & 0 & 4\\ 2 & 9 & \frac{2}{3}\end{bmatrix}$. (See Example 4)

35. $3A$ **36.** $-6B$ **37.** $-2A-7B$

38. $4A-3B$ **39.** $-4(A+B)$ **40.** $2(A-B)$

41. $-3A+5(A-B)$ **42.** $-8A-2(A+B)$

For Exercises 43–48, use $A=\begin{bmatrix}1 & 6\\ 4 & -2\end{bmatrix}$ and $B=\begin{bmatrix}2 & -4\\ 6 & 9\end{bmatrix}$ and solve for X. (See Example 5)

43. $2X-B=A$ **44.** $3X+A=B$ **45.** $A+5X=B$

46. $B-4X=A$ **47.** $2A-B=10X$ **48.** $3B-A=-2X$

Objective 4: Multiply Matrices

49. Given that A is a 4×2 matrix and B is a 2×1 matrix,
- **a.** Is AB defined? If so, what is the order of AB?
- **b.** Is BA defined? If so, what is the order of BA?

50. Given that C is a 3×7 matrix and D is a 7×2 matrix,
- **a.** Is CD defined? If so, what is the order of CD?
- **b.** Is DC defined? If so, what is the order of DC?

51. Given that E is a 5×1 matrix and F is a 1×5 matrix,
- **a.** Is EF defined? If so, what is the order of EF?
- **b.** Is FE defined? If so, what is the order of FE?

52. Given that G is a 1×6 matrix and H is a 6×1 matrix,
- **a.** Is GH defined? If so, what is the order of GH?
- **b.** Is HG defined? If so, what is the order of HG?

For Exercises 53–64, (See Examples 6–7)

- **a.** Find AB if possible.
- **b.** Find BA if possible.
- **c.** Find A^2 if possible.

53. $A=\begin{bmatrix}2 & 3\\ 5 & 7\end{bmatrix}$ and $B=\begin{bmatrix}1 & 4\\ -1 & 3\end{bmatrix}$

54. $A=\begin{bmatrix}1 & -6\\ 5 & 10\end{bmatrix}$ and $B=\begin{bmatrix}-2 & 3\\ 7 & -1\end{bmatrix}$

55. $A=\begin{bmatrix}2 & 4\\ -6 & 3\\ 1 & 7\end{bmatrix}$ and $B=\begin{bmatrix}1 & 4 & -1\\ -2 & 0 & 10\end{bmatrix}$

56. $A=\begin{bmatrix}1 & 3 & 4\\ -2 & 5 & 6\end{bmatrix}$ and $B=\begin{bmatrix}1 & 3\\ 9 & 2\\ 0 & 4\end{bmatrix}$

57. $A=\begin{bmatrix}-9 & 2 & 3\\ -1 & 5 & 4\\ 0 & 1 & 7\end{bmatrix}$ and $B=\begin{bmatrix}-1\\ 5\\ 0\end{bmatrix}$

58. $A=\begin{bmatrix}2\\ -1\\ 3\end{bmatrix}$ and $B=\begin{bmatrix}2 & 7 & -1\\ 0 & 4 & 1\\ 0 & 3 & -6\end{bmatrix}$

59. $A=\begin{bmatrix}1 & \frac{1}{2}\end{bmatrix}$ and $B=\begin{bmatrix}-\frac{1}{3}\\ 2\end{bmatrix}$

60. $A=\begin{bmatrix}4\\ \frac{3}{4}\\ 1\end{bmatrix}$ and $B=\begin{bmatrix}-5 & \frac{1}{2} & \frac{1}{3}\end{bmatrix}$

61. $A=\begin{bmatrix}4\\ -6\end{bmatrix}$ and $B=\begin{bmatrix}1 & 2 & 5 & 6\end{bmatrix}$

62. $A=[4]$ and $B=[-3 \quad 4 \quad 1]$

63. $A=[-5]$ and $B=[5]$

64. $A=[6]$ and $B=[-2]$

ISTUDY

For Exercises 65–68, find AB and BA.

65. $A = \begin{bmatrix} 3.1 & -2.3 \\ 1.1 & 6.5 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

66. $A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 0.05 & -0.07 \\ 0.16 & 0.09 \end{bmatrix}$

67. $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} \frac{9}{5} & -3 & \sqrt{6} \\ 5 & \frac{1}{2} & 2 \\ 3 & 0 & 1 \end{bmatrix}$

68. $A = \begin{bmatrix} \frac{2}{3} & 5 & \sqrt{2} \\ 1 & 0 & 3 \\ -\frac{1}{4} & 0 & 8 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

Objective 5: Apply Operations on Matrices

69. Matrix D gives the dealer invoice prices for sedan and hatchback models of a car with manual transmission or automatic transmission. Matrix M gives the MSRP (manufacturer's suggested retail price) for the cars.

$$D = \begin{array}{c} \begin{matrix} \textbf{Sedan} & \textbf{Hatchback} \end{matrix} \\ \begin{bmatrix} \$29{,}000 & \$27{,}500 \\ \$28{,}500 & \$26{,}900 \end{bmatrix} \begin{matrix} \textbf{Manual} \\ \textbf{Automatic} \end{matrix} \end{array}$$

$$M = \begin{array}{c} \begin{matrix} \textbf{Sedan} & \textbf{Hatchback} \end{matrix} \\ \begin{bmatrix} \$32{,}600 & \$29{,}900 \\ \$31{,}900 & \$28{,}900 \end{bmatrix} \begin{matrix} \textbf{Manual} \\ \textbf{Automatic} \end{matrix} \end{array}$$

a. Compute $M - D$ and interpret the result.

b. A buyer thinks that a fair price is 6% above dealer invoice. Use scalar multiplication to determine a matrix F that gives the fair price for these cars for each type of transmission.

70. In matrix C, a coffee shop records the cost to produce a cup of standard Columbian coffee and the cost to produce a cup of hot chocolate. Matrix P contains the selling prices to the customer.

$$C = \begin{array}{c} \begin{matrix} \textbf{Coffee} & \textbf{Chocolate} \end{matrix} \\ \begin{bmatrix} \$0.90 & \$0.84 \\ \$1.26 & \$1.15 \\ \$1.64 & \$1.50 \end{bmatrix} \begin{matrix} \textbf{Small} \\ \textbf{Medium} \\ \textbf{Large} \end{matrix} \end{array}$$

$$P = \begin{array}{c} \begin{matrix} \textbf{Coffee} & \textbf{Chocolate} \end{matrix} \\ \begin{bmatrix} \$3.05 & \$2.25 \\ \$3.65 & \$3.05 \\ \$4.15 & \$3.65 \end{bmatrix} \begin{matrix} \textbf{Small} \\ \textbf{Medium} \\ \textbf{Large} \end{matrix} \end{array}$$

a. Compute $P - C$ and interpret its meaning.

b. If the tax rate in a certain city is 7%, use scalar multiplication to find a matrix F that gives the final price to the customer (including sales tax) for both beverages for each size. Round each entry to the nearest cent.

71. A street vendor at a parade sells fresh lemonade, soda, bottled water, and iced-tea, and the unit price for each item is given in matrix P. The number of units sold of each item is given in matrix N. Compute NP and interpret the result.

$$N = \begin{array}{c} \begin{matrix} \textbf{Lemonade} & \textbf{Soda} & \textbf{Water} & \textbf{Tea} \end{matrix} \\ [150 \quad 270 \quad 440 \quad 80], \end{array}$$

$$P = \begin{bmatrix} \$2.50 \\ \$1.50 \\ \$2.00 \\ \$2.00 \end{bmatrix} \begin{matrix} \textbf{Lemonade} \\ \textbf{Soda} \\ \textbf{Water} \\ \textbf{Tea} \end{matrix}$$

72. A math course has 4 exams weighted 20%, 25%, 25%, and 30%, respectively, toward the final grade. Suppose that a student earns grades of 75, 84, 92, and 86, respectively, on the four exams. The weights are given in matrix W and the test grades are given in matrix G. Compute WG and interpret the result.

$$W = \begin{array}{c} \begin{matrix} \textbf{Test 1} & \textbf{Test 2} & \textbf{Test 3} & \textbf{Test 4} \end{matrix} \\ [0.20 \quad 0.25 \quad 0.25 \quad 0.30], \end{array} \quad G = \begin{bmatrix} 75 \\ 84 \\ 92 \\ 86 \end{bmatrix} \begin{matrix} \textbf{Test 1} \\ \textbf{Test 2} \\ \textbf{Test 3} \\ \textbf{Test 4} \end{matrix}$$

73. An electronics store sells three models of tablets. The number of each model sold during "Black Friday" weekend is given in matrix A. The selling price and profit for each model are given in matrix B. (**See Example 8**)

$$A = \begin{array}{c} \begin{matrix} \textbf{A} & \textbf{B} & \textbf{C} \end{matrix} \\ \begin{bmatrix} 84 & 70 & 32 \\ 62 & 48 & 16 \\ 70 & 40 & 12 \end{bmatrix} \begin{matrix} \textbf{Friday} \\ \textbf{Saturday} \\ \textbf{Sunday} \end{matrix} \end{array} \quad B = \begin{array}{c} \begin{matrix} \textbf{Selling Price} & \textbf{Profit} \end{matrix} \\ \begin{bmatrix} \$499 & \$200 \\ \$599 & \$240 \\ \$629 & \$280 \end{bmatrix} \begin{matrix} \textbf{A} \\ \textbf{B Model} \\ \textbf{C} \end{matrix} \end{array}$$

a. Compute AB and interpret the result.

b. Determine the total revenue for Sunday.

c. Determine the total profit for the 3-day period for these three models.

74. A gas station manager records the number of gallons of Regular, Plus, and Premium gasoline sold during the week (Monday–Friday) and on the weekends (Saturday–Sunday) in matrix A. The selling price and profit for 1 gal of each type of gasoline are given in matrix B.

$$A = \begin{array}{c} \begin{matrix} \textbf{Regular} & \textbf{Plus} & \textbf{Premium} \end{matrix} \\ \begin{bmatrix} 4600 & 1850 & 720 \\ 2300 & 620 & 480 \end{bmatrix} \begin{matrix} \textbf{Weekdays} \\ \textbf{Weekend} \end{matrix} \end{array}$$

$$B = \begin{array}{c} \begin{matrix} \textbf{Selling Price} & \textbf{Profit} \end{matrix} \\ \begin{bmatrix} \$3.59 & \$0.21 \\ \$3.79 & \$0.24 \\ \$4.19 & \$0.18 \end{bmatrix} \begin{matrix} \textbf{Regular} \\ \textbf{Plus} \\ \textbf{Premium} \end{matrix} \end{array}$$

a. Compute AB and interpret the result.

b. Determine the profit for the weekend.

c. Determine the revenue for the entire week.

ISTUDY

75. The labor costs per hour for an electrician, plumber, and air-conditioning/heating expert are given in matrix L. The time required from each specialist for three new model homes is given in matrix T.

$$L = \begin{matrix} \text{Cost/hr} \\ \begin{bmatrix} \$45 \\ \$38 \\ \$35 \end{bmatrix} \end{matrix} \begin{matrix} \\ \text{Electrician} \\ \text{Plumber} \\ \text{AC/heating} \end{matrix}$$

$$T = \begin{matrix} & \text{Time (hr)} & & \\ \text{Electrician} & \text{Plumber} & \text{AC/heating} & \\ \begin{bmatrix} 22 & 16 & 14 \\ 28 & 21 & 18 \\ 18 & 14 & 9 \end{bmatrix} & & & \begin{matrix} \text{Model 1} \\ \text{Model 2} \\ \text{Model 3} \end{matrix} \end{matrix}$$

a. Which product, LT or TL, gives the total cost for these three services for each model?

b. Find a matrix that gives the total cost for these three services for each model.

77. A student researches the cost for three cell phone plans. Matrix C contains the cost per text message and the cost per minute over the maximum number of minutes allowed in each plan. Matrix N_1 contains the number of text messages and the number of minutes over the maximum incurred for 1 month. Matrix N_3 represents the number of text messages and number of minutes over the maximum for 3 months.

$$C = \begin{matrix} \text{Cost/text} & \text{Cost/min} & \\ \begin{bmatrix} \$0.25 & \$0.40 \\ \$0 & \$0.40 \\ \$0.10 & \$0 \end{bmatrix} & & \begin{matrix} \text{Plan A} \\ \text{Plan B} \\ \text{Plan C} \end{matrix} \end{matrix}$$

$$N_1 = \begin{bmatrix} 24 \\ 100 \end{bmatrix} \begin{matrix} \text{Number of texts} \\ \text{Minutes over} \end{matrix}$$

$$N_3 = \begin{matrix} \text{Month 1} & \text{Month 2} & \text{Month 3} & \\ \begin{bmatrix} 24 & 56 & 30 \\ 100 & 24 & 0 \end{bmatrix} & & & \begin{matrix} \text{Number of texts} \\ \text{Minutes over} \end{matrix} \end{matrix}$$

a. Find the product CN_1 and interpret its meaning.

b. Find the product CN_3 and interpret its meaning.

76. The number of calories burned per hour for three activities is given in matrix N for a 140-lb person training for a triathlon. The time spent on each activity for two different training days is given in matrix T.

$$N = \begin{matrix} \text{Calories/hr} \\ \begin{bmatrix} 540 \\ 400 \\ 360 \end{bmatrix} \end{matrix} \begin{matrix} \\ \text{Running} \\ \text{Bicycling} \\ \text{Swimming} \end{matrix}$$

$$T = \begin{matrix} & \text{Time} & & \\ \text{Running} & \text{Bicycling} & \text{Swimming} & \\ \begin{bmatrix} 45 \text{ min} & 1 \text{ hr} & 30 \text{ min} \\ 1 \text{ hr} & 1 \text{ hr } 30 \text{ min} & 45 \text{ min} \end{bmatrix} & & & \begin{matrix} \text{Day 1} \\ \text{Day 2} \end{matrix} \end{matrix}$$

a. Which product, NT or TN, gives the total number of calories burned from these activities for each day?

b. Find a matrix that gives the total number of calories burned from these activities for each day.

78. Refer to Exercise 77. Suppose that matrix B represents the base cost for each cell phone plan and matrix T represents the tax for each plan.

$$B = \begin{bmatrix} \$39.99 \\ \$49.99 \\ \$59.99 \end{bmatrix} \begin{matrix} \text{Plan A} \\ \text{Plan B} \\ \text{Plan C} \end{matrix}$$

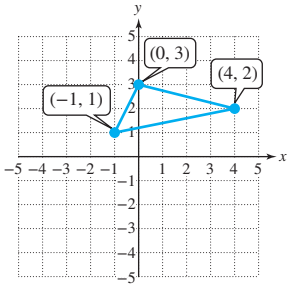
$$T = \begin{bmatrix} \$11.96 \\ \$13.04 \\ \$14.91 \end{bmatrix} \begin{matrix} \text{Plan A} \\ \text{Plan B} \\ \text{Plan C} \end{matrix}$$

a. Compute $B + CN_1 + T$ and interpret its meaning.

b. Which cell phone plan is the least expensive if the student has 60 text messages and talks 20 min more than the maximum?

ISTUDY

79. a. Write a matrix A that represents the coordinates of the vertices of the triangle. Place the x-coordinate of each point in the first row of A and the corresponding y-coordinate in the second row of A. (**See Example 9**)



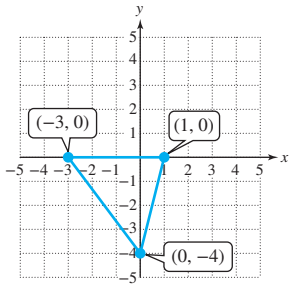
b. Use addition of matrices to shift the triangle 2 units to the right and 4 units downward.

c. Find the product $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} A$ and explain the effect on the graph of the triangle.

d. Find the product $\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} A$ and explain the effect on the graph of the triangle.

e. Find $\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} A + \begin{bmatrix} -1 & -1 & -1 \\ 2 & 2 & 2 \end{bmatrix}$ and explain the effect on the graph of the triangle.

80. a. Write a matrix A that represents the coordinates of the vertices of the triangle. Place the x-coordinate of each point in the first row of A and the corresponding y-coordinate in the second row of A.



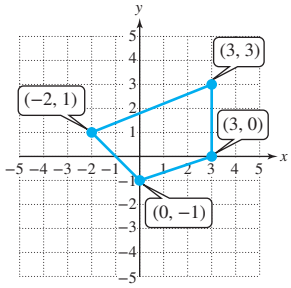
b. Use addition of matrices to shift the triangle 1 unit to the left and 3 units upward.

c. Find the product $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} A$ and explain the effect on the graph of the triangle.

d. Find the product $\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} A$ and explain the effect on the graph of the triangle.

e. Find $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} A + \begin{bmatrix} 2 & 2 & 2 \\ -5 & -5 & -5 \end{bmatrix}$ and explain the effect on the graph of the triangle.

81. a. Write a matrix A that represents the coordinates of the vertices of the quadrilateral.



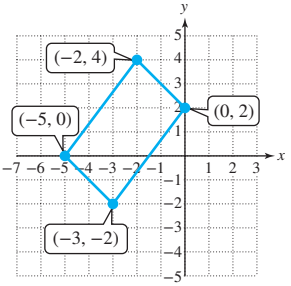
b. What operation on A will shift the graph of the quadrilateral 3 units downward?

c. What operation on A will shift the graph 4 units to the left?

d. Use matrix multiplication to reflect the graph across the x-axis.

e. Use matrix multiplication to reflect the graph across the y-axis.

82. a. Write a matrix A that represents the coordinates of the vertices of the quadrilateral.



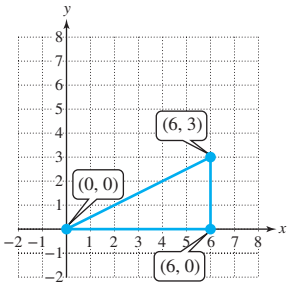
b. What operation on A will shift the graph of the quadrilateral 6 units upward?

c. What operation on A will shift the graph 2 units to the right?

d. Use matrix multiplication to reflect the graph across the x-axis.

e. Use matrix multiplication to reflect the graph across the y-axis.

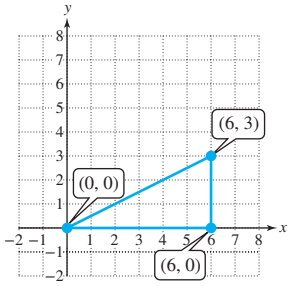
83. a. Write a matrix A that represents the coordinates of the vertices of the triangle.



b. Multiply $\begin{bmatrix} \frac{\sqrt{3}}{2} & -\frac{1}{2} \\ \frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix} A$ and round each entry to 1 decimal place.

c. Graph the figure represented by the matrix from part (b). What effect does this product have on the graph of the triangle?

84. a. Write a matrix A that represents the coordinates of the vertices of the triangle.



b. Multiply $\begin{bmatrix} \frac{1}{2} & -\frac{\sqrt{3}}{2} \\ \frac{\sqrt{3}}{2} & \frac{1}{2} \end{bmatrix} A$ and round each entry to 1 decimal place.

c. Graph the figure represented by the matrix from part (b). What effect does this product have on the graph of the triangle?

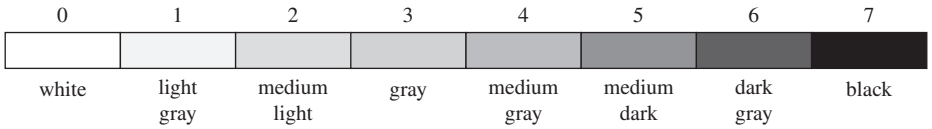
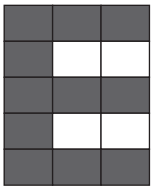
For Exercises 85–86, use the following gray scale.



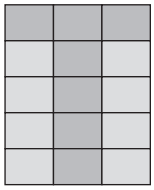
85. a. Write a 5×3 matrix that represents the letter E in dark gray on a white background.

b. Use matrix addition to change the pixels so that the letter E is medium dark on a light gray background.



86. a. Write a 5×3 matrix that represents the letter T in medium gray on a medium light background.

b. Use matrix addition to change the pixels so that the letter T is dark gray on a light gray background.



Mixed Exercises

For Exercises 87–92, use matrices A, B, and C to prove the given properties. Assume that the elements within A, B, and C are real numbers.

$$A = \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix} \quad B = \begin{bmatrix} b_1 & b_2 \\ b_3 & b_4 \end{bmatrix} \quad C = \begin{bmatrix} c_1 & c_2 \\ c_3 & c_4 \end{bmatrix}$$

87. Commutative property of matrix addition

$$A + B = B + A$$

88. Associative property of matrix addition

$$A + (B + C) = (A + B) + C$$

89. Inverse property of matrix addition

$$A + (-A) = 0$$

90. Identity property of matrix addition

$$A + 0 = A$$

91. Associative property of scalar multiplication

$$s(tA) = (st)A$$

92. Distributive property of scalar multiplication

$$t(A + B) = tA + tB$$

93. Given $A = \begin{bmatrix} i & 0 \\ 0 & i \end{bmatrix}$, find A^2, A^3, and A^4.

(*Hint*: Recall that $i = \sqrt{-1}$.) Discuss the similarities between A^n and i^n, where n is a positive integer.

94. Given $B = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$, find B^2.

95. a. For real numbers a, b, c, and d, find the product.

$$\begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}\begin{bmatrix} c & 0 \\ 0 & d \end{bmatrix}$$

b. Based on the form of the product of part (a), compute the following product mentally.

$$\begin{bmatrix} 3 & 0 \\ 0 & 7 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}$$

96. Find the product.

$$\begin{bmatrix} a & a \\ b & b \end{bmatrix}\begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix}$$

Write About It

97. Explain why the product of a 3×2 matrix by a 3×2 matrix is undefined.

98. Explain how to add or subtract matrices.

99. Given a matrix, $A = [a_{ij}]$, explain how to find the additive inverse of A.

100. Given two matrices A and B, how can you determine the order of AB, assuming that the product is defined?

Technology Connections

For Exercises 101–104, refer to matrices A, B, and C and perform the indicated operations on a calculator.

$$A = \begin{bmatrix} 1.05 & 3.9 \\ 4.12 & -9.4 \\ -2.4 & 1.5 \end{bmatrix} \quad B = \begin{bmatrix} -10 & 30 \\ 24 & -36 \\ 18 & -8 \end{bmatrix} \quad C = \begin{bmatrix} 6.2 \\ 4.9 \end{bmatrix}$$

101. $2.5A - 3.6B$ **102.** $-6.4(A + B)$ **103.** $-3AC$ **104.** $7.5BC$

SECTION 10.4 Inverse Matrices and Matrix Equations

OBJECTIVES

1. Identify Identity and Inverse Matrices
2. Determine the Inverse of a Matrix
3. Solve Systems of Linear Equations Using the Inverse of a Matrix

1. Identify Identity and Inverse Matrices

The identity element under the multiplication of real numbers is 1 because $a \cdot 1 = a$ and $1 \cdot a = a$. We now investigate a similar property for the product of square matrices. The **identity matrix** I_n for matrix multiplication is the $n \times n$ square matrix with 1's along the main diagonal and 0's for all other elements. For example:

The identity matrix of order 2 / The identity matrix of order 3

$$I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \text{and} \quad I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

For an $n \times n$ square matrix A, we have that

$$AI_n = A \quad \text{and} \quad I_nA = A \quad \text{(Identity property of matrix multiplication)}$$

In Example 1, we illustrate the identity property of matrix multiplication using a 2×2 matrix.

EXAMPLE 1 Illustrating the Identity Property of Matrix Multiplication

Given $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ show that

a. $AI_2 = A$ **b.** $I_2A = A$

Solution:

a. $AI_2 = \begin{bmatrix} a & b \\ c & d \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} a(1) + b(0) & a(0) + b(1) \\ c(1) + d(0) & c(0) + d(1) \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ ✓

b. $I_2A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} 1(a) + 0(c) & 1(b) + 0(d) \\ 0(a) + 1(c) & 0(b) + 1(d) \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ ✓

Skill Practice 1 Given $A = \begin{bmatrix} 3 & -4 \\ -2 & 10 \end{bmatrix}$ show that

a. $AI_2 = A$ **b.** $I_2A = A$

For a nonzero real number a, the multiplicative inverse of a is $\frac{1}{a}$ because $a \cdot \frac{1}{a} = 1$ and $\frac{1}{a} \cdot a = 1$. We define the multiplicative inverse of a square matrix in a similar fashion.

Answers

1. a. $\begin{bmatrix} 3 & -4 \\ -2 & 10 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & -4 \\ -2 & 10 \end{bmatrix}$

b. $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\begin{bmatrix} 3 & -4 \\ -2 & 10 \end{bmatrix} = \begin{bmatrix} 3 & -4 \\ -2 & 10 \end{bmatrix}$

ISTUDY

Avoiding Mistakes

Be sure to interpret the notation A^{-1} as the *inverse* of A, rather than the reciprocal of A. That is, $A^{-1} \neq \frac{1}{A}$.

Multiplicative Inverse of a Square Matrix

Let A be an $n \times n$ matrix and let I_n be the identity matrix of order n. If there exists an $n \times n$ matrix A^{-1} such that

$$AA^{-1} = I_n \quad \text{and} \quad A^{-1}A = I_n$$

then A^{-1} (read as "A inverse") is the **multiplicative inverse** of A.

EXAMPLE 2 Determining Whether Two Matrices Are Inverses

Determine whether $A = \begin{bmatrix} 3 & 2 \\ 7 & 5 \end{bmatrix}$ and $B = \begin{bmatrix} 5 & -2 \\ -7 & 3 \end{bmatrix}$ are inverses.

Solution:

We must show that $AB = I_2$ and $BA = I_2$.

$$AB = \begin{bmatrix} 3 & 2 \\ 7 & 5 \end{bmatrix}\begin{bmatrix} 5 & -2 \\ -7 & 3 \end{bmatrix} = \begin{bmatrix} 3(5) + 2(-7) & 3(-2) + 2(3) \\ 7(5) + 5(-7) & 7(-2) + 5(3) \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \checkmark$$

$$BA = \begin{bmatrix} 5 & -2 \\ -7 & 3 \end{bmatrix}\begin{bmatrix} 3 & 2 \\ 7 & 5 \end{bmatrix} = \begin{bmatrix} 5(3) + (-2)(7) & 5(2) + (-2)(5) \\ -7(3) + 3(7) & -7(2) + 3(5) \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \checkmark$$

Skill Practice 2

Determine whether $A = \begin{bmatrix} 4 & 3 \\ 13 & 10 \end{bmatrix}$ and $B = \begin{bmatrix} 10 & -3 \\ -13 & 4 \end{bmatrix}$ are inverses.

2. Determine the Inverse of a Matrix

In Example 2, we showed that two given matrices are inverses. Now we look at the task of finding the inverse of a matrix. In Example 3, we will find the inverse of a 2×2 matrix directly from the definition. Then, we develop a general procedure to find the inverse of an $n \times n$ matrix, if the inverse exists.

EXAMPLE 3 Finding the Inverse of a Matrix

Given $A = \begin{bmatrix} 2 & 9 \\ 1 & 5 \end{bmatrix}$, find A^{-1}.

Solution:

We need to find a matrix $A^{-1} = \begin{bmatrix} x_1 & x_2 \\ x_3 & x_4 \end{bmatrix}$ such that $AA^{-1} = I_2$. That is,

$$\begin{bmatrix} 2 & 9 \\ 1 & 5 \end{bmatrix}\begin{bmatrix} x_1 & x_2 \\ x_3 & x_4 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \longrightarrow \begin{bmatrix} 2x_1 + 9x_3 & 2x_2 + 9x_4 \\ x_1 + 5x_3 & x_2 + 5x_4 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Answer

2. Yes; $AB = I_2$ and $BA = I_2$.

ISTUDY

For the matrices to be equal, their corresponding elements must be equal. This results in two systems of equations.

Equating the elements from the 1st column

$$\begin{cases} 2x_1 + 9x_3 = 1 \\ x_1 + 5x_3 = 0 \end{cases} \quad \text{and} \quad \begin{cases} 2x_2 + 9x_4 = 0 \\ x_2 + 5x_4 = 1 \end{cases}$$

Equating the elements from the 2nd column

The corresponding augmented matrices are

$$\left[\begin{array}{cc|c} 2 & 9 & 1 \\ 1 & 5 & 0 \end{array}\right] \quad \text{and} \quad \left[\begin{array}{cc|c} 2 & 9 & 0 \\ 1 & 5 & 1 \end{array}\right]$$

We can solve both systems simultaneously by placing the identity matrix to the right of the array of coefficients.

$$\left[\begin{array}{cc|cc} 2 & 9 & 1 & 0 \\ 1 & 5 & 0 & 1 \end{array}\right]$$

Apply Gauss-Jordan elimination.

$$\left[\begin{array}{cc|cc} 2 & 9 & 1 & 0 \\ 1 & 5 & 0 & 1 \end{array}\right] \xrightarrow{R_1 \Leftrightarrow R_2} \left[\begin{array}{cc|cc} 1 & 5 & 0 & 1 \\ 2 & 9 & 1 & 0 \end{array}\right] \xrightarrow{-2R_1 + R_2 \to R_2} \left[\begin{array}{cc|cc} 1 & 5 & 0 & 1 \\ 0 & -1 & 1 & -2 \end{array}\right]$$

$$\xrightarrow{-1R_2 \to R_2} \left[\begin{array}{cc|cc} 1 & 5 & 0 & 1 \\ 0 & 1 & -1 & 2 \end{array}\right] \xrightarrow{-5R_2 + R_1 \to R_1} \left[\begin{array}{cc|cc} 1 & 0 & 5 & -9 \\ 0 & 1 & -1 & 2 \end{array}\right]$$

This result represents the following two matrices and their corresponding systems of equations.

$$\begin{matrix} x_1 & x_3 \\ \downarrow & \downarrow \end{matrix} \left[\begin{array}{cc|c} 1 & 0 & 5 \\ 0 & 1 & -1 \end{array}\right] \quad \text{and} \quad \begin{matrix} x_2 & x_4 \\ \downarrow & \downarrow \end{matrix} \left[\begin{array}{cc|c} 1 & 0 & -9 \\ 0 & 1 & 2 \end{array}\right]$$

$x_1 = 5, x_3 = -1$ $\qquad$ $x_2 = -9, x_4 = 2$

Therefore, we have: $A^{-1} = \begin{bmatrix} x_1 & x_2 \\ x_3 & x_4 \end{bmatrix} = \begin{bmatrix} 5 & -9 \\ -1 & 2 \end{bmatrix}$

Avoiding Mistakes

The solution to Example 3 can be checked by verifying that $AA^{-1} = I_2$ and $A^{-1}A = I_2$.

Skill Practice 3 Given $B = \begin{bmatrix} 9 & 7 \\ 5 & 4 \end{bmatrix}$, find B^{-1}.

In Example 3, we transformed the left side of the augmented matrix into the identity matrix. That is, we performed row operations to make the array on the left of the vertical bar have 1's along the main diagonal, and 0's elsewhere. In the process, we make the following important observation.

- The array of elements to the right of the vertical bar is the inverse of A.

This observation leads to a general procedure to find the multiplicative inverse of a matrix, provided that the inverse exists.

Finding the Multiplicative Inverse of a Square Matrix

Let A be an $n \times n$ matrix for which A^{-1} exists, and let I_n be the $n \times n$ identity matrix. To find A^{-1},

Step 1 Write a matrix of the form $[A \,|\, I_n]$.
Step 2 Perform row operations to write the matrix in the form $[I_n \,|\, B]$.
Step 3 The matrix B is A^{-1}.

Answer

3. $B^{-1} = \begin{bmatrix} 4 & -7 \\ -5 & 9 \end{bmatrix}$

ISTUDY

It is important to note that not all matrices have a multiplicative inverse. If a matrix A is reducible to a row-equivalent matrix with one or more rows of zeros, then the matrix cannot be written in the form $[I_n \mid B]$. Therefore, the matrix does not have an inverse, and we say that the matrix is **singular.** A matrix that *does* have a multiplicative inverse is said to be **invertible** or **nonsingular.**

In Example 4, we use the general procedure to find the inverse of a 3×3 invertible matrix.

EXAMPLE 4 Finding the Inverse of a Matrix

Given $A = \begin{bmatrix} 1 & 3 & 0 \\ 1 & 1 & -2 \\ -3 & -3 & 5 \end{bmatrix}$, find A^{-1} if possible.

Solution:

$$\left[\begin{array}{ccc|ccc} 1 & 3 & 0 & 1 & 0 & 0 \\ 1 & 1 & -2 & 0 & 1 & 0 \\ -3 & -3 & 5 & 0 & 0 & 1 \end{array}\right]$$

Set up the matrix $[A \mid I_3]$.

Transform the left side of the matrix to the 3×3 identity matrix.

$$\xrightarrow[3R_1 + R_3 \to R_3]{-1R_1 + R_2 \to R_2} \left[\begin{array}{ccc|ccc} 1 & 3 & 0 & 1 & 0 & 0 \\ 0 & -2 & -2 & -1 & 1 & 0 \\ 0 & 6 & 5 & 3 & 0 & 1 \end{array}\right] \xrightarrow{-\frac{1}{2}R_2 \to R_2} \left[\begin{array}{ccc|ccc} 1 & 3 & 0 & 1 & 0 & 0 \\ 0 & 1 & 1 & \frac{1}{2} & -\frac{1}{2} & 0 \\ 0 & 6 & 5 & 3 & 0 & 1 \end{array}\right]$$

$$\xrightarrow[-6R_2 + R_3 \to R_3]{-3R_2 + R_1 \to R_1} \left[\begin{array}{ccc|ccc} 1 & 0 & -3 & -\frac{1}{2} & \frac{3}{2} & 0 \\ 0 & 1 & 1 & \frac{1}{2} & -\frac{1}{2} & 0 \\ 0 & 0 & -1 & 0 & 3 & 1 \end{array}\right] \xrightarrow{-1R_3 \to R_3} \left[\begin{array}{ccc|ccc} 1 & 0 & -3 & -\frac{1}{2} & \frac{3}{2} & 0 \\ 0 & 1 & 1 & \frac{1}{2} & -\frac{1}{2} & 0 \\ 0 & 0 & 1 & 0 & -3 & -1 \end{array}\right]$$

$$\xrightarrow[-1R_3 + R_2 \to R_2]{3R_3 + R_1 \to R_1} \left[\begin{array}{ccc|ccc} 1 & 0 & 0 & -\frac{1}{2} & -\frac{15}{2} & -3 \\ 0 & 1 & 0 & \frac{1}{2} & \frac{5}{2} & 1 \\ 0 & 0 & 1 & 0 & -3 & -1 \end{array}\right]$$

The left side of the matrix is the 3×3 identity matrix.

The right side of the matrix represents the inverse of A.

$$A^{-1} = \begin{bmatrix} -\frac{1}{2} & -\frac{15}{2} & -3 \\ \frac{1}{2} & \frac{5}{2} & 1 \\ 0 & -3 & -1 \end{bmatrix}$$

Avoiding Mistakes

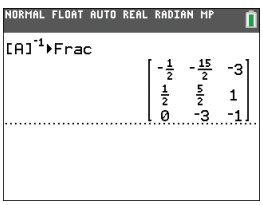
As a check, verify that $A \cdot A^{-1} = I_3$ and $A^{-1} \cdot A = I_3$.

Skill Practice 4 Given $A = \begin{bmatrix} -2 & 4 & 1 \\ 4 & -13 & 10 \\ 3 & -9 & 6 \end{bmatrix}$ find A^{-1} if possible.

TECHNOLOGY CONNECTIONS

Finding the Inverse of a Nonsingular Square Matrix

To find the inverse of a nonsingular matrix [A] using a calculator, first enter the matrix into the calculator using the MATRIX menu. Then place [A] on the home screen and use the x^{-1} key to take the inverse of [A]. It is very important to realize that in this context, the calculator uses the x^{-1} key for the inverse of a matrix, not the reciprocal of a real number.



Answer

4. $A^{-1} = \begin{bmatrix} 4 & -11 & \frac{53}{3} \\ 2 & -5 & 8 \\ 1 & -2 & \frac{10}{3} \end{bmatrix}$

ISTUDY

In Example 5, we identify a singular matrix—that is, a matrix that has no inverse.

EXAMPLE 5 Identifying a Singular Matrix

Show that matrix A is singular. $A = \begin{bmatrix} 1 & 2 & 0 \\ 4 & 5 & 1 \\ 2 & 1 & 1 \end{bmatrix}$

Solution:

$$\left[\begin{array}{ccc|ccc} 1 & 2 & 0 & 1 & 0 & 0 \\ 4 & 5 & 1 & 0 & 1 & 0 \\ 2 & 1 & 1 & 0 & 0 & 1 \end{array}\right]$$

Set up the matrix $[A \mid I_3]$.
Transform the left side of the matrix to the 3×3 identity matrix.

$$\begin{array}{l} -4R_1 + R_2 \to R_2 \\ -2R_1 + R_3 \to R_3 \end{array} \left[\begin{array}{ccc|ccc} 1 & 2 & 0 & 1 & 0 & 0 \\ 0 & -3 & 1 & -4 & 1 & 0 \\ 0 & -3 & 1 & -2 & 0 & 1 \end{array}\right]$$

On the left of the vertical bar, the elements in rows 2 and 3 are multiples of each other (in fact they are identical). Therefore, $-1R_2 + R_3 \to R_3$ results in zeros in row 3 to the left of the bar.

$$-1R_2 + R_3 \to R_3 \left[\begin{array}{ccc|ccc} 1 & 2 & 0 & 1 & 0 & 0 \\ 0 & -3 & 1 & -4 & 1 & 0 \\ 0 & 0 & 0 & 2 & -1 & 1 \end{array}\right]$$

The left side of the matrix cannot be transformed into the 3×3 identity matrix I_3. Therefore, matrix A does not have an inverse.

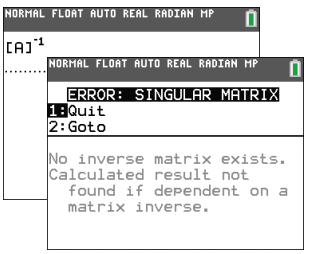
A is a singular matrix (does not have an inverse).

Skill Practice 5 Show that matrix A is singular. $A = \begin{bmatrix} 1 & -3 & -7 \\ 3 & -7 & -17 \\ 1 & 0 & -1 \end{bmatrix}$

TECHNOLOGY CONNECTIONS

Identifying a Singular Matrix

A calculator will return an error message if we attempt to find the inverse of a singular matrix. Consider matrix A from Example 5. The calculator returns the error message shown.



To find the inverse of an invertible 2×2 matrix, we can take a direct approach and apply the following formula.

Formula for the Inverse of a 2×2 Invertible Matrix

Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ be an invertible matrix. Then the inverse A^{-1} is given by:

$$A^{-1} = \frac{1}{ad - bc} \cdot \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

TIP If A is an invertible matrix then the restriction $ad - bc \neq 0$ is implied.

Answer

5. The matrix $[A \mid I_3]$ cannot be written in the form $[I_3 \mid B]$ by using row operations. Therefore, A is a singular matrix.

ISTUDY

Avoiding Mistakes

The formula to find the inverse of an invertible 2×2 matrix does not apply to matrices of higher order.

This formula can be verified by applying the general procedure to find the inverse of A. See Exercise 69.

$$\left[\begin{array}{cc|cc} a & b & 1 & 0 \\ c & d & 0 & 1 \end{array}\right] \xrightarrow[\text{matrix}]{\text{row-equivalent}} \left[\begin{array}{cc|cc} 1 & 0 & \frac{d}{ad-bc} & \frac{-b}{ad-bc} \\ 0 & 1 & \frac{-c}{ad-bc} & \frac{a}{ad-bc} \end{array}\right]$$

$$\xrightarrow{\text{inverse of } A} \frac{1}{ad-bc} \cdot \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

EXAMPLE 6 Finding the Inverse of a 2×2 Matrix

Given $A = \begin{bmatrix} 2 & 9 \\ 1 & 5 \end{bmatrix}$, find A^{-1} and compare to the result of Example 3.

Solution:

$\begin{bmatrix} 2 & 9 \\ 1 & 5 \end{bmatrix}$ $a = 2, b = 9, c = 1, d = 5$

$$A^{-1} = \frac{1}{ad-bc} \cdot \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} = \frac{1}{(2)(5)-(9)(1)} \cdot \begin{bmatrix} 5 & -9 \\ -1 & 2 \end{bmatrix}$$

$$= \frac{1}{1} \cdot \begin{bmatrix} 5 & -9 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} 5 & -9 \\ -1 & 2 \end{bmatrix}$$

This is the same result as was found in Example 3.

Skill Practice 6 Given $B = \begin{bmatrix} 9 & 7 \\ 5 & 4 \end{bmatrix}$, find B^{-1}.

3. Solve Systems of Linear Equations Using the Inverse of a Matrix

A system of linear equations written in standard form can be represented by using matrix multiplication. For example:

$$\begin{aligned} 3x - 2y + z &= 4 \\ x + 4y - z &= 2 \\ 2x + 5y - 2z &= 1 \end{aligned} \xrightarrow[\text{matrix equation}]{\text{corresponding}} \begin{bmatrix} 3 & -2 & 1 \\ 1 & 4 & -1 \\ 2 & 5 & -2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}$$

coefficient matrix — column matrix of variables — column matrix of constants

The matrix on the left is called the **coefficient matrix.** It consists of the coefficients of the variable terms.

If we denote the coefficient matrix by A, the column matrix of variables as X, and the column matrix of constant terms as B, we can write the equation as $AX = B$. If A^{-1} exists, then we can solve the equation for X by multiplying both sides by A^{-1}.

$AX = B$	To solve this equation, the goal is to isolate X.
$A^{-1}AX = A^{-1}B$	Multiply both sides by A^{-1} (provided that A^{-1} exists).
$(A^{-1}A)X = A^{-1}B$	
$I_nX = A^{-1}B$	The product of a matrix and its inverse is the identity matrix.
$X = A^{-1}B$	

Answer

6. $B^{-1} = \begin{bmatrix} 4 & -7 \\ -5 & 9 \end{bmatrix}$

This process is summarized as follows:

Solving Systems of Linear Equations Using Inverse Matrices

Suppose that $AX = B$ represents a system of n linear equations in n variables with a unique solution. Then,

$$X = A^{-1}B$$

where A is the coefficient matrix, B is the matrix of constants, and X is the matrix of variables.

Avoiding Mistakes

The technique of using inverse matrices to solve a system of linear equations does not apply if matrix A does not have an inverse. This occurs when the system of equations is inconsistent or the equations are dependent.

EXAMPLE 7 Solving a System of Equations by Using an Inverse Matrix

Use the inverse of the coefficient matrix to solve the system.

$$\begin{aligned} x + 3y &= -10 \\ x + y - 2z &= -4 \\ -3x - 3y + 5z &= 11 \end{aligned}$$

Solution:

$$AX = B$$

$$\begin{aligned} x + 3y &= -10 \\ x + y - 2z &= -4 \\ -3x - 3y + 5z &= 11 \end{aligned} \longrightarrow \begin{bmatrix} 1 & 3 & 0 \\ 1 & 1 & -2 \\ -3 & -3 & 5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -10 \\ -4 \\ 11 \end{bmatrix}$$

From Example 4, we have that $A^{-1} = \begin{bmatrix} -\frac{1}{2} & -\frac{15}{2} & -3 \\ \frac{1}{2} & \frac{5}{2} & 1 \\ 0 & -3 & -1 \end{bmatrix}$.

$$X = A^{-1}B$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} & -\frac{15}{2} & -3 \\ \frac{1}{2} & \frac{5}{2} & 1 \\ 0 & -3 & -1 \end{bmatrix} \begin{bmatrix} -10 \\ -4 \\ 11 \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} \left(-\frac{1}{2}\right)(-10) + \left(-\frac{15}{2}\right)(-4) + (-3)(11) \\ \left(\frac{1}{2}\right)(-10) + \left(\frac{5}{2}\right)(-4) + (1)(11) \\ (0)(-10) + (-3)(-4) + (-1)(11) \end{bmatrix} = \begin{bmatrix} 2 \\ -4 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 2 \\ -4 \\ 1 \end{bmatrix}$$

Therefore, $x = 2$, $y = -4$, and $z = 1$.
The solution set is $\{(2, -4, 1)\}$.

Skill Practice 7 Use the inverse of the coefficient matrix found in Skill Practice 4 to solve the system.

$$\begin{aligned} -2x + 4y + z &= 0 \\ 4x - 13y + 10z &= 24 \\ 3x - 9y + 6z &= 15 \end{aligned}$$

Answer
7. {(1, 0, 2)}

SECTION 10.4 Practice Exercises

Prerequisite Review

For Exercises R.1–R.4, match the statement with the property that describes it.

a. Identity property of addition
b. Inverse property of multiplication
c. Identity property of multiplication
d. Inverse property of addition

R.1. $\frac{1}{7} \cdot 7 = 1$
R.2. $15 \cdot 1 = 15$
R.3. $-6 + 6 = 0$
R.4. $7 + 0 = 7$

Concept Connections

1. The symbol I_n represents the _____ matrix of order n.

2. I_n is an $n \times n$ matrix with _____'s along the main diagonal and _____'s elsewhere.

3. Given an $n \times n$ matrix A, if there exists a matrix A^{-1} such that $A \cdot A^{-1} = I_n$ and $A^{-1} \cdot A = I_n$, then A^{-1} is called the _____ of A.

4. A matrix that does not have an inverse is called a _____ matrix. A matrix that does have an inverse is said to be invertible or _____.

5. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ be an invertible matrix. Then a formula for the inverse A^{-1} is given by _____.

6. Suppose that the matrix equation $AX = B$ represents a system of n linear equations in n variables with a unique solution. Then $X =$ _____.

Objective 1: Identify Identity and Inverse Matrices

7. Write the matrix I_2.

8. Write the matrix I_3.

For Exercises 9–12, verify that

a. $AI_n = A$

b. $I_nA = A$ **(See Example 1)**

9. $A = \begin{bmatrix} -\frac{7}{8} & \sqrt{5} \\ 5.1 & 8 \end{bmatrix}$

10. $A = \begin{bmatrix} \sqrt{3} & 1 \\ \pi & 4 \end{bmatrix}$

11. $A = \begin{bmatrix} 1 & -3 & 4 \\ 9 & 5 & 3 \\ 11 & -6 & -4 \end{bmatrix}$

12. $A = \begin{bmatrix} -3 & 9 & 1 \\ 0 & 4 & -1 \\ 5 & 0 & 3 \end{bmatrix}$

For Exercises 13–18, determine whether A and B are inverses. (See Example 2)

13. $A = \begin{bmatrix} 10 & -3 \\ 4 & -2 \end{bmatrix}$ and $B = \begin{bmatrix} \frac{1}{4} & -\frac{3}{8} \\ \frac{1}{2} & -\frac{5}{4} \end{bmatrix}$

14. $A = \begin{bmatrix} 4 & -1 \\ -8 & 6 \end{bmatrix}$ and $B = \begin{bmatrix} \frac{3}{8} & \frac{1}{16} \\ \frac{1}{2} & \frac{1}{4} \end{bmatrix}$

15. $A = \begin{bmatrix} -2 & -3 & 1 \\ -3 & -3 & 1 \\ -2 & -4 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & -1 & 0 \\ 1 & 0 & -1 \\ 6 & -2 & -3 \end{bmatrix}$

16. $A = \begin{bmatrix} -1 & 2 & 1 \\ -5 & 8 & 2 \\ 7 & -11 & -3 \end{bmatrix}$ and $B = \begin{bmatrix} 2 & 5 & 4 \\ 1 & 4 & 3 \\ 1 & -3 & -2 \end{bmatrix}$

17. $A = \begin{bmatrix} 2 & 1 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} 4 & -3 \\ -7 & 6 \end{bmatrix}$

18. $A = \begin{bmatrix} 3 & 2 \\ 10 & 7 \end{bmatrix}$ and $B = \begin{bmatrix} -7 & 10 \\ 11 & -15 \end{bmatrix}$

Objective 2: Determine the Inverse of a Matrix

For Exercises 19–34, determine the inverse of the given matrix if possible. Otherwise, state that the matrix is singular. (See Examples 3–6)

19. $A = \begin{bmatrix} -4 & -3 \\ 6 & 5 \end{bmatrix}$

20. $A = \begin{bmatrix} 5 & -3 \\ 10 & -7 \end{bmatrix}$

21. $A = \begin{bmatrix} -8 & -2 \\ 10 & 5 \end{bmatrix}$

22. $A = \begin{bmatrix} 0 & 1 \\ 6 & -2 \end{bmatrix}$

23. $A = \begin{bmatrix} 3 & 7 \\ 6 & 14 \end{bmatrix}$

24. $A = \begin{bmatrix} 2 & -5 \\ -6 & 15 \end{bmatrix}$

ISTUDY

25. $A = \begin{bmatrix} 2 & -7 & 8 \\ 1 & -3 & 3 \\ 1 & -5 & 6 \end{bmatrix}$

26. $A = \begin{bmatrix} 1 & -1 & 1 \\ 1 & 1 & -2 \\ -1 & 0 & 1 \end{bmatrix}$

27. $A = \begin{bmatrix} 1 & -2 & 2 \\ 2 & -3 & 1 \\ 0 & 1 & -1 \end{bmatrix}$

28. $A = \begin{bmatrix} -2 & 5 & -4 \\ 1 & -2 & 1 \\ 1 & -5 & 9 \end{bmatrix}$

29. $A = \begin{bmatrix} 5 & 7 & -11 \\ 3 & 5 & -9 \\ 1 & 1 & -1 \end{bmatrix}$

30. $A = \begin{bmatrix} 1 & 3 & 9 \\ 2 & 7 & 22 \\ -5 & -17 & -53 \end{bmatrix}$

31. $A = \begin{bmatrix} 0 & 1 & 1 \\ \frac{5}{3} & -1 & -3 \\ -1 & 1 & 2 \end{bmatrix}$

32. $A = \begin{bmatrix} 3 & -1 & -\frac{1}{2} \\ 2 & -1 & \frac{1}{2} \\ -5 & 2 & \frac{1}{2} \end{bmatrix}$

33. $A = \begin{bmatrix} 1 & -2 & 5 & 0 \\ 0 & -1 & 2 & 0 \\ 0 & 1 & -1 & 0 \\ 2 & -1 & 7 & 1 \end{bmatrix}$

34. $A = \begin{bmatrix} 1 & 3 & 0 & -3 \\ 0 & 1 & 0 & -2 \\ -2 & -4 & 1 & 2 \\ 0 & 1 & 1 & 0 \end{bmatrix}$

Objective 3: Solve Systems of Linear Equations Using the Inverse of a Matrix

For Exercises 35–38, write the system of equations as a matrix equation of the form $AX = B$, where A is the coefficient matrix, X is the column matrix of variables, and B is the column matrix of constants.

35. $3x - 4y = -1$
$2x + y = 14$

36. $-6x - y = 1$
$2x + 3y = 13$

37. $9x - 6y + 4z = 27$
$4x - z = 1$
$3y + z = 0$

38. $-3x + 8z = 4$
$6y - z = 7$
$2x - y + 6z = -15$

For Exercises 39–50, solve the system by using the inverse of the coefficient matrix. (See Example 7)

39. $-4x - 3y = -4$
$6x + 5y = 8$
(See Exercise 19 for A^{-1}.)

40. $5x - 3y = -20$
$10x - 7y = -50$
(See Exercise 20 for A^{-1}.)

41. $3x + 7y = -5$
$4x + 9y = -7$

42. $3x - 8y = -1$
$-4x + 11y = 2$

43. $2x - 7y + 8z = 1$
$x - 3y + 3z = 0$
$x - 5y + 6z = 2$
(See Exercise 25 for A^{-1}.)

44. $x - y + z = -4$
$x + y - 2z = 12$
$-x + z = -5$
(See Exercise 26 for A^{-1}.)

45. $x - 2y + 2z = -12$
$2x - 3y + z = -10$
$y - z = 6$
(See Exercise 27 for A^{-1}.)

46. $-2x + 5y - 4z = -20$
$x - 2y + z = 8$
$x - 5y + 9z = 24$
(See Exercise 28 for A^{-1}.)

47. $r - 2s + t = 2$
$-r + 4s + t = 3$
$2r - 2s - t = -1$

48. $a - b + 3c = 2$
$2a + b + 2c = 2$
$-2a - 2b + c = 3$

49. $w - 2x + 5y = 3$
$-x + 2y = 1$
$x - y = -1$
$2w - x + 7y + z = 5$
(See Exercise 33 for A^{-1}.)

50. $w + 3x - 3z = 8$
$x - 2z = 4$
$-2w - 4x + y + 2z = -6$
$x + y = 0$
(See Exercise 34 for A^{-1}.)

Mixed Exercises

For Exercises 51–58, determine whether the statement is true or false. If a statement is false, explain why.

51. A 3×2 matrix has a multiplicative inverse.

52. A 2×3 matrix has a multiplicative inverse.

53. Every square matrix has an inverse.

54. Every singular matrix has an inverse.

ISTUDY

55. Every nonsingular matrix has an inverse.

56. The matrix $\begin{bmatrix} -a & -b \\ a & b \end{bmatrix}$ is invertible.

57. The matrix $\begin{bmatrix} x & y \\ 2x & 2y \end{bmatrix}$ is invertible.

58. The inverse of the matrix I_4 is itself.

59. Find a 2×2 matrix that is its own inverse. Answers will vary.

60. Given an invertible 2×2 matrix A and the nonzero real number k, find the inverse of kA in terms of A^{-1}.

61. Given $A = \begin{bmatrix} 3 & 2 \\ 5 & 6 \end{bmatrix}$,

a. Find A^{-1}. **b.** Find $(A^{-1})^{-1}$.

62. Given $B = \begin{bmatrix} -3 & 2 \\ -5 & 4 \end{bmatrix}$,

a. Find B^{-1}. **b.** Find $(B^{-1})^{-1}$.

63. Given $A = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}$, where a and b are nonzero real numbers, find A^{-1}.

64. Given $A = \begin{bmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{bmatrix}$, where a, b, and c are nonzero real numbers, find A^{-1}.

65. Use $A = \begin{bmatrix} -4 & 11 \\ -1 & 3 \end{bmatrix}$ and $A^{-1} = \begin{bmatrix} -3 & 11 \\ -1 & 4 \end{bmatrix}$ to solve the system.

a. $-4x + 11y = -66$
$3y - x = -19$

b. $-4x + 11y = \frac{16}{3}$
$-x + 3y = \frac{3}{2}$

66. Use $B = \begin{bmatrix} 1 & -2 & 0 \\ 0 & 1 & -1 \\ -2 & 0 & 3 \end{bmatrix}$ and $B^{-1} = \begin{bmatrix} -3 & -6 & -2 \\ -2 & -3 & -1 \\ -2 & -4 & -1 \end{bmatrix}$ to solve the system.

a. $x - 2y = 8$
$y - z = -8$
$-2x + 3z = 10$

b. $x - 2y = -3$
$y - z = 0$
$-2x + 3z = 3$

Write About It

67. Explain how you can determine if two $n \times n$ matrices, A and B, are inverses.

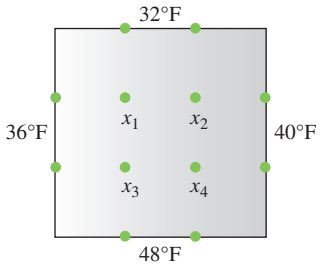
68. Given a matrix $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, for what conditions on a, b, c, and d will the matrix not have an inverse?

Expanding Your Skills

69. Given $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, perform row operations on the matrix $[A \,|\, I_n]$ to find A^{-1}. This confirms the formula for the inverse of an invertible 2×2 matrix. (See page 960.)

70. Show by counterexample that $(AB)^{-1} \neq A^{-1}B^{-1}$. That is, find two matrices A and B for which $(AB)^{-1} \neq A^{-1}B^{-1}$.

Physicists know that if each edge of a thin conducting plate is kept at a constant temperature, then the temperature at the interior points is the mean (average) of the four surrounding points equidistant from the interior point. Use this principle in Exercise 71 to find the temperature at points x_1, x_2, x_3, and x_4.



71. *Hint*: Set up four linear equations to represent the temperature at points x_1, x_2, x_3, and x_4. Then solve the system. For example, one equation would be:

$x_1 = \frac{1}{4}(36 + 32 + x_2 + x_3)$

Technology Connections

For Exercises 72–73, use a graphing utility to find the inverse of the given matrix. Round the elements in the inverse to 2 decimal places.

72. $A = \begin{bmatrix} 0.04 & 0.13 & -0.08 & -0.43 \\ 0.19 & 0.33 & 0.06 & -0.84 \\ 0.01 & 0.08 & -0.11 & 0.46 \\ 0.37 & -1.42 & 0.03 & 0.52 \end{bmatrix}$

73. $A = \begin{bmatrix} 3.5 & 2.1 & 1.6 & 2.4 \\ -4.5 & 3.9 & -9.1 & 3.8 \\ 5.7 & 6.8 & -1.4 & -7.7 \\ 3.3 & 2.8 & 4.6 & -1.0 \end{bmatrix}$

For Exercises 74–75, use a graphing calculator and the inverse of the coefficient matrix to find the solution to the given system. Round to 2 decimal places.

74.
$$\begin{aligned} (\log 2)x + (\sqrt{7})y + \quad z &= 4.1 \\ (e^2)x - (\sqrt{3})y - \quad \pi z &= -3.7 \\ (\ln 10)\,x + \quad y - 2.2z &= 7.2 \end{aligned}$$

75.
$$\begin{aligned} (\sqrt{11})x + \quad y - (\ln 5)z &= 52.3 \\ (\sqrt{7})x - \quad \pi y + (e^3)z &= -27.5 \\ -x + (\log 81)\,y - \quad z &= 69.8 \end{aligned}$$

Point of Interest

Cryptography (from the Greek *crypt* for "hidden" or "secret," and *graphy* for "write" or "study") is the study of coding and decoding messages. During World War II, coded messages were used by all sides to relay information. Some methods were alphanumeric ciphers and others, such as the Native American "code talkers," used a language unknown to adversaries to speak in open communication over the radio. Breaking the codes used by Germany and Japan was crucial to winning the war, and it required the work of thousands of men and women, including the author's uncle.

Navajo code talkers
Saul Loeb/AFP/Getty Images

Alan Turing
Archivio GBB/Alamy Stock Photo

One of the more famous codebreakers of World War II was the British mathematician Alan Turing. Turing successfully worked on breaking the cipher codes produced by Nazi Germany's Enigma machine. Tragically, Turing was convicted of "gross indecency" in 1952 as a result of his sexual orientation and was found dead by cyanide poisoning in 1954. He was posthumously pardoned in 2013 by Queen Elizabeth II.

One style of encoding a message uses matrices. The process begins by assigning a number (1–26) to each letter of the alphabet and a 0 to designate a space. Other numbers may be assigned to punctuation or special characters (e.g., % = 27, ! = 28).

Table 10-2

A	1	I	9	Q	17	Y	25
B	2	J	10	R	18	Z	26
C	3	K	11	S	19	Space	0
D	4	L	12	T	20		
E	5	M	13	U	21		
F	6	N	14	V	22		
G	7	O	15	W	23		
H	8	P	16	X	24		

Using Table 10-2, the message MEET AT TWO would become:

M	E	E	T		A	T		T	W	O
13	5	5	20	0	1	20	0	20	23	15

This gives a list of numbers to place in a matrix:

13, 5, 5, 20, 0, 1, 20, 0, 20, 23, 15

Exactly *how* the list of numbers is arranged depends on the encoding and decoding matrices. An invertible matrix must be used to encode the message, and the inverse of the encoding matrix is used to decode the message.

For example, if the coding matrix is $A = \begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix}$, then the decoding matrix is $A^{-1} = \begin{bmatrix} 2 & -1 \\ -3 & 2 \end{bmatrix}$.

If the coding matrix is $B = \begin{bmatrix} 8 & -5 & -2 \\ -11 & 7 & 3 \\ -34 & 21 & 9 \end{bmatrix}$, then the decoding matrix is $B^{-1} = \begin{bmatrix} 0 & 3 & -1 \\ -3 & 4 & -2 \\ 7 & 2 & 1 \end{bmatrix}$.

To use A as the encoding matrix, arrange the numbers in the message matrix M in columns of 2. Notice that a zero in the last row is used to complete the matrix.

$$\begin{bmatrix} M & E & E & T & \_ & A \\ T & \_ & T & W & O & \_ \end{bmatrix} \text{ becomes } M = \begin{bmatrix} 13 & 5 & 5 & 20 & 0 & 1 \\ 20 & 0 & 20 & 23 & 15 & 0 \end{bmatrix}$$

Next, multiply:

$$AM = \begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} \begin{bmatrix} 13 & 5 & 5 & 20 & 0 & 1 \\ 20 & 0 & 20 & 23 & 15 & 0 \end{bmatrix} = \begin{bmatrix} 46 & 10 & 30 & 63 & 15 & 2 \\ 79 & 15 & 55 & 106 & 30 & 3 \end{bmatrix}$$

The encoded matrix, AM, may be decoded by using the inverse matrix A^{-1}. Multiply:

$$A^{-1}(AM) = \begin{bmatrix} 2 & -1 \\ -3 & 2 \end{bmatrix} \begin{bmatrix} 46 & 10 & 30 & 63 & 15 & 2 \\ 79 & 15 & 55 & 106 & 30 & 3 \end{bmatrix} = M$$

To use B as the encoding matrix, arrange the message in columns of 3.

$$\begin{bmatrix} M & E & E & T \\ \_ & A & T & \_ \\ T & W & O & \_ \end{bmatrix} \text{ becomes } M = \begin{bmatrix} 13 & 5 & 5 & 20 \\ 0 & 1 & 20 & 0 \\ 20 & 23 & 15 & 0 \end{bmatrix}$$

Multiply BM to encode and $B^{-1}(BM)$ to decode.

$$BM = \begin{bmatrix} 8 & -5 & -2 \\ -11 & 7 & 3 \\ -34 & 21 & 9 \end{bmatrix} \begin{bmatrix} 13 & 5 & 5 & 20 \\ 0 & 1 & 20 & 0 \\ 20 & 23 & 15 & 0 \end{bmatrix} = \begin{bmatrix} 64 & -11 & -90 & 160 \\ -83 & 21 & 130 & -220 \\ -262 & 58 & 385 & -680 \end{bmatrix}$$

For Exercises 76–77, a message is represented in a matrix by using the numerical code given in Table 10-2. The message is then encoded by forming a new matrix, P, as the product of an encoding matrix, A, and the original matrix.

a. Determine the decoding matrix, A^{-1}.

b. Decode the message.

76. $A = \begin{bmatrix} 3 & 2 \\ 7 & 5 \end{bmatrix}$, $P = \begin{bmatrix} 29 & 17 & 78 & 10 & 104 & 15 \\ 70 & 42 & 185 & 25 & 249 & 35 \end{bmatrix}$

77. $A = \begin{bmatrix} 1 & 2 & 4 \\ -1 & -1 & 1 \\ 0 & 1 & 4 \end{bmatrix}$, $P = \begin{bmatrix} 73 & 44 & 59 \\ -43 & -14 & -15 \\ 29 & 24 & 39 \end{bmatrix}$

ISTUDY

SECTION 10.5 Determinants and Cramer's Rule

OBJECTIVES

1. Evaluate the Determinant of a 2 × 2 Matrix
2. Evaluate the Determinant of an $n \times n$ Matrix
3. Apply Cramer's Rule

1. Evaluate the Determinant of a 2 × 2 Matrix

In this section, we present yet another method to solve a linear system with one unique solution. This method, called Cramer's rule, enables us to write a formula to solve a system based on the coefficients of the equations in the system.

Before studying Cramer's rule, we need to become familiar with the determinant of a square matrix. Associated with every square matrix is a real number called the *determinant* of the matrix. A determinant of a square matrix A, denoted $|A|$, is written by enclosing the elements of the matrix within two vertical bars. For example:

$$\text{Given } A = \begin{bmatrix} 3 & -1 \\ 4 & 0 \end{bmatrix}, \text{ then } |A| = \begin{vmatrix} 3 & -1 \\ 4 & 0 \end{vmatrix}$$

Avoiding Mistakes

Notice that a determinant is denoted using vertical bars, whereas a matrix is denoted using brackets.

Determinants have many applications in mathematics, including solving systems of linear equations, finding the area of a triangle, determining whether three points are collinear, and finding an equation of a line through two points (see Exercises 77–84). The determinant of a 2 × 2 matrix is defined as follows:

Determinant of a 2 × 2 Matrix

The **determinant** of the matrix $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ is $ad - bc$. That is,

$$|A| = \begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc.$$

EXAMPLE 1 Evaluating a 2 × 2 Determinant

Evaluate the determinant of each matrix.

a. $A = \begin{bmatrix} 6 & -2 \\ 5 & \frac{1}{3} \end{bmatrix}$ **b.** $B = \begin{bmatrix} 2 & -11 \\ 0 & 0 \end{bmatrix}$

Solution:

a. $|A| = \begin{vmatrix} 6 & -2 \\ 5 & \frac{1}{3} \end{vmatrix} = \underset{a \cdot d}{(6)(\tfrac{1}{3})} - \underset{b \cdot c}{(-2)(5)} = 12$ $\quad a = 6, b = -2, c = 5, \text{ and } d = \frac{1}{3}$

b. $|B| = \begin{bmatrix} 2 & -11 \\ 0 & 0 \end{bmatrix} = \underset{a \cdot d}{(2)(0)} - \underset{b \cdot c}{(-11)(0)} = 0$ $\quad a = 2, b = -11, c = 0, \text{ and } d = 0$

TIP Example 1(b) illustrates that the determinant of a matrix having a row of all zeros is 0. The same is true for a matrix having a column of all zeros.

Skill Practice 1 Evaluate the determinant.

a. $\begin{vmatrix} 3 & -\frac{1}{2} \\ 10 & 2 \end{vmatrix}$ **b.** $\begin{vmatrix} 9 & 0 \\ -4 & 0 \end{vmatrix}$

2. Evaluate the Determinant of an $n \times n$ Matrix

We now develop the tools to compute the determinant of a higher-order square matrix. To find the determinant of an $n \times n$ matrix $A = [a_{ij}]$ we first need to define the minor of an element of the matrix. For any element a_{ij}, the **minor** M_{ij} of that

Answers
1. a. 11 b. 0

element is the determinant of the resulting matrix obtained by deleting the ith row and jth column. For example, consider the matrix:

$$A = [a_{ij}] = \begin{bmatrix} 5 & -1 & 6 \\ 0 & -7 & 1 \\ 4 & 2 & 6 \end{bmatrix}$$

The element a_{11} is 5. The minor of this element is found by deleting the first row and first column and then evaluating the determinant of the remaining 2×2 matrix:

$$\begin{bmatrix} 5 & -1 & 6 \\ 0 & -7 & 1 \\ 4 & 2 & 6 \end{bmatrix} \qquad M_{11} = \begin{vmatrix} -7 & 1 \\ 2 & 6 \end{vmatrix} = (-7)(6) - (1)(2) = -44$$

The element a_{32} is 2. The minor of this element is found by deleting the third row and second column and then evaluating the determinant of the remaining 2×2 matrix:

$$\begin{bmatrix} 5 & -1 & 6 \\ 0 & -7 & 1 \\ 4 & 2 & 6 \end{bmatrix} \qquad M_{32} = \begin{vmatrix} 5 & 6 \\ 0 & 1 \end{vmatrix} = (5)(1) - (6)(0) = 5$$

EXAMPLE 2 **Determining the Minor for Elements in a Matrix**

Find the minor for each element in the first column of the matrix.

$$\begin{bmatrix} 3 & 4 & -1 \\ 2 & -4 & 5 \\ 0 & 1 & -6 \end{bmatrix}$$

Solution:

For the element a_{11}:

$$\begin{bmatrix} 3 & 4 & -1 \\ 2 & -4 & 5 \\ 0 & 1 & -6 \end{bmatrix} \qquad M_{11} = \begin{vmatrix} -4 & 5 \\ 1 & -6 \end{vmatrix} = (-4)(-6) - (5)(1) = 19$$

For the element a_{21}:

$$\begin{bmatrix} 3 & 4 & -1 \\ 2 & -4 & 5 \\ 0 & 1 & -6 \end{bmatrix} \qquad M_{21} = \begin{vmatrix} 4 & -1 \\ 1 & -6 \end{vmatrix} = (4)(-6) - (-1)(1) = -23$$

For the element a_{31}:

$$\begin{bmatrix} 3 & 4 & -1 \\ 2 & -4 & 5 \\ 0 & 1 & -6 \end{bmatrix} \qquad M_{31} = \begin{vmatrix} 4 & -1 \\ -4 & 5 \end{vmatrix} = (4)(5) - (-1)(-4) = 16$$

Skill Practice 2 Find the minor for each element in the second row of the matrix from Example 2.

Next, we define the determinant for a 3×3 matrix.

Answer

2. $M_{21} = -23$; $M_{22} = -18$; $M_{23} = 3$

Determinant of a 3 × 3 Matrix

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1\begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - a_2\begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} + a_3\begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix} \text{ or equivalently,}$$

$$= a_1(b_2c_3 - c_2b_3) - a_2(b_1c_3 - c_1b_3) + a_3(b_1c_2 - c_1b_2) \quad \text{or}$$

$$= a_1b_2c_3 + b_1c_2a_3 + c_1a_2b_3 - a_3b_2c_1 - b_3c_2a_1 - c_3a_2b_1$$

From this definition, we see that the determinant of the given 3 × 3 matrix can be written as

$$a_1 \cdot (\text{minor of } a_1) - a_2 \cdot (\text{minor of } a_2) + a_3 \cdot (\text{minor of } a_3)$$

EXAMPLE 3 Evaluating the Determinant of a 3 × 3 Matrix

Evaluate the determinant of the matrix. $A = \begin{bmatrix} 2 & 4 & 2 \\ 1 & -3 & 0 \\ -5 & 5 & -1 \end{bmatrix}$

Solution:

$$|A| = \begin{vmatrix} 2 & 4 & 2 \\ 1 & -3 & 0 \\ -5 & 5 & -1 \end{vmatrix} = 2 \cdot \overbrace{\begin{vmatrix} -3 & 0 \\ 5 & -1 \end{vmatrix}}^{\text{minor of } 2} - (1)\overbrace{\begin{vmatrix} 4 & 2 \\ 5 & -1 \end{vmatrix}}^{\text{minor of } 1} + (-5) \cdot \overbrace{\begin{vmatrix} 4 & 2 \\ -3 & 0 \end{vmatrix}}^{\text{minor of } -5}$$

$$= 2[(-3)(-1) - (0)(5)] - 1[(4)(-1) - (2)(5)] + (-5)[(4)(0) - (2)(-3)]$$

$$= 2(3) - 1(-14) - 5(6)$$

$$= -10$$

Skill Practice 3 Evaluate the determinant. $\begin{vmatrix} -2 & 4 & 9 \\ 5 & -1 & 2 \\ 1 & 1 & 6 \end{vmatrix}$

Although we defined the determinant of a 3 × 3 matrix by expanding the minors of the elements in the first column, *any row or column can be used*. However, we must choose the correct sign to apply to the product of factors of each term. The following array of signs is helpful.

row 1, column 1
1 + 1 = 2 (even)

row 1, column 2
1 + 2 = 3 (odd)

$$\begin{bmatrix} + & - & + \\ - & + & - \\ + & - & + \end{bmatrix}$$

Notice that the sign is positive if the sum of the row and column numbers is even. The sign is negative if the sum of the row and column numbers is odd.

Answer
3. −42

ISTUDY

To evaluate the determinant of an $n \times n$ matrix, first choose any row or column. For each element a_{ij} in the selected row or column, multiply the minor by 1 or -1, depending on whether the sum of the row and column numbers is even or odd. That is, for the element a_{ij}, we have $(-1)^{i+j}M_{ij}$. This product is called the *cofactor* of the element a_{ij}.

Cofactor of an Element of a Matrix

Given a square matrix $A = [a_{ij}]$, the **cofactor** of a_{ij} is $(-1)^{i+j}M_{ij}$, where M_{ij} is the minor of a_{ij}.

Using the definition of the cofactor of an element of an $n \times n$ matrix, we can now present a generic method to find the determinant of the matrix.

Evaluating the Determinant of an $n \times n$ Matrix by Expanding Cofactors

Step 1 Choose any row or column.
Step 2 Multiply each element in the selected row or column by its cofactor.
Step 3 The value of the determinant is the sum of the products from step 2.

It is important to note that this three-step process to evaluate a determinant works for any $n \times n$ matrix, including a 2×2 matrix. For example, given $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, we can evaluate the determinant of A by expanding cofactors about the first row. The cofactor of a is d, and the cofactor of b is $-c$. Therefore,

$$\begin{aligned} |A| &= a(d) + b(-c) \\ &= ad - bc \text{ as expected.} \end{aligned}$$

EXAMPLE 4 Evaluating the Determinant of a 3×3 Matrix

Evaluate the determinant of the matrix from Example 3 by expanding cofactors about the elements in the third row.

$$A = \begin{bmatrix} 2 & 4 & 2 \\ 1 & -3 & 0 \\ -5 & 5 & -1 \end{bmatrix}$$

Solution:

$$\begin{vmatrix} 2 & 4 & 2 \\ 1 & -3 & 0 \\ -5 & 5 & -1 \end{vmatrix} = \overbrace{(-5)(-1)^{3+1}\begin{vmatrix} 4 & 2 \\ -3 & 0 \end{vmatrix}}^{\text{cofactor of } -5} + \overbrace{(5)(-1)^{3+2}\begin{vmatrix} 2 & 2 \\ 1 & 0 \end{vmatrix}}^{\text{cofactor of } 5} + \overbrace{(-1)(-1)^{3+3}\begin{vmatrix} 2 & 4 \\ 1 & -3 \end{vmatrix}}^{\text{cofactor of } -1}$$

$$\begin{aligned} &= (-5)(1)[(4)(0) - (2)(-3)] + (5)(-1)[(2)(0) - (2)(1)] + (-1)(1)[(2)(-3) - (4)(1)] \\ &= -5(6) - 5(-2) - 1(-10) \\ &= -30 + 10 + 10 \\ &= -10 \end{aligned}$$

This is the same result as in Example 3.

ISTUDY

Skill Practice 4 Evaluate the determinant by expanding cofactors about the elements in the third column.

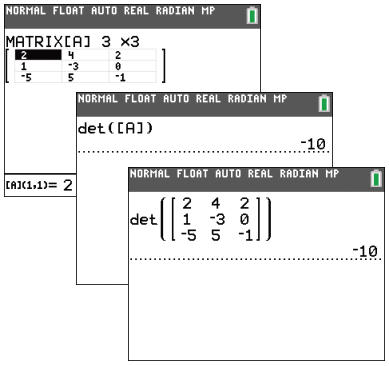
$$\begin{vmatrix} -2 & 4 & 9 \\ 5 & -1 & 2 \\ 1 & 1 & 6 \end{vmatrix}$$

TECHNOLOGY CONNECTIONS

Evaluating a Determinant

To find the determinant of a matrix on a graphing calculator, first enter the matrix in the calculator by using the MATRIX menu and EDIT menu. Select a name for the matrix such as [A]. Then access the determinant function det(under the MATRIX and MATH menus. Enter det([A]) in the home screen and press ENTER.

Alternatively, if the calculator is in "MATHPRINT" mode, enter the matrix by selecting ALPHA F3.



TIP The determinant of a 3 × 3 matrix can also be evaluated by using the "method of diagonals."

Step 1: Recopy columns 1 and 2 to the right of the matrix.

Step 2: Multiply the elements on the diagonals labeled d_1 through d_6 (each diagonal has three elements).

Step 3: The value of the determinant is $(d_1 + d_2 + d_3) - (d_4 + d_5 + d_6)$.

The determinant from Example 4 is evaluated as follows:

$$\begin{bmatrix} 2 & 4 & 2 & 2 & 4 \\ 1 & -3 & 0 & 1 & -3 \\ -5 & 5 & -1 & -5 & 5 \end{bmatrix}$$

d_4 d_5 d_6 d_1 d_2 d_3

$$\begin{aligned} &= [(2)(-3)(-1) + (4)(0)(-5) + (2)(1)(5)] \\ &\quad - [(2)(-3)(-5) + (2)(0)(5) + (4)(1)(-1)] \\ &= -10 \end{aligned}$$

Some students find the method of diagonals to be a faster technique to find the determinant of a 3 × 3 matrix. However, it is critical to note that the method of diagonals only works for the determinant of a 3 × 3 matrix.

Perhaps one of the most important applications of the determinant of a matrix is to determine whether the matrix has an inverse. In Section 10.4, we found the inverse of a 2 × 2 matrix $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ by applying the formula $A^{-1} = \dfrac{1}{ad - bc}\begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$. This is equivalent to $A^{-1} = \dfrac{1}{|A|}\begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$. Furthermore, the inverse exists if $ad - bc \neq 0$ or equivalently, if $|A| \neq 0$. This is true in general for any $n \times n$ matrix.

Using Determinants to Determine if a Matrix Is Invertible

Let A be an $n \times n$ matrix. Then A is invertible if and only if $|A| \neq 0$.

Answer
4. −42

ISTUDY

In Example 5, we will use the determinant of A to determine if A has an inverse.

EXAMPLE 5 **Using a Determinant to Determine if a Matrix Is Invertible**

Use $|A|$ to determine if A is invertible. $A = \begin{vmatrix} -2 & 0 & 1 & 2 \\ 6 & 2 & -2 & 5 \\ 5 & 3 & -1 & 1 \\ 0 & 4 & 2 & 1 \end{vmatrix}$

Solution:

To evaluate a determinant, we can simplify the arithmetic by expanding around the row or column that contains the greatest number of 0 elements. In this case, we have chosen row 1.

$$\begin{vmatrix} -2 & 0 & 1 & 2 \\ 6 & 2 & -2 & 5 \\ 5 & 3 & -1 & 1 \\ 0 & 4 & 2 & 1 \end{vmatrix} = -2(-1)^{1+1}\begin{vmatrix} 2 & -2 & 5 \\ 3 & -1 & 1 \\ 4 & 2 & 1 \end{vmatrix} + 0(-1)^{1+2}\begin{vmatrix} 6 & -2 & 5 \\ 5 & -1 & 1 \\ 0 & 2 & 1 \end{vmatrix}$$
$$+ 1(-1)^{1+3}\begin{vmatrix} 6 & 2 & 5 \\ 5 & 3 & 1 \\ 0 & 4 & 1 \end{vmatrix} + 2(-1)^{1+4}\begin{vmatrix} 6 & 2 & -2 \\ 5 & 3 & -1 \\ 0 & 4 & 2 \end{vmatrix}$$

The second term is zero. Evaluating the determinants in the first, third, and fourth terms (shown in red), we have:

$$\begin{vmatrix} -2 & 0 & 1 & 2 \\ 6 & 2 & -2 & 5 \\ 5 & 3 & -1 & 1 \\ 0 & 4 & 2 & 1 \end{vmatrix} = -2(1)(42) + 0 + 1(1)(84) + 2(-1)(0) = 0$$

The determinant of A is zero. Therefore, A is not invertible.

Skill Practice 5 Use $|A|$ to determine if A is invertible. $A = \begin{vmatrix} 3 & 2 & 1 & 0 \\ 4 & 0 & 3 & 1 \\ 2 & 0 & 0 & 5 \\ 3 & -1 & 0 & 9 \end{vmatrix}$

3. Apply Cramer's Rule

We have learned several methods to solve a system of linear equations: the substitution method, the addition method, Gaussian elimination, Gauss-Jordan elimination, and the application of matrix inverses. We now present another method called Cramer's rule.

Cramer's rule involves finding the ratio of several determinants derived from the coefficients of the equations within the system. For example, consider the following system of equations.

$$a_1x + b_1y = c_1$$
$$a_2x + b_2y = c_2$$

Answer

5. $|A| = -9$; Since $|A| \neq 0$, A is invertible.

ISTUDY

Using the addition method to solve for x, we have

$$\begin{aligned} a_1x + b_1y &= c_1 \\ a_2x + b_2y &= c_2 \end{aligned} \xrightarrow[\text{Multiply by } -b_1.]{\text{Multiply by } b_2.} \begin{aligned} a_1b_2x + b_1b_2y &= c_1b_2 \\ -a_2b_1x - b_1b_2y &= -c_2b_1 \\ \hline (a_1b_2 - a_2b_1)x &= c_1b_2 - c_2b_1 \end{aligned}$$

$$x = \frac{c_1b_2 - c_2b_1}{a_1b_2 - a_2b_1} = \frac{\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}$$

Using similar logic, we can show that $y = \dfrac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1} = \dfrac{\begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}$

These results are summarized as Cramer's rule for a system of linear equations in two variables.

Cramer's Rule for a System of Two Linear Equations in Two Variables

Given the system $\begin{aligned} a_1x + b_1y &= c_1 \\ a_2x + b_2y &= c_2 \end{aligned}$

let $D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$, $D_x = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}$, and $D_y = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}$.

Then if $D \neq 0$, the system has the unique solution: $x = \dfrac{D_x}{D}$ and $y = \dfrac{D_y}{D}$

TIP Here are some memory tips to remember the patterns presented in Cramer's rule.

$$\begin{aligned} a_1x + b_1y &= c_1 \\ a_2x + b_2y &= c_2 \end{aligned}$$

Coefficients of x terms, y terms

1. The determinant D is the determinant of the coefficients of x and y. $D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$

x-coefficients replaced by c_1 and c_2

2. The determinant D_x has the column of x term coefficients replaced by c_1 and c_2. $D_x = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}$

y-coefficients replaced by c_1 and c_2

3. The determinant D_y has the column of y term coefficients replaced by c_1 and c_2. $D_y = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}$

ISTUDY

EXAMPLE 6 Solving a 2 × 2 System by Using Cramer's Rule

Solve the system by using Cramer's rule. $-11x + 6y = 4$, $2x - 5y = -3$

Solution:

For this system, $a_1 = -11$, $b_1 = 6$, $c_1 = 4$, $a_2 = 2$, $b_2 = -5$, and $c_2 = -3$.

$$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} \longrightarrow D = \begin{vmatrix} -11 & 6 \\ 2 & -5 \end{vmatrix} = (-11)(-5) - (6)(2) = 43$$

$$D_x = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix} \longrightarrow D_x = \begin{vmatrix} 4 & 6 \\ -3 & -5 \end{vmatrix} = (4)(-5) - (6)(-3) = -2$$

$$D_y = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix} \longrightarrow D_y = \begin{vmatrix} -11 & 4 \\ 2 & -3 \end{vmatrix} = (-11)(-3) - (4)(2) = 25$$

Therefore, $x = \dfrac{D_x}{D} = \dfrac{-2}{43}$ and $y = \dfrac{D_y}{D} = \dfrac{25}{43}$.

The solution set is $\left\{\left(-\frac{2}{43}, \frac{25}{43}\right)\right\}$.

Skill Practice 6 Solve the system by using Cramer's rule. $3x - 4y = 9$, $-5x + 6y = 2$

The patterns associated with Cramer's rule can be generalized to solve a system of n linear equations in n variables.

Cramer's Rule for a System of *n* Linear Equations in *n* Variables

Consider the following system of n linear equations in n variables.

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \cdots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \cdots + a_{2n}x_n &= b_2 \\ &\vdots \\ a_{n1}x_1 + a_{n2}x_2 + \cdots + a_{nn}x_n &= b_n \end{aligned}$$

If the system has a unique solution, then the solution is $(x_1, x_2, \ldots, x_i, \ldots, x_n)$, where

$$x_1 = \frac{D_1}{D}, x_2 = \frac{D_2}{D}, \ldots, x_i = \frac{D_i}{D}, \ldots, x_n = \frac{D_n}{D}.$$

$D \neq 0$ is the determinant of the coefficient matrix, and D_i is the determinant formed by replacing the ith column of the coefficient matrix by the column of constants $b_1, b_2, \ldots, b_n$.

In Example 7, we apply Cramer's rule to a system of equations with three variables.

Answer

6. $\left\{\left(-31, -\frac{51}{2}\right)\right\}$

EXAMPLE 7 Solving a 3 × 3 System by Using Cramer's Rule

Solve the system by using Cramer's rule.

$$\begin{aligned} 2x - 3y + 5z &= 11 \\ -5x + 7y - 2z &= -6 \\ 9x - 2y + 3z &= 4 \end{aligned}$$

Solution:

Evaluate the determinants D, D_x, D_y, and D_z.

$$D = \begin{vmatrix} 2 & -3 & 5 \\ -5 & 7 & -2 \\ 9 & -2 & 3 \end{vmatrix} = -222 \qquad D_x = \begin{vmatrix} 11 & -3 & 5 \\ -6 & 7 & -2 \\ 4 & -2 & 3 \end{vmatrix} = 77$$

$$D_y = \begin{vmatrix} 2 & 11 & 5 \\ -5 & -6 & -2 \\ 9 & 4 & 3 \end{vmatrix} = 117 \qquad D_z = \begin{vmatrix} 2 & -3 & 11 \\ -5 & 7 & -6 \\ 9 & -2 & 4 \end{vmatrix} = -449$$

Therefore, $x = \dfrac{D_x}{D} = -\dfrac{77}{222}$, $y = \dfrac{D_y}{D} = -\dfrac{117}{222}$ or $-\dfrac{39}{74}$, and $z = \dfrac{D_z}{D} = \dfrac{449}{222}$.

The solution set is $\left\{\left(-\dfrac{77}{222}, -\dfrac{39}{74}, \dfrac{449}{222}\right)\right\}$.

Avoiding Mistakes

It is important to note that each equation in the system of equations should be written in standard form before applying Cramer's rule.

Skill Practice 7 Solve the system by using Cramer's rule.

$$\begin{aligned} 5x + 3y - 3z &= -14 \\ 3x - 4y + z &= 2 \\ x + 7y + z &= 6 \end{aligned}$$

Although Cramer's rule may seem cumbersome for solving a 3 × 3 system of linear equations, it provides convenient formulas that can be programmed into a computer or calculator to solve the system. However, it is important to remember that Cramer's rule does not apply if $D = 0$. In such a case, the system of equations is either inconsistent (has no solution) or the equations are dependent (the system has infinitely many solutions).

EXAMPLE 8 Identifying Whether Cramer's Rule Applies

Solve the system by using Cramer's rule if possible. Otherwise, use a different method.

$$\begin{aligned} x + 3y &= 6 \\ -2x - 6y &= -12 \end{aligned}$$

Solution:

Evaluate D. $D = \begin{vmatrix} 1 & 3 \\ -2 & -6 \end{vmatrix} = 1(-6) - 3(-2) = -6 + 6 = 0$

Since $D = 0$, Cramer's rule does not apply. Using Gauss-Jordan elimination, we have

$$\left[\begin{array}{cc|c} 1 & 3 & 6 \\ -2 & -6 & -12 \end{array}\right] \xrightarrow{2R_1 + R_2 \to R_2} \left[\begin{array}{cc|c} 1 & 3 & 6 \\ 0 & 0 & 0 \end{array}\right]$$

The last row of the augmented matrix represents the equation $0 = 0$, which is true for all values of x and y. The system reduces to the single equation $x + 3y = 6$, and there are infinitely many solutions.

The solution set is $\{(6 - 3y, y) \mid y \text{ is any real number}\}$.

Answer

7. $\left\{\left(-\frac{13}{34}, \frac{5}{17}, \frac{147}{34}\right)\right\}$

ISTUDY

Skill Practice 8 Solve the system by using Cramer's rule if possible. Otherwise, use a different method.

$$x + 4y = 2$$
$$3x + 12y = 4$$

Answer
8. { }

SECTION 10.5 Practice Exercises

Prerequisite Review

For Exercises R.1–R.2, simplify the exponential expression.

R.1. $(-1)^4$ **R.2.** $(-1)^7$

R.3. Write an equation of the line that passes through the points $(-3, 5)$ and $(-2, 4)$. Write the equation in slope-intercept form.

Concept Connections

1. Associated with every square matrix A is a real number denoted by $|A|$ called the _____ of A.

2. For a 2×2 matrix $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, $|A| = \begin{vmatrix} a & b \\ c & d \end{vmatrix} =$ _____.

3. Given $A = [a_{ij}]$, the _____ of the element a_{ij} is the determinant obtained by deleting the ith row and jth column.

4. Given $A = [a_{ij}]$, then the value $(-1)^{i+j} M_{ij}$ is called the _____ of the element a_{ij}.

5. The determinant of a 3×3 matrix

$A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}$ is given by

$$|A| = a_1 \begin{vmatrix} \square & \square \\ \square & \square \end{vmatrix} - a_2 \begin{vmatrix} \square & \square \\ \square & \square \end{vmatrix} + a_3 \begin{vmatrix} \square & \square \\ \square & \square \end{vmatrix}$$

6. Suppose that the given system has one solution.

$$a_1x + b_1y = c_1$$
$$a_2x + b_2y = c_2$$

Cramer's rule gives the solution as $x = \frac{\square}{\square}$ and $y = \frac{\square}{\square}$, where $D = \begin{vmatrix} \square & \square \\ \square & \square \end{vmatrix}$, $D_x = \begin{vmatrix} \square & \square \\ \square & \square \end{vmatrix}$, and $D_y = \begin{vmatrix} \square & \square \\ \square & \square \end{vmatrix}$.

Objective 1: Evaluate the Determinant of a 2 × 2 Matrix

For Exercises 7–16, evaluate the determinant of the matrix. (See Example 1)

7. $A = \begin{bmatrix} 3 & -2 \\ 6 & 5 \end{bmatrix}$ **8.** $B = \begin{bmatrix} 7 & 12 \\ -1 & 4 \end{bmatrix}$ **9.** $C = \begin{bmatrix} \frac{2}{3} & \frac{1}{5} \\ 10 & 12 \end{bmatrix}$ **10.** $D = \begin{bmatrix} \frac{8}{9} & 4 \\ \frac{5}{2} & 18 \end{bmatrix}$

11. $E = \begin{bmatrix} -3 & 0 \\ 4 & 0 \end{bmatrix}$ **12.** $F = \begin{bmatrix} 0 & 9 \\ 0 & 4 \end{bmatrix}$ **13.** $G = \begin{bmatrix} x & 4 \\ 9 & x \end{bmatrix}$ **14.** $H = \begin{bmatrix} y & 16 \\ 4 & y \end{bmatrix}$

15. $T = \begin{bmatrix} e^x & e^{2x} \\ 4 & -e^x \end{bmatrix}$ **16.** $V = \begin{bmatrix} \log x & \log x \\ 2 & 5 \end{bmatrix}$

Objective 2: Evaluate the Determinant of an $n \times n$ Matrix

For Exercises 17–22, refer to the matrix $A = [a_{ij}] = \begin{bmatrix} -6 & 11 & 8 \\ 4 & -2 & -5 \\ -3 & 7 & 10 \end{bmatrix}$.

a. Find the minor of the given element. (**See Example 2**)

b. Find the cofactor of the given element.

17. a_{12} **18.** a_{23} **19.** a_{31}

20. a_{13} **21.** a_{22} **22.** a_{33}

ISTUDY

For Exercises 23–32, evaluate the determinant of the matrix and state whether the matrix is invertible. (See Examples 3–5)

23. $A = \begin{bmatrix} 4 & 1 & 3 \\ 0 & -1 & 2 \\ 5 & 8 & 0 \end{bmatrix}$

24. $B = \begin{bmatrix} 9 & 5 & -1 \\ 2 & 0 & 4 \\ 7 & -2 & 0 \end{bmatrix}$

25. $C = \begin{bmatrix} 5 & 1 & 6 \\ 2 & 3 & 4 \\ 8 & -1 & 7 \end{bmatrix}$

26. $D = \begin{bmatrix} -3 & 1 & -2 \\ 10 & 5 & 8 \\ 6 & 7 & -4 \end{bmatrix}$

27. $E = \begin{bmatrix} 2 & 0 & 1 \\ 1 & -1 & 2 \\ 3 & 1 & 0 \end{bmatrix}$

28. $F = \begin{bmatrix} 1 & -3 & 17 \\ 1 & -1 & 7 \\ 2 & -5 & 29 \end{bmatrix}$

29. $G = \begin{bmatrix} 5 & 6 & 4 & 1 \\ 2 & 0 & 3 & 0 \\ 0 & 1 & 4 & 0 \\ -1 & 2 & 0 & 0 \end{bmatrix}$

30. $H = \begin{bmatrix} 8 & 0 & 5 & 1 \\ 0 & 3 & 4 & -2 \\ 2 & 6 & 3 & 0 \\ -1 & 0 & 0 & 0 \end{bmatrix}$

31. $T = \begin{bmatrix} 3 & 8 & 1 & 4 \\ -2 & 4 & 0 & 5 \\ -1 & 1 & 0 & -1 \\ 0 & 5 & 2 & 3 \end{bmatrix}$

32. $W = \begin{bmatrix} 2 & 5 & 2 & 4 \\ 0 & 0 & -3 & 1 \\ 4 & 8 & 0 & 1 \\ -1 & 2 & 0 & 5 \end{bmatrix}$

Objective 3: Apply Cramer's Rule

For Exercises 33–48, solve the system if possible by using Cramer's rule. If Cramer's rule does not apply, solve the system by using another method. (See Examples 6–8)

33. $2x + 10y = 11$
$3x - 5y = 6$

34. $-5x - 8y = 3$
$4x + 7y = 13$

35. $-10x + 4y = 7$
$6x = 7y + 2$

36. $11x + 6y = 8$
$2x = 9y + 5$

37. $3(x - y) = y + 8$
$y = \frac{3}{4}x - 2$

38. $5(x + y) = 7x + 4$
$4x = 10y - 8$

39. $y = -3x + 7$
$\frac{1}{2}x + \frac{1}{6}y = 1$

40. $x = 4y + 5$
$3(x - 4) = 12y$

41. $11x - 3z = 1$
$2y + 9z = 6$
$4x + 5y = -9$

42. $-2x + 6y = 9$
$5y + 7z = 1$
$4x - 3z = -8$

43. $2x - 5y + z = 11$
$3x + 7y - 4z = 8$
$x - 9y + 2z = 4$

44. $-5x - 6y + 8z = 1$
$2x + y - 4z = 5$
$3x - 4y - z = -2$

45. $2x - 3y + z = 6$
$-4x + 6y - 2z = -12$
$6x - 9y + 3z = 18$

46. $-x + y - 3z = 4$
$3x - 3y + 9z = -12$
$-2x + 2y - 6z = 8$

47. $x - 2y + 3z = -1$
$5x - 7y + 3z = 1$
$x - 5z = 2$

48. $x + 3y - 5z = 10$
$-2x - 4y + 8z = -14$
$x + y - 3z = 5$

For Exercises 49–50, use Cramer's rule to solve for the indicated variable.

49. $x_1 + 2x_2 + 3x_3 - 4x_4 = 3$
$5x_2 + x_4 = 9$
$x_1 + 4x_3 = -1$
$5x_3 - 2x_4 = 8$
Solve for x_2.

50. $-2x_1 - x_2 + x_3 + 3x_4 = 10$
$x_1 + 5x_3 = 4$
$2x_2 + x_4 = -1$
$4x_3 + 2x_4 = 7$
Solve for x_3.

Mixed Exercises

For Exercises 51–52, suppose that the graph of a parabola $f(x) = ax^2 + bx + c$ passes through the given points, (x, y).

a. Write a system of linear equations of the form $ax + by + cz = d$ using the given points.

b. Solve the system using determinants and give the equation of the parabola.

51. (3, 5), (5, −1), (7, −3)

52. (−2, 4), (−1, 3), (0, 4)

For Exercises 53–54, three noncollinear points, (x, y), are given.

a. Find the general form of the circle, $x^2 + y^2 + Dx + Ey + F = 0$, that passes through the points by setting up a system of equations and solving for D, E, and F using Cramer's rule.

b. Write the equation in the form $(x - h)^2 + (y - k)^2 = r^2$ and determine the center and radius.

53. $(3, 5)$, $(5, -1)$, $(7, -3)$

54. $(-2, 4)$, $(-1, 3)$, $(0, 4)$

For Exercises 55–56, suppose that the graph of the cubic polynomial $p(x) = x^3 + bx^2 + cx + d$ passes through the given points, (x, y). Find the equation of the polynomial. (Consider checking your answer using a graphing utility.)

55. $(3, 5)$, $(5, -1)$, $(7, -3)$

56. $(-2, 4)$, $(-1, 3)$, $(0, 4)$

Given a square matrix A, elementary row operations (or column operations) performed on A affect the value of $|A|$ in the following ways:

- Interchanging any two rows (or columns) of A will change the sign of $|A|$.
- Multiplying a row (or column) of A by a constant real number k multiplies $|A|$ by k.
- Adding a multiple of a row (or column) of A to another row (or column) of A does not change the value of $|A|$.

For Exercises 57–62, demonstrate these three properties.

57. Given $A = \begin{bmatrix} 5 & 2 \\ -3 & 6 \end{bmatrix}$ and $B = \begin{bmatrix} -3 & 6 \\ 5 & 2 \end{bmatrix}$,

a. Evaluate $|A|$.

b. Evaluate $|B|$.

c. How are A and B related and how are $|A|$ and $|B|$ related?

58. Given $A = \begin{bmatrix} 2 & -7 \\ 4 & 10 \end{bmatrix}$ and $B = \begin{bmatrix} 4 & 10 \\ 2 & -7 \end{bmatrix}$,

a. Evaluate $|A|$.

b. Evaluate $|B|$.

c. How are A and B related and how are $|A|$ and $|B|$ related?

59. Given $A = \begin{bmatrix} 1 & -3 \\ 4 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 2 & -6 \\ 4 & 1 \end{bmatrix}$,

a. Evaluate $|A|$.

b. Evaluate $|B|$.

c. How are A and B related and how are $|A|$ and $|B|$ related?

60. Given $A = \begin{bmatrix} 2 & 1 \\ 5 & 7 \end{bmatrix}$ and $B = \begin{bmatrix} -6 & -3 \\ 5 & 7 \end{bmatrix}$,

a. Evaluate $|A|$.

b. Evaluate $|B|$.

c. How are A and B related and how are $|A|$ and $|B|$ related?

61. Given $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 2 \\ 6 & 10 \end{bmatrix}$,

a. Evaluate $|A|$.

b. Evaluate $|B|$.

c. How are A and B related and how are $|A|$ and $|B|$ related?

62. Given $A = \begin{bmatrix} 1 & 1 \\ 5 & 6 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 1 \\ 3 & 4 \end{bmatrix}$,

a. Evaluate $|A|$.

b. Evaluate $|B|$.

c. How are A and B related and how are $|A|$ and $|B|$ related?

Given a square matrix A, if either of the following conditions is true, then $|A| = 0$.

- **A row (or column) of A consists entirely of zeros.**
- **One row (or column) is a constant multiple of another row (or column).**

For Exercises 63–66, demonstrate these two properties.

63. Given $A = \begin{bmatrix} 3 & 5 \\ 6 & 10 \end{bmatrix}$, find $|A|$.

64. Given $A = \begin{bmatrix} -2 & 7 \\ -6 & 21 \end{bmatrix}$, find $|A|$.

65. Given $A = \begin{bmatrix} 4 & -5 & 0 \\ 3 & -1 & 0 \\ 0 & 1 & 0 \end{bmatrix}$, find $|A|$.

66. Given $A = \begin{bmatrix} 5 & 3 & 1 \\ -1 & 0 & 3 \\ 0 & 0 & 0 \end{bmatrix}$, find $|A|$.

67. Evaluate $|I_2|$.

68. Evaluate $|I_3|$.

69. Evaluate $\begin{vmatrix} a & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & c \end{vmatrix}$.

70. Evaluate $\begin{vmatrix} x & 0 \\ 0 & x \end{vmatrix}$.

ISTUDY

71. If A and B are square matrices, then the product property of determinants indicates that $|AB| = |A| \cdot |B|$. Use matrix A and matrix B to demonstrate this property.

$$A = \begin{bmatrix} 4 & -2 \\ 3 & 1 \end{bmatrix} \text{ and } B = \begin{bmatrix} -5 & 1 \\ 3 & 2 \end{bmatrix}$$

72. The **transpose** of a square matrix A, denoted as A^T, is a square matrix that results by writing the rows of A as the columns of A^T.

a. Given $A = \begin{bmatrix} 1 & 2 & 5 \\ 0 & 8 & 4 \\ 3 & 7 & 6 \end{bmatrix}$, find A^T.

b. Show that $|A| = |A^T|$.

Write About It

73. What is the difference between the minor of an element a_{ij} and the cofactor of the element?

74. Explain the difference between the notation $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ and $\begin{vmatrix} a & b \\ c & d \end{vmatrix}$.

75. The determinant of a square matrix can be computed by expanding the cofactors of the elements in any row or column. How would you choose which row or column?

76. Consider the system shown here. Describe the pattern associated with constructing the determinants used with Cramer's rule.

$$a_1x + b_1y = c_1$$
$$a_2x + b_2y = c_2$$

Expanding Your Skills

Determinants can be used to determine whether three points are collinear (lie on the same line). Given the ordered pairs (x_1, y_1), (x_2, y_2), and (x_3, y_3), the points are collinear if the determinant to the right equals zero. For Exercises 77–80, determine if the points are collinear.

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

77. (3, 6), (6, 10), (−3, −2)

78. (−2, 1), (−4, −4), (4, 16)

79. (4, −3), (5, −7), (8, −14)

80. (0, 6), (1, 4), (4, −6)

The equation at the right represents an equation of the line passing through the distinct points (x_1, y_1) and (x_2, y_2). For Exercises 81–82,

$$\begin{vmatrix} x & y & 1 \\ x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \end{vmatrix} = 0$$

a. Use the determinant equation to write an equation of the line passing through the given points.

b. Write the equation of the line in slope-intercept form.

81. (−3, 2) and (−4, 6)

82. (−4, 1) and (−5, 4)

For Exercises 83–84, use the formula at the right to find the area of a triangle with vertices (x_1, y_1), (x_2, y_2), and (x_3, y_3). Choose the + or − sign so that the value of the area is positive.

$$\text{Area} = \pm\frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

83. (1, 0), (7, −2), (4, −5)

84. (−2, 1), (−1, −6), (−8, −5)

The given determinant equation represents the equation of a circle passing through the distinct, noncollinear points (x_1, y_1), (x_2, y_2), and (x_3, y_3). For Exercises 85–86, use the determinant equation to write the equation of a circle in the form $(x - h)^2 + (y - k)^2 = r^2$ passing through the given points.

$$\begin{vmatrix} x^2 + y^2 & x & y & 1 \\ x_1^2 + y_1^2 & x_1 & y_1 & 1 \\ x_2^2 + y_2^2 & x_2 & y_2 & 1 \\ x_3^2 + y_3^2 & x_3 & y_3 & 1 \end{vmatrix} = 0$$

85. (4, −6), (5, 1), (8, 2)

86. (6, 2), (−1, 3), (2, −6)

Technology Connections

For Exercises 87–90, use a graphing utility to evaluate the determinant of the matrix. Round to the nearest whole unit.

87. $\begin{bmatrix} \sqrt{3} & e & 1.6 \\ \log 5 & -2\pi & \ln 3 \\ -4 & 8.4 & -\sqrt{6} \end{bmatrix}$

88. $\begin{bmatrix} 8.9 & -2.3 & 3.8 \\ -1.7 & 0.9 & 4.6 \\ 2.7 & 10.1 & 14.9 \end{bmatrix}$

89. $A = \begin{bmatrix} -0.4 & 1.5 & 9 & 11.3 \\ -3.5 & 0.2 & -1.1 & 3 \\ 8 & 9.4 & -5.4 & 2 \\ -1 & 4.6 & 10.8 & -9.7 \end{bmatrix}$

90. $B = \begin{bmatrix} -2\pi & e^2 & 9.1 & \log 2 \\ \log 50 & -\sqrt{11} & 4.3 & \pi \\ -4.9 & 0 & e^2 & 8.1 \\ \sqrt{7} & \ln 7 & -9.7 & 0 \end{bmatrix}$

ISTUDY

PROBLEM RECOGNITION EXERCISES

Using Multiple Methods to Solve Systems of Linear Equations

For Exercises 1–4, solve the system of equations using

a. The substitution method or the addition method (see Sections 9.1 and 9.2).
b. Gaussian elimination (see Section 10.1).
c. Gauss-Jordan elimination (see Section 10.1).
d. The inverse of the coefficient matrix (see Section 10.4).
e. Cramer's rule (see Section 10.5).

1. $x = -3y - 10$
$-3x - 7y = 22$

2. $2x = 2 - 8y$
$3x + 10y = 5$

3. $x + 2y - z = 0$
$2x + z = 4$
$2x - y + 2z = 5$

4. $x + 4y + 2z = 10$
$2y + z = 4$
$x + y = 2$

For Exercises 5–8,

a. Evaluate the determinant of the coefficient matrix.
b. Based on the value of the determinant from part (a), can an inverse matrix or Cramer's rule be used to solve the system?
c. Solve the system using an appropriate method.

5. $1.5x - 2y = 3$
$-3x + 4y = 12$

6. $5x - 2y = 1$
$x - 0.4y = 4$

7. $x - 3y + 7z = 1$
$-2x + 5y - 11z = -3$
$x - 5y + 13z = -1$

8. $x - 2y + 3z = -7$
$-2x + y = -1$
$x - z = 3$

CHAPTER 10 KEY CONCEPTS

SECTION 10.1 Solving Systems of Linear Equations Using Matrices	Reference
A system of linear equations can be represented by an **augmented matrix.**	p. 918
Elementary row operations can be used to write a matrix in row-echelon form or reduced row-echelon form. 1. Interchange two rows. 2. Multiply a row by a nonzero constant. 3. Add a nonzero multiple of one row to another row.	p. 919
The method of **Gaussian elimination** uses elementary row operations to write an augmented matrix in row-echelon form so that the system can be solved by back substitution.	p. 921
With the method of **Gauss-Jordan elimination,** the augmented matrix is written in *reduced* row-echelon form so that the solution can be found by inspection.	p. 923
SECTION 10.2 Inconsistent Systems and Dependent Equations	**Reference**
A system of equations that has no solution is called an **inconsistent system.** An inconsistent system is detected algebraically if a contradiction is reached when solving the system.	p. 929
A system of linear equations may have infinitely many solutions. In such a case, the equations are said to be **dependent.** Dependent equations are detected algebraically if an identity is reached when solving the system.	p. 930

SECTION 10.3 Operations on Matrices	Reference
An $m \times n$ matrix has m rows and n columns.	p. 939
Adding and subtracting matrices: If A and B represent two matrices of the same order, then $A + B$ and $A - B$ are found by adding or subtracting the corresponding elements.	p. 641
Scalar multiplication: Let $A = [a_{ij}]$ be an $m \times n$ matrix and let k be a real number. Then, $kA = [ka_{ij}]$.	p. 943
Matrix multiplication: Let A be an $m \times p$ matrix and let B be a $p \times n$ matrix, then the product AB is an $m \times n$ matrix. For the matrix AB, the element in the ith row and jth column is the sum of the products of the corresponding elements in the ith row of A and the jth column of B (the inner product of the ith row and jth column). *Note*: If the number of columns in A does not equal the number of rows in B, then it is not possible to compute the product AB.	p. 945

SECTION 10.4 Inverse Matrices and Matrix Equations	Reference
The **identity matrix** I_n for the multiplication of matrices is the $n \times n$ square matrix with 1's along the main diagonal and 0's for all other elements.	p. 956
Inverse of a square matrix: Let A be an $n \times n$ matrix. If there exists an $n \times n$ matrix A^{-1} such that $AA^{-1} = I_n \quad \text{and} \quad A^{-1}A = I_n$ then A^{-1} is the **multiplicative inverse** of A.	p. 957
A matrix that does not have an inverse is called a **singular matrix.** A matrix that does have an inverse is said to be **invertible** or **nonsingular.**	p. 959
Finding the inverse of a nonsingular matrix: Let A be an $n \times n$ matrix for which A^{-1} exists. To find A^{-1}: **Step 1** Write a matrix of the form $[A \mid I_n]$. **Step 2** Perform row operations to write the matrix in the form $[I_n \mid B]$. **Step 3** The matrix B is A^{-1}.	p. 958
The inverse of a nonsingular 2×2 matrix A can also be found as follows: If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then $A^{-1} = \frac{1}{ad - bc} \cdot \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$, or equivalently $A^{-1} = \frac{1}{\lvert A \rvert} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$.	p. 960
Solving a system using inverse matrices: Suppose that $AX = B$ represents a system of n linear equations in n variables with a unique solution. Then, $X = A^{-1}B$ where A is the coefficient matrix, B is the matrix of constants, and X is the matrix of variables.	p. 962

SECTION 10.5 Determinants and Cramer's Rule	Reference
Associated with every square matrix is a real number called the determinant of the matrix.	p. 968
Determinant of a 2 × 2 matrix: Given $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, the determinant of A is denoted by $\lvert A \rvert$ or $\begin{vmatrix} a & b \\ c & d \end{vmatrix}$ and the value is $ad - bc$.	p. 968

Given an $n \times n$ matrix $A = [a_{ij}]$, the **minor** M_{ij} of an element a_{ij} is the determinant of the resulting matrix obtained by deleting the ith row and jth column.	p. 968
The **cofactor** of a_{ij} is $(-1)^{i+j}M_{ij}$ where M_{ij} is the minor of a_{ij}.	p. 971
Determinant of a 3 × 3 matrix: $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix}$	p. 970
Find the determinant of an $n \times n$ matrix: **Step 1** Choose any row or column. **Step 2** Multiply each element in the selected row or column by its cofactor. **Step 3** The value of the determinant is the sum of the products from step 2.	p. 971
Cramer's rule for a system of two equations and two variables: Given $a_1x + b_1y = c_1$, $a_2x + b_2y = c_2$ if $D \neq 0$, then $x = \frac{D_x}{D}$ and $y = \frac{D_y}{D}$, where $D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$, $D_x = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}$, and $D_y = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}$.	p. 974
The patterns associated with Cramer's rule can be generalized to solve a system of n linear equations in n variables.	p. 975
When applying Cramer's rule, if $D = 0$, then the system has either no solution or infinitely many solutions.	p. 976

Detailed Chapter Summaries are available with the online resources.

CHAPTER 10 Review Exercises

SECTION 10.1

1. Write a system of linear equations represented by the augmented matrix. Then write the solution set.

$$\left[\begin{array}{ccc|c} 1 & -2 & 3 & -1 \\ 0 & 1 & 4 & -11 \\ 0 & 0 & 1 & -2 \end{array}\right]$$

For Exercises 2–4, perform the elementary row operations on the matrix. $\left[\begin{array}{cc|c} 2 & -3 & 1 \\ 5 & 6 & -4 \end{array}\right]$

2. $R_1 \Leftrightarrow R_2$

3. $\frac{1}{2}R_1 \rightarrow R_1$

4. $-2R_1 + R_2 \rightarrow R_2$

For Exercises 5–8, solve the system by using Gaussian elimination or Gauss-Jordan elimination.

5. $-2x + y = -16$
$x - 2y = 17$

6. $2(x - 6y) = 36$
$47y = 7x - 141$

7. $2x - 5y + 18z = 44$
$x - 3y + 11z = 27$
$x - 2y + 11z = 29$

8. $w + x - 2z = 3$
$2x - 3z = 3$
$2w + y + z = 3$
$4y - z = 9$

9. Chloe borrowed a total of $10,000. She borrowed part of the money from a friend who did not charge her interest. Of the remaining money, Chloe borrowed part from a credit union at 5% simple interest and the rest from a bank at 7.5% interest. At the end of 1 yr, she owed $500 in interest. If she borrowed $1000 less from her friend than she did from the bank, determine how much Chloe borrowed from each source.

SECTION 10.2

For Exercises 10–13, determine the solution set for the system represented by each augmented matrix.

10. $\left[\begin{array}{cc|c} 1 & 0 & 4 \\ 0 & 1 & 0 \end{array}\right]$

11. $\left[\begin{array}{cc|c} 1 & -2 & 6 \\ 0 & 0 & 1 \end{array}\right]$

ISTUDY

12. $\left[\begin{array}{cc|c} 1 & 4 & 0 \\ 0 & 0 & 0 \end{array}\right]$

13. $\left[\begin{array}{ccc|c} 1 & 0 & -3 & 0 \\ 0 & 1 & 2 & 1 \\ 0 & 0 & 0 & 0 \end{array}\right]$

For Exercises 14–19, solve the system by using Gaussian elimination or Gauss-Jordan elimination.

14. $3x + 6y = -9$
$x + 2y = -3$

15. $-(2x - y) = 8 - y$
$y = x - 6$

16. $x - 2y = 3z - 10$
$x - y = z - 7$
$3x - 7y - 11z = -320$

17. $x - 3z = 5$
$-2x + y + 10z = -7$
$x + y + z = 8$

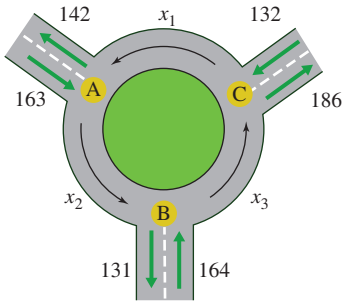
18. $2x = 3y - z - 4$
$x - 2y = z + 2y - 2$
$x + y = 2z - 2$

19. $5y = x + 2z + 1$
$2(x - 5y) + 4z = -2$
$3(x + 2z) = 15y - 3$

20. The solution set to a system of dependent equations is given. Write three ordered triples that are solutions to the system. Answers may vary.

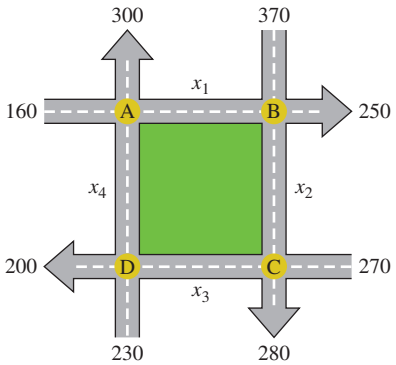
$\{(2z - 3, z + 2, z) \mid z \text{ is any real number}\}$

21. a. Assume that traffic flows freely around the traffic circle. The flow rates given are measured in vehicles per hour. If the flow rate x_3 is 130 vehicles per hour, determine the flow rates x_1 and x_2.



b. If traffic between intersections B and C flows at a rate of between 100 and 150 vehicles per hour, inclusive, find the range of values for x_1 and x_2.

22. a. Assume that traffic flows freely through intersections A, B, C, and D and that all flow rates are measured in vehicles per hour. If the flow rate x_4 is 220 vehicles per hour, find the flow rates x_1, x_2, and x_3.



b. If the flow rate x_4 is between 200 and 250 vehicles per hour, inclusive, find the range of values x_1, x_2, and x_3.

SECTION 10.3

For Exercises 23–26,

a. Give the order of the matrix.

b. Classify the matrix as a square matrix, row matrix, column matrix, or none of these.

23. $\begin{bmatrix} 1 & 2 \\ -3 & \pi \\ 4.1 & \sqrt{2} \end{bmatrix}$

24. $[8 \quad 4 \quad 1 \quad -6]$

25. $\begin{bmatrix} -3.1 \\ 8.7 \end{bmatrix}$

26. $\begin{bmatrix} -3 & 8 \\ 0 & 0 \end{bmatrix}$

For Exercises 27–28, determine the value of the given element of the matrix $A = [a_{ij}]$.

$$A = \begin{bmatrix} -1 & 8 & -3 \\ 4 & 6 & 9 \end{bmatrix}$$

27. a_{21}

28. a_{12}

29. For what value of x, y, and z will $A = B$?

$$A = \begin{bmatrix} 3 & -4 \\ x & z \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} y & -4 \\ 6 & 8 \end{bmatrix}$$

30. Solve the equation $-3X + A = B$ for X, given that

$$A = \begin{bmatrix} 2 & -7 \\ 2 & -5 \end{bmatrix} \text{ and } B = \begin{bmatrix} 5 & 2 \\ -1 & 7 \end{bmatrix}.$$

For Exercises 31–40, perform the indicated operations if possible.

$$A = \begin{bmatrix} -4 & 1 \\ 6 & -2 \\ 1 & 3 \end{bmatrix} \quad B = \begin{bmatrix} 2 & 3 & -7 \\ 1 & 5 & -6 \end{bmatrix} \quad C = \begin{bmatrix} \pi & 4 \\ -3 & 1 \\ 0 & 5 \end{bmatrix}$$

31. $3A$

32. $-2B$

33. $A + B$

34. $B + C$

35. $2A - C$

36. $4A + 3B$

37. AB

38. BC

39. AC

40. CA

For Exercises 41–44, perform the indicated operations if possible.

$$A = \begin{bmatrix} 2 & 6 \\ -1 & 4 \end{bmatrix} \quad B = \begin{bmatrix} 1 \\ -3 \end{bmatrix} \quad C = [2 \quad 7]$$

41. A^2

43. BC

44. CB

45. A company owns two movie theaters in town. The number of popcorns and drinks sold for each theater is given in matrix Q. The price per item is given in matrix P. Find the product QP and interpret the result.

$$Q = \begin{array}{c} \begin{array}{cccc} \textbf{Popcorn (small)} & \textbf{Popcorn (large)} & \textbf{Drinks (small)} & \textbf{Drinks (large)} \end{array} \\ \begin{bmatrix} 386 & 244 & 418 & 216 \\ 450 & 382 & 476 & 262 \end{bmatrix} \end{array} \begin{array}{l} \textbf{Theater 1} \\ \textbf{Theater 2} \end{array}$$

$$P = \begin{bmatrix} \$8.50 \\ \$6.50 \\ \$5.50 \\ \$3.50 \end{bmatrix} \begin{array}{l} \textbf{Popcorn (small)} \\ \textbf{Popcorn (large)} \\ \textbf{Drinks (small)} \\ \textbf{Drinks (large)} \end{array}$$

ISTUDY

46. Matrix M gives the manufacturer price for four models of dining room tables. Matrix P gives the retail price to the customer.

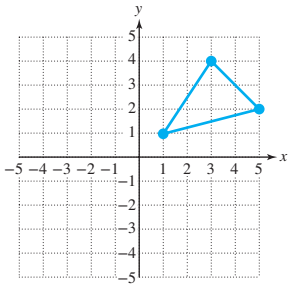
$$M = \begin{matrix} \\ \text{Large} \\ \text{Small} \end{matrix}\begin{matrix} \begin{matrix}\text{Wood} & \text{Metal}\end{matrix} \\ \begin{bmatrix} \$1050 & \$940 \\ \$890 & \$800 \end{bmatrix} \end{matrix}$$

$$P = \begin{matrix} \\ \text{Large} \\ \text{Small} \end{matrix}\begin{matrix} \begin{matrix}\text{Wood} & \text{Metal}\end{matrix} \\ \begin{bmatrix} \$1365 & \$1222 \\ \$1157 & \$1040 \end{bmatrix} \end{matrix}$$

a. Compute $P - M$ and interpret its meaning.

b. If the tax rate in a certain city is 6%, use scalar multiplication to find a matrix F that gives the final price (including sales tax) to the customer for each model.

47. a. Write a matrix A that represents the coordinates of the vertices of the triangle. Place the x-coordinate of each point in the first row of A and the corresponding y-coordinate in the second row of A.



b. Use addition of matrices to shift the triangle 3 units to the left and 1 unit downward.

c. Find the product $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} A$ and explain the effect on the graph of the triangle.

d. Find the product $\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} A$ and explain the effect on the graph of the triangle.

SECTION 10.4

48. Given two $n \times n$ matrices A and B, what are the criteria for the matrices to be inverses?

49. Determine whether A and B are inverses.

$$A = \begin{bmatrix} 4 & 1 \\ 3 & 2 \end{bmatrix} \quad B = \begin{bmatrix} 2 & -3 \\ -1 & 4 \end{bmatrix}$$

50. Determine whether A and B are inverses.

$$A = \begin{bmatrix} 1 & 3 \\ 2 & 1 \end{bmatrix} \quad B = \begin{bmatrix} -\frac{1}{5} & \frac{3}{5} \\ \frac{2}{5} & -\frac{1}{5} \end{bmatrix}$$

For Exercises 51–56, determine the inverse of the given matrix if possible. Otherwise state that the matrix is singular.

51. $A = \begin{bmatrix} 5 & -2 \\ 1 & 2 \end{bmatrix}$

52. $A = \begin{bmatrix} \frac{1}{4} & \frac{3}{8} \\ \frac{1}{8} & -\frac{1}{16} \end{bmatrix}$

53. $A = \begin{bmatrix} 2 & 3 \\ 16 & 24 \end{bmatrix}$

54. $A = \begin{bmatrix} 1 & 0 & 1 \\ -1 & 5 & -3 \\ 1 & -3 & 2 \end{bmatrix}$

55. $A = \begin{bmatrix} -5 & 4 & 1 \\ 15 & -12 & -4 \\ 4 & -3 & -1 \end{bmatrix}$

56. $A = \begin{bmatrix} 1 & -3 & -17 \\ 1 & -2 & -12 \\ 0 & -2 & -10 \end{bmatrix}$

57. Write the system of equations as a matrix equation of the form $AX = B$, where A is the coefficient matrix, X is the column matrix of variables, and B is the column matrix of constants.

$$\begin{aligned} -3x + 7y &= 6 \\ 4x \quad\; + 2z &= -3 \\ 2x - \; y + 5z &= -13 \end{aligned}$$

For Exercises 58–61, solve the system using the inverse of the coefficient matrix.

58. $\frac{1}{4}x + \frac{3}{8}y = 4$ (See Exercise 52 for A^{-1}.)

$\frac{1}{8}x - \frac{1}{16}y = -2$

59. $5x - 2y = 26$ (See Exercise 51 for A^{-1}.)

$x + 2y = -2$

60. $x + z = 2$ (See Exercise 54 for A^{-1}.)

$-x + 5y - 3z = -6$

$x - 3y + 2z = 3$

61. $-5x + 4y + z = 6$ (See Exercise 55 for A^{-1}.)

$15x - 12y - 4z = -21$

$4x - 3y - z = -5$

SECTION 10.5

For Exercises 62–65, refer to the matrix

$$A = [a_{ij}] = \begin{bmatrix} \mathbf{-5} & \mathbf{4} & \mathbf{-2} \\ \mathbf{1} & \mathbf{0} & \mathbf{6} \\ \mathbf{8} & \mathbf{-9} & \mathbf{0} \end{bmatrix}.$$

a. Find the minor of the given element.

b. Find the cofactor of the given element.

62. a_{13} **63.** a_{31} **64.** a_{32} **65.** a_{23}

For Exercises 66–71, evaluate the determinant of the given matrix.

66. $A = \begin{bmatrix} 9 & -4 \\ 2 & -3 \end{bmatrix}$

67. $B = \begin{bmatrix} 3 & x \\ x & 27 \end{bmatrix}$

68. $C = \begin{bmatrix} 9 & -15 \\ -3 & 5 \end{bmatrix}$

69. $D = \begin{bmatrix} 4 & -1 & 0 \\ 6 & 8 & -2 \\ 1 & 5 & 3 \end{bmatrix}$

70. $E = \begin{bmatrix} 4 & -9 & 0 \\ -3 & 8 & 0 \\ 6 & 1 & 0 \end{bmatrix}$

71. $F = \begin{bmatrix} -2 & 0 & 3 & 1 \\ 1 & 1 & 0 & 5 \\ 4 & 0 & 0 & -2 \\ 0 & -3 & 0 & 6 \end{bmatrix}$

For Exercises 72–76, solve the system by using Cramer's rule if possible. If Cramer's rule does not apply, use another method to solve the system.

72. $3x - 7y = 11$

$4x + 2y = 3$

73. $9x = 3y + 5$

$-2(x + 3y) = 4$

ISTUDY

74. $2x + 5y = 10$
$10y = -4(x - 5)$

75. $3x - 2y + z = 4$
$5x + 3y + 6z = 1$
$-2x + 5z = 7$

76. $2x + y - z = 5$
$7x + 7y - 6z = 5$
$3x + 5y - 4z = -1$

For Exercises 77–78, use Cramer's rule to solve for the indicated variable.

77. $-6x + 7y = 8$ Solve for y.
$2x + 5y + z = -3$
$3x + 2z = 11$

78. $3x_1 + 4x_3 = 6$ Solve for x_4.
$4x_1 + 2x_3 + x_4 = -7$
$x_2 - 3x_4 = 2$
$5x_3 + x_4 = 1$

CHAPTER 10 Test

For Exercises 1–3, perform the elementary row operations on the matrix $A = \left[\begin{array}{ccc|c} 3 & 1 & 4 & -2 \\ 1 & 5 & -3 & 1 \\ 0 & 4 & 2 & 6 \end{array}\right]$.

1. $R_1 \Leftrightarrow R_2$ **2.** $-3R_2 + R_1 \to R_1$ **3.** $\frac{1}{4}R_3 \to R_3$

4. Explain why the matrix is not in reduced row-echelon form.

$$\left[\begin{array}{ccc|c} 1 & 0 & 6 & 4 \\ 0 & 1 & 0 & 2 \\ 0 & 0 & 1 & -3 \end{array}\right]$$

For Exercises 5–7, write the solution set for the system represented by each augmented matrix.

5. $\left[\begin{array}{cc|c} 1 & 4 & 2 \\ 0 & 1 & 3 \end{array}\right]$ **6.** $\left[\begin{array}{ccc|c} 1 & 0 & 0 & 4 \\ 0 & 1 & 0 & 2 \\ 0 & 0 & 0 & 1 \end{array}\right]$

7. $\left[\begin{array}{ccc|c} 1 & 0 & -3 & 0 \\ 0 & 1 & 2 & 5 \\ 0 & 0 & 0 & 0 \end{array}\right]$

For Exercises 8–9, refer to the matrix $A = \begin{bmatrix} -1 & 3 & 0 \\ 2 & 5 & -4 \\ 6 & 9 & -8 \end{bmatrix}$.

a. Find the minor of the given element.
b. Find the cofactor of the given element.

8. a_{12} **9.** a_{31}

For Exercises 10–11, evaluate the determinant of the matrix.

10. $A = \begin{bmatrix} 3 & 7 \\ 4 & -1 \end{bmatrix}$ **11.** $B = \begin{bmatrix} -3 & 4 & 7 \\ 1 & -2 & 3 \\ 6 & 5 & 0 \end{bmatrix}$

12. Use the determinant of A to determine whether A has an inverse.

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 4 & 11 \\ 2 & 5 & 10 \end{bmatrix}$$

For Exercises 13–16, solve the system by using Gaussian elimination or Gauss-Jordan elimination.

13. $-3(x + y) = 3y - 12$
$-3x = 4y - 6$

14. $-3x = 11 - 18y$
$x - 6y = 2$

15. $x - 2y = 5z + 4$
$6y + 18z = 2x - 8$
$-3x + 8y + 20z = -18$

16. $2x + 6y + 30z = 2$
$x + 2y + 11z = 0$
$-3x - 6y - 33z = 0$

17. Solve the system by using Cramer's rule.

$$3x - 5y = 7$$
$$11x + 2y = 8$$

18. Use Cramer's rule to solve for x.

$$2x = 3y - 4z + 11$$
$$9x + y = z - 1$$
$$3x - 4y = 7$$

19. Solve the equation $A - 4X = B$ for X, given that $A = \begin{bmatrix} 2 & 5 \\ -2 & -3 \end{bmatrix}$ and $B = \begin{bmatrix} 6 & -3 \\ 14 & 5 \end{bmatrix}$.

For Exercises 20–23, perform the indicated operations if possible.

$A = \begin{bmatrix} 4 & 1 & -3 \\ 2 & 4 & 6 \end{bmatrix}$ $B = \begin{bmatrix} 1 & 9 \\ 0 & -1 \\ 3 & 5 \end{bmatrix}$ $C = \begin{bmatrix} 0 & 1 & -4 \\ 2 & -1 & 8 \end{bmatrix}$

20. $2A - 3C$ **21.** $A + B$ **22.** AB **23.** BA

24. Determine whether A and B are inverses.

$$A = \begin{bmatrix} -1 & \frac{2}{3} & -\frac{2}{3} \\ 1 & -\frac{1}{3} & \frac{1}{3} \\ 1 & -\frac{2}{3} & \frac{5}{3} \end{bmatrix} \text{ and } B = \begin{bmatrix} 1 & 2 & 0 \\ 4 & 3 & 1 \\ 1 & 0 & 1 \end{bmatrix}$$

For Exercises 25–27, determine the inverse of the matrix if possible. Otherwise, state that the matrix is singular.

25. $A = \begin{bmatrix} 3 & 2 \\ 5 & 4 \end{bmatrix}$ **26.** $A = \begin{bmatrix} 2 & 5 & 10 \\ 1 & 3 & 7 \\ 1 & 4 & 11 \end{bmatrix}$

ISTUDY

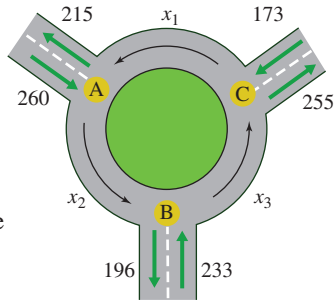
27. $A = \begin{bmatrix} 3 & -1 & -1 \\ 2 & -1 & 1 \\ -5 & 2 & 1 \end{bmatrix}$

For Exercises 28–29, solve the system by using the inverse of the coefficient matrix.

28. $3x + 2y = 13$ (See Exercise 25 for A^{-1}.)
$5x + 4y = 25$

29. $3x - y - z = 8$ (See Exercise 27 for A^{-1}.)
$2x + z = y$
$-5x + 2y + z = -11$

30. a. Assume that traffic flows freely around the traffic circle. The flow rates given are measured in vehicles per hour. If the flow rate x_3 is 210 vehicles per hour, determine the flow rates x_1 and x_2.



b. If traffic between intersections B and C flows at a rate of between 200 and 250 vehicles per hour, inclusive, find the range of values for x_1 and x_2.

31. Matrix C represents the number of calories burned per hour of exercise riding a bicycle, running, and walking for individuals of two different weights. Matrix N represents the number of hours spent working out with each type of activity for a given week. Find the product CN and interpret its meaning.

$$C = \begin{array}{c} \\ \text{120-lb person} \\ \text{180-lb person} \end{array} \begin{array}{c} \begin{bmatrix} \text{Bike} & \text{Run} & \text{Walk} \\ 400 & 500 & 320 \\ 550 & 780 & 480 \end{bmatrix} \end{array}$$

$$N = \begin{bmatrix} 6 \\ 3 \\ 5 \end{bmatrix} \begin{array}{l} \text{Bike} \\ \text{Run} \\ \text{Walk} \end{array}$$

32. Given three points (x_1, y_1), (x_2, y_2), and (x_3, y_3), the points are collinear if the following determinant is equal to zero.

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

Determine if the points $(4, -11)$, $(-1, -1)$, and $(-5, 7)$ are collinear.

CHAPTER 10 Cumulative Review Exercises

1. Given $f(x) = x^3$, find the difference quotient $\dfrac{f(x+h) - f(x)}{h}$.

2. Given $f(x) = -2(x-4)^2 - 5$,

a. Determine the vertex of the graph of the parabola.

b. Determine the intervals over which the graph is increasing.

c. Determine the intervals over which the graph is decreasing.

d. Write the domain in interval notation.

e. Write the range in interval notation.

3. Given $f(x) = \sqrt{2x-3}$, find the average rate of change on the interval $\left[2, \frac{7}{2}\right]$.

4. Simplify each expression.

a. i^{57} **b.** i^{22}

5. Divide and write the answer in the form $a + bi$. $\dfrac{3+4i}{2-3i}$

6. Find the distance between the points $(1, -7)$ and $(4, 2)$.

7. Determine the center and radius of the circle defined by $\left(x + \frac{5}{3}\right)^2 + y^2 = 11$.

8. Technetium-99m (abbreviated ^{99m}Tc) is a short-lived gamma-ray emitter that is used in nuclear medicine. Suppose that a patient is given a small amount of ^{99m}Tc for a diagnostic test. Further suppose that the amount of ^{99m}Tc decays exponentially according to the model $Q(t) = Q_0 e^{-kt}$. The value Q_0 is the initial amount administered, and $Q(t)$ represents the amount of ^{99m}Tc remaining after t hours. The value of k is the decay constant.

a. If 94% of the technetium has decayed after 24 hr (that is, 6% remains), determine the value of k. Round to 3 decimal places.

b. If 30 mCi is initially given to a patient for blood pool imaging of the heart, determine the amount remaining after 10 hr. Round to 1 decimal place.

c. Determine the amount of time required for the amount of ^{99m}Tc to fall below 1% of the original amount given. Round to 1 decimal place.

For Exercises 9–12,

a. Graph the function.
b. Write the domain in interval notation.
c. Write the range in interval notation.

9. $f(x) = e^{x-2} + 1$

10. $g(x) = \ln(x+4)$

11. $h(x) = \sqrt{-x}$

12. $k(x) = \begin{cases} (x-1)^2 - 2 & \text{for } x \le 1 \\ x + 1 & \text{for } x > 1 \end{cases}$

ISTUDY

For Exercises 13–14, solve the system of equations.

13. $3(x - y) = y - 3$

$$-2x + \frac{1}{2}y = -11$$

14. $2x - y + 5z = -2$

$$x \quad + 4z = 0$$

$$x + y = 2 - 7z$$

15. Determine if the graph of the equation $|x| + y^2 = 9$ is symmetric with respect to the x-axis, y-axis, origin, or none of these.

16. Determine if the function defined by $f(x) = 6x^3 - 4x$ is even, odd, or neither.

For Exercises 17–20, refer to the given matrices and perform the indicated operations.

$$A = \begin{bmatrix} 2 & -3 \\ 1 & 6 \end{bmatrix} \quad B = \begin{bmatrix} 1 & 4 \\ 0 & 7 \end{bmatrix} \quad C = \begin{bmatrix} -1 & 4 & 0 \\ 4 & 2 & 6 \\ 3 & -2 & 0 \end{bmatrix}$$

17. AB **18.** $|C|$ **19.** $4A - B$ **20.** A^{-1}

For Exercises 21–23, find the union or intersection of the given sets. Write the answers in set-builder notation.

$$A = \{x \mid 3 < x\},\ B = \{x \mid -2 < x \le 4\},\ C = \{x \mid x \ge 5\}$$

21. $A \cup B$ **22.** $A \cap B$ **23.** $A \cap C$

For Exercises 24–27, solve the equation or inequality. Write the solution set to the inequalities in interval notation if possible.

24. $2x - 3 - 5\sqrt{2x - 3} + 4 = 0$

25. $|-x + 4| = |x - 4|$

26. $\dfrac{x + 4}{2x - 1} \ge 1$

27. $\log_2(3x - 4) = \log_2(x + 1) + 1$

28. Find all zeros of $f(x) = 2x^3 - x^2 + 18x - 9$.

29. Find the asymptotes. $r(x) = \dfrac{2x - 1}{x^2 - 9}$

30. Write the expression as a single logarithm.

11.6 Plane Curves and Parametric Equations 1065

Many television viewers today rely on a satellite dish to provide a wide variety of programming options. A satellite dish is a parabolic device that receives microwave signals from broadcast centers via communications satellites. The data are then compressed and rendered into a digital form that can be viewed on an electronic device such as a television, computer, or smartphone.

In this chapter, we begin with the study of three types of curves called conic sections: the ellipse, the hyperbola, and the parabola. As we work through the chapter, we will learn how the reflective properties of these curves are used in numerous applications. For example, microwaves received by a satellite dish bounce off the parabolic surface to a common point called the focus. It is at this point that the receiver is placed to gather and interpret the signal that ultimately delivers hundreds of channels to our television set.

Later in the chapter, we represent equations of conics using polar coordinates. This is advantageous in certain applications such as modeling planetary motions. In addition, we will learn how to represent curves in a plane using a third variable called a parameter. In particular, using time as a parameter enables us to determine the time and location of a point traveling along a curve.

ISTUDY

SECTION 11.1 The Ellipse

OBJECTIVES

1. Graph an Ellipse Centered at the Origin
2. Graph an Ellipse Centered at (h, k)
3. Use Ellipses in Applications
4. Determine and Apply the Eccentricity of an Ellipse

1. Graph an Ellipse Centered at the Origin

In this chapter, we investigate four types of curves called conic sections. Specifically, these are the circle (covered in detail in Section 2.2), the ellipse, the hyperbola, and the parabola. Conic sections derive their names because each is the intersection of a plane and a double-napped cone (Figure 11-1).

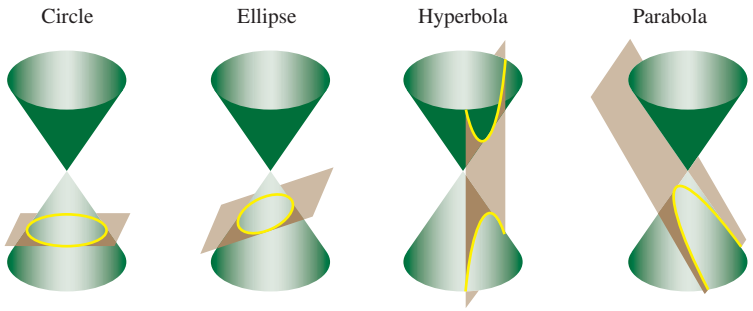

Figure 11-1

Recall from Section 2.2 that a circle is the set of all points in a plane, r units from a fixed point (the center of the circle), where r is the radius of the circle. We derived the standard form of an equation of a circle from the distance formula by noting that the distance between the center of the circle (h, k) and a point on the circle (x, y) is r units.

Standard Form of an Equation of a Circle

Given a circle centered at (h, k) with radius r, the standard form of an equation of the circle is given by $(x - h)^2 + (y - k)^2 = r^2$ for $r > 0$.

Example

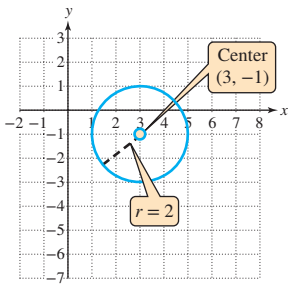
$(x - 3)^2 + (y + 1)^2 = 4$

Standard form

$(x - 3)^2 + [y - (-1)]^2 = 2^2$

Center: $(3, -1)$

Radius: 2



We now study a second type of conic section called an ellipse. An ellipse is an oval-shaped curve that appears in applications in many fields, including architecture, acoustics, medicine, and astronomy. To determine an equation of an ellipse, we first need to formalize the definition.

Definition of an Ellipse

An **ellipse** is the set of all points (x, y) in a plane such that the sum of the distances between (x, y) and two fixed points is a constant. The fixed points are called the **foci** (plural of **focus**) of the ellipse.

To visualize the definition of an ellipse, consider the following application. Suppose Sonya wants to cut an elliptical rug from a rectangular rug to avoid a stain made by the family dog. Two tacks are placed along the center horizontal line. Then the ends of a slack piece of rope are tied to each tack. With the rope pulled tight, Sonya traces out a curve. This curve is an ellipse, and the tacks are located at the foci of the ellipse (Figure 11-2).

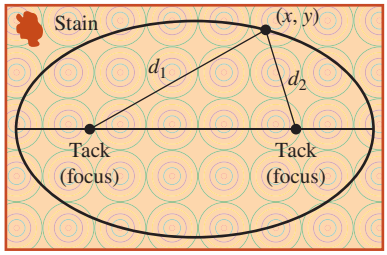


Figure 11-2

An ellipse may be elongated in any direction; however, we will study only those that are elongated horizontally and vertically. Figure 11-3 and Figure 11-4 show ellipses centered at the origin with foci on the x-axis and y-axis, respectively. The line through the foci intersects the ellipse at two points called **vertices.** The line segment with endpoints at the vertices is called the **major axis.** The **center** of the ellipse is the midpoint of the major axis. The line segment perpendicular to the major axis and passing through the center of the ellipse with endpoints on the ellipse is called the **minor axis.**

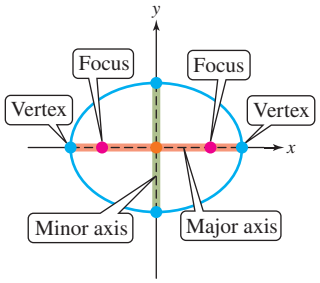

Figure 11-3

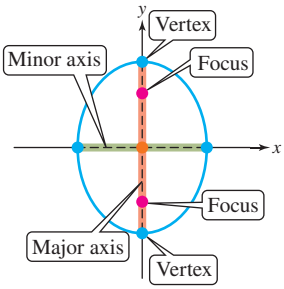

Figure 11-4

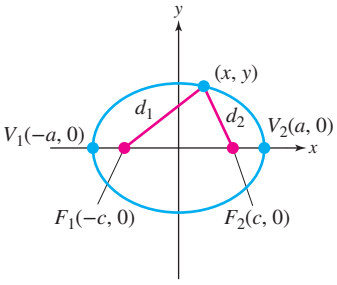

Figure 11-5

We will derive the standard form of an equation of an ellipse centered at the origin with foci on the x-axis. In Figure 11-5, the foci are labeled as $F_1(-c, 0)$ and $F_2(c, 0)$, and the vertices are labeled as $V_1(-a, 0)$ and $V_2(a, 0)$. Let (x, y) be an arbitrary point on the ellipse, and let the distances between (x, y) and the two foci be d_1 and d_2.

From Figure 11-5, the distance from F_1 to V_2 is $(a + c)$. The distance from F_2 to V_2 is $(a - c)$. By the definition of an ellipse, the sum of the distances between a point on the ellipse (such as V_2) and the two foci must be constant. Adding $(a + c)$ and $(a - c)$, we see that this constant is $2a$.

$$(a + c) + (a - c) = 2a$$

The sum of the distances between a point on an ellipse and the two foci is equal to the length of the major axis, $2a$.

The sum of the distances between (x, y) and the two foci is equal to $2a$.

$$\begin{aligned} d_1 \quad &+ \quad d_2 \quad = 2a \\ \sqrt{[(x-(-c)]^2 + (y-0)^2} &+ \sqrt{(x-c)^2 + (y-0)^2} = 2a \quad \text{Apply the distance formula.} \\ \sqrt{(x+c)^2 + y^2} &+ \sqrt{(x-c)^2 + y^2} \quad = 2a \quad \text{Simplify within parentheses.} \end{aligned}$$

ISTUDY

In Exercise 109, we guide you through a series of algebraic steps to eliminate the radicals. Then collecting the variable terms on one side and the constant terms on the other side, the equation becomes

$$(a^2 - c^2)x^2 + a^2y^2 = a^2(a^2 - c^2) \quad (1)$$

From Figure 11-5, we see that the distance between F_1 and F_2 is $2c$. Furthermore, since $d_1 + d_2 = 2a$, we have that $2c < 2a$, which implies that $c < a$ and that $a^2 - c^2 > 0$. Letting $b^2 = a^2 - c^2$, Equation (1) becomes

$$b^2x^2 + a^2y^2 = a^2b^2$$

$$\frac{b^2x^2}{a^2b^2} + \frac{a^2y^2}{a^2b^2} = \frac{a^2b^2}{a^2b^2} \quad \text{Divide both sides by } a^2b^2.$$

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{Standard form of an equation of an ellipse}$$

This equation represents an ellipse centered at the origin with foci on the x-axis. The length of the major axis is $2a$ and the length of the minor axis is $2b$. The value a is also referred to as the length of the **semimajor axis** (the distance from the center of an ellipse to a vertex). The value b is referred to as the length of the **semiminor axis** (half the length of the minor axis).

In a similar manner, we can develop the standard form of an equation of an ellipse centered at the origin with foci on the y-axis. These two equations are summarized as follows:

Standard Forms of an Equation of an Ellipse Centered at the Origin

The standard forms of an equation of an ellipse centered at the origin are as follows. Assume that

- $a > b > 0$.
- The length of the major axis is $2a$, and the length of the minor axis is $2b$.

	Major Axis: x-axis	**Major Axis: y-axis**
Equation:	$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$	$\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$
Center:	$(0, 0)$	$(0, 0)$
Foci: (*Note*: $c^2 = a^2 - b^2$)	$(c, 0)$ and $(-c, 0)$	$(0, c)$ and $(0, -c)$
Vertices: Endpoints: major axis	$(a, 0)$ and $(-a, 0)$	$(0, a)$ and $(0, -a)$
Endpoints: minor axis	$(0, b)$ and $(0, -b)$	$(b, 0)$ and $(-b, 0)$
Graph:		
Avoiding Mistakes

It is important to note that the foci are not actually on the graph of an elliptical curve. However, the foci are used to define the curve.

ISTUDY

For an ellipse centered at the origin, the x- and y-intercepts are the endpoints of the major and minor axes. For example, for an ellipse centered at (0, 0) with foci on the x-axis, we have:

Standard form:

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

x-intercept: substitute 0 for y.

$$\frac{x^2}{a^2}+\frac{(0)^2}{b^2}=1$$
$$\frac{x^2}{a^2}=1$$
$$x^2=a^2$$
$$x=\pm a$$

y-intercept: substitute 0 for x.

$$\frac{(0)^2}{a^2}+\frac{y^2}{b^2}=1$$
$$\frac{y^2}{b^2}=1$$
$$y^2=b^2$$
$$y=\pm b$$

In Example 1, we graph an ellipse and identify the key features.

EXAMPLE 1 Graphing an Ellipse Centered at the Origin

Given $\frac{x^2}{16}+\frac{y^2}{9}=1$, graph the ellipse, and identify the center, vertices, and foci.

Solution:

$$\frac{x^2}{16}+\frac{y^2}{9}=1$$

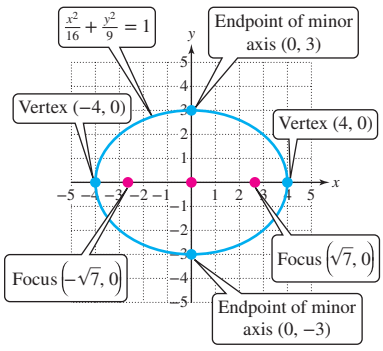
The equation is in the standard form of an ellipse. Since $16 > 9$, $a^2 = 16$ and $b^2 = 9$. Since the greater number in the denominator is found in the x^2 term, the ellipse is elongated horizontally and the foci are on the x-axis.

$$\frac{x^2}{(4)^2}+\frac{y^2}{(3)^2}=1$$

$a = 4$ and $b = 3$

$a^2 = 16$, and because $a > 0$, we have that $a = 4$.
$b^2 = 9$, and because $b > 0$, we have that $b = 3$.

To graph the ellipse, plot the vertices (endpoints of the major axis) and the endpoints of the minor axis, and sketch the ellipse through the points.



Center: (0, 0)

Vertices: $(a, 0)$ and $(-a, 0)$
(4, 0) and (−4, 0)

Minor axis endpoints: $(0, b)$ and $(0, -b)$
(0, 3) and (0, −3)

To find the foci, use the relationship

$$c^2 = a^2 - b^2$$
$$c^2 = (4)^2 - (3)^2 = 16 - 9 = 7$$
$$c^2 = 7 \quad \text{(Recall that } c > 0.\text{)}$$
$$c = \sqrt{7} \approx 2.65$$

Foci: $(c, 0)$ and $(-c, 0)$
$(\sqrt{7}, 0)$ and $(-\sqrt{7}, 0)$

It is important to note that the center and foci of the ellipse are not actually part of the curve. For this reason, we graphed the curve in blue and plotted the foci and center in red.

Skill Practice 1 Graph the ellipse, and identify the center, vertices, minor axis endpoints, and foci. $\frac{x^2}{9}+\frac{y^2}{4}=1$

The graph of an ellipse does not define y as a function of x (the graph fails the vertical line test). However, an ellipse can be defined by the union of two functions:

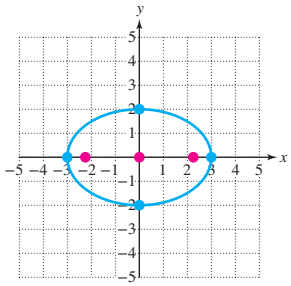
Point of Interest

The National Center for the Performing Arts in Beijing, People's Republic of China, is a semielliptical dome made of titanium and glass and surrounded by an artificial lake. On a calm day, the reflection from the lake gives the illusion of a full ellipse.

Best View Stock/Alamy Stock Photo

Answer

1.

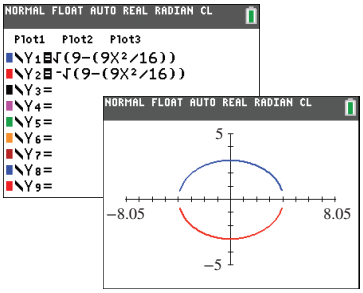


Center: (0, 0)
Vertices: (3, 0) and (−3, 0)
Minor axis endpoints: (0, 2) and (0, −2)
Foci: $(\sqrt{5}, 0)$ and $(-\sqrt{5}, 0)$

an upper semiellipse and a lower semiellipse. This is helpful for graphing an ellipse on a graphing utility.

From Example 1, we have

$$\frac{x^2}{16} + \frac{y^2}{9} = 1 \longrightarrow y = \pm\sqrt{9 - \frac{9x^2}{16}}$$



The functions represent the top and bottom semiellipses, respectively.

$$y = \sqrt{9 - \frac{9x^2}{16}} \quad \text{top semiellipse}$$

$$y = -\sqrt{9 - \frac{9x^2}{16}} \quad \text{bottom semiellipse}$$

EXAMPLE 2 Graphing an Ellipse Centered at the Origin

Given $25x^2 + 9y^2 = 225$, graph the ellipse and identify the center, vertices, minor axis endpoints, and foci.

Solution:

$25x^2 + 9y^2 = 225$

For the equation to be in the standard form for an ellipse, we require the constant term to be 1.

$\frac{25x^2}{225} + \frac{9y^2}{225} = \frac{225}{225}$

Divide both sides by 225.

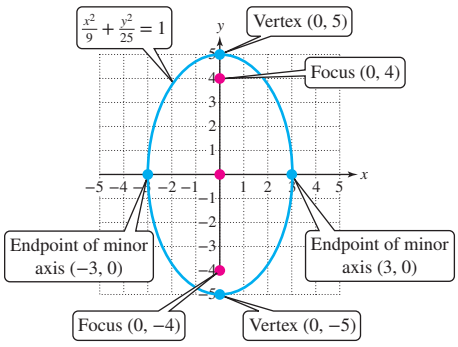
$\frac{x^2}{9} + \frac{y^2}{25} = 1$

Since $25 > 9$, $a^2 = 25$ and $b^2 = 9$. Since the greater number in the denominator is found in the y^2 term, the ellipse is elongated vertically and the foci are on the y-axis.

$\frac{x^2}{(3)^2} + \frac{y^2}{(5)^2} = 1$

$b = 3$, $a = 5$

$a^2 = 25$, and because $a > 0$, we have that $a = 5$.
$b^2 = 9$, and because $b > 0$, we have that $b = 3$.



Center: (0, 0)

Vertices: $(0, a)$ and $(0, -a)$
$(0, 5)$ and $(0, -5)$

Minor axis endpoints: $(b, 0)$ and $(-b, 0)$
$(3, 0)$ and $(-3, 0)$

To find the foci, use the relationship

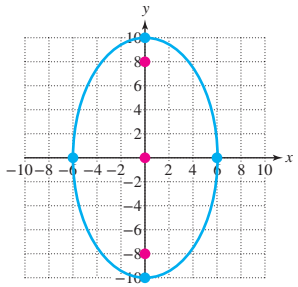
$c^2 = a^2 - b^2$
$c^2 = (5)^2 - (3)^2 = 25 - 9 = 16$
$c^2 = 16$
$c = 4$ (Recall that $c > 0$.)

Foci: $(0, c)$ and $(0, -c)$
$(0, 4)$ and $(0, -4)$

Skill Practice 2 Graph the ellipse and identify the center, vertices, minor axis endpoints, and foci. $25x^2 + 9y^2 = 900$

TIP For an equation of an ellipse written in standard form, the term containing the larger denominator indicates the direction of elongation of the graph. In Example 2, the larger denominator of 25 is located in the y term. Notice that the ellipse is elongated vertically.

Answer
2.



Center: (0, 0)
Vertices: (0, 10), (0, −10)
Minor axis endpoints: (6, 0), (−6, 0)
Foci: (0, 8), (0, −8)

2. Graph an Ellipse Centered at (h, k)

In Section 2.2, we learned that the standard form of an equation of a circle centered at the origin with radius r is given by $x^2 + y^2 = r^2$. For a circle centered at (h, k), we have the equation

$$(x - h)^2 + (y - k)^2 = r^2 \qquad \text{Circle centered at } (h, k) \text{ with radius } r$$

ISTUDY

Replacing x by $x - h$ and y by $y - k$ shifts the graph of $x^2 + y^2 = r^2$ a total of h units horizontally and k units vertically. The same is true for an equation of an ellipse.

Standard Forms of an Equation of an Ellipse Centered at (h, k)

The standard forms of an equation of an ellipse centered at (h, k) are as follows. Assume that

- $a > b > 0$.
- The length of the major axis is $2a$, and the length of the minor axis is $2b$.

	Major Axis Horizontal	**Major Axis Vertical**
Equation:	$\dfrac{(x-h)^2}{a^2} + \dfrac{(y-k)^2}{b^2} = 1$	$\dfrac{(x-h)^2}{b^2} + \dfrac{(y-k)^2}{a^2} = 1$
Center:	(h, k)	(h, k)
Foci: (*Note*: $c^2 = a^2 - b^2$)	$(h + c, k)$ and $(h - c, k)$	$(h, k + c)$ and $(h, k - c)$
Vertices: Endpoints: major axis	$(h + a, k)$ and $(h - a, k)$	$(h, k + a)$ and $(h, k - a)$
Endpoints: minor axis	$(h, k + b)$ and $(h, k - b)$	$(h + b, k)$ and $(h - b, k)$
Graph:		
To graph an ellipse centered at (h, k), it is helpful to locate the center first as well as to identify the orientation of the ellipse (elongated horizontally or elongated vertically). Then use the values of a and b to locate the endpoints of the major and minor axes. This is demonstrated in Example 3.

EXAMPLE 3 Graphing an Ellipse Centered at (h, k)

Graph the ellipse and identify the center, vertices, endpoints of the minor axis, and foci. $\dfrac{(x-3)^2}{16} + \dfrac{(y+2)^2}{25} = 1$

Solution:

$$\frac{(x-3)^2}{16} + \frac{(y+2)^2}{25} = 1$$

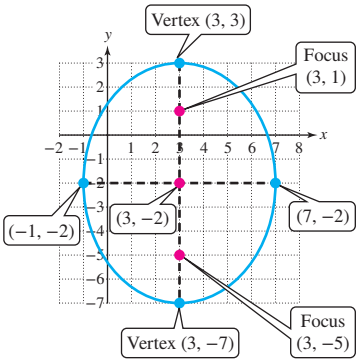
The standard form of an equation of an ellipse is given. The quantity $(y + 2)^2$ is equivalent to $[y - (-2)]^2$. Therefore, the center of the ellipse is $(3, -2)$.

$$\frac{(x-3)^2}{(4)^2} + \frac{[y-(-2)]^2}{(5)^2} = 1$$

$b = 4$ $a = 5$

Since $25 > 16$, $a^2 = 25$ and $b^2 = 16$. $a = 5$ and $b = 4$. Since the greater number in the denominator is found in the y^2 term, the ellipse is elongated vertically.

ISTUDY



Center: (3, −2)
The vertices are a units above and below the center.
Vertices: (3, −2 + 5) and (3, −2 − 5)
(3, 3) and (3, −7)
The minor axis endpoints are b units to the right and left of the center.
Minor axis endpoints: (3 + 4, −2) and (3 − 4, −2)
(7, −2) and (−1, −2)
To find the foci, use the relationship
$c^2 = a^2 - b^2$
$c^2 = (5)^2 - (4)^2 = 25 - 16 = 9$
$c = 3$ (Recall that $c > 0$.)
The foci are c units above and below the center. The foci are (3, 1) and (3, −5).

Skill Practice 3 Graph the ellipse and identify the center, vertices, foci, and endpoints of the minor axis. $\dfrac{(x+1)^2}{25} + \dfrac{(y-2)^2}{9} = 1$

The equation of the ellipse from Example 3 can be expanded by expanding the binomials and combining like terms.

$$\frac{(x-3)^2}{16} + \frac{(y+2)^2}{25} = 1 \qquad \text{Standard form}$$

$$400\left[\frac{(x-3)^2}{16} + \frac{(y+2)^2}{25}\right] = 400(1) \qquad \text{Clear fractions.}$$

$$25(x-3)^2 + 16(y+2)^2 = 400$$

$$25(x^2 - 6x + 9) + 16(y^2 + 4y + 4) = 400 \qquad \text{Expand the binomials.}$$

$$25x^2 + 16y^2 - 150x + 64y - 111 = 0 \qquad \text{Expanded form}$$

Given an equation of an ellipse in expanded form, we can reverse this process by completing the square to write the equation in standard form. The benefit of writing an equation in standard form is that we can easily identify the center of the ellipse and the values of a and b.

EXAMPLE 4 Writing an Equation of an Ellipse in Standard Form

Given $3x^2 + 7y^2 + 6x - 28y + 10 = 0$,

a. Write the equation of the ellipse in standard form.

b. Identify the center, vertices, foci, and endpoints of the minor axis.

Solution:

a. $3x^2 + 7y^2 + 6x - 28y + 10 = 0$

Group the x terms and group the y terms.

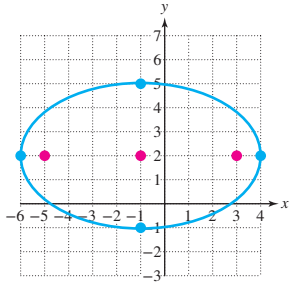
$$3x^2 + 6x + 7y^2 - 28y = -10$$

Move the constant term to the right side of the equation.

$$3(x^2 + 2x + \_\_\_) + 7(y^2 - 4y + \_\_\_) = -10$$

Factor out the leading coefficient from the x and y terms. Leave room to complete the square within parentheses.

Answer
3.



Center: (−1, 2)
Vertices: (4, 2), (−6, 2)
Minor axis endpoints: (−1, 5), (−1, −1)
Foci: (3, 2), (−5, 2)

ISTUDY

$3 \cdot 1$ is added to the left side. $7 \cdot 4$ is added to the left side.

$$3(x^2 + 2x + 1) + 7(y^2 - 4y + 4) = -10 + 3 + 28$$

To balance the equation add $3 \cdot 1$ and $7 \cdot 4$ to the right side.

Complete the square. Note that $\left[\frac{1}{2}(2)\right]^2 = 1$ and $\left[\frac{1}{2}(-4)\right]^2 = 4$.

The values 1 and 4 are added inside parentheses. However, as a result of the factors of 3 and 7 in front of the parentheses, $3 \cdot 1$ and $7 \cdot 4$ are actually added to the left side of the equation.

$$3(x + 1)^2 + 7(y - 2)^2 = 21$$

To write the equation in standard form, we require that the constant on the right side of the equation be 1.

$$\frac{3(x + 1)^2}{21} + \frac{7(y - 2)^2}{21} = \frac{21}{21}$$

Divide both sides by 21.

$$\frac{(x + 1)^2}{7} + \frac{(y - 2)^2}{3} = 1$$

Standard form

b. $$\frac{[x - (-1)]^2}{7} + \frac{(y - 2)^2}{3} = 1$$

The center is $(-1, 2)$.

Since $7 > 3$, $a^2 = 7$ and $b^2 = 3$. The greater number in the denominator is in the x^2 term. Therefore, the ellipse is elongated horizontally.

$a^2 = 7$. Because $a > 0$, $a = \sqrt{7}$.

$b^2 = 3$. Because $b > 0$, $b = \sqrt{3}$.

$c^2 = a^2 - b^2 = 7 - 3 = 4$

$c^2 = 4$, and because $c > 0$, we have $c = 2$.

$$\frac{[x - (-1)]^2}{(\sqrt{7})^2} + \frac{(y - 2)^2}{(\sqrt{3})^2} = 1$$

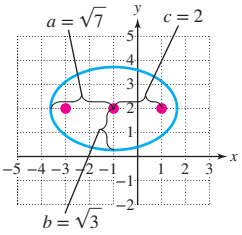
$a = \sqrt{7}$ $b = \sqrt{3}$

The center is $(-1, 2)$.

The vertices are $(-1 + \sqrt{7}, 2)$ and $(-1 - \sqrt{7}, 2)$.

The foci are $(1, 2)$ and $(-3, 2)$.

The endpoints of the minor axis are $(-1, 2 + \sqrt{3})$ and $(-1, 2 - \sqrt{3})$.



Skill Practice 4 Repeat Example 4 with $2x^2 + 11y^2 - 12x + 44y + 40 = 0$.

Now that we know the standard form of an equation of an ellipse, we can build an equation based on known information about the ellipse. This is demonstrated in Example 5.

EXAMPLE 5 Finding an Equation of an Ellipse from Given Information

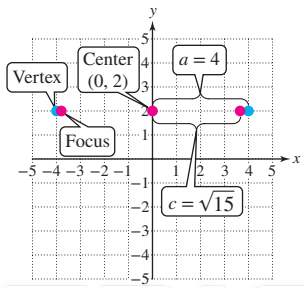
Determine the standard form of an equation of an ellipse with vertices $(4, 2)$ and $(-4, 2)$ and foci $(\sqrt{15}, 2)$ and $(-\sqrt{15}, 2)$.

Solution:

Plotting the given points tells us that the ellipse is elongated horizontally. Therefore, the standard form is

$$\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1$$

The center is midway between the vertices. Therefore, the center is $(0, 2)$, indicating that $h = 0$ and $k = 2$.



Answers

4. a. $\frac{(x - 3)^2}{11} + \frac{(y + 2)^2}{2} = 1$

b. Center: $(3, -2)$; Vertices: $(3 + \sqrt{11}, -2)$ and $(3 - \sqrt{11}, -2)$

Foci: $(0, -2)$ and $(6, -2)$; Minor axis endpoints: $(3, -2 + \sqrt{2})$ and $(3, -2 - \sqrt{2})$

ISTUDY

The vertices are located 4 units away from the center. This means that $a = 4$. The foci are located $\sqrt{15}$ units from the center, indicating that $c = \sqrt{15}$. The only missing piece of information is the value of b. We can find b from the relationship $c^2 = a^2 - b^2$ or equivalently $b^2 = a^2 - c^2$.

$$b^2 = (4)^2 - (\sqrt{15})^2$$
$$b^2 = 1$$
$$b = 1 \quad \text{(Recall that } b > 0.\text{)}$$
$$\frac{(x-0)^2}{(4)^2} + \frac{(y-2)^2}{(1)^2} = 1$$ Substitute $h = 0$, $k = 2$, $a = 4$, and $b = 1$ into the standard form.
$$\frac{x^2}{16} + \frac{(y-2)^2}{1} = 1 \quad \text{or} \quad \frac{x^2}{16} + (y-2)^2 = 1$$ Standard form

Skill Practice 5 Determine the standard form of an equation of an ellipse with vertices (3, 3) and (−3, 3) and foci $(2\sqrt{2}, 3)$ and $(-2\sqrt{2}, 3)$.

3. Use Ellipses in Applications

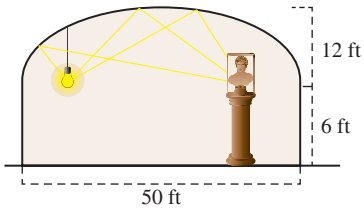
The ellipse and its three-dimensional counterpart, the ellipsoid (an object in the shape of a blimp), have many useful applications that arise from the reflective property of the ellipse. For example, consider an elliptical-shaped dome. Sound or light waves emitted from one focus are reflected off the surface to the other focus. This principle is applied in Example 6.

EXAMPLE 6 Applying the Reflective Property of an Ellipse

A room in a museum has a semielliptical dome with a major axis of 50 ft and a semiminor axis of 12 ft. A light is placed at one focus of the ellipse and the light that reflects off the ceiling will be directed to the other focus. The museum curator wants to place a sculpture so that the sculpture is at the other focus where it will be illuminated by the light.

a. Choose a coordinate system so that the ellipse is oriented with horizontal major axis with the center placed at (0, 0). Write an equation of the semiellipse.

b. Approximately where should the sculpture be placed?



Solution:

a. A graph of the semiellipse is shown in Figure 11-6. The length of the semimajor axis is 25 ft ($a = 25$), and the length of the semiminor axis is 12 ft ($b = 12$). An equation of the full ellipse is

$$\frac{x^2}{25^2} + \frac{y^2}{12^2} = 1 \quad \text{or} \quad \frac{x^2}{625} + \frac{y^2}{144} = 1.$$

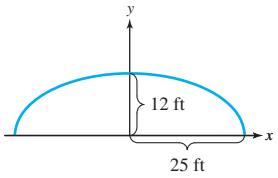


Figure 11-6

We want the top half only, which is given by $\frac{x^2}{625} + \frac{y^2}{144} = 1$ for $y \geq 0$, or equivalently $y = 12\sqrt{1 - \frac{x^2}{625}}$.

Answer

5. $\frac{x^2}{9} + (y-3)^2 = 1$

b. To find the location of the sculpture, we must find the location of the other focus.

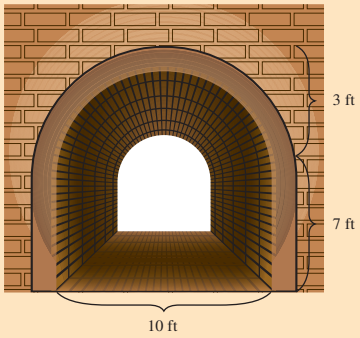
$$c^2 = a^2 - b^2$$
$$c^2 = (25)^2 - (12)^2 = 625 - 144 = 481$$
$$c = \pm\sqrt{481} \approx \pm 21.9$$

The sculpture should be located approximately 21.9 ft from the center of the room along the major axis, opposite the light source, and 6 ft up.

Skill Practice 6 A tunnel has vertical sides of 7 ft with a semielliptical top. The width of the tunnel is 10 ft, and the height at the top is 10 ft.

a. Write an equation of the semiellipse. For convenience, place the coordinate system with (0, 0) at the center of the ellipse.

b. To construct the tunnel, an engineer needs to find the location of the foci. How far from the center are the foci?



4. Determine and Apply the Eccentricity of an Ellipse

The degree of elongation of an ellipse is measured by the eccentricity e of the ellipse.

Eccentricity of an Ellipse

For an ellipse defined by $\dfrac{(x-h)^2}{a^2} + \dfrac{(y-k)^2}{b^2} = 1$ or $\dfrac{(x-h)^2}{b^2} + \dfrac{(y-k)^2}{a^2} = 1$,

the **eccentricity** e is given by $e = \dfrac{c}{a}$, where $a > b > 0$, $c > 0$, and $c^2 = a^2 - b^2$.

Note: The eccentricity of an ellipse is a number between 0 and 1; that is, $0 < e < 1$.

With this definition, we see that the eccentricity of an ellipse is the ratio of the distance between a focus and the center to the distance between a vertex and the center; that is, $e = \frac{c}{a}$.

- If the foci are near the vertices (that is, a is only slightly greater than c), then the ellipse is more elongated (Figure 11-7).
- If the foci are near the center, then the ellipse is more circular (Figure 11-8).

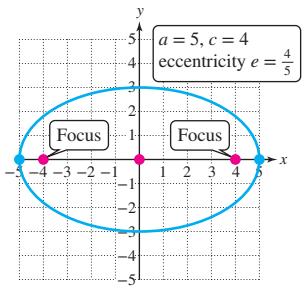


Figure 11-7

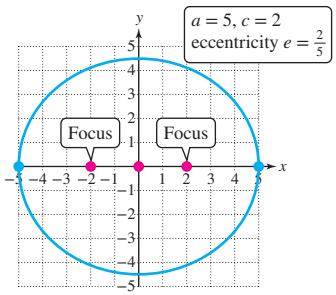

Figure 11-8

The orbits of the planets in our solar system are elliptical with the Sun at one focus. The eccentricities given in Table 11-1 indicate that the orbit of Venus is the most circular and the orbit of Pluto is the most elongated. (*Source*: NASA, www.nasa.gov)

Answers

6. a. $\dfrac{x^2}{25} + \dfrac{y^2}{9} = 1$; $y \geq 0$ or equivalently $y = 3\sqrt{1 - \dfrac{x^2}{25}}$

b. The foci are 4 ft to the right and left of the center of the semiellipse. These are at points 7 ft above the ground and 4 ft left and right of the center of the tunnel.

ISTUDY

Table 11-1

Planet	Eccentricity
Mercury	0.2056
Venus	0.0067 ← The orbit of Venus is the most circular.
Earth	0.0167
Mars	0.0935
Jupiter	0.0489
Saturn	0.0565
Uranus	0.0457
Neptune	0.0113
Pluto (dwarf planet)	0.2488 ← The orbit of Pluto is the most elongated.

EXAMPLE 7 Using Eccentricity in an Application

The point in a planet's orbit where it is closest to the Sun is called **perihelion** and the point where it is farthest away is called **aphelion** (Figure 11-9). Suppose that Mars is 2.0662×10^8 km from the Sun at perihelion. Use the eccentricity from Table 11-1 to find the distance between Mars and the Sun at aphelion.

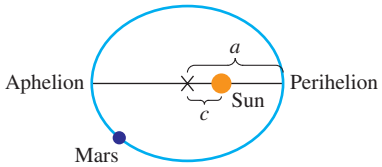

Figure 11-9

Solution:

For convenience, we have labeled the center of the ellipse as point C and the focus at which the Sun resides as point S. Aphelion and perihelion are labeled A and P, respectively (Figure 11-10).

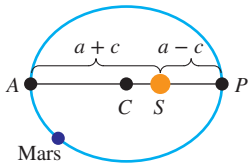

Figure 11-10

We need to find the distance between Mars and the Sun at aphelion. This is given by $a + c$. Since a and c are two unknown values, we need two independent relationships between a and c.

The distance at perihelion and the eccentricity give such information.

(1) $a - c = 2.0662 \times 10^8$ (distance at perihelion)

(2) $\frac{c}{a} = 0.0935 \longrightarrow c = 0.0935a$ (eccentricity)

This a nonlinear system of equations.

$$a - 0.0935a = 2.0662 \times 10^8$$ Use the substitution method.

$$0.9065a = 2.0662 \times 10^8$$ Combine like terms.

$$a \approx 2.2793 \times 10^8$$ Divide by 0.9065.

$$c = 0.0935(2.2793 \times 10^8)$$ Back substitute.

$$c = 2.1311 \times 10^7$$

Thus, $a + c = 2.2793 \times 10^8 + 2.1311 \times 10^7$

$= 2.4924 \times 10^8$

The distance between Mars and the Sun at aphelion (the farthest point from the Sun) is approximately 2.4924×10^8 km.

Skill Practice 7 Pluto is 7.376×10^9 km at aphelion (farthest point from the Sun). Use the eccentricity of Pluto's orbit of 0.2488 to find the closest distance between Pluto and the Sun.

Answer

7. 4.437×10^9 km

SECTION 11.1 Practice Exercises

Prerequisite Review

For Exercises R.1–R.3, determine the center and radius of the circle.

R.1. $x^2 + (y + 5)^2 = 8$ **R.2.** $x^2 + y^2 = 25$ **R.3.** $(x - 4)^2 + (y + 3)^2 = 81$

For Exercises R.4–R.5, find the value of n so that the expression is a perfect square trinomial. Then factor the trinomial.

R.4. $a^2 - 8a + n$ **R.5.** $y^2 + 7y + n$

R.6. Complete the square and write the equation of the circle in standard form. $x^2 + y^2 + 10x - 10y + 41 = 0$

Concept Connections

1. The circle, the ellipse, the hyperbola, and the parabola are categories of _____ sections.

2. An _____ is a set of points (x, y) in a plane such that the sum of the distances between (x, y) and two fixed points called _____ is a constant.

3. The line through the foci intersects an ellipse at two points called _____.

4. The line segment with endpoints at the vertices of an ellipse is called the _____ axis.

5. The line segment perpendicular to the major axis, with endpoints on the ellipse, and passing through the center of the ellipse, is called the _____ axis.

6. Given $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, where $a > b > 0$, the ordered pairs representing the vertices are _____ and _____. The ordered pairs representing the endpoints of the minor axis are _____ and _____.

7. Given $\frac{(x - h)^2}{b^2} + \frac{(y - k)^2}{a^2} = 1$, where $a > b > 0$, the ordered pairs representing the endpoints of the vertices are _____ and _____. The ordered pairs representing the endpoints of the minor axis are _____ and _____.

8. When referring to the standard form of an equation of an ellipse, the _____ e is defined as $e = \frac{\square}{\square}$.

Objective 1: Graph an Ellipse Centered at the Origin

For Exercises 9–10,

a. Use the distance formula to find the distances d_1, d_2, d_3, and d_4.

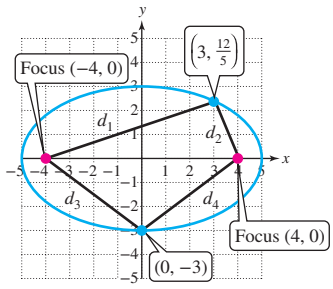
b. Find the sum $d_1 + d_2$.

c. Find the sum $d_3 + d_4$.

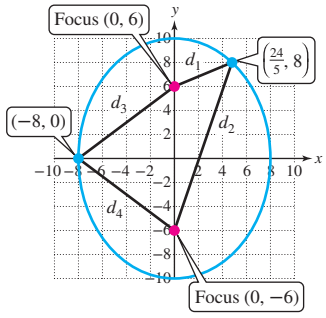
d. How do the sums from parts (b) and (c) compare?

e. How do the sums of the distances from parts (b) and (c) relate to the length of the major axis?

9.



10.



For Exercises 11–12, from the equation of the ellipse, determine if the major axis is horizontal or vertical.

11. a. $\frac{x^2}{2} + \frac{y^2}{5} = 1$ **b.** $\frac{x^2}{5} + \frac{y^2}{2} = 1$

12. a. $\frac{x^2}{11} + \frac{y^2}{10} = 1$ **b.** $\frac{x^2}{10} + \frac{y^2}{11} = 1$

ISTUDY

For Exercises 13–22,

a. Identify the center of the ellipse.
b. Determine the value of a.
c. Determine the value of b.
d. Identify the vertices.
e. Identify the endpoints of the minor axis.
f. Identify the foci.
g. Determine the length of the major axis.
h. Determine the length of the minor axis.
i. Graph the ellipse. **(See Examples 1–2)**

13. $\frac{x^2}{100} + \frac{y^2}{25} = 1$
14. $\frac{x^2}{64} + \frac{y^2}{49} = 1$
15. $\frac{x^2}{25} + \frac{y^2}{100} = 1$
16. $\frac{x^2}{49} + \frac{y^2}{64} = 1$
17. $4x^2 + 25y^2 = 100$
18. $9x^2 + 64y^2 = 576$
19. $-36x^2 - 4y^2 = -36$
20. $-64x^2 - 16y^2 = -64$
21. $\frac{x^2}{12} + \frac{y^2}{5} = 1$
22. $\frac{x^2}{18} + \frac{y^2}{7} = 1$

Objective 2: Graph an Ellipse Centered at (h, k)

For Exercises 23–32,

a. Identify the center of the ellipse.
b. Identify the vertices.
c. Identify the endpoints of the minor axis.
d. Identify the foci.
e. Graph the ellipse. (**See Example 3**)

23. $\frac{(x-1)^2}{25} + \frac{(y+6)^2}{16} = 1$
24. $\frac{(x-3)^2}{25} + \frac{(y+4)^2}{9} = 1$
25. $\frac{(x+4)^2}{49} + \frac{(y-2)^2}{64} = 1$
26. $\frac{(x+1)^2}{36} + \frac{(y-5)^2}{81} = 1$
27. $(x-6)^2 + \frac{y^2}{9} = 1$
28. $(x-2)^2 + \frac{y^2}{4} = 1$
29. $x^2 + 9(y+1)^2 = 81$
30. $x^2 + 4(y+4)^2 = 100$
31. $\frac{4(x-3)^2}{25} + \frac{16(y-2)^2}{49} = 1$
32. $\frac{4(x-4)^2}{81} + \frac{16(y-3)^2}{225} = 1$

For Exercises 33–42,

a. Write the equation of the ellipse in standard form. (**See Example 4**)
b. Identify the center, vertices, endpoints of the minor axis, and foci.

33. $3x^2 + 5y^2 + 12x - 60y + 177 = 0$
34. $7x^2 + 11y^2 + 70x - 66y + 197 = 0$
35. $3x^2 + 2y^2 - 30x - 4y + 59 = 0$
36. $5x^2 + 2y^2 - 40x - 12y + 78 = 0$
37. $4x^2 + y^2 + 14y + 45 = 0$
38. $x^2 + 49y^2 - 6x - 40 = 0$
39. $36x^2 + 100y^2 - 180x + 800y + 925 = 0$
40. $4x^2 + 9y^2 - 12x + 18y - 18 = 0$
41. $4x^2 + 9y^2 - 8x + 3 = 0$
42. $25x^2 + 16y^2 + 64y + 63 = 0$

For Exercises 43–56, write the standard form of an equation of an ellipse subject to the given conditions. (See Example 5)

43. Vertices: (4, 0) and (−4, 0);
Foci: (3, 0) and (−3, 0)
44. Vertices: (6, 0) and (−6, 0);
Foci: (5, 0) and (−5, 0)
45. Endpoints of minor axis: $(\sqrt{17}, 0)$ and $(-\sqrt{17}, 0)$;
Foci: (0, 9) and (0, −9)
46. Endpoints of minor axis: $(\sqrt{21}, 0)$ and $(-\sqrt{21}, 0)$;
Foci: (0, 5) and (0, −5)
47. Major axis parallel to the x-axis; Center: (2, 3);
Length of major axis: 14 units;
Length of minor axis: 10 units
48. Major axis parallel to the y-axis; Center: (1, 5);
Length of major axis: 22 units;
Length of minor axis: 14 units
49. Foci: (0, 1) and (8, 1);
Length of minor axis: 6 units
50. Foci: (−3, 3) and (7, 3);
Length of minor axis: 8 units
51. Vertices: (0, 5) and (0, −5);
Passes through $\left(\frac{16}{5}, 3\right)$
52. Vertices: (0, 13) and (0, −13);
Passes through $\left(\frac{25}{13}, 12\right)$

ISTUDY

53. Vertices: $(3, 4)$ and $(3, -4)$;
Foci: $(3, \sqrt{11})$ and $(3, -\sqrt{11})$

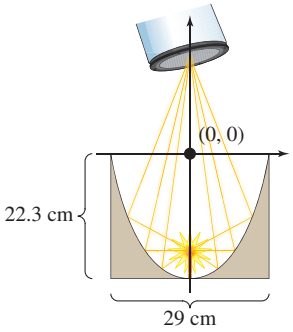
54. Vertices: $(4, 5)$ and $(-4, 5)$;
Foci: $(\sqrt{6}, 5)$ and $(-\sqrt{6}, 5)$

55. Vertices: $(2, 1)$ and $(-12, 1)$;
Foci: $(-5 - \sqrt{33}, 1)$ and $(-5 + \sqrt{33}, 1)$

56. Vertices: $(-8, 4)$ and $(2, 4)$;
Foci: $(-3 - \sqrt{21}, 4)$ and $(-3 + \sqrt{21}, 4)$

Objective 3: Use Ellipses in Applications

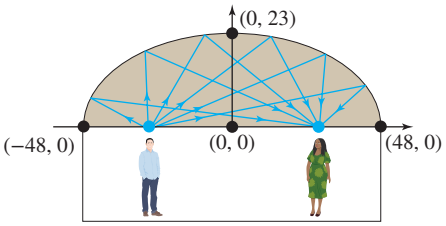
57. The reflective property of an ellipse is used in lithotripsy. Lithotripsy is a technique for treating kidney stones without surgery. Instead, high-energy shock waves are emitted from one focus of an elliptical shell and reflected painlessly to a patient's kidney stone located at the other focus. The vibration from the shock waves shatters the stone into pieces small enough to pass through the patient's urine.



A vertical cross section of a lithotripter is in the shape of a semiellipse with the dimensions shown. Approximate the distance from the center along the major axis where the patient's kidney stone should be located so that the shock waves will target the stone. Round to 2 decimal places. **(See Example 6)**

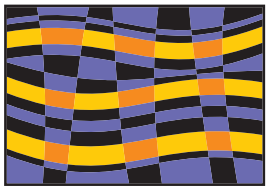
58. The reflective property of an ellipse is the principle behind "whispering galleries." These are rooms with elliptically shaped ceilings such that a person standing at one focus can hear even the slightest whisper spoken by another person standing at the other focus.

Suppose that a dome has a semielliptical ceiling, 96 ft long and 23 ft high. Choose a coordinate system so that the center of the semiellipse is $(0, 0)$ with vertices $(-48, 0)$ and $(48, 0)$ and with the top of the ceiling at $(0, 23)$.



Approximately how far from the center along the major axis should each person be standing to hear the "whispering" effect? Round to 1 decimal place.

59. A homeowner wants to make an elliptical rug from a 12-ft by 10-ft rectangular piece of carpeting.

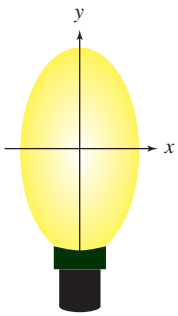


a. What lengths of the major and minor axes would maximize the area of the new rug?

b. Write an equation of the ellipse with maximum area. Use a coordinate system with the origin at the center of the rug and horizontal major axis.

c. To cut the rectangular piece of carpeting, the homeowner needs to know the location of the foci. Tacks will then be attached at the foci, and a piece of string the length of the major axis will be fastened to the tacks. Drawing the string tight, the homeowner will use a piece of chalk to trace the ellipse. At what coordinates should the tacks be located? Describe the location.

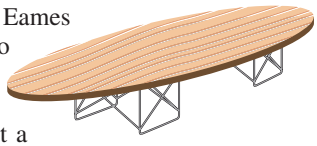
60. Coordinate axes are superimposed on a photo of an elliptical lightbulb.



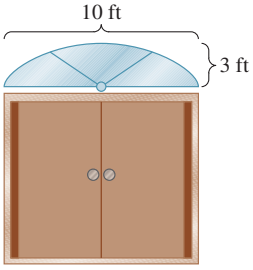
a. If the vertices are 1.5 in. from the center and the width of the bulb is 1 in. at its widest point, write an equation of the elliptical curve along the outside edge of the bulb (do not consider the metal fixture at the bottom as part of the elliptical shape).

b. If the company logo is to be placed at one of the foci, at what coordinates could the logo be placed? Describe the location.

61. Charles and Bernice ("Ray") Eames were American designers who made major contributions to modern architecture and furniture design. Suppose that a manufacturer wants to make an Eames elliptical coffee table 90 in. long and 30 in. wide out of an 8 ft by 4 ft piece of birch plywood. If the center of a piece of plywood is positioned at $(0, 0)$, determine the distance from the center at which the foci should be located to draw the ellipse.



62. A window above a door is to be made in the shape of a semiellipse. If the window is 10 ft at the base and 3 ft high at the center, determine the distance from the center at which the foci are located.



ISTUDY

Objective 4: Determine and Apply the Eccentricity of an Ellipse

63. Choose one: The eccentricity of an ellipse is a number
- **a.** less than 0.
- **b.** between 0 and 1.
- **c.** greater than 1.

64. Choose one: An ellipse with eccentricity close to 0 will appear
- **a.** more elongated.
- **b.** more circular.

65. Choose one: An ellipse with eccentricity close to 1 will appear
- **a.** more elongated.
- **b.** more circular.

66. Choose one: If the foci of an ellipse are close to the center of the ellipse, then the graph will appear
- **a.** more elongated.
- **b.** more circular.

For Exercises 67–72, determine the eccentricity of the ellipse.

67. $\frac{x^2}{169} + \frac{y^2}{25} = 1$

68. $\frac{x^2}{100} + \frac{y^2}{64} = 1$

69. $\frac{\left(x + \frac{4}{5}\right)^2}{144} + \frac{\left(y - \frac{5}{3}\right)^2}{225} = 1$

70. $\frac{\left(x - \frac{1}{3}\right)^2}{9} + \frac{\left(y + \frac{7}{9}\right)^2}{25} = 1$

71. $\frac{x^2}{12} + \frac{(y-3)^2}{6} = 1$

72. $\frac{(x+7)^2}{18} + \frac{y^2}{12} = 1$

73. Halley's Comet and the Earth both orbit the Sun in elliptical paths with the Sun at one focus. The eccentricity of the comet's orbit is 0.967 and the eccentricity of the Earth's orbit is 0.0167. The eccentricity for the Earth is close to zero, whereas the eccentricity for Halley's Comet is close to 1. Based on this information, how do the orbits compare?

74. Halley's Comet and the comet Hale-Bopp both orbit the Sun in elliptical paths with the Sun at one focus. The eccentricity of Halley's Comet's orbit is 0.967 and the eccentricity of comet Hale-Bopp's orbit is 0.995. Which comet has a more elongated orbit?

75. The Moon's orbit around the Earth is elliptical with the Earth at one focus and with eccentricity 0.0549. If the distance between the Moon and Earth at the closest point is 363,300 km, determine the distance at the farthest point. Round to the nearest 100 km. (**See Example 7**)

76. The planet Saturn orbits the Sun in an elliptical path with the Sun at one focus. The eccentricity of the orbit is 0.0565, and the distance between the Sun and Saturn at perihelion (the closest point) is 1.353×10^9 km. Determine the distance at aphelion (the farthest point). Round to the nearest million kilometers.

77. The Roman Coliseum is an elliptical stone and concrete amphitheater in the center of Rome, built between 70 A.D. and 80 A.D. The Coliseum seated approximately 50,000 spectators and was used among other things for gladiatorial contests.
- **a.** Using a vertical major axis, write an equation of the ellipse representing the center arena if the maximum length is 287 ft and the maximum width is 180 ft. Place the origin at the center of the arena.
- **b.** Approximate the eccentricity of the center arena. Round to 2 decimal places.
- **c.** Find an equation of the outer ellipse if the maximum length is 615 ft and the maximum width is 510 ft.
- **d.** Approximate the eccentricity of the outer ellipse. Round to 2 decimal places.
- **e.** Explain how you know that the outer ellipse is more circular than the inner ellipse.

Michael Evans/Life File/Photodisc/ Getty Images

78. *The Ellipse*, also called *President's Park South,* is a park in Washington, D.C. The lawn area is elliptical with a major axis of 1058 ft and minor axis of 903 ft.
- **a.** Find an equation of the elliptical boundary. Take the horizontal axes to be the major axis and locate the origin of the coordinate system at the center of the ellipse.
- **b.** Approximate the eccentricity of the ellipse. Round to 2 decimal places.

For Exercises 79–82, write the standard form of an equation of the ellipse subject to the following conditions.

79. Center: (0, 0); Eccentricity: $\frac{15}{17}$; Major axis vertical of length 34 units

80. Center: (0, 0); Eccentricity: $\frac{40}{41}$; Major axis vertical of length 82 units

81. Foci: (0, −1) and (8, −1); Eccentricity: $\frac{4}{5}$

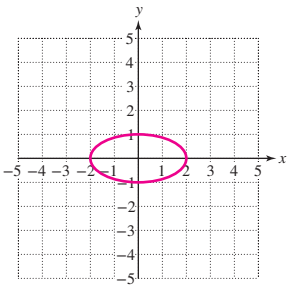
82. Foci: (0, −1) and (−6, −1); Eccentricity: $\frac{3}{5}$

ISTUDY

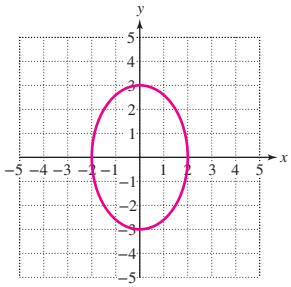
Mixed Exercises

For Exercises 83–86, write the equation of the ellipse in standard form. Determine the eccentricity and coordinates of the foci.

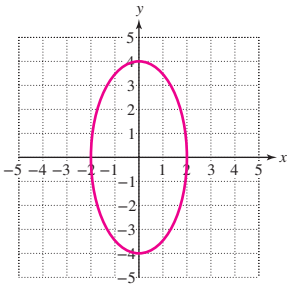
83. a.



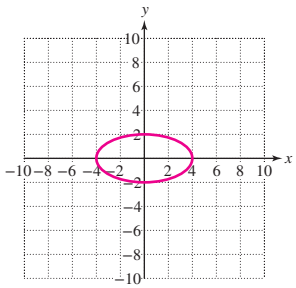
b.



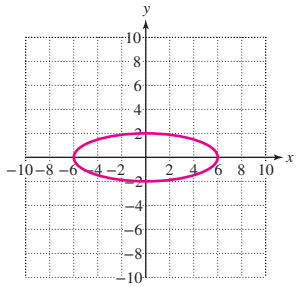
c.



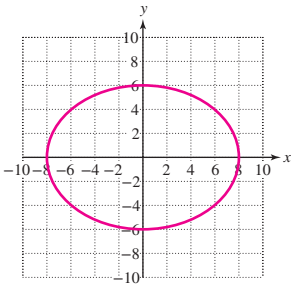
84. a.



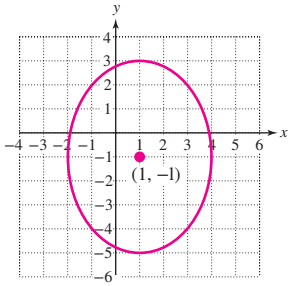
b.



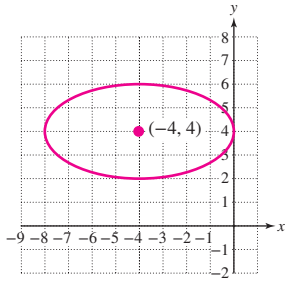
c.



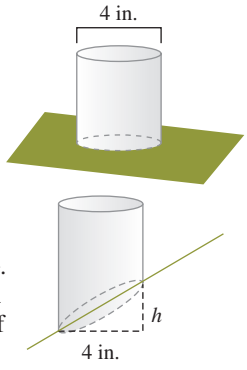
85.



86.



87. A circular vent pipe is placed on a flat roof.

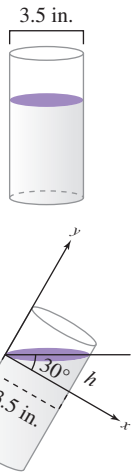


a. Write an equation of the circular cross section that the pipe makes with the roof. Assume that the origin is placed at the center of the circle.

b. Now suppose that the pipe is placed on a roof with a slope of $\frac{3}{5}$. What shape will the cross section of the pipe form with the plane of the roof?

c. Determine the length of the major and minor axes. Find the exact value and approximate to 1 decimal place if necessary.

88. A cylindrical glass of water with diameter 3.5 in. sits on a horizontal countertop.



a. Write an equation of the circular surface of the water. Assume that the origin is placed at the center of the circle.

b. If the glass is tipped 30°, what shape will the surface of the water have?

c. With the glass tipped 30°, the waterline makes a slope of $\frac{1}{2}$ with the coordinate system shown. Determine the length of the major and minor axes. Round to 1 decimal place.

ISTUDY

89. The graph of $\frac{x^2}{9} + \frac{y^2}{4} = 1$ represents an ellipse.

Determine the part of the ellipse represented by the given equation.

a. $y = 2\sqrt{1 - \frac{x^2}{9}}$ **b.** $y = -2\sqrt{1 - \frac{x^2}{9}}$

c. $x = 3\sqrt{1 - \frac{y^2}{4}}$ **d.** $x = -3\sqrt{1 - \frac{y^2}{4}}$

90. The graph of $\frac{x^2}{16} + \frac{y^2}{81} = 1$ represents an ellipse.

Determine the part of the ellipse represented by the given equation.

a. $x = -4\sqrt{1 - \frac{y^2}{81}}$ **b.** $x = 4\sqrt{1 - \frac{y^2}{81}}$

c. $y = 9\sqrt{1 - \frac{x^2}{16}}$ **d.** $y = -9\sqrt{1 - \frac{x^2}{16}}$

For Exercises 91–94, solve the system of equations.

91. $\frac{x^2}{25} + \frac{y^2}{9} = 1$

$3x + 5y = 15$

92. $13y = 12x - 156$

$\frac{x^2}{169} + \frac{y^2}{144} = 1$

93. $\frac{x^2}{4} + \frac{y^2}{16} = 1$

$y = -x^2 + 4$

94. $\frac{x^2}{64} + \frac{y^2}{289} = 1$

$y = \frac{13}{64}x^2 - 13$

For Exercises 95–96, graph the equations on the same coordinate system and determine the points of intersection.

95. $\frac{x^2}{4} + \frac{y^2}{9} = 1$

$\frac{x^2}{9} + \frac{y^2}{4} = 1$

96. $\frac{x^2}{4} + \frac{y^2}{9} = 1$

$\frac{x^2}{4} + \frac{y^2}{4} = 1$

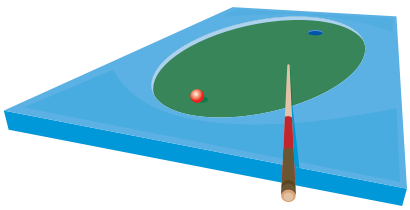
Given an ellipse with major axis of length $2a$ and minor axis of length $2b$, the area is given by $A = \pi ab$. The perimeter is *approximated* by $P \approx \pi\sqrt{2(a^2 + b^2)}$. For Exercises 97–98,

a. Determine the area of the ellipse. **b.** Approximate the perimeter.

97. $\frac{x^2}{8} + \frac{(y+3)^2}{4} = 1$

98. $\frac{(x-1)^2}{9} + \frac{y^2}{11} = 1$

Write About It



99. A pool table is in the shape of an ellipse with one pocket located at one focus of the ellipse. If a ball is located at the other focus, explain why a player can strike the ball in any direction to have the ball land in the pocket.

100. Given an equation of an ellipse in standard form, how do you determine whether the major axis is horizontal or vertical?

101. Explain the difference between the graphs of the two equations.

$4x^2 + 9y^2 = 36$ $4x + 9y = 36$

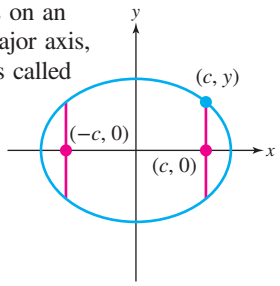
102. Discuss the solution set of the equation.

$\frac{(x-4)^2}{9} + \frac{(x+2)^2}{16} = -1$

ISTUDY

Expanding Your Skills

103. A line segment with endpoints on an ellipse, perpendicular to the major axis, and passing through a focus, is called a *latus rectum* of the ellipse. Show that the length of a latus rectum is $\frac{2b^2}{a}$ for the ellipse.



$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

[*Hint*: Substitute (c, y) into the equation and solve for y. Recall that $c^2 = a^2 - b^2$.]

104. A line segment with endpoints on an ellipse and passing through a focus of the ellipse is called a focal chord. Given the ellipse

$$\frac{x^2}{25} + \frac{y^2}{16} = 1$$

a. Show that one focus of the ellipse lies on the line $y = \frac{4}{3}x + 4$.

b. Determine the points of intersection between the ellipse and the line.

c. Approximate the length of the focal chord that lies on the line $y = \frac{4}{3}x + 4$. Round to 2 decimal places.

105. This exercise guides you through the steps to find an equation of the tangent line to a point (x_1, y_1) on an ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

a. From calculus, we know that the slope of the tangent line to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at the point (x_1, y_1) is given by $m = -\frac{b^2 x_1}{a^2 y_1}$. Write the point-slope form of an equation of the tangent line to the ellipse through (x_1, y_1).

b. Simplify the equation from part (a) to eliminate the parentheses and clear the denominator.

c. Divide each term in the equation from part (b) by a^2b^2.

d. The point (x_1, y_1) is on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$. Therefore, substituting (x_1, y_1) into the equation of the ellipse will yield $\frac{x_1^2}{a^2} + \frac{y_1^2}{b^2} = 1$. Use this equation and the result from part (c) to obtain the equation of the tangent line $\left(\frac{x_1}{a^2}\right)x + \left(\frac{y_1}{b^2}\right)y = 1$.

From Exercise 105, we learned that the tangent line through a point (x_1, y_1) on an ellipse of the form $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is given by $\left(\frac{x_1}{a^2}\right)x + \left(\frac{y_1}{b^2}\right)y = 1$. Likewise, we can show that the tangent line through a point (x_1, y_1) on an ellipse of the form $\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$ is given by $\left(\frac{x_1}{b^2}\right)x + \left(\frac{y_1}{a^2}\right)y = 1$.

For Exercises 106–108, use these results to find an equation of the tangent line at the given point on the curve. Write the answer in slope-intercept form, if possible.

106. $\frac{x^2}{100} + \frac{y^2}{25} = 1$

a. $(8, -3)$ **b.** $(10, 0)$

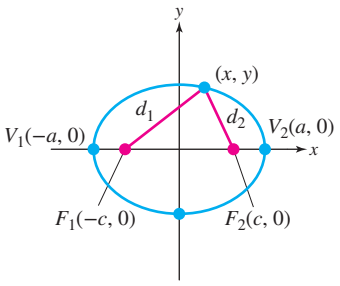
107. $\frac{x^2}{10} + \frac{y^2}{15} = 1$

a. $(2, 3)$ **b.** $(0, -\sqrt{15})$

108. $x^2 + y^2 = 10$ (*Hint*: A circle is a special case of an ellipse where $a = b$.)

a. $(2, \sqrt{6})$ **b.** $(3, 1)$

109. This exercise guides you through the steps to find the standard form of an equation of an ellipse centered at the origin with foci on the x-axis.



a. Refer to the figure to verify that the distance from F_1 to V_2 is $(a + c)$ and the distance from F_2 to V_2 is $(a - c)$. Verify that the sum of these distances is $2a$.

b. Write an expression that represents the sum of the distances from F_1 to (x, y) and from F_2 to (x, y). Then set this expression equal to $2a$.

c. Given the equation $\sqrt{(x + c)^2 + y^2} + \sqrt{(x - c)^2 + y^2} = 2a$, isolate the leftmost radical and square both sides of the equation. Show that the equation can be written as $a\sqrt{(x - c)^2 + y^2} = a^2 - xc$.

d. Square both sides of the equation $a\sqrt{(x - c)^2 + y^2} = a^2 - xc$ and show that the equation can be written as $(a^2 - c^2)x^2 + a^2y^2 = a^2(a^2 - c^2)$. (*Hint*: Collect variable terms on the left side of the equation and constant terms on the right side.)

e. Replace $a^2 - c^2$ by b^2. Then divide both sides of the equation by a^2b^2. Verify that the resulting equation is $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

ISTUDY

110. Find the points on the ellipse that are twice the distance from one focus to the other.

$$\frac{x^2}{25} + \frac{y^2}{9} = 1$$

111. An ellipsoid is a three-dimensional surface that resembles the shape of the blimps we see at sporting events. Mathematically, an equation of an ellipsoid centered at the origin of a three-dimensional coordinate system is given by

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1.$$

a. Explain how the formula for an ellipsoid is similar to a two-dimensional formula for an ellipse centered at the origin.

b. The graph of $\frac{x^2}{9} + \frac{y^2}{36} + \frac{z^2}{4} = 1$ can be generated using computer software (see figure). Write an equation that results if $z = 0$. What does this equation represent?

c. Write the equation that results if $x = 0$. What does this equation represent?

d. Write the equation that results if $y = 0$. What does this equation represent?

SECTION 11.2 The Hyperbola

OBJECTIVES

1. Graph a Hyperbola Centered at the Origin
2. Graph a Hyperbola Centered at (h, k)
3. Determine the Eccentricity of a Hyperbola
4. Use Hyperbolas in Applications

1. Graph a Hyperbola Centered at the Origin

In this section, we will study another type of conic section called the hyperbola (Figure 11-11).

Definition of a Hyperbola

A **hyperbola** is the set of all points (x, y) in a plane such that the difference in distances between (x, y) and two fixed points (foci) is a positive constant.

In Figure 11-12, we present a hyperbola with foci on the x-axis. By definition, the curve is the set of points such that $d_1 - d_2$ is a positive constant.

TIP The definition of a hyperbola differs from the definition of an ellipse in that the curve is the set of points for which the difference (rather than the sum) of d_1 and d_2 is a constant.

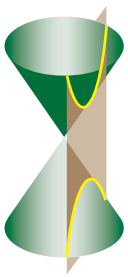

Figure 11-11

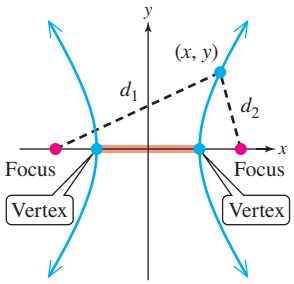

Figure 11-12

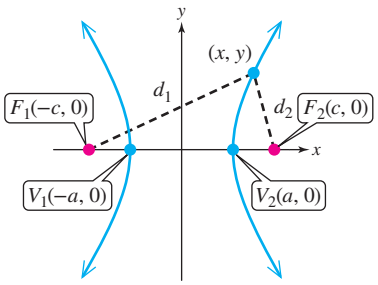

Figure 11-13

Notice that the hyperbola consists of two parts called **branches.** The points where the hyperbola intersects the line through the foci are called the **vertices.** The line segment between the vertices (highlighted in red) is called the **transverse axis.** The midpoint of the transverse axis is the **center** of the hyperbola.

To derive the standard form of an equation of a hyperbola, consider a hyperbola centered at the origin with foci on the x-axis (Figure 11-13). The points $F_1(-c, 0)$ and $F_2(c, 0)$ are the foci and the vertices are $V_1(-a, 0)$ and $V_2(a, 0)$.

ISTUDY

The distance between F_1 and V_2 is $c + a$. The distance between F_2 and V_2 is $c - a$. By the definition of a hyperbola, the positive difference between a point on the hyperbola (such as V_2) and the two foci is a positive constant. Subtracting $(c + a)$ and $(c - a)$, we have

$$(c + a) - (c - a) = 2a$$

Therefore, the difference of the distances between (x, y) and the two foci is equal to $2a$.

$$d_1 - d_2 = 2a$$

$$\sqrt{[(x-(-c)]^2 + (y-0)^2} - \sqrt{(x-c)^2 + (y-0)^2} = 2a \qquad \text{Apply the distance formula.}$$

$$\sqrt{(x+c)^2 + y^2} - \sqrt{(x-c)^2 + y^2} = 2a \qquad \text{Simplify within parentheses.}$$

In Exercise 90, we guide you through a series of algebraic steps to eliminate the radicals. Then, collecting the variable terms on the left side and the constant terms on the right side, the equation becomes

$$(c^2 - a^2)x^2 - a^2y^2 = a^2(c^2 - a^2) \tag{1}$$

From Figure 11-13, we see that $d_1 - d_2 = 2a < 2c$. Therefore, $a < c$ and $c^2 - a^2 > 0$. Substituting $b^2 = c^2 - a^2$ in Equation (1) we have

$$b^2x^2 - a^2y^2 = a^2b^2$$

$$\frac{b^2x^2}{a^2b^2} - \frac{a^2y^2}{a^2b^2} = \frac{a^2b^2}{a^2b^2} \qquad \text{Divide both sides by } a^2b^2.$$

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \qquad \text{Standard form}$$

This equation represents a hyperbola centered at the origin with foci on the x-axis. In a similar manner, we can develop the standard equation of a hyperbola centered at the origin with foci on the y-axis. These two equations are summarized as follows:

Avoiding Mistakes

Notice that we do not have the restriction that $a > b$ as with the ellipse.

Standard Forms of an Equation of a Hyperbola Centered at the Origin

The standard forms of an equation of a hyperbola centered at the origin are as follows. Assume that $a > 0$ and $b > 0$.

	Transverse Axis: x-axis	Transverse Axis: y-axis
Equation:	$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$	$\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$
Center:	$(0, 0)$	$(0, 0)$
Foci: $(c^2 = a^2 + b^2)$	$(c, 0)$ and $(-c, 0)$	$(0, c)$ and $(0, -c)$
Vertices:	$(a, 0)$ and $(-a, 0)$	$(0, a)$ and $(0, -a)$
Asymptotes:	$y = \frac{b}{a}x$ and $y = -\frac{b}{a}x$	$y = \frac{a}{b}x$ and $y = -\frac{a}{b}x$
Graph:	 Figure 11-14	 Figure 11-15

TIP Notice that an equation of a hyperbola shows a *difference* between the square terms, whereas an equation of an ellipse shows a sum of the square terms.

ISTUDY

From the standard forms of an equation of a hyperbola, notice that the variable term with the positive coefficient always contains a^2 in the denominator. This term also indicates the orientation of the hyperbola.

- If the variable term with the positive coefficient is the x^2 term, then the transverse axis is horizontal and the branches of the hyperbola open horizontally.
- If the variable term with the positive coefficient is the y^2 term, then the transverse axis is vertical and the branches of the hyperbola open vertically.

As x or y increase, the branches of a hyperbola approach a pair of asymptotes. For example, given the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ (horizontal transverse axis),

$$\begin{aligned} y &= \pm b\sqrt{\frac{x^2}{a^2} - 1} \\ &= \pm b\sqrt{\frac{x^2 - a^2}{a^2}} \\ &= \pm\frac{b}{a}\sqrt{x^2 - a^2} \end{aligned}$$

As $x \to \infty$, the term a^2 is insignificant (very small relative to x^2), so the radical approaches $\sqrt{x^2} = x$. Thus, for large values of x, the graph of the hyperbola approaches $y = \pm\frac{b}{a}x$. Likewise, as $x \to -\infty$, the graph of the hyperbola approaches $y = \pm\frac{b}{a}x$.

As with the graph of a rational function, the asymptotes are lines of reference that help graph the curve. To identify the asymptotes, first sketch a **reference rectangle** with dimensions $2a$ by $2b$, centered at the center of the hyperbola (Figures 11-14 and 11-15). The asymptotes are the lines through the opposite corners of the rectangle.

The length of the transverse axis is $2a$. The line segment passing through the center of the hyperbola, perpendicular to the transverse axis, and with endpoints on the reference rectangle is called the **conjugate axis.** The length of the conjugate axis is $2b$.

To graph a hyperbola, we suggest the following guidelines.

Graphing a Hyperbola

Step 1 Identify the center and vertices.

Step 2 Draw the reference rectangle centered at the center of the hyperbola, with dimensions $2a$ and $2b$ as shown in Figures 11-14 and 11-15.

Step 3 Draw the asymptotes through the opposite corners of the rectangle.

Step 4 Sketch each branch of the hyperbola starting at the vertices and approaching the asymptotes.

EXAMPLE 1 Graphing a Hyperbola Centered at the Origin

Given $\frac{x^2}{4} - \frac{y^2}{9} = 1$,

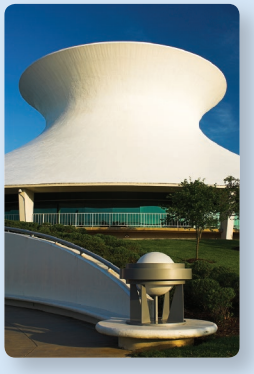
a. Graph the hyperbola.

b. Identify the center, vertices, foci, and equations of the asymptotes.

ISTUDY

Point of Interest

The James S. McDonnell Planetarium in St. Louis, Missouri, has vertical cross sections in the shape of a hyperbola.



Joe Mamer Photography/ Alamy Stock Photo

Solution:

a. $\dfrac{x^2}{4} - \dfrac{y^2}{9} = 1$

$\dfrac{x^2}{(2)^2} - \dfrac{y^2}{(3)^2} = 1$

$a = 2$, $b = 3$

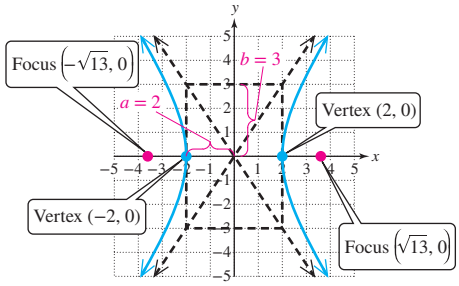
Step 1: The equation is in the standard form of a hyperbola centered at (0, 0).

The x^2 term has the positive coefficient, indicating that the transverse axis is horizontal. The denominator of the x^2 term is a^2.

$a^2 = 4$, and because $a > 0$, we have that $a = 2$.
$b^2 = 9$, and because $b > 0$, we have that $b = 3$.

Vertices: $(a, 0)$ and $(-a, 0)$
$(2, 0)$ and $(-2, 0)$
Note that $c^2 = a^2 + b^2 = 4 + 9 = 13$.
Since $c > 0$, $c = \sqrt{13}$.
Foci: $(c, 0)$ and $(-c, 0)$
$(\sqrt{13}, 0)$ and $(-\sqrt{13}, 0)$

Steps 2–3: Draw the reference rectangle and asymptotes.



The reference rectangle is centered at the center of the hyperbola, (0, 0).
Draw the rectangle with width $2a$ in the direction of the transverse axis. The height of the rectangle is the length of the conjugate axis $2b$.
Draw the asymptotes through the opposite corners of the reference rectangle.

Step 4: Sketch each branch of the hyperbola starting at the vertices and approaching the asymptotes.

b. The center is (0, 0).
The vertices are (−2, 0) and (2, 0).
The foci are $(-\sqrt{13}, 0)$ and $(\sqrt{13}, 0)$.

The equations of the asymptotes are $y = \frac{b}{a}x$ and $y = -\frac{b}{a}x$.
Therefore, the asymptotes are $y = \frac{3}{2}x$ and $y = -\frac{3}{2}x$.

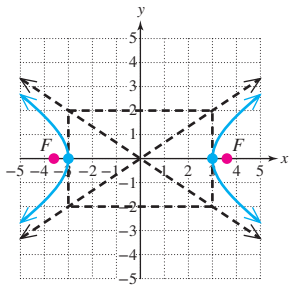
TIP If you find it difficult to memorize the equations of the asymptotes, the equations can be found by using the point-slope formula and the points defining the opposite corners of the reference rectangle.

Skill Practice 1 Repeat Example 1 with the equation: $\dfrac{x^2}{9} - \dfrac{y^2}{4} = 1$

In Example 2, we graph a hyperbola in which the transverse axis is vertical and the conjugate axis is horizontal.

Answers

1. a.



b. Center: (0, 0)
Vertices: (−3, 0), (3, 0)
Foci: $(-\sqrt{13}, 0)$, $(\sqrt{13}, 0)$
Asymptotes: $y = \frac{2}{3}x$ and $y = -\frac{2}{3}x$.

EXAMPLE 2 Graphing a Hyperbola Centered at the Origin

Given $16y^2 - 9x^2 = 144$,

a. Graph the hyperbola.

b. Identify the center, vertices, foci, and equations of the asymptotes.

Solution:

a. $16y^2 - 9x^2 = 144$

For the equation to be in the standard form for a hyperbola, we require the constant term to be 1.

$$\frac{16y^2}{144} - \frac{9x^2}{144} = \frac{144}{144}$$

Divide both sides by 144.

$$\frac{y^2}{9} - \frac{x^2}{16} = 1$$

The y^2 term has the positive coefficient, indicating that the transverse axis is vertical. The denominator of the y^2 term is a^2.

$$\frac{y^2}{(3)^2} - \frac{x^2}{(4)^2} = 1$$

$a = 3$ $b = 4$

Step 1: The hyperbola is centered at (0, 0).

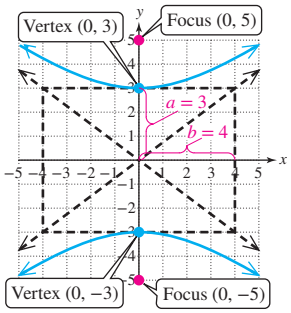
$a^2 = 9$, and because $a > 0$, we have that $a = 3$.
$b^2 = 16$, and because $b > 0$, we have that $b = 4$.

Vertices: $(0, a)$ and $(0, -a)$
$(0, 3)$ and $(0, -3)$

Note that $c^2 = a^2 + b^2 = 9 + 16 = 25$ and $c = 5$.

Foci: $(0, c)$ and $(0, -c)$
$(0, 5)$ and $(0, -5)$

Steps 2–3: Draw the reference rectangle and asymptotes.



Draw the rectangle centered at the origin and with height $2a$ and width $2b$.

Draw the asymptotes through the opposite corners of the reference rectangle.

Step 4: Sketch each branch of the hyperbola starting at the vertices and approaching the asymptotes.

b. The center is (0, 0).
The vertices are (0, 3) and (0, −3).
The foci are (0, −5) and (0, 5).

The equations of the asymptotes are $y = \frac{a}{b}x$ and $y = -\frac{a}{b}x$.
Therefore, the asymptotes are $y = \frac{3}{4}x$ and $y = -\frac{3}{4}x$.

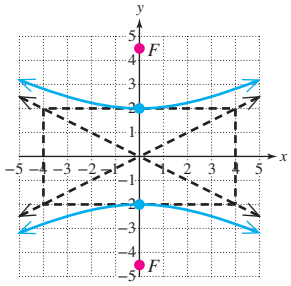
Skill Practice 2 Repeat Example 2 with the equation: $4y^2 - x^2 = 16$

2. Graph a Hyperbola Centered at (*h*, *k*)

In the standard form of a hyperbola, if x and y are replaced by $x - h$ and $y - k$, then the graph of the hyperbola is shifted h units horizontally and k units vertically. The hyperbola is then centered at (h, k).

Answers

2. a.



b. Center: (0, 0)
Vertices: (0, 2), (0, −2)
Foci: $(0, 2\sqrt{5})$, $(0, -2\sqrt{5})$
Asymptotes: $y = \frac{1}{2}x$ and $y = -\frac{1}{2}x$.

Standard Forms of an Equation of a Hyperbola Centered at (h, k)

The standard forms of an equation of a hyperbola centered at (h, k) are as follows. Assume that $a > 0$ and $b > 0$.

	Transverse Axis Horizontal	**Transverse Axis Vertical**
Equation:	$\dfrac{(x-h)^2}{a^2} - \dfrac{(y-k)^2}{b^2} = 1$	$\dfrac{(y-k)^2}{a^2} - \dfrac{(x-h)^2}{b^2} = 1$
Center:	(h, k)	(h, k)
Foci: (*Note*: $c^2 = a^2 + b^2$)	$(h + c, k)$ and $(h - c, k)$	$(h, k + c)$ and $(h, k - c)$
Vertices:	$(h + a, k)$ and $(h - a, k)$	$(h, k + a)$ and $(h, k - a)$
Asymptotes:	$y - k = \pm\frac{b}{a}(x - h)$	$y - k = \pm\frac{a}{b}(x - h)$
Graph:		
To graph a hyperbola centered at (h, k), first locate the center and identify the orientation of the hyperbola (transverse axis horizontal or vertical). Then use the values of a and b to draw the reference rectangle. Draw the asymptotes through the corners of the reference rectangle. Finally, sketch the hyperbola starting at the vertices and approaching the asymptotes.

EXAMPLE 3 Graphing a Hyperbola Centered at (h, k)

Given $-\dfrac{(x-2)^2}{9} + (y+3)^2 = 1$,

a. Graph the hyperbola.

b. Identify the center, vertices, foci, and equations of the asymptotes.

Solution:

a. $-\dfrac{(x-2)^2}{9} + \dfrac{(y+3)^2}{1} = 1$

$\dfrac{[y-(-3)]^2}{(1)^2} - \dfrac{(x-2)^2}{(3)^2} = 1$

$a = 1$ $b = 3$

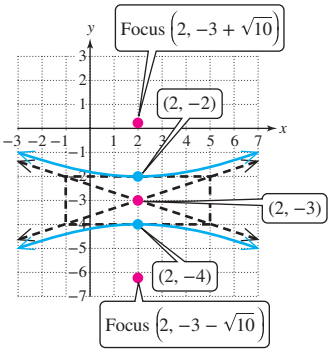
Step 1: Center: $(2, -3)$

The y^2 term has a positive coefficient. Therefore, the transverse axis is vertical.

We have $a^2 = 1$ and $b^2 = 9$.

Thus, $a = 1$ and $b = 3$.

Steps 2–3: Draw the reference rectangle and asymptotes.



Draw the rectangle centered at $(2, -3)$ with vertical sides of length $2a$ and horizontal sides of length $2b$.

Draw the asymptotes through the opposite corners of the reference rectangle.

The vertices are a units above and below the center.

Vertices: $(2, -3 + 1)$ and $(2, -3 - 1)$
$(2, -2)$ and $(2, -4)$

Step 4: Sketch the hyperbola.

To find the foci, use the relationship:

$$c^2 = a^2 + b^2$$
$$c^2 = 1 + 9 = 10$$
$$c = \sqrt{10} \quad \text{(Recall that } c > 0.\text{)}$$

The foci are c units above and below the center.

The foci are $(2, -3 + \sqrt{10})$ and $(2, -3 - \sqrt{10})$.

b. The center is $(2, -3)$.

The vertices are $(2, -2)$ and $(2, -4)$.

The foci are $(2, -3 + \sqrt{10})$ and $(2, -3 - \sqrt{10})$.

The equations of the asymptotes can be found by using the point-slope formula and the points through the opposite vertices of the reference rectangle.

Alternatively, the asymptotes can be found by using $y - k = \pm\frac{a}{b}(x - h)$, where h and k are the coordinates of the center.

$$y - k = \frac{a}{b}(x - h) \qquad y - k = -\frac{a}{b}(x - h)$$
$$y - (-3) = \frac{1}{3}(x - 2) \qquad y - (-3) = -\frac{1}{3}(x - 2)$$
$$y = \frac{1}{3}x - \frac{11}{3} \qquad y = -\frac{1}{3}x - \frac{7}{3}$$

Skill Practice 3 Repeat Example 3 with the equation:

$$-\frac{(x + 1)^2}{4} + \frac{(y - 4)^2}{25} = 1$$

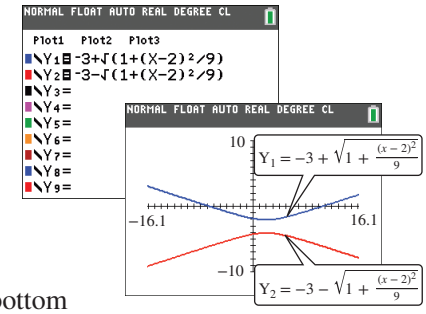
TECHNOLOGY CONNECTIONS

Graphing a Hyperbola

To graph the hyperbola from Example 3 on a graphing utility, first solve the equation for y. We have

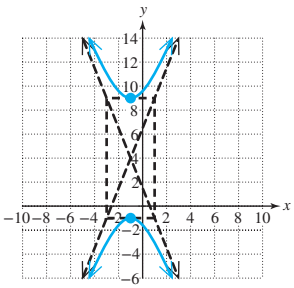
$$-\frac{(x - 2)^2}{9} + (y + 3)^2 = 1$$
$$y = -3 \pm \sqrt{1 + \frac{(x - 2)^2}{9}}$$

The functions represent the top and bottom branches of the hyperbola, respectively.



Answers

3. a.



b. Center: $(-1, 4)$
Vertices: $(-1, 9)$, $(-1, -1)$
Foci: $(-1, 4 + \sqrt{29})$, $(-1, 4 - \sqrt{29})$
Asymptotes: $y = -\frac{5}{2}x + \frac{3}{2}$, $y = \frac{5}{2}x + \frac{13}{2}$

The equation of the hyperbola from Example 3 can be expanded by expanding the binomials and combining like terms.

$$-\frac{(x-2)^2}{9}+(y+3)^2=1 \qquad \text{Standard form}$$

$$9\cdot\left[-\frac{(x-2)^2}{9}+(y+3)^2\right]=9\cdot(1) \qquad \text{Clear fractions.}$$

$$-(x-2)^2+9(y+3)^2=9$$

$$-x^2+4x-4+9y^2+54y+81=9 \qquad \text{Expand the binomials.}$$

$$-x^2+9y^2+4x+54y+68=0 \qquad \text{Expanded form}$$

Given an equation of a hyperbola in expanded form, we can reverse this process by completing the square to write the equation in standard form. This is shown in Example 4.

EXAMPLE 4 Writing an Equation of a Hyperbola in Standard Form

Write the equation of the hyperbola in standard form. $11x^2-2y^2+66x-4y+75=0$

Solution:

$$11x^2-2y^2+66x-4y+75=0$$

Group the x variable terms and group the y variable terms.

$$11x^2+66x-2y^2-4y=-75$$

Move the constant term to the right side of the equation.

$$11(x^2+6x\quad)-2(y^2+2y\quad)=-75$$

Factor out the leading coefficient from the x and y terms. Leave room to complete the square within parentheses.

$11\cdot 9$ is added to the left side. $-2\cdot 1$ is added to the left side.

$$11(x^2+6x+9)-2(y^2+2y+1)=-75+99-2$$

$11\cdot 9 \quad -2\cdot 1$

Complete the square. Note that $\left[\frac{1}{2}(6)\right]^2=9$ and $\left[\frac{1}{2}(2)\right]^2=1$. The values 9 and 1 were added inside parentheses. However, $11\cdot 9$ and $-2\cdot 1$ were actually added to the left side as a result of the factors in front of the parentheses.

$$11(x+3)^2-2(y+1)^2=22$$

To write the equation in standard form, we require a 1 on the right side of the equation.

$$\frac{11(x+3)^2}{22}-\frac{2(y+1)^2}{22}=\frac{22}{22}$$

Divide both sides by 22.

$$\frac{(x+3)^2}{2}-\frac{(y+1)^2}{11}=1$$

Standard form

Skill Practice 4 Write the equation of the hyperbola in standard form.
$3x^2-7y^2+30x+56y-58=0$

In Example 5, we determine the standard form of an equation of a hyperbola based on known information about the hyperbola.

Answer

4. $\frac{(x+5)^2}{7}-\frac{(y-4)^2}{3}=1$

ISTUDY

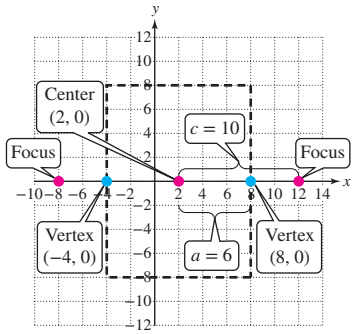
EXAMPLE 5 **Finding an Equation of a Hyperbola**

Determine the standard form of an equation of a hyperbola with vertices $(-4, 0)$ and $(8, 0)$ and foci $(-8, 0)$ and $(12, 0)$.

Solution:

Plotting the given points tells us that the foci are aligned horizontally. Therefore, the transverse axis of the hyperbola is horizontal. The standard form is

$$\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$$



The center is midway between the vertices. Therefore, the center is $(2, 0)$, indicating that $h = 2$ and $k = 0$.

The vertices are located 6 units away from the center. This means that $a = 6$.

The foci are located 10 units from the center, indicating that $c = 10$.

The only missing piece of information is the value of b. We can find b from the relationship $c^2 = a^2 + b^2$ or equivalently $b^2 = c^2 - a^2$.

$$b^2 = (10)^2 - (6)^2$$
$$b^2 = 64$$
$$b = 8 \quad \text{(Recall that } b > 0.\text{)}$$

$$\frac{(x-2)^2}{(6)^2} - \frac{(y-0)^2}{(8)^2} = 1 \quad \text{Substitute } h = 2,\ k = 0,\ a = 6, \text{ and } b = 8.$$

$$\frac{(x-2)^2}{36} - \frac{y^2}{64} = 1 \quad \text{Standard form}$$

Skill Practice 5 Determine the standard form of an equation of a hyperbola with vertices $(-9, 0)$ and $(1, 0)$ and foci $(-17, 0)$ and $(9, 0)$.

3. Determine the Eccentricity of a Hyperbola

The branches of a hyperbola may be wider or narrower depending on the eccentricity of the hyperbola. Like the ellipse, the eccentricity of a hyperbola is given by $e = \frac{c}{a}$.

Eccentricity of a Hyperbola

For a hyperbola defined by $\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$ or $\frac{(y-k)^2}{a^2} - \frac{(x-h)^2}{b^2} = 1$, the **eccentricity** e is given by $e = \frac{c}{a}$, where $a > 0$, $c > 0$, and $c^2 = a^2 + b^2$.

Note: The eccentricity of a hyperbola is a number greater than 1; that is, $e > 1$.

Answer

5. $\frac{(x+4)^2}{25} - \frac{y^2}{144} = 1$

ISTUDY

In Example 6, we compare the graphs of two hyperbolas with different eccentricities.

EXAMPLE 6 Finding the Eccentricity of a Hyperbola

Determine the eccentricity of the hyperbola.

a. $\dfrac{x^2}{16} - \dfrac{y^2}{9} = 1$ **b.** $\dfrac{x^2}{9} - \dfrac{y^2}{16} = 1$

Solution:

a. $\dfrac{x^2}{16} - \dfrac{y^2}{9} = 1$

$\dfrac{x^2}{(4)^2} - \dfrac{y^2}{(3)^2} = 1$

$a = 4$, $b = 3$

The x^2 term has a positive coefficient. Therefore, $a^2 = 16$.

$a^2 = 16$, and because $a > 0$, we have that $a = 4$.
$b^2 = 9$, and because $b > 0$, we have that $b = 3$.
$c^2 = a^2 + b^2 = (4)^2 + (3)^2 = 25$
$c = 5$ (Recall that $c > 0$.)

Therefore, $e = \dfrac{c}{a} = \dfrac{5}{4}$.

b. $\dfrac{x^2}{9} - \dfrac{y^2}{16} = 1$

$\dfrac{x^2}{(3)^2} - \dfrac{y^2}{(4)^2} = 1$

$a = 3$, $b = 4$

The x^2 term has a positive coefficient. Therefore, $a^2 = 9$.

$a^2 = 9$, and because $a > 0$, we have that $a = 3$.
$b^2 = 16$, and because $b > 0$, we have that $b = 4$.
$c^2 = a^2 + b^2 = (3)^2 + (4)^2 = 25$
$c = 5$ (Recall that $c > 0$.)

Therefore, $e = \dfrac{c}{a} = \dfrac{5}{3}$.

The graphs of the hyperbolas are shown in Figures 11-16 and 11-17. Compare the graphs, and notice that the hyperbola in Figure 11-17 has a greater eccentricity and that the branches open wider.

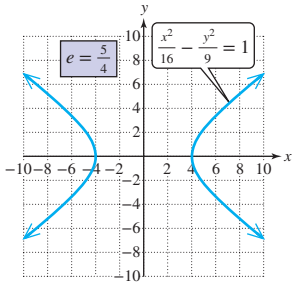


Figure 11-16

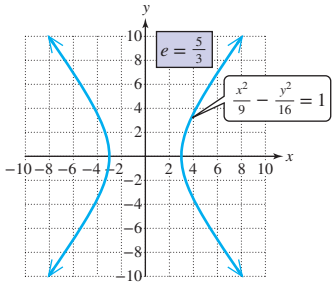

Figure 11-17

Skill Practice 6 Determine the eccentricity of the hyperbola.

a. $\dfrac{y^2}{25} - \dfrac{x^2}{144} = 1$ **b.** $\dfrac{y^2}{144} - \dfrac{x^2}{25} = 1$

Answers

6. a. $e = \dfrac{13}{5}$ **b.** $e = \dfrac{13}{12}$

4. Use Hyperbolas in Applications

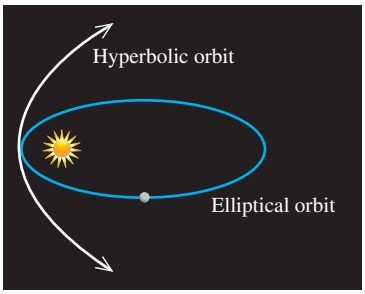

Figure 11-18

Applications of hyperbolas arise in many fields. For example, astronomers know that some comets, such as Halley's comet, follow an elliptical path around the Sun. Other comets have a hyperbolic orbit because they are not captured by the Sun's gravity (Figure 11-18).

Hyperbolas also provide the mathematical basis for LORAN (LOng RAnge Navigation), a technique used for navigation before global positioning systems were introduced. A ship using LORAN measures the difference in time between synchronized radio signals from two different transmitters. Using the relationship $d = rt$, the difference in distances between the ship and the two transmitters ($d_1 - d_2$) can be computed. Thus, the position of the ship is located on the hyperbolic path with the two transmitters at the foci (Figure 11-19).

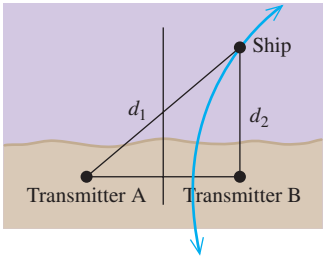

Figure 11-19

The same principle used in LORAN can also be used with sound waves to locate the source of sound heard from two different receivers. This is demonstrated in Example 7.

EXAMPLE 7 Using a Hyperbola in an Application

Suppose that two people located 3 mi (15,840 ft) apart at points A and B hear a clap of thunder (Figure 11-20). The time difference between the sound heard at point A and the sound heard at point B is 10 sec. If sound travels 1100 ft/sec, find an equation of the hyperbola (with foci at A and B) on which the point of origination of the sound must lie.

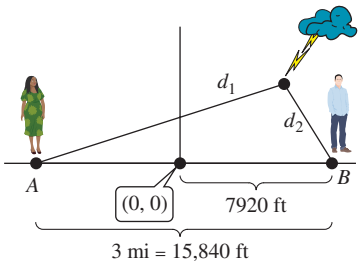

Figure 11-20

Solution:

First, we choose a coordinate system with the origin midway between the two observers. The two observers are at the points (7920, 0) and (−7920, 0). Let d_1 and d_2 represent the distances between each observer and the source of the sound (Figure 11-20).

The difference in distance $d_1 - d_2$ can be computed from the relationship $d = rt$.

$$d_1 - d_2 = (1100 \text{ ft/s})(10 \text{ s}) = 11{,}000 \text{ ft}$$

By the definition of a hyperbola, the source of the sound must be at a point on the hyperbola for which $d_1 - d_2 = 11{,}000$. The center of the hyperbola is (0, 0), and the transverse axis is horizontal with foci (7920, 0) and (−7920, 0). The standard form of the equation of the hyperbola is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

The value $d_1 - d_2 = 2a$

$11{,}000 = 2a$

$a = 5500$ ft

From the location of the foci, $c = 7920$ ft.

$c^2 = a^2 + b^2$. Taking $b > 0$, we have $b = \sqrt{c^2 - a^2}$.

$b = \sqrt{(7920)^2 - (5500)^2} \approx 5699$ ft

The source of the sound must be at a point on the curve $\dfrac{x^2}{(5500)^2} - \dfrac{y^2}{(5699)^2} = 1$.

Skill Practice 7 Repeat Example 7 with two observers 4 mi apart, who hear a clap of thunder 16 sec apart. (*Hint*: 5280 ft = 1 mi.)

Answer

7. $\dfrac{x^2}{(8800)^2} - \dfrac{y^2}{(5837)^2} = 1$

The hyperbola, like the ellipse, has an interesting property of reflection. Light directed toward one focus of a hyperbolic mirror is reflected toward the other focus of the hyperbola (Figure 11-21). This property is used in the design of Cassegrain reflecting telescopes. The telescope is a combination of a primary parabolic mirror and a secondary hyperbolic mirror (Figure 11-22). Light from distant stars is reflected off the parabolic mirror toward the focus of the hyperbolic mirror. The light is then reflected again toward an eyepiece located at the other focus of the hyperbola.

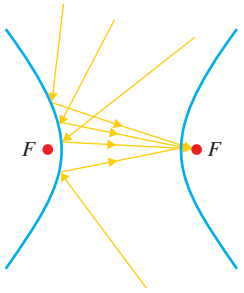

Figure 11-21

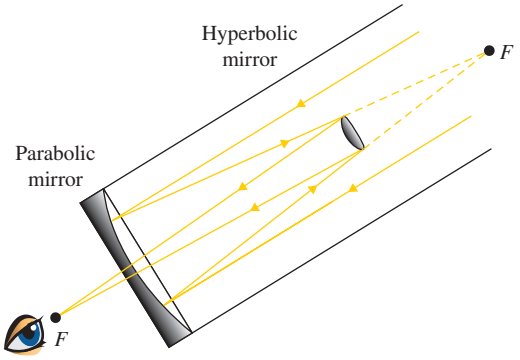

Figure 11-22

SECTION 11.2 Practice Exercises

Prerequisite Review

R.1. Use the distance formula to find the distance between the points (6, 12) and (−1, 12).

For Exercises R.2–R.3, write an equation of the line satisfying the given conditions. Write the answer in slope-intercept form.

R.2. The line passes through the point (−8, 8) and has a slope of −8.

R.3. The line passes through (−8, 8) and (1, −2).

Concept Connections

1. A _____ is the set of points (x, y) in a plane such that the difference in distances between (x, y) and two fixed points (called _____) is a positive constant.

2. The points where a hyperbola intersects the line through the foci are called the _____.

3. The line segment between the vertices of a hyperbola is called the _____ axis.

4. The line segment perpendicular to the transverse axis passing through the center of a hyperbola, and with endpoints on the reference rectangle, is called the _____ axis.

5. The equation $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ represents a _____ hyperbola with a (horizontal/vertical) transverse axis. The vertices are given by the ordered pairs _____ and _____. The asymptotes are given by the equations _____ and _____.

6. The equation $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$ represents a _____ hyperbola with a (horizontal/vertical) transverse axis. The vertices are given by the ordered pairs _____ and _____. The asymptotes are given by the equations _____ and _____.

ISTUDY

Objective 1: Graph a Hyperbola Centered at the Origin

For Exercises 7–8,

a. Use the distance formula to find the distances d_1, d_2, d_3, and d_4.

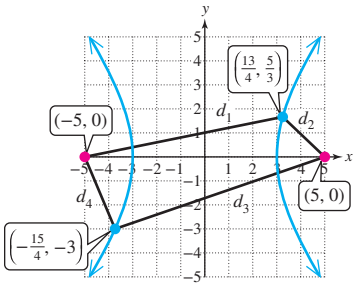
b. Find the difference of the distances: $d_1 - d_2$.

c. Find the difference of the distances: $d_3 - d_4$.

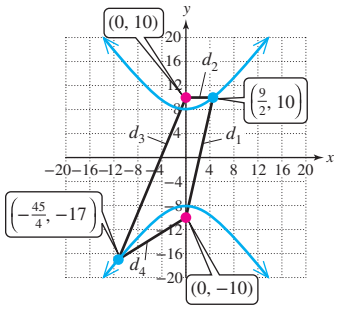
d. How do the results from parts (b) and (c) compare?

e. How do the results of part (b) and part (c) compare to the length of the transverse axis?

7.



8.



For Exercises 9–12, determine whether the transverse axis and foci of the hyperbola are on the *x*-axis or the *y*-axis.

9. $\dfrac{x^2}{15} - \dfrac{y^2}{20} = 1$ **10.** $\dfrac{y^2}{12} - \dfrac{x^2}{18} = 1$ **11.** $-x^2 + \dfrac{y^2}{3} = 1$ **12.** $-\dfrac{y^2}{16} + x^2 = 1$

For Exercises 13–22,

a. Identify the center. **b.** Identify the vertices.

c. Identify the foci. **d.** Write equations for the asymptotes.

e. Graph the hyperbola. **(See Examples 1–2)**

13. $\dfrac{x^2}{16} - \dfrac{y^2}{25} = 1$ **14.** $\dfrac{x^2}{25} - \dfrac{y^2}{36} = 1$ **15.** $\dfrac{y^2}{4} - \dfrac{x^2}{36} = 1$ **16.** $\dfrac{y^2}{9} - \dfrac{x^2}{49} = 1$

17. $25y^2 - 81x^2 = 2025$ **18.** $49y^2 - 16x^2 = 784$ **19.** $-5x^2 + 7y^2 = -35$ **20.** $-7x^2 + 11y^2 = -77$

21. $\dfrac{4x^2}{25} - \dfrac{16y^2}{49} = 1$ **22.** $\dfrac{4x^2}{81} - \dfrac{16y^2}{225} = 1$

Objective 2: Graph a Hyperbola Centered at (*h*, *k*)

For Exercises 23–32,

a. Identify the center. **b.** Identify the vertices.

c. Identify the foci. **d.** Write equations for the asymptotes.

e. Graph the hyperbola. **(See Example 3)**

23. $\dfrac{(x-4)^2}{9} - \dfrac{(y+2)^2}{16} = 1$ **24.** $\dfrac{(x-3)^2}{36} - \dfrac{(y+1)^2}{64} = 1$ **25.** $\dfrac{(y-5)^2}{49} - \dfrac{(x+3)^2}{25} = 1$

26. $\dfrac{(y-4)^2}{36} - \dfrac{(x+5)^2}{16} = 1$ **27.** $100(y-7)^2 - 81(x+4)^2 = -8100$ **28.** $49(y-3)^2 - 100(x+6)^2 = -4900$

29. $y^2 - \dfrac{(x-3)^2}{12} = 1$ **30.** $y^2 - \dfrac{(x-2)^2}{18} = 1$ **31.** $x^2 - \dfrac{(y-4)^2}{8} = 1$

32. $x^2 - \dfrac{(y-6)^2}{24} = 1$

For Exercises 33–40,

a. Write the equation of the hyperbola in standard form. **(See Example 4)**

b. Identify the center, vertices, and foci.

33. $7x^2 - 5y^2 + 42x + 10y + 23 = 0$ **34.** $5x^2 - 3y^2 + 10x + 24y - 73 = 0$

35. $-5x^2 + 9y^2 + 20x - 72y + 79 = 0$ **36.** $-7x^2 + 16y^2 - 70x + 96y - 143 = 0$

37. $4x^2 - y^2 - 10y - 29 = 0$ **38.** $9x^2 - y^2 - 14y - 58 = 0$

39. $-36x^2 + 64y^2 + 108x + 256y - 401 = 0$ **40.** $-144x^2 + 25y^2 + 720x - 50y - 4475 = 0$

ISTUDY

For Exercises 41–50, write the standard form of the equation of the hyperbola subject to the given conditions. (See Example 5)

41. Vertices: (12, 0), (−12, 0); Foci: (13, 0), (−13, 0)

42. Vertices: (40, 0), (−40, 0); Foci: (41, 0), (−41, 0)

43. Vertices: (0, 12), (0, −12); Asymptotes: $y = \pm\frac{4}{3}x$

44. Vertices: (0, 15), (0, −15); Asymptotes: $y = \pm\frac{15}{8}x$

45. Vertices: (−3, −3), (7, −3);
Slope of the asymptotes: $\pm\frac{7}{5}$

46. Vertices: (2, 1), (−10, 1);
Slope of the asymptotes: $\pm\frac{5}{6}$

47. Vertices: (−3, 0), (−3, 8);
Foci: $(-3, 4 + \sqrt{21}), (-3, 4 - \sqrt{21})$

48. Vertices: (2, −1), (2, −11);
Foci: $(2, -6 + \sqrt{31}), (2, -6 - \sqrt{31})$

49. Corners of the reference rectangle: (8, 7), (−6, 7), (8, −3), (−6, −3); Horizontal transverse axis

50. Corners of the reference rectangle: (7, 6), (−1, 6), (7, 0), (−1, 0); Horizontal transverse axis

Objective 3: Determine the Eccentricity of a Hyperbola

For Exercises 51–52,

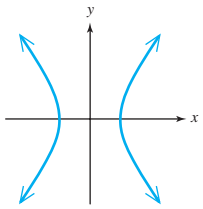
a. Determine the eccentricity of each hyperbola. (**See Example 6**)

b. Based on the eccentricity, match the equation with its graph. The scaling is the same for both graphs.

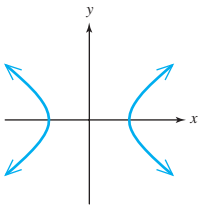
51. Equation 1: $\dfrac{x^2}{144} - \dfrac{y^2}{81} = 1$

Equation 2: $\dfrac{x^2}{81} - \dfrac{y^2}{144} = 1$

A.



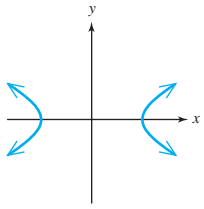
B.



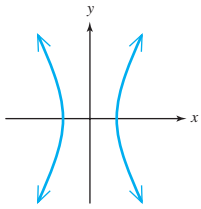
52. Equation 1: $\dfrac{x^2}{225} - \dfrac{y^2}{64} = 1$

Equation 2: $\dfrac{x^2}{64} - \dfrac{y^2}{225} = 1$

A.



B.



For Exercises 53–54, determine the eccentricity.

53. $\dfrac{(y - \frac{2}{3})^2}{1600} - \dfrac{(x + \frac{7}{4})^2}{81} = 1$

54. $\dfrac{(y - 3.8)^2}{49} - \dfrac{(x - 2.7)^2}{576} = 1$

55. Determine the eccentricity of a hyperbola with a horizontal transverse axis of length 24 units and asymptotes $y = \pm\frac{3}{4}x$.

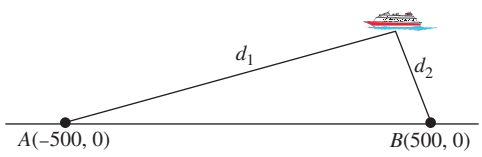
56. Determine the eccentricity of a hyperbola with a vertical transverse axis of length 48 units and asymptotes $y = \pm\frac{12}{5}x$.

57. Determine the standard form of an equation of a hyperbola with eccentricity $\frac{5}{4}$ and vertices (−1, −1) and (7, −1).

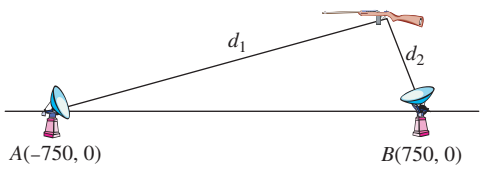
58. Determine the standard form of an equation of a hyperbola with eccentricity $\frac{13}{12}$ and vertices (−2, 8) and (−2, −16).

Objective 4: Use Hyperbolas in Applications

59. Two radio transmitters are 1000 mi apart at points A and B along a coastline. Using LORAN on the ship, the time difference between the radio signals is 4 milliseconds (0.004 sec). If radio signals travel 186 mi/millisecond, find an equation of the hyperbola with foci at A and B, on which the ship is located. (**See Example 7**)



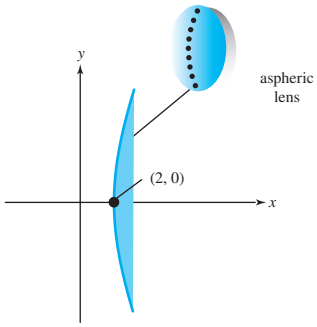
60. Suppose that two microphones 1500 m apart at points A and B detect the sound of a rifle shot. The time difference between the sound detected at point A and the sound detected at point B is 4 sec. If sound travels at approximately 330 m/sec, find an equation of the hyperbola with foci at A and B defining the points where the shooter may be located.



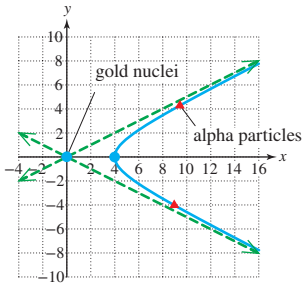
ISTUDY

61. In some designs of eyeglasses, the surface is "aspheric," meaning that the contour varies slightly from spherical. An aspheric lens is often used to correct for spherical aberration—a distortion due to increased refraction of light rays when they strike the lens near its edge. Aspheric lenses are often designed with hyperbolic cross sections.

Write an equation of the cross section of the hyperbolic lens shown if the center is (0, 0), one vertex is (2, 0), and the focal length (distance between center and foci) is $\sqrt{85}$. Assume that all units are in millimeters.

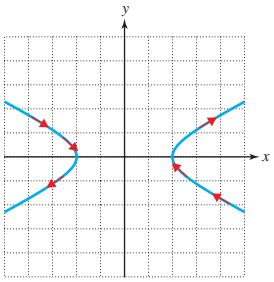


62. In 1911, Ernest Rutherford discovered the nucleus of the atom. Experiments leading to this discovery involved the scattering of alpha particles by the heavy nuclei in gold foil. When alpha particles are thrust toward the gold nuclei, the particles are deflected and follow a hyperbolic path.

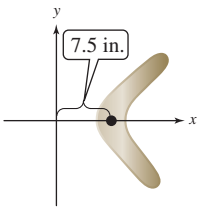


Suppose that the minimum distance that the alpha particles get to the gold nuclei is 4 microns (1 micron is one-millionth of a meter) and that the hyperbolic path has asymptotes of $y = \pm\frac{1}{2}x$. Determine an equation of the path of the particles shown.

63. Atomic particles with like charges tend to repel one another. Suppose that two beams of like-charged particles are hurled toward each other from two parallel atomic accelerators. The path defined by the particles is $x^2 - 4y^2 = 36$, where x and y are measured in microns. What is the minimum distance between the particles?

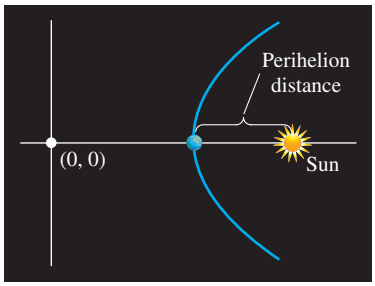


64. A returning boomerang is a V-shaped throwing device made from two wings that are set at a slight tilt and that have an airfoil design. One side is rounded and the other side is flat, similar to an airplane propeller. When thrown properly, a boomerang follows a circular flight path and should theoretically return close to the point of release.



The boomerang pictured is approximately in the shape of one branch of a hyperbola (although the two wings are in slightly different planes). To construct the hyperbola, an engineer needs to know the location of the foci. Determine the location of the focus to the right of the center if the vertex is 7.5 in. from the center and the equations of the asymptotes are $y = \pm\frac{4}{5}x$. Round the coordinates to the nearest tenth of an inch.

65. In September 2009, Australian astronomer Robert H. McNaught discovered comet C/2009 R_1 (McNaught). The orbit of this comet is hyperbolic with the Sun at one focus. Because the orbit is not elliptical, the comet will not be captured by the Sun's gravitational pull and instead will pass by the Sun only once. The comet reached perihelion on July 2, 2010. (*Source*: Minor Planet Center, http://minorplanetcenter.net/)



The path of the comet can be modeled by the equation

$$\frac{x^2}{(1191.2)^2} - \frac{y^2}{(30.9)^2} = 1$$

where x and y are measured in AU (astronomical units).

a. Determine the distance (in AU) at perihelion. Round to 1 decimal place.

b. Using the rounded value from part (a), if 1 AU $\approx$ 93,000,000 mi, find the distance in miles.

ISTUDY

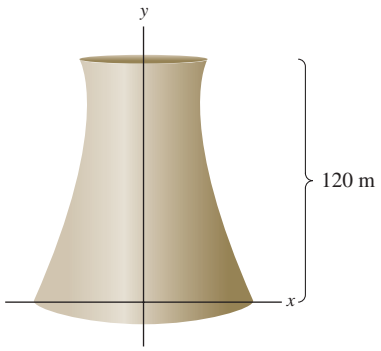
66. The cross section of a cooling tower of a nuclear power plant is in the shape of a hyperbola and can be modeled by the equation

$$\frac{x^2}{625} - \frac{(y - 80)^2}{2500} = 1$$

where x and y are measured in meters. The top of the tower is 120 m above the base.

a. Determine the diameter of the tower at the base. Round to the nearest meter.

b. Determine the diameter of the tower at the top. Round to the nearest meter.



Mixed Exercises

For Exercises 67–70, identify the equation as representing an ellipse or a hyperbola, and match the equation with the graph.

67. $\dfrac{(x - 5)^2}{49} + \dfrac{(y + 2)^2}{36} = 1$

68. $\dfrac{(x - 5)^2}{36} + \dfrac{(y + 2)^2}{49} = 1$

69. $\dfrac{(x - 5)^2}{49} - \dfrac{(y + 2)^2}{36} = 1$

70. $-\dfrac{(x - 5)^2}{49} + \dfrac{(y + 2)^2}{36} = 1$

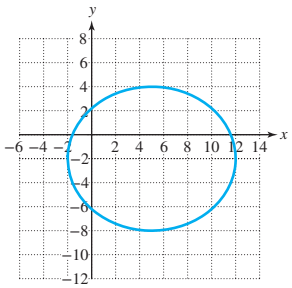
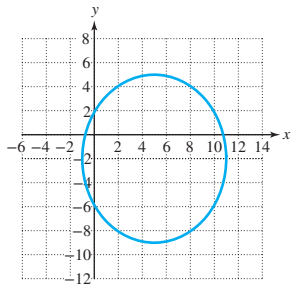
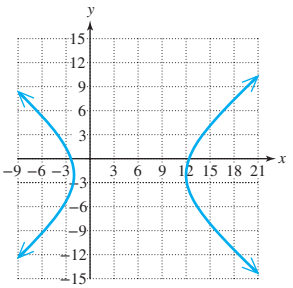
B.



C.

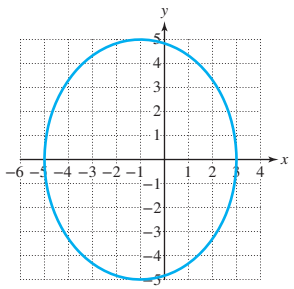


D.

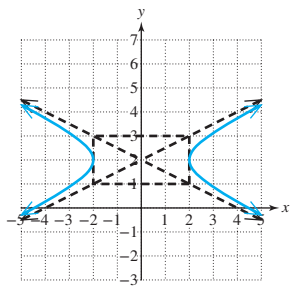


For Exercises 71–74, find the standard form of the equation of the ellipse or hyperbola shown.

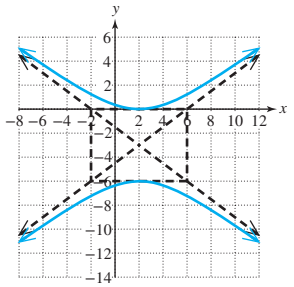
71.



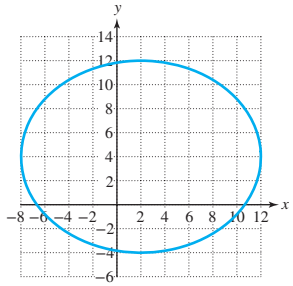
72.



73.



74.



For Exercises 75–76, graph the equations on the same coordinate system and determine the points of intersection.

75. $\dfrac{x^2}{4} - \dfrac{y^2}{9} = 1$

$y^2 - \dfrac{x^2}{4} = 1$

76. $xy = 2$

$\dfrac{y^2}{2} - x^2 = 1$

For Exercises 77–78, solve the system of equations.

77. $9x^2 - 4y^2 = 36$

$-13x^2 + 8y^2 = 8$

78. $x^2 + 4y^2 = 36$

$4x^2 - y^2 = 8$

Write About It

79. Given an equation of a hyperbola in standard form, how do you determine whether the transverse axis is horizontal or vertical?

80. Discuss the solution set of the equation.

$$\frac{x^2}{4} - \frac{y^2}{9} = 0$$

Expanding Your Skills

81. What is the eccentricity of a hyperbola if the asymptotes are perpendicular?

82. a. Describe the graph of $y = 4\sqrt{1 + \dfrac{x^2}{9}}$.

b. Does the equation $y = 4\sqrt{1 + \dfrac{x^2}{9}}$ define y as a function of x?

c. Sketch $y = 4\sqrt{1 + \dfrac{x^2}{9}}$.

d. Determine the interval(s) over which the function is increasing.

e. Determine the interval(s) over which the function is decreasing.

An equation of the tangent line through a point (x_1, y_1) on a hyperbola of the form $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$ is given by $\left(\dfrac{x_1}{a^2}\right)x - \left(\dfrac{y_1}{b^2}\right)y = 1$.

The proof is similar to the proof offered in Exercise 105 of Section 11.1. For Exercises 83–85, use this result to

a. Find an equation of the tangent line at the given point on the curve. Write the answer in slope-intercept form, if possible.

b. Find an equation of the *normal* line at the given point on the curve. The **normal line** is the line perpendicular to the tangent line at the given point. Write the answer in slope-intercept form, if possible.

83. $\dfrac{x^2}{9} - \dfrac{y^2}{16} = 1;\ \left(-\dfrac{15}{4}, -3\right)$

84. $\dfrac{x^2}{9} - \dfrac{y^2}{4} = 1;\ (3\sqrt{5}, 4)$

85. $\dfrac{x^2}{9} - y^2 = 1;\ \left(5, -\dfrac{4}{3}\right)$

Two conic sections with the same foci are called *confocal*. For Exercises 86–88, match each conic section with its confocal curve, A, B, or C. Then identify the common foci.

A. $\dfrac{x^2}{12} + \dfrac{y^2}{6} = 1$ **B.** $\dfrac{x^2}{25} + \dfrac{y^2}{16} = 1$ **C.** $\dfrac{x^2}{16} - \dfrac{y^2}{9} = 1$

86. $\dfrac{x^2}{4} - \dfrac{y^2}{21} = 1$

87. $\dfrac{x^2}{5} - y^2 = 1$

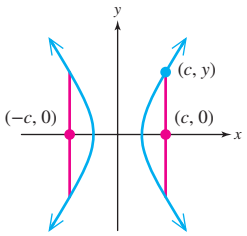
88. $\dfrac{x^2}{16} + \dfrac{y^2}{7} = 1$

ISTUDY

89. A line segment with endpoints on a hyperbola, perpendicular to the transverse axis, and passing through a focus is called a *latus rectum* of the hyperbola (shown in red). Show that the length of a latus rectum is $\frac{2b^2}{a}$ for the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

[*Hint*: Substitute (c, y) into the equation and solve for y. Recall that $c^2 = a^2 + b^2$.]



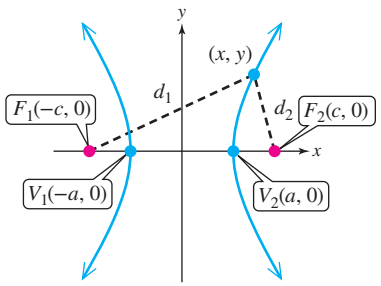
90. This exercise guides you through the steps to find the standard form of an equation of a hyperbola centered at the origin with foci on the x-axis.

a. Refer to the figure to verify that the distance between F_1 and V_2 is $(c + a)$ and the distance between F_2 and V_2 is $(c - a)$. Verify that the *difference* between these distances is $2a$.

b. Write an expression that represents the difference of the distances from F_1 to (x, y) and from F_2 to (x, y). Then set this expression equal to $2a$.

c. Given the equation $\sqrt{(x + c)^2 + y^2} - \sqrt{(x - c)^2 + y^2} = 2a$, isolate the leftmost radical and square both sides of the equation. Show that the equation can be written as $cx - a^2 = a\sqrt{(x - c)^2 + y^2}$.

d. Square both sides of the equation $cx - a^2 = a\sqrt{(x - c)^2 + y^2}$ and show that the equation can be written as $(c^2 - a^2)x^2 - a^2y^2 = a^2(c^2 - a^2)$. (*Hint*: Collect variable terms on the left side of the equation and constant terms on the right side.)



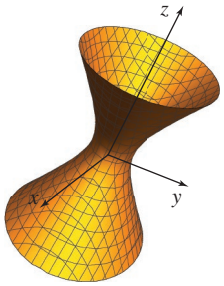
e. Replace $c^2 - a^2$ by b^2. Then divide both sides of the equation by a^2b^2. Verify that the resulting equation is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$.

91. A hyperboloid of one sheet is a three-dimensional surface generated by an equation of the form $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$. The surface has hyperbolic cross sections and either circular cross sections or elliptical cross sections.

a. Write the equation with $z = 0$. What type of curve is represented by this equation?

b. Write the equation with $x = 0$. What type of curve is represented by this equation?

c. Write the equation with $y = 0$. What type of curve is represented by this equation?



92. a. Radio signals emitted from points $(8, 0)$ and $(-8, 0)$ indicate that a plane is 8 mi closer to $(8, 0)$ than to $(-8, 0)$. Find an equation of the hyperbola that passes through the plane's location and with foci $(8, 0)$ and $(-8, 0)$. All units are in miles.

b. At the same time, radio signals emitted from points $(0, 8)$ and $(0, -8)$ indicate that the plane is 4 mi farther from $(0, 8)$ than from $(0, -8)$. Find an equation of the hyperbola that passes through the plane's location and with foci $(0, 8)$ and $(0, -8)$.

c. From the figure, the plane is located in the fourth quadrant of the coordinate system. Solve the system of equations defining the two hyperbolas for the point of intersection in the fourth quadrant. This is the location of the plane. Then round the coordinates to the nearest tenth of a mile.

SECTION 11.3 The Parabola

OBJECTIVES

1. Identify the Focus and Directrix of a Parabola
2. Graph a Parabola with Vertex at the Origin
3. Graph a Parabola with Vertex (h, k)
4. Use Parabolas in Applications

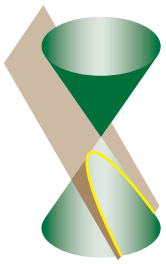

Figure 11-23

1. Identify the Focus and Directrix of a Parabola

A parabola is another type of conic section generated by the cross section of a cone intersected by a plane (Figure 11-23). An equation of the form $y = ax^2 + bx + c$ $(a \neq 0)$ is a parabola opening upward if $a > 0$ and opening downward if $a < 0$. We now extend our study of parabolas to include those that open to the left and right. To do so, we will define a parabola geometrically.

Definition of a Parabola

A **parabola** is the set of all points in a plane that are equidistant from a fixed line (called the **directrix**) and a fixed point (called the **focus**).

Figure 11-24 shows a parabola opening upward. The line perpendicular to the directrix and passing through the focus is called the **axis of symmetry.** The **vertex** of the parabola is the point of intersection of the parabola and the axis of symmetry.

A point $P(x, y)$ is on the parabola if $d_1 = d_2$ where d_1 is the distance between the focus and P, and d_2 is the perpendicular distance between P and the directrix.

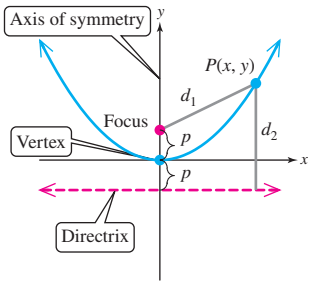

Figure 11-24

To develop an algebraic equation that represents a parabola, we will consider a parabola with vertex at the origin and with a vertical line of symmetry (that is, the parabola opens upward or downward). See Figure 11-25. In the discussion that follows, the same logic can be applied to a parabola with a horizontal line of symmetry (the parabola opens to the left or to the right).

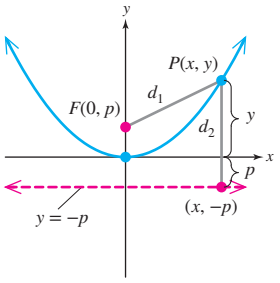

Figure 11-25

The distance between the vertex and the focus of a parabola is called the **focal length** and is often represented by $|p|$. Suppose that we choose a coordinate system with the vertex at the origin and focus $F(0, p)$. Because the distance between any point on the parabola and the focus must equal the distance between the point and the directrix, the directrix is a horizontal line $|p|$ units from the vertex. The equation of the directrix is $y = -p$.

TIP The shortest distance between P and the directrix is the *perpendicular distance*. This is the length of the line segment perpendicular to the directrix with one endpoint at P and the other endpoint on the directrix.

Let $P(x, y)$ represent any point on the parabola. Then the distance between $F(0, p)$ and $P(x, y)$ can be found by using the distance formula.

$$d_1 = \sqrt{(x - 0)^2 + (y - p)^2}$$

The distance from $P(x, y)$ to the directrix is the vertical distance between $P(x, y)$ and the point $(x, -p)$ on the directrix.

$$d_2 = y + p$$

Equating d_1 and d_2, we have

$$\sqrt{x^2 + (y - p)^2} = y + p$$

Square both sides.

$$x^2 + (y - p)^2 = (y + p)^2$$

Expand the binomials.

$$x^2 + y^2 - 2py + p^2 = y^2 + 2py + p^2$$

$$x^2 = 4py$$

Standard form
If $p > 0$, the parabola opens upward.
If $p < 0$, the parabola opens downward.

The equation $x^2 = 4py$ represents a parabola with vertex at the origin and focus on the y-axis. Using similar logic, we can derive the standard form of an equation of a parabola with focus on the x-axis.

Standard Forms of an Equation of a Parabola with Vertex at the Origin

	Axis of Symmetry: y-axis	Axis of Symmetry: x-axis
Equation:	$x^2 = 4py$	$y^2 = 4px$
Vertex:	$(0, 0)$	$(0, 0)$
Focus:	$(0, p)$	$(p, 0)$
Directrix:	$y = -p$	$x = -p$
Axis of symmetry:	$x = 0$	$y = 0$
Graph: $(p > 0)$		Graph: $(p < 0)$		
Avoiding Mistakes

Notice that an equation of a parabola has only one variable squared, whereas an equation of an ellipse or hyperbola has both x and y appearing to the second power.

TIP The orientation of a parabola (whether it opens vertically or horizontally) can be determined by noting the linear term in the equation. For the equation $x^2 = 4py$, the y term is linear (to the first power). Therefore, the parabola will open in the y direction (upward or downward). For the equation $y^2 = 4px$, the x term is linear, so the parabola will open to the left or right.

From Section 3.1, we became accustomed to writing an equation of a quadratic function with vertex at the origin in the form $y = ax^2$. The benefit of writing the equation as $x^2 = 4py$ is that we can identify the value of p, which gives us the distance $|p|$ between the vertex and the focus.

Finding the location of the focus is particularly important in applications. For example, a flashlight has a mirror with cross section in the shape of a parabola (Figure 11-26). The bulb is located at the focus. The light emitted from the bulb will reflect off the mirror in lines parallel to the axis of symmetry to form a beam of light. This is a result of the reflective property of a parabola.

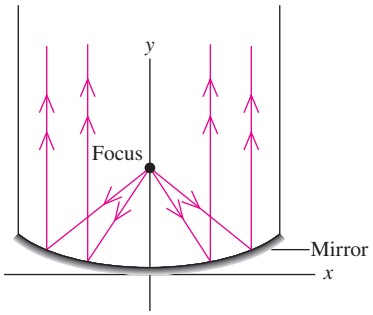

Figure 11-26

ISTUDY

EXAMPLE 1 Determining the Focus and Directrix of a Parabola

An engineer designs a flashlight with a parabolic mirror. A coordinate system is chosen so that the vertex of a cross section through the center of the mirror is located at (0, 0). The equation of the parabola is modeled by $x^2 = 8y$, where x and y are measured in centimeters.

a. Where should the bulb be placed to make use of the reflective property of the parabola? That is, find the location of the focus.

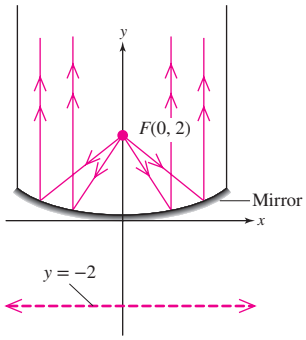
b. Write an equation of the directrix.

Solution:

a. $x^2 = 8y$ is in the form $x^2 = 4py$ with $4p = 8$.

$4p = 8$

$p = 2$ Since the equation is in the form $x^2 = 4py$, the focus is on the y-axis. Furthermore, since $p > 0$, the parabola opens upward, and the focus is $|p|$ units above the vertex.



The focus is (0, 2).

The bulb should be placed 2 cm above the vertex.

b. The directrix is the horizontal line $|p|$ units below the vertex.

The equation of the directrix is $y = -2$.

Skill Practice 1 Given a parabola defined by $x^2 = 4y$, find the focus and an equation of the directrix.

2. Graph a Parabola with Vertex at the Origin

In Examples 2 and 3, we practice graphing parabolas with vertex at the origin. To sketch the graph, we will identify the location of the vertex and the orientation of the parabola (up or down versus left or right). To determine how "wide" to graph the parabola, we will determine the length of the line segment passing through the focus, perpendicular to the axis of symmetry with endpoints on the parabola. This line segment is called the **latus rectum.**

For the parabola defined by $x^2 = 4py$, the endpoints of the latus rectum will have the same y-coordinate as the focus. Therefore, to find the endpoints of the latus rectum, we can substitute p for y in the equation (Figure 11-27).

$x^2 = 4py$

$x^2 = 4p(p)$ Substitute p for y.

$x^2 = 4p^2$

$x = \pm 2|p|$

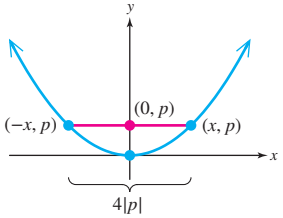


Figure 11-27

Thus, the endpoints of the latus rectum are located $2|p|$ units to the left and right of the focus at $(-2|p|, p)$ and $(2|p|, p)$. The length of the latus rectum is called the **focal diameter** and is equal to $4|p|$.

In Example 2, we graph a parabola by using the vertex, orientation of the parabola, and focal diameter.

Answer

1. Focus: (0, 1); Directrix: $y = -1$

EXAMPLE 2 Graphing a Parabola with Vertex at the Origin

Given $x^2 = -12y$,

a. Identify the vertex, focus, and focal diameter.
b. Identify the endpoints of the latus rectum and graph the parabola.
c. Write equations for the directrix and axis of symmetry.

Solution:

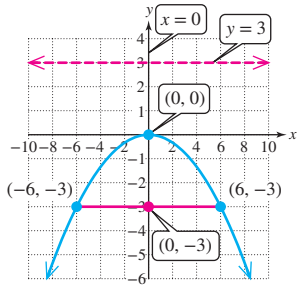
a. $x^2 = -12y$ The equation is in the standard form $x^2 = 4py$. From the standard form, we see that the focus is on the y-axis and that the parabola will open upward or downward. The vertex is (0, 0), with $4p = -12$.

$4p = -12$

$p = -3$ Because $p < 0$, the parabola will open downward.

The vertex is (0, 0).
The focus is $(0, p)$, which is $(0, -3)$.
The focal diameter is $4|p|$, which is $4|(-3)| = 12$.

b. Plot the vertex and locate the focus. Note that the focus is shown in red because it is not actually part of the graph. The focal diameter is 12 units. Therefore, plot points 6 units to the left and right of the focus. These are the endpoints of the latus rectum: (6, −3) and (−6, −3).



c. Equation of the directrix: $y = 3$
Equation of the axis of symmetry: $x = 0$

TIP The focal diameter gives the length of the latus rectum. This is helpful for graphing a parabola because it tells us the "width" of the parabola at the focus.

Skill Practice 2 Repeat Example 2 with the equation: $x^2 = -8y$

In Example 3, we graph a parabola opening horizontally.

EXAMPLE 3 Graphing a Parabola with Vertex at the Origin

Given $2y^2 = 32x$,

a. Identify the vertex, focus, and focal diameter.
b. Identify the endpoints of the latus rectum and graph the parabola.
c. Write equations for the directrix and axis of symmetry.

Solution:

a. $2y^2 = 32x$ Divide both sides by 2 to obtain a coefficient of 1 on the square term.

$y^2 = 16x$ The equation is in the standard form $y^2 = 4px$. From the standard form, we see that the focus is on the x-axis, and that the parabola will open to the left or right. The vertex is (0, 0) and $4p = 16$.

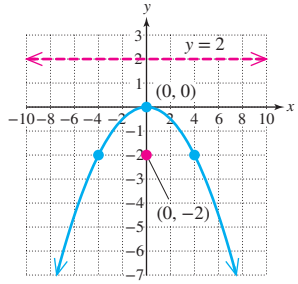
$4p = 16$

$p = 4$ Because $p > 0$, the parabola will open to the right.

The vertex is (0, 0).
The focus is $(p, 0)$, which is (4, 0).
The focal diameter is $4|p|$, which is $4|(4)| = 16$.

Answers

2. a. Vertex: (0, 0); Focus: (0, −2); Focal diameter: 8
b. (−4, −2), (4, −2)
c. Directrix: $y = 2$; Axis of symmetry: $x = 0$

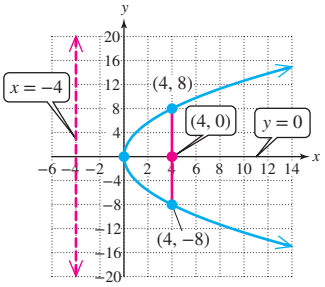


ISTUDY

b. Plot the vertex and locate the focus. The focal diameter is 16 units. Therefore, plot points 8 units above and 8 units below the focus. These are the endpoints of the latus rectum, (4, 8) and (4, −8).

c. Equation of the directrix: $x = -4$

Equation of the axis of symmetry: $y = 0$



Skill Practice 3 Repeat Example 3 with the equation: $y^2 = -12x$

3. Graph a Parabola with Vertex (h, k)

In the standard form of a parabola, if x and y are replaced by $x - h$ and $y - k$, then the graph of the parabola is shifted h units horizontally and k units vertically. The vertex is (h, k).

Standard Forms of an Equation of a Parabola with Vertex (h, k)

	Vertical Axis of Symmetry	Horizontal Axis of Symmetry
Equation:	$(x - h)^2 = 4p(y - k)$	$(y - k)^2 = 4p(x - h)$
Vertex:	(h, k)	(h, k)
Focus:	$(h, k + p)$	$(h + p, k)$
Directrix:	$y = k - p$	$x = h - p$
Axis of symmetry:	$x = h$	$y = k$
Graph:		Note:	• If $p > 0$, the parabola opens upward as shown. • If $p < 0$, the parabola opens downward.	• If $p > 0$, the parabola opens to the right as shown. • If $p < 0$, the parabola opens to the left.

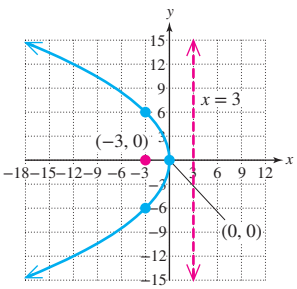
To graph a parabola with vertex (h, k), first locate the vertex and identify the orientation of the parabola (vertical axis of symmetry or horizontal axis of symmetry). Then identify the focus, directrix, and endpoints of the latus rectum. Finally, sketch the parabola through the vertex and endpoints of the latus rectum.

Answers

3. a. Vertex: (0, 0); Focus: (−3, 0); Focal diameter: 12

b. (−3, 6), (−3, −6)

c. Directrix: $x = 3$; Axis of symmetry: $y = 0$



EXAMPLE 4 Graphing a Parabola with Vertex (h, k)

Given $(y + 3)^2 = -4(x - 2)$,

a. Identify the vertex, focus, and focal diameter.

b. Identify the endpoints of the latus rectum and graph the parabola.

c. Write equations for the directrix and axis of symmetry.

Solution:

a. $(y + 3)^2 = -4(x - 2)$

The equation is in the form $(y - k)^2 = 4p(x - h)$, where $h = 2$ and $k = -3$. The vertex is $(2, -3)$, and $4p = -4$. This implies that $p = -1$.

$4p = -4$

$p = -1$

The x term is linear. Therefore, the parabola will open in the x direction (left or right). Furthermore, since $p < 0$, the parabola will open to the left.

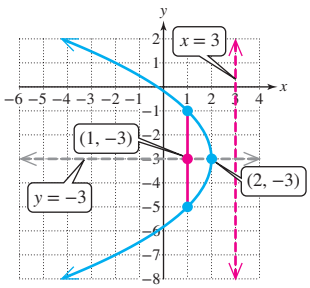
The vertex is $(2, -3)$.

The focus is $(1, -3)$. Since $p = -1$, the focus is 1 unit to the left of the vertex.

The focal diameter is 4. The focal diameter is $4|p| = 4|(-1)| = 4$.

b. Plot the vertex and locate the focus. The focal diameter is 4 units. Therefore, plot points 2 units above and below the focus. These are the endpoints of the latus rectum: $(1, -1)$ and $(1, -5)$.

Sketch the curve through the vertex and endpoints of the latus rectum.



c. Equation of the directrix: $x = 3$

Equation of the axis of symmetry: $y = -3$

Skill Practice 4 Repeat Example 4 with the equation: $(y - 2)^2 = -8(x - 4)$

TECHNOLOGY CONNECTIONS

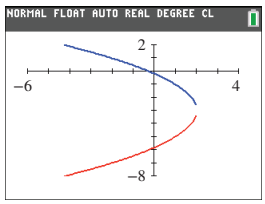
Graphing a Parabola

To graph the parabola from Example 4 on a graphing utility, first solve the equation for y.

$$(y + 3)^2 = -4(x - 2)$$

$$y = -3 \pm \sqrt{-4(x - 2)} \qquad \text{Solve for } y.$$

The functions represent the top and bottom branches of the parabola, respectively.



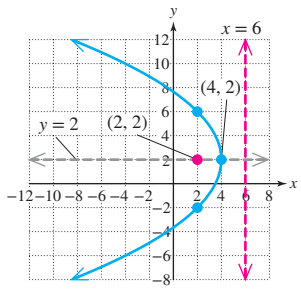
Sometimes an equation of a parabola is given in expanded form. We can complete the square to write the equation in standard form. The process involves completing the square on either the x or y term, depending on which variable is squared in the equation. This is demonstrated in Example 5.

Answers

4. a. Vertex: (4, 2); Focus: (2, 2); Focal diameter: 8

b. (2, 6), (2, −2)

c. Directrix: $x = 6$; Axis of symmetry: $y = 2$



ISTUDY

EXAMPLE 5 Writing an Equation of a Parabola in Standard Form

Given the equation of the parabola $4x^2 - 20x - 8y + 57 = 0$,

a. Write the equation in standard form.
b. Identify the vertex, focus, and focal diameter.
c. Graph the parabola.

Solution:

a. $4x^2 - 20x - 8y + 57 = 0$
$4(x^2 - 5x \quad) = 8y - 57$

The x term is squared. Therefore, we complete the square on x on the left side. Move the y term and constant term to the right.

$4 \cdot \frac{25}{4}$ is added to the left side. $4 \cdot \frac{25}{4}$

$4\left(x^2 - 5x + \frac{25}{4}\right) = 8y - 57 + 25$

Complete the square.
Note that $\left[\frac{1}{2} \cdot (-5)\right]^2 = \left[-\frac{5}{2}\right]^2 = \frac{25}{4}$.

$4\left(x - \frac{5}{2}\right)^2 = 8y - 32$

The value $\frac{25}{4}$ was added inside the parentheses. However, $4 \cdot \frac{25}{4}$ was actually added to the left side as a result of the factor 4 in front of the parentheses.

$\frac{4\left(x - \frac{5}{2}\right)^2}{4} = \frac{8y - 32}{4}$

$\left(x - \frac{5}{2}\right)^2 = 2y - 8$

To write the equation in standard form, we require the coefficient of the square term to be 1. Divide both sides by 4.

$\left(x - \frac{5}{2}\right)^2 = 2(y - 4)$

Factor out the leading coefficient on the right side of the equation. The equation is in the form $(x - h)^2 = 4p(y - k)$.

b. $4p = 2$
$p = \frac{1}{2}$

The y term is linear. Therefore, the parabola will open in the y direction (upward or downward). Furthermore, since $p > 0$, the parabola will open upward.

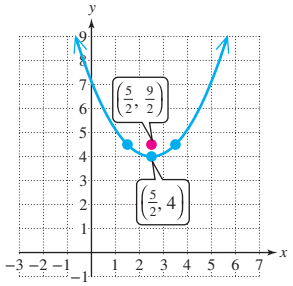
The vertex is $\left(\frac{5}{2}, 4\right)$.

The focus is $\left(\frac{5}{2}, 4 + \frac{1}{2}\right) = \left(\frac{5}{2}, \frac{9}{2}\right)$.
The focal diameter is 2.

Since $p = \frac{1}{2}$, the focus is $\frac{1}{2}$ unit above the vertex.
The focal diameter is $4|p| = 4\left|\frac{1}{2}\right| = 2$.

c. Plot the vertex and locate the focus. The focal diameter is 2 units. Therefore, plot points 1 unit to the left and right of the focus. These are the points $\left(\frac{3}{2}, \frac{9}{2}\right)$ and $\left(\frac{7}{2}, \frac{9}{2}\right)$.

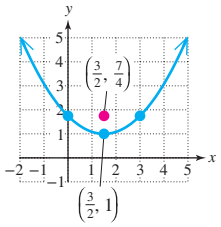
Sketch the curve.



Skill Practice 5 Repeat Example 5 with the equation:
$4x^2 - 12x - 12y + 21 = 0$

In Example 6, we determine the standard form of an equation of a parabola based on known information about the parabola.

Answers
5. a. $\left(x - \frac{3}{2}\right)^2 = 3(y - 1)$
b. Vertex: $\left(\frac{3}{2}, 1\right)$; Focus: $\left(\frac{3}{2}, \frac{7}{4}\right)$; Focal diameter: 3
c.



EXAMPLE 6 Writing an Equation of a Parabola

Determine the standard form of an equation of the parabola with focus (1, 2) and directrix $x = 7$.

Solution:

The directrix is a vertical line $x = 7$ and the focus is 6 units to the left of the directrix (Figure 11-28). The vertex is halfway between the directrix and focus. Therefore, the vertex is 3 units to the right of the focus at (4, 2). This indicates that $h = 4$ and $k = 2$.

The parabola must open away from the directrix and toward the focus, which in this case is to the left. The standard equation is

$$(y - k)^2 = 4p(x - h)$$

The distance between the focus and vertex is 3. Therefore, $|p| = 3$. Because the parabola opens to the left, $p < 0$, indicating that $p = -3$.

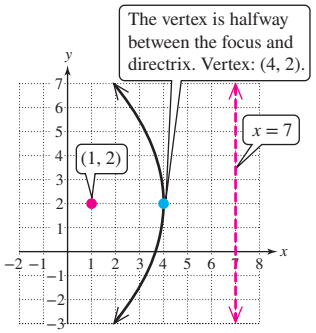


Figure 11-28

The equation is:
$$(y - k)^2 = 4p(x - h)$$
$$(y - 2)^2 = 4(-3)(x - 4)$$
$$(y - 2)^2 = -12(x - 4)$$

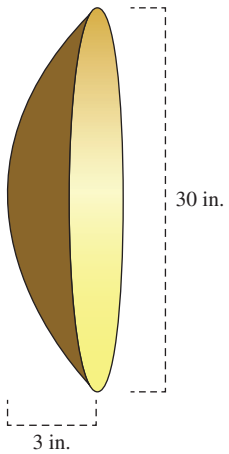
Skill Practice 6 Determine the standard form of an equation of a parabola with focus $(-2, 3)$ and directrix $y = 7$.

4. Use Parabolas in Applications

We complete this section by determining an equation of a parabola used to construct a satellite dish. A parabolic satellite dish uses the reflective property of a parabola to gather radio waves and direct the signal to a common focus to make the signal stronger.

EXAMPLE 7 Applying an Equation of a Parabola

A satellite dish is in the shape of a paraboloid. Cross sections taken parallel to the direction the dish opens are parabolic. Cross sections taken perpendicular to the direction the dish opens are circular. The diameter of the dish is 30 in. and the depth is 3 in.



a. Find an equation of a parabolic cross section through the vertex of the dish.

b. Where should the receiver be placed?

Solution:

a. Orient the dish with the vertex at the origin of a rectangular coordinate system with the dish opening along the positive x-axis (Figure 11-29). An equation of a parabolic cross section through the origin is of the form $y^2 = 4px$. To solve for the value of p, we can

Answer
6. $(x + 2)^2 = -8(y - 5)$

use a known point on the parabola such as (3, 15) or (3, −15). Using (3, 15), we have

$$y^2 = 4px$$
$$(15)^2 = 4p(3)$$
$$225 = 12p$$
$$p = 18.75$$

Therefore, an equation of a parabolic cross section through the origin is

$$y^2 = 4(18.75)x$$
$$y^2 = 75x$$

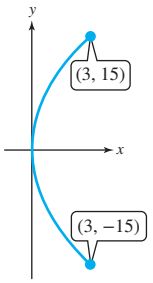


Figure 11-29

b. The receiver should be placed at the focus of the parabola. Since the focal length is $|p| = |18.75| = 18.75$, the receiver should be placed at (18.75, 0).

Skill Practice 7 Repeat Example 7 with a radio telescope of diameter 70 m and depth 14 m.

Answers
7. a. $y^2 = 87.5x$
b. (21.875, 0)

SECTION 11.3 Practice Exercises

Prerequisite Review

R.1. Use the distance formula to find the distance between the points (−1, −2) and (−2, −9).

For Exercises R.2–R.3, write an equation of the line satisfying the given conditions.

R.2. The line is parallel to the line $y = 4$ and passes through (−4, 3).

R.3. The line is perpendicular to the x-axis and passes through (2, 1).

Concept Connections

1. A _____ is the set of all points in a plane that are equidistant from a fixed line (called the _____) and a fixed point (called the _____).

2. The line perpendicular to the directrix and passing through the focus of a parabola is called the axis of _____.

3. The _____ of a parabola is the point of intersection of the parabola and the axis of symmetry.

4. The distance between the vertex and the focus of a parabola is called the _____ length and is often represented by $|p|$.

5. Given $y^2 = 4px$ with $p < 0$, the parabola opens (upward/downward/left/right).

6. Given $x^2 = 4py$ with $p > 0$, the parabola opens (upward/downward/left/right).

7. The line segment perpendicular to the axis of symmetry, passing through the focus and with endpoints on the parabola, is called the _____ _____.

8. The length of the latus rectum is called the _____ diameter.

9. Given $(x - h)^2 = 4p(y - k)$, the ordered pairs representing the vertex and focus are _____ and _____, respectively. The directrix is the line defined by the equation _____.

10. Given $(y - k)^2 = 4p(x - h)$, the ordered pairs representing the vertex and focus are _____ and _____, respectively. The directrix is the line defined by the equation _____.

11. If the directrix is horizontal, then the parabola opens (horizontally/vertically).

12. If the line of symmetry is horizontal, then the parabola opens (horizontally/vertically).

ISTUDY

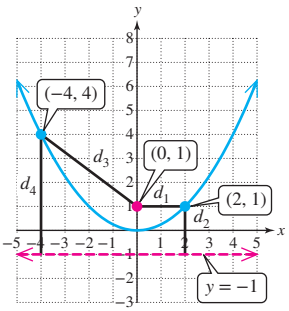
For Exercises 13–14, the graph of a parabola is given.

a. Determine the distances d_1, d_2, d_3, and d_4.

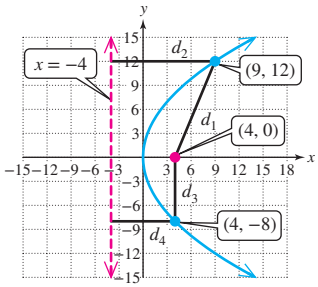
b. Compare d_1 and d_2.

c. Compare d_3 and d_4.

13.



14.



Objective 1: Identify the Focus and Directrix of a Parabola

For Exercises 15–22, a model of the form $x^2 = 4py$ or $y^2 = 4px$ is given.

a. Determine the value of p.

b. Identify the focus of the parabola.

c. Write an equation for the directrix. (**See Example 1**)

15. $x^2 = 24y$

16. $x^2 = 12y$

17. $y^2 = 36x$

18. $y^2 = 48x$

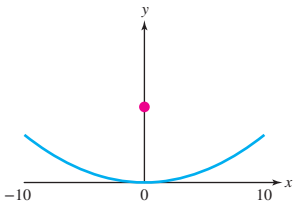
19. $x^2 = -5y$

20. $x^2 = -11y$

21. $-x = y^2$

22. $-3x = y^2$

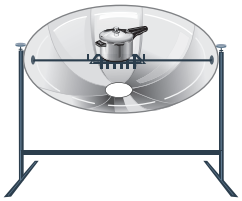
23. A 20-in. satellite dish for a television has parabolic cross sections. A coordinate system is chosen so that the vertex of a cross section through the center of the dish is located at (0, 0). The equation of the parabola is modeled by $x^2 = 25.2y$, where x and y are measured in inches.



a. Where should the receiver be placed to maximize signal strength? That is, where is the focus? (**See Example 1**)

b. Determine the equation of the directrix.

24. Solar cookers provide an alternative form of cooking in regions of the world where consistent sources of fuel are not readily available. Suppose that a 36-in. solar cooker has parabolic cross sections. A coordinate system is chosen with the origin placed at the vertex of a cross section through the center of the mirror. The equation of the parabola is modeled by $x^2 = 82y$, where x and y are measured in inches.



a. Where should a pot be placed to maximize heat? That is, where is the focus?

b. Determine the equation of the directrix.

25. If a cross section of the parabolic mirror in a flashlight has an equation $y^2 = 2x$, where should the bulb be placed?

26. A cross section of the parabolic mirror in a car headlight is modeled by $y^2 = 12x$. Where should the bulb be placed?

ISTUDY

Objective 2: Graph a Parabola with Vertex at the Origin

For Exercises 27–34, an equation of a parabola $x^2 = 4py$ or $y^2 = 4px$ is given.

a. Identify the vertex, value of p, focus, and focal diameter of the parabola.

b. Identify the endpoints of the latus rectum.

c. Graph the parabola.

d. Write equations for the directrix and axis of symmetry. (**See Examples 2–3**)

27. $x^2 = -4y$ **28.** $x^2 = -20y$ **29.** $10y^2 = 80x$ **30.** $3y^2 = 12x$

31. $4x^2 = 40y$ **32.** $2x^2 = 14y$ **33.** $y^2 = -x$ **34.** $y^2 = -2x$

Objective 3: Graph a Parabola with Vertex (h, k)

For Exercises 35–44, an equation of a parabola $(x - h)^2 = 4p(y - k)$ or $(y - k)^2 = 4p(x - h)$ is given.

a. Identify the vertex, value of p, focus, and focal diameter of the parabola.

b. Identify the endpoints of the latus rectum.

c. Graph the parabola.

d. Write equations for the directrix and axis of symmetry. (**See Example 4**)

35. $(y + 1)^2 = -12(x - 4)$ **36.** $(y + 4)^2 = -16(x - 2)$ **37.** $(x - 1)^2 = -4(y + 5)$

38. $(x - 5)^2 = -8(y + 2)$ **39.** $(x + 3)^2 = 2\left(y - \frac{3}{2}\right)$ **40.** $(x + 2)^2 = \left(y - \frac{7}{4}\right)$

41. $-(y - 3)^2 = 7\left(x - \frac{1}{4}\right)$ **42.** $-(y - 6)^2 = 9\left(x - \frac{3}{4}\right)$ **43.** $2(y - 3) = \frac{1}{10}(x + 6)^2$

44. $8(y - 2) = \frac{1}{2}(x + 3)^2$

For Exercises 45–52, an equation of a parabola is given.

a. Write the equation of the parabola in standard form.

b. Identify the vertex, focus, and focal diameter. (**See Example 5**)

45. $x^2 - 6x - 4y + 5 = 0$ **46.** $x^2 - 4x - 8y - 20 = 0$ **47.** $y^2 + 4y + 8x + 52 = 0$

48. $y^2 + 8y + 4x + 36 = 0$ **49.** $4x^2 - 28x + 24y + 73 = 0$ **50.** $4x^2 + 36x + 40y + 1 = 0$

51. $16y^2 + 24y - 16x + 57 = 0$ **52.** $16y^2 - 56y - 16x + 81 = 0$

For Exercises 53–58, fill in the blanks. Let $|p|$ represent the focal length (distance between the vertex and focus).

53. If the directrix of a parabola is given by $y = 4$ and the focus is (1, 10), then the vertex is given by the ordered pair _____ and the value of p is _____.

54. If the directrix of a parabola is given by $x = 6$ and the focus is (2, 1), then the vertex is given by the ordered pair _____ and the value of p is _____.

55. If the vertex of a parabola is (−3, 0) and the focus is (−7, 0), then the directrix is given by the equation _____, and the value of p is _____.

56. If the vertex of a parabola is (4, −2) and the focus is (4, −7), then the directrix is given by the equation _____, and the value of p is _____.

57. If the focal length of a parabola is 3 units, then the length of the latus rectum is _____ units.

58. If the focal diameter of a parabola is 8 units, then the focal length is _____ units.

59. If the focal length of a parabola is 6 units and the vertex is (3, 2), is it possible to determine whether the parabola opens upward, downward, to the right, or to the left? Explain.

60. If the axis of symmetry of a parabola is given by $x = 4$, is it possible for the directrix to have the equation $x = 3$? Explain.

For Exercises 61–68, determine the standard form of an equation of the parabola subject to the given conditions. (See Example 6)

61. Vertex: (0, 0); Directrix: $x = 4$

62. Vertex: (0, 0); Directrix: $y = -2$

63. Focus: (2, 4); Vertex: (2, 1)

64. Focus: (5, 3): Vertex: (3, 3)

65. Focus: (−6, −2); Directrix: $y = 0$

66. Focus: (−4, 5); Directrix: $x = 0$

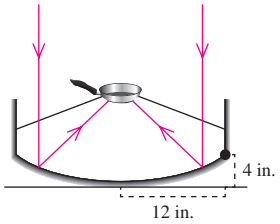
67. Vertex: (2, 3); Parabola passes through (6, 5) (*Hint*: There are two possible answers.)

68. Vertex: (−4, 2); Parabola passes through (8, 14) (*Hint*: There are two possible answers.)

ISTUDY

Objective 4: Use Parabolas in Applications

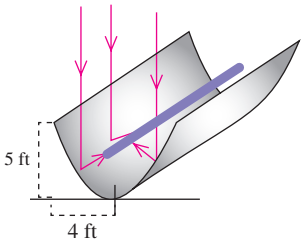
69. Suppose that a solar cooker has a parabolic mirror (see figure).



a. Use a coordinate system with origin at the vertex of the mirror and write an equation of a parabolic cross section of the mirror.

b. Where should a pot be placed so that it receives maximum heat? (**See Example 7**)

70. A solar water heater is made from a long sheet of metal bent so that the cross sections are parabolic. A long tube of water is placed inside the curved surface so that the height of the tube is equal to the focal length of the parabolic cross section. In this way, water in the tube is exposed to maximum heat.

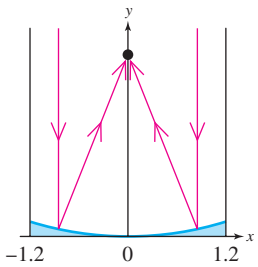


a. Determine the focal length of the parabolic cross sections so that the engineer knows where to place the tube.

b. Use a coordinate system with origin at the vertex of a parabolic cross section and write an equation of the parabola.

71. The Hubble Space Telescope was launched into space in 1990 and now orbits the Earth at 5 mi/sec at a distance of 353 mi above the Earth. From its location in space, the Hubble is free from the distortion of the Earth's atmosphere, enabling it to return magnificent images from distant stars and galaxies. The quality of the Hubble's images results from a large parabolic mirror, 2.4 m (7.9 ft) in diameter, that collects light from space.

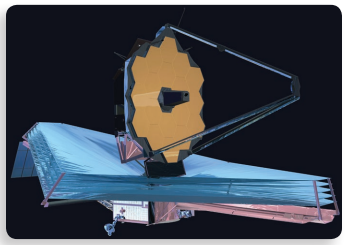
Suppose that a coordinate system is chosen so that the vertex of a cross section through the center of the mirror is located at (0, 0). Furthermore, the focal length is 57.6 m.



a. Assume that x and y are measured in meters. Write an equation of the parabolic cross section of the mirror for $-1.2 \le x \le 1.2$. See figure.

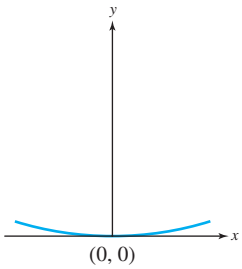
b. How thick is the mirror at the edge? That is, what is the y value for $x = 1.2$?

72. The James Webb Space Telescope (JWST) is a new space telescope that will enable scientists to see the earliest stars formed in the universe. The JWST will orbit the Sun in an orbit roughly 1.5 million km from the Earth, in a position with the Earth between the telescope and the Sun. The primary mirror of the JWST will consist of 18 hexagonally shaped segments that when fitted together will be 6.5 m in diameter (over 2.5 times the diameter of the Hubble). With a larger mirror, the JWST will be able to collect more light to "see" deeper into space.



NASA/GSFC

The primary mirror when pieced together will function as a parabolic mirror with a focal length of 131.4 m. Suppose that a coordinate system is chosen with (0, 0) at the center of a cross section of the primary mirror. Write an equation of the parabolic cross section of the mirror for $-3.25 \le x \le 3.25$. Assume that x and y are measured in meters.

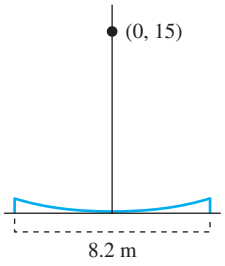


73. The Subaru telescope is a large optical-infrared telescope at the summit of Mauna Kea, Hawaii. The telescope has a parabolic mirror 8.2 m in diameter with a focal length of 15 m.

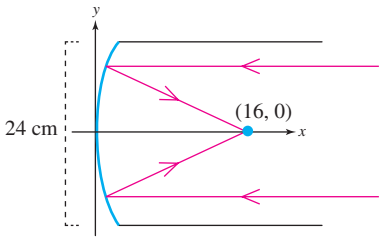
a. Suppose that a cross section of the mirror is taken through the vertex, and that a coordinate system is set up with (0, 0) placed at the vertex. If the focus is (0, 15), find an equation representing the curve.

b. Determine the vertical displacement of the mirror relative to horizontal at the edge of the mirror. That is, find the y value at a point 4.1 m to the left or right of the vertex.

c. What is the average slope between the vertex of the parabola and the point on the curve at the right edge?



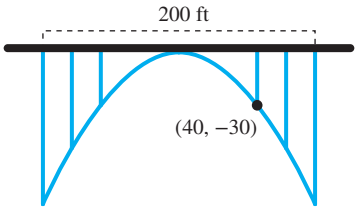
74. A parabolic mirror on a telescope has a focal length of 16 cm.



a. For the coordinate system shown, write an equation of the parabolic cross section of the mirror.

b. Determine the displacement of the mirror relative to the y-axis at the edge of the mirror. That is, find the x value at a point 12 cm above or below the vertex.

75. A parabolic arch forms a structure that allows equal vertical loading along its length.

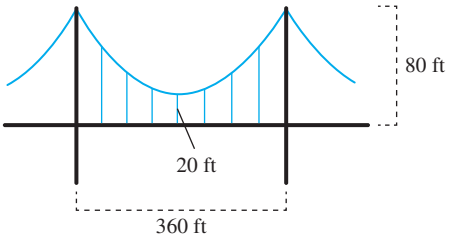


a. Take the origin at the vertex of the parabolic arch, and write an equation of the parabola.

b. Determine the focal length.

c. Determine the length of the vertical support 60 ft from the center.

76. A cable hanging freely between two vertical support beams forms a curve called a catenary. The shape of a catenary resembles a parabola, but mathematically the two functions are quite different.



a. On a graphing utility, graph a catenary defined by $y = \frac{1}{2}(e^x + e^{-x})$ and graph the parabola defined by $y = x^2 + 1$.

b. A catenary and a parabola are so similar in shape that we can often use a parabolic curve to approximate the shape of a catenary. For example, a bridge has cables suspended from a larger approximately parabolic cable. Take the origin at a point on the road directly below the vertex and write an equation of the parabolic cable.

c. Determine the focal length of the parabolic cable.

d. Determine the length of the vertical support cable 100 ft from the vertex. Round to the nearest tenth of a foot.

Expanding Your Skills

For Exercises 93–96, each equation represents the graph of a parabola. Write the equation in standard form, and identify the vertex and focus.

93. $(x - 3)^2 + (y - 10)^2 = (x + 1)^2$

94. $(x - 2)^2 + (y - 4)^2 = (x + 16)^2$

95. $(y - 3)^2 + (x - 9)^2 = (y - 1)^2$

96. $(y + 4)^2 + (x + 1)^2 = (y - 18)^2$

A line is tangent to a parabola if it intersects the parabola at one point *and* is not parallel to the axis of symmetry.

- **For a parabola given by $x^2 = 4py$, an equation of the tangent line through the point (x_0, y_0) is $y = \frac{x_0}{2p}x - y_0$.**
- **For a parabola given by $y^2 = 4px$, an equation of the tangent line through the point (x_0, y_0) is $y = \frac{2p}{y_0}x + \frac{y_0}{2}$.**

For Exercises 97–100, find an equation of the tangent line (or tangent lines) to the parabola at the indicated point or value. Write the answer in slope-intercept form.

97. $x^2 = 4y$

a. at the point $\left(5, \frac{25}{4}\right)$ **b.** at $x = 3$

98. $x^2 = -8y$

a. at the point $\left(-2, -\frac{1}{2}\right)$ **b.** at $x = 3$

99. $y^2 = 20x$

a. at the point $(5, -10)$ **b.** at $x = \frac{4}{5}$

100. $y^2 = -3x$

a. at the point $(-12, -6)$ **b.** at $x = -\frac{16}{3}$

101. The surface defined by the equation $z = 4x^2 + y^2$ is called an elliptical paraboloid.

a. Write the equation with $x = 0$. What type of curve is represented by this equation?

b. Write the equation with $y = 0$. What type of curve is represented by this equation?

c. Write the equation with $z = 0$. What type of curve is represented by this equation?

PROBLEM RECOGNITION EXERCISES

Comparing Equations of Conic Sections and the General Equation

For Exercises 1–8, identify each equation as representing a circle, an ellipse, a hyperbola, or a parabola.

- If the equation represents a circle, identify the center and radius.
- If the equation represents an ellipse, identify the center, vertices, endpoints of the minor axis, foci, and eccentricity.
- If the equation represents a hyperbola, identify the center, vertices, foci, equations of the asymptotes, and eccentricity.
- If the equation represents a parabola, identify the vertex, focus, equation of the directrix, and equation of the axis of symmetry.

1. $\frac{(x-2)^2}{16} - \frac{(y+2)^2}{9} = 1$

2. $9x^2 + 25(y - 2)^2 = 225$

3. $(y - 5)^2 = -(x + 2)$

ISTUDY

4. $(x-3)^2+(y+7)^2=25$

5. $16(x+1)^2+y^2=16$

6. $(x-1)^2=10(y+3)$

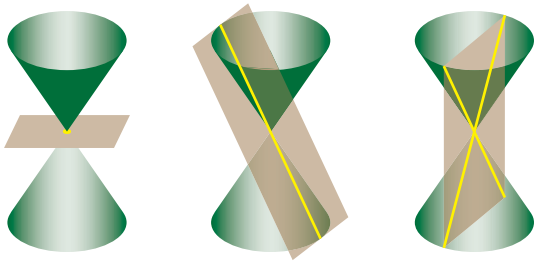
7. $-(x+1)^2-(y+6)^2=-16$

8. $-\dfrac{(x+4)^2}{25}+\dfrac{(y-1)^2}{144}=1$

Suppose that the binomials within an equation of a conic section are expanded and all terms are collected on the left side of the equation. The result will be an equation of the conic section written in **general form:**

$$Ax^2+Cy^2+Dx+Ey+F=0, \text{ where } A \text{ and } C \text{ are not both zero.}$$

Furthermore, given an equation of a conic section in general form, we can complete the square to identify the type of conic that the equation represents. In some cases, however, the graph of an equation in general form is a **degenerate conic section.** Geometrically, a degenerate case occurs when a plane intersects a double-napped cone in a point, a line, or a pair of intersecting lines.



TIP The general form of an equation of a conic section also has a term Bxy, which rotates the curve. Some courses in trigonometry address rotated conics.

General Equation of a Conic Section

The graph of the equation $Ax^2+Cy^2+Dx+Ey+F=0$, where A and C are not both zero, is a conic section or a degenerate conic. If the graph represents a conic section, then the graph is

1. A circle if $A=C$.
2. An ellipse if $AC>0$ (A and C have the same sign).
3. A hyperbola if $AC<0$ (A and C have opposite signs).
4. A parabola if $AC=0$ (A or C equals zero).

For Exercises 9–16, determine whether the equation represents a circle, an ellipse, a hyperbola, or a parabola. Write the equation in standard form.

9. $9x^2-16y^2-36x-64y-172=0$

10. $9x^2+25y^2-100y-125=0$

11. $y^2-10y+x+27=0$

12. $x^2+y^2-6x+14y+33=0$

13. $16x^2+y^2+32x=0$

14. $x^2-2x-10y-29=0$

15. $x^2+y^2+2x+12y+21=0$

16. $-144x^2+25y^2-1152x-50y-5879=0$

For Exercises 17–22, an equation of a degenerate conic section is given. Complete the square and describe the graph of each equation.

17. $x^2+y^2-4x+2y+5=0$

18. $9x^2+4y^2-24y+36=0$

19. $4x^2-y^2-32x-4y+60=0$

20. $9x^2-4y^2-90x-8y+221=0$

21. $9x^2+4y^2-16y+52=0$

22. $x^2+y^2+12x+37=0$

23. Given $Ax^2+Cy^2+Dx+Ey+F=0$, show that the equation represents a circle if $A=C\neq 0$ and $D^2+E^2-4AF>0$.

24. Consider $Ax^2+Cy^2+Dx+Ey+F=0$, for $A\neq 0$ and $C\neq 0$.

a. For A and C of the same sign, show that the equation represents an ellipse if $\dfrac{D^2}{4A}+\dfrac{E^2}{4C}-F$ has the same sign as A.

b. For A and C of opposite signs, show that the equation represents a hyperbola if $\dfrac{D^2}{4A}+\dfrac{E^2}{4C}-F\neq 0$.

25. Given $Ax^2+Cy^2+Dx+Ey+F=0$, show that the equation represents a parabola if $A=0$ but $C\neq 0$ and $D\neq 0$.

ISTUDY

SECTION 11.4 Rotation of Axes

OBJECTIVES

1. Identify Conic Sections with No Rotation
2. Use the Rotation of Axes Formulas
3. Transform Equations by Rotation of Axes
4. Use the Discriminant to Identify Conic Sections Containing a *Bxy* Term

1. Identify Conic Sections with No Rotation

In Sections 11.1–11.3, we analyzed equations of the form

$$Ax^2 + Cy^2 + Dx + Ey + F = 0 \quad (1)$$

Equation (1) represents a conic section or a degenerate case. For nondegenerate cases, we can complete the square on the quadratic expressions in x and y to determine the type of conic section represented by the equation. Alternatively we can identify the type of conic section directly from the equation based on the values of A and C.

General Equation of a Conic with No Rotation

The graph of the equation $Ax^2 + Cy^2 + Dx + Ey + F = 0$, where A and C are not both zero, is a conic section or a degenerate case. If the graph represents a conic section, then the graph is

1. A circle if $A = C$.
2. An ellipse if $AC > 0$ (A and C have the same sign).
3. A hyperbola if $AC < 0$ (A and C have opposite signs).
4. A parabola if $AC = 0$ (A or C equals zero).

EXAMPLE 1 Identifying Conic Sections with No Rotation

The equations represent nondegenerate conic sections. Identify the type of conic section.

a. $x^2 - y^2 - 4x = 0$
b. $y^2 - 12x - 6y + 23 = 0$
c. $36x^2 + 36y^2 - 18x + 24y + 5 = 0$
d. $4x^2 + y^2 + 24x - 2y + 3 = 0$

Solution:

a. $x^2 - y^2 - 4x = 0$

The coefficients of the square terms are $A = 1$ and $C = -1$. Since A and C have opposite signs ($AC < 0$), the graph is a hyperbola.

b. $y^2 - 12x - 6y + 23 = 0$

The equation does not have an x^2 term. Since $A = 0$, the graph is a parabola.

c. $36x^2 + 36y^2 - 18x + 24y + 5 = 0$

Since A and C are equal ($A = C = 36$), the graph is a circle.

d. $4x^2 + y^2 + 24x - 2y + 3 = 0$

The coefficients of the square terms are $A = 4$ and $C = 1$. Since A and C have the same sign ($AC > 0$), the graph is an ellipse.

Skill Practice 1 The equations represent nondegenerate conic sections. Identify the type of conic section.

a. $x^2 + y^2 - 4x - 14 = 0$
b. $4x^2 - 9y^2 + 54y - 117 = 0$
c. $4x^2 - 16x - y + 15 = 0$
d. $25x^2 + 4y^2 + 250x - 16y + 541 = 0$

Answers

1. **a.** Circle **b.** Hyperbola **c.** Parabola **d.** Ellipse

2. Use the Rotation of Axes Formulas

We now consider the most general second-degree polynomial equation in two variables.

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \tag{2}$$

Equation (2) differs from equation (1) $Ax^2 + Cy^2 + Dx + Ey + F = 0$ because of the existence of the Bxy term. We will see that the graph of (2) is also a conic section (or degenerate case). Excluding degenerate cases, the term Bxy introduces a rotation of the graph through an angle θ (Figure 11-30). To analyze the graph, we can rotate the x- and y-axes about the origin through an angle θ to form a new coordinate system with axes x' and y' (Figure 11-31). Relative to the x'- and y'-axes, the graph has no rotation.

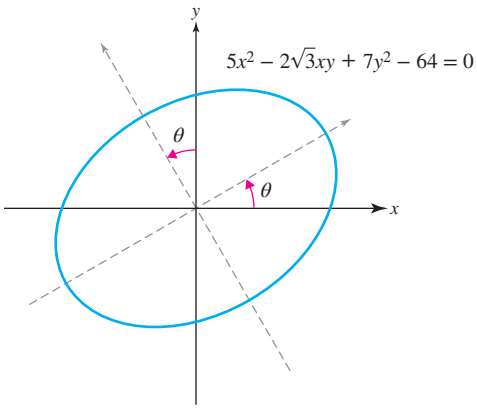


Figure 11-30

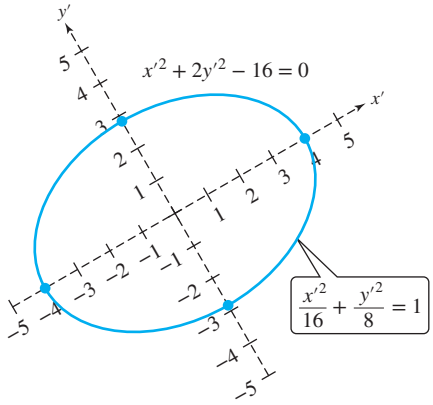

Figure 11-31

The goal in this section is to transform the original equation (2) in the variables x and y to a new equation in x' and y' with $B = 0$.

Suppose that a point $P(x, y)$ relative to the xy-plane has coordinate $P(x', y')$ relative to the $x'y'$-plane (Figure 11-32). Let r represent the distance between P and the origin and let α be the angle made by line segment $\overline{OP}$ and the positive x'-axis.

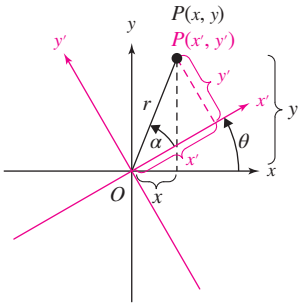

Figure 11-32

From Figure 11-32, we have

(3) $x' = r\cos\alpha$ (5) $x = r\cos(\theta + \alpha)$

(4) $y' = r\sin\alpha$ (6) $y = r\sin(\theta + \alpha)$

Applying the sum formula for cosine in equation (5), we have

$$\begin{aligned} x &= r\cos(\theta + \alpha) \\ &= r(\cos\theta\cos\alpha - \sin\theta\sin\alpha) \\ &= (r\cos\alpha)\cos\theta - (r\sin\alpha)\sin\theta \\ &= x'\cos\theta - y'\sin\theta \end{aligned}$$

By equations (3) and (4)

Applying the sum formula for sine in equation (6), we have

$$\begin{aligned} y &= r\sin(\theta + \alpha) \\ &= r(\sin\theta\cos\alpha + \cos\theta\sin\alpha) \\ &= (r\cos\alpha)\sin\theta + (r\sin\alpha)\cos\theta \\ &= x'\sin\theta + y'\cos\theta \end{aligned}$$

By equations (3) and (4)

ISTUDY

Treating the equations $x = x'\cos\theta - y'\sin\theta$ and $y = x'\sin\theta + y'\cos\theta$ as a system of equations, we can also solve for x' and y' in terms of x and y (see Exercise 51).

Rotation of Axes

Suppose that the x- and y-axes in a rectangular coordinate system are rotated about the origin through an angle θ to form the x'- and y'-axes. Then the coordinates of $P(x, y)$ in the xy-plane are related to $P(x', y')$ in the $x'y'$-plane as follows.

x and y in terms of x' and y'	x' and y' in terms of x and y
(7) $x = x'\cos\theta - y'\sin\theta$	(9) $x' = x\cos\theta + y\sin\theta$
(8) $y = x'\sin\theta + y'\cos\theta$	(10) $y' = -x\sin\theta + y\cos\theta$

EXAMPLE 2 Identifying Coordinates of a Point after Rotating the Coordinate Axes

Suppose that the x- and y-axes are rotated 60° about the origin to form the x'- and y'-axes. Given $P(6, -2)$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.

Solution:

$P(6, -2)$ corresponds to $x = 6$ and $y = -2$.

Using rotation equations (9) and (10),

we have $x' = x\cos\theta + y\sin\theta$

$= 6\cos 60° + (-2)\sin 60°$

$= 6\left(\frac{1}{2}\right) + (-2)\left(\frac{\sqrt{3}}{2}\right) = 3 - \sqrt{3}$

$y' = -x\sin\theta + y\cos\theta$

$= -6\sin 60° - 2\cos 60°$

$= -6\left(\frac{\sqrt{3}}{2}\right) + (-2)\left(\frac{1}{2}\right) = -3\sqrt{3} - 1$

$P(x', y')$ is $(3 - \sqrt{3}, -3\sqrt{3} - 1) \approx (1.3, -6.2)$.

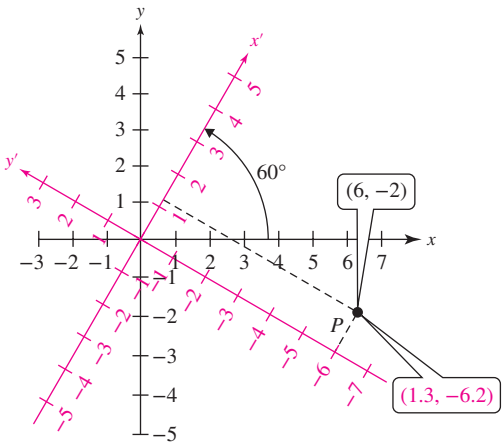

Figure 11-33

TIP In Figure 11-33, the coordinates of point P are given relative to the xy-plane and the $x'y'$-plane.

Skill Practice 2 Suppose that the x- and y-axes are rotated 45° about the origin to form the x'- and y'-axes. Given $P(-4, 2)$ in the xy-plane, find the coordinate of P in the $x'y'$-plane.

The equation $y = \frac{1}{x}$ was first graphed in Section 2.6 (Figure 11-34). The graph looks like a hyperbola rotated through some angle about the origin. This is indeed the case. The equation can be written as $xy = 1$ and the left side of the equation is the Bxy term in a general second-degree polynomial equation. In Example 3, we show that the graph of $xy = 1$ is a hyperbola rotated 45° from the x-axis.

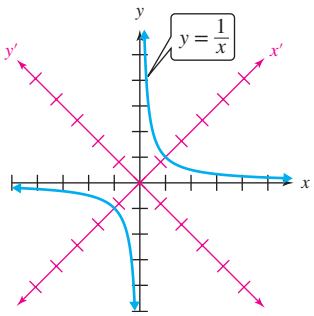

Figure 11-34

Answer
2. $(-\sqrt{2}, 3\sqrt{2})$

EXAMPLE 3 Rotating Axes and Transforming an Equation

Assume that the x- and y-axes are rotated through an angle of 45° about the origin to form the x'- and y'-axes. Write the equation $xy = 1$ in $x'y'$-coordinates. Discuss the result.

Solution:

Use the rotation formulas (7) and (8) and replace x by $x'\cos\theta - y'\sin\theta$ and y by $x'\sin\theta + y'\cos\theta$.

$$xy = 1$$

$$(x'\cos 45° - y'\sin 45°)(x'\sin 45° + y'\cos 45°) = 1$$

$$\left[x'\left(\frac{\sqrt{2}}{2}\right) - y'\left(\frac{\sqrt{2}}{2}\right)\right]\left[x'\left(\frac{\sqrt{2}}{2}\right) + y'\left(\frac{\sqrt{2}}{2}\right)\right] = 1$$

$$\left(\frac{\sqrt{2}}{2}\right)\left(\frac{\sqrt{2}}{2}\right)(x' - y')(x' + y' = 1 \qquad \text{Factor } \tfrac{\sqrt{2}}{2} \text{ from each binomial factor.}$$

$$\frac{1}{2}\left(x'^2 - y'^2\right) = 1 \qquad \text{Multiply conjugates.}$$

$$x'^2 - y'^2 - 2 = 0 \qquad \text{Multiply both sides by 2 and collect terms on the left.}$$

The equation is of the form $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$. Notice that relative to the $x'y'$-coordinate system, there is no rotation term $B'x'y'$. Furthermore, $A' = 1$ and $C' = -1$, so the product $A'C' = -1 < 0$, indicating that the graph is a hyperbola.

We can write the equation in the standard form of a hyperbola, $\frac{x'^2}{a^2} - \frac{y'^2}{b^2} = 1$.

$$\frac{x'^2}{2} - \frac{y'^2}{2} = 1 \quad \text{where } a^2 = 2 \text{ and } b^2 = 2.$$

The center of the hyperbola is at the origin and the vertices are on the x'-axis at $(-\sqrt{2}, 0)$ and $(\sqrt{2}, 0)$. The equations of the asymptotes are given by $y' = \pm\frac{b}{a}x'$, which is $y' = \pm\frac{\sqrt{2}}{\sqrt{2}}x'$ or simply $y' = \pm x'$. These are the x- and y-axes in the original coordinate system (Figure 11-35).

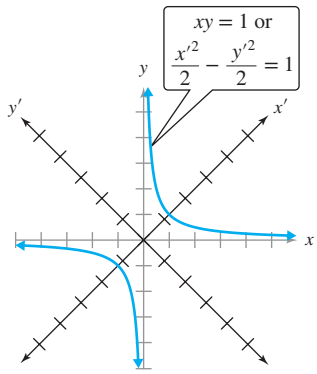

Figure 11-35

Skill Practice 3 Write the equation $xy = 8$ in terms of x' and y' given that the angle of rotation of the x'- and y'-axes is 45° from the x- and y-axes.

3. Transform Equations by Rotation of Axes

The technique used in Example 3 can be used to transform any equation of the form

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \qquad (2)$$

to an equation in x' and y' with no $x'y'$ term by choosing an appropriate angle of rotation, θ. To find θ, substitute $x = x'\cos\theta - y'\sin\theta$ and $y = x'\sin\theta + y'\cos\theta$ into (2).

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \qquad (2)$$

$$A(x'\cos\theta - y'\sin\theta)^2 + B(x'\cos\theta - y'\sin\theta)(x'\sin\theta + y'\cos\theta)$$
$$+ C(x'\sin\theta + y'\cos\theta)^2 + D(x'\cos\theta - y'\sin\theta)$$
$$+ E(x'\sin\theta + y'\cos\theta) + F = 0$$

Answer

3. $x'^2 - y'^2 - 16 = 0$ or $\frac{x'^2}{16} - \frac{y'^2}{16} = 1$

Expanding binomial factors and collecting like terms results in an equation of the form

$$A'x'^2 + B'x'y' + C'y'^2 + D'x' + E'y' + F' = 0$$

where
$$\begin{aligned} A' &= A\cos^2\theta + B\sin\theta\cos\theta + C\sin^2\theta \\ B' &= 2(C - A)\sin\theta\cos\theta + B(\cos^2\theta - \sin^2\theta) \\ C' &= A\sin^2\theta - B\sin\theta\cos\theta + C\cos^2\theta \\ D' &= D\cos\theta + E\sin\theta \\ E' &= -D\sin\theta + E\cos\theta \\ F' &= F \end{aligned}$$

To eliminate the $x'y'$ term, we require $B' = 0$. Thus,

$$2(C - A)\sin\theta\cos\theta + B(\cos^2\theta - \sin^2\theta) = 0$$

Recall that $2\sin\theta\cos\theta = \sin 2\theta$ and $\cos^2\theta - \sin^2\theta = \cos 2\theta$.

$$(C - A)\sin 2\theta + B\cos 2\theta = 0$$

$$B\cos 2\theta = (A - C)\sin 2\theta$$

$$\cot 2\theta = \frac{A - C}{B}$$

Divide both sides by $B\sin 2\theta$.

There are an infinite number of solutions to the equation $\cot 2\theta = \dfrac{A - C}{B}$, however, we choose θ to be an acute angle. The cotangent function is used rather than the tangent function because $\cot^{-1}\left(\dfrac{A - C}{B}\right)$ returns $0 < 2\theta < \pi$ and thus, $0 < \theta < \dfrac{\pi}{2}$.

Formula for Determining an Angle of Rotation

To write the general second-degree polynomial equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \tag{2}$$

with no xy term, rotate the axes through an acute angle θ given by

$$\cot 2\theta = \frac{A - C}{B}$$

The resulting equation is $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$, where the coefficients are found by substituting $x'\cos\theta - y'\sin\theta$ for x and $x'\sin\theta + y'\cos\theta$ for y into (2).

In Example 4, we will eliminate the xy term in the equation $5x^2 - 2\sqrt{3}xy + 7y^2 - 64 = 0$ and verify that it represents the graph of an ellipse as shown in Figures 11-30 and 11-31.

EXAMPLE 4 Eliminating the *xy* Term in an Equation

Given $5x^2 - 2\sqrt{3}xy + 7y^2 - 64 = 0$,

a. Determine an acute angle of rotation to eliminate the xy term.
b. Use a rotation of axes to eliminate the xy term in the equation.
c. Identify the type of curve represented by the equation.
d. Sketch the graph.

ISTUDY

Solution:

a. To eliminate the xy term in the equation $5x^2 - 2\sqrt{3}xy + 7y^2 - 64 = 0$, we need to rotate the x- and y-axes through an angle θ that satisfies

$$\cot 2\theta = \frac{A - C}{B} \Rightarrow \cot 2\theta = \frac{5 - 7}{-2\sqrt{3}} = \frac{1}{\sqrt{3}} \Rightarrow 2\theta = 60^\circ \Rightarrow \theta = 30^\circ$$

b. Using rotation formulas (7) and (8), we have

$$x = x'\cos\theta - y'\sin\theta = x'\cos 30^\circ - y'\sin 30^\circ = \frac{\sqrt{3}}{2}x' - \frac{1}{2}y'$$

$$y = x'\sin\theta + y'\cos\theta = x'\sin 30^\circ + y'\cos 30^\circ = \frac{1}{2}x' + \frac{\sqrt{3}}{2}y'$$

Substitute $x = \frac{\sqrt{3}}{2}x' - \frac{1}{2}y'$ and $y = \frac{1}{2}x' + \frac{\sqrt{3}}{2}y'$ into the original equation.

$$\boxed{\text{A}} \quad 5\left(\frac{\sqrt{3}}{2}x' - \frac{1}{2}y'\right)^2 - 2\sqrt{3}\left(\frac{\sqrt{3}}{2}x' - \frac{1}{2}y'\right)\left(\frac{1}{2}x' + \frac{\sqrt{3}}{2}y'\right) + 7\left(\frac{1}{2}x' + \frac{\sqrt{3}}{2}y'\right)^2 - 64 = 0$$

To facilitate the "bookkeeping," consider simplifying the first three terms on the left side of equation A separately.

$$5\left(\frac{\sqrt{3}}{2}x' - \frac{1}{2}y'\right)^2 = 5\left(\frac{3}{4}x'^2 - \frac{\sqrt{3}}{2}x'y' + \frac{1}{4}y'^2\right)$$
$$= \frac{15}{4}x'^2 - \frac{5\sqrt{3}}{2}x'y' + \frac{5}{4}y'^2$$

$$-2\sqrt{3}\left(\frac{\sqrt{3}}{2}x' - \frac{1}{2}y'\right)\left(\frac{1}{2}x' + \frac{\sqrt{3}}{2}y'\right) = -2\sqrt{3}\left(\frac{\sqrt{3}}{4}x'^2 + \frac{3}{4}x'y' - \frac{1}{4}x'y' - \frac{\sqrt{3}}{4}y'^2\right)$$
$$= -2\sqrt{3}\left(\frac{\sqrt{3}}{4}x'^2 + \frac{1}{2}x'y' - \frac{\sqrt{3}}{4}y'^2\right)$$
$$= -\frac{3}{2}x'^2 - \sqrt{3}x'y' + \frac{3}{2}y'^2$$

$$7\left(\frac{1}{2}x' + \frac{\sqrt{3}}{2}y'\right)^2 = 7\left(\frac{1}{4}x'^2 + \frac{\sqrt{3}}{2}x'y' + \frac{3}{4}y'^2\right)$$
$$= \frac{7}{4}x'^2 + \frac{7\sqrt{3}}{2}x'y' + \frac{21}{4}y'^2$$

Equation A becomes

$$\frac{15}{4}x'^2 - \frac{5\sqrt{3}}{2}x'y' + \frac{5}{4}y'^2 - \frac{3}{2}x'^2 - \sqrt{3}x'y' + \frac{3}{2}y'^2 + \frac{7}{4}x'^2 + \frac{7\sqrt{3}}{2}x'y' + \frac{21}{4}y'^2 - 64 = 0$$

$$4x'^2 + 8y'^2 - 64 = 0$$

$$x'^2 + 2y'^2 - 16 = 0$$

c. The equation $x'^2 + 2y'^2 - 16 = 0$ is of the form $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$ with $A' = 1$ and $C' = 2$. Since A' and C' have the same sign ($A'C' > 0$), the equation is an ellipse.

ISTUDY

d. To graph the equation, divide both sides of the equation by 16 and write the equation in standard form.

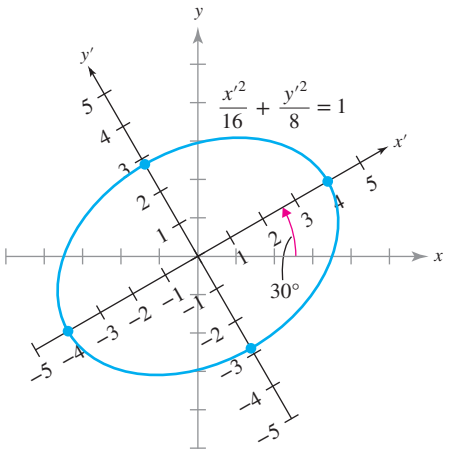
$$\frac{x'^2}{16} + \frac{y'^2}{8} = 1$$

Relative to the $x'y'$-plane, the equation is an ellipse with center $(0, 0)$.

$a = \sqrt{16} = 4$ and $b = \sqrt{8} = 2\sqrt{2}$

The vertices are $(4, 0)$ and $(-4, 0)$ in the $x'y'$-plane.

The endpoints of the minor axis are $(0, 2\sqrt{2})$ and $(0, -2\sqrt{2})$ in the $x'y'$-plane.



Skill Practice 4 Given $5x^2 + 2\sqrt{3}xy + 7y^2 - 32 = 0$,

a. Determine an acute angle of rotation to eliminate the xy term.

b. Use a rotation of axes to eliminate the xy term in the equation.

c. Identify the type of curve represented by the equation.

d. Sketch the graph.

4. Use the Discriminant to Identify Conic Sections Containing a *Bxy* Term

In Example 4, we have an equation of a conic section of the form

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \tag{2}$$

To eliminate the rotation term Bxy, we rotated the x- and y-axes through a suitable angle θ to form the x'- and y'-axes and an equation of the form $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$. Since the new equation has no rotation term, we then used the values of A' and C' to identify the type of conic section represented by the equation.

This method to identify a conic section involves tedious algebra. Fortunately, we now present a means to identify the type of conic section represented by equation (2) by using the coefficients A, B, and C.

Suppose that the x- and y-axes are rotated about the origin through an angle θ to form the x'- and y'-axes. As a result, the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ is changed into the equation $A'x'^2 + B'x'y' + C'y'^2 + D'x' + E'y' + F' = 0$. From the equations on page 1046 relating A, B, and C to A', B', and C', we can show that

$$B^2 - 4AC = B'^2 - 4A'C'.$$

When θ is chosen such that $B' = 0$, we have

$$B^2 - 4AC = -4A'C'.$$

Excluding degenerate cases, the type of conic section represented by the equation $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$ can be determined by the product $A'C'$.

The equation $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$ represents

An ellipse (or a circle) if $A'C' > 0$.

A hyperbola if $A'C' < 0$.

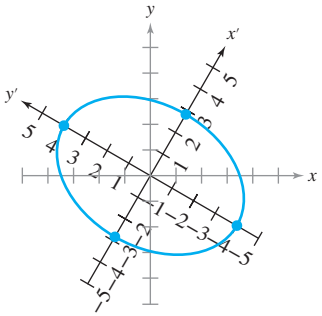
A parabola if $A'C' = 0$.

Since $B^2 - 4AC = -4A'C'$, nonzero values of $B^2 - 4AC$ have the *opposite* sign of $A'C'$. Therefore, we can make the following statements about the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$.

Answers

4. a. 60° **b.** $2x'^2 + y'^2 = 8$

c. Ellipse **d.** $\frac{x'^2}{4} + \frac{y'^2}{8} = 1$



ISTUDY

TIP The discriminant $B^2 - 4AC = B'^2 - 4A'C'$ is unchanged under rotation. That is, the value of $B^2 - 4AC$ and $B'^2 - 4A'C'$ are the same regardless of the angle of rotation. For this reason, we say that the discriminant is **invariant** under rotation.

Identify Conic by the Discriminant

Excluding degenerate cases, the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ represents

An ellipse (or a circle) if $B^2 - 4AC < 0$.
A hyperbola if $B^2 - 4AC > 0$.
A parabola if $B^2 - 4AC = 0$.

The quantity $B^2 - 4AC$ is called the **discriminant** of the equation.

In Examples 5 and 6, we use the discriminant to identify the type of conic section represented by a general second-degree polynomial equation. Then we graph the equation.

EXAMPLE 5 Graphing a Rotated Conic Section

The equation $x^2 + 6xy + 9y^2 - 7\sqrt{10}x - 11\sqrt{10}y + 30 = 0$ is a conic section (nondegenerate case).

a. Use the discriminant to determine the type of conic section represented.
b. Use a suitable rotation to eliminate the xy term.
c. Sketch the graph.

Solution:

a. $x^2 + 6xy + 9y^2 - 7\sqrt{10}x - 11\sqrt{10}y + 30 = 0$

Since $B^2 - 4AC = (6)^2 - 4(1)(9) = 0$, the equation represents a parabola. $A = 1$, $B = 6$, and $C = 9$

b. We need to rotate the x- and y-axes through an angle θ that satisfies

$$\cot 2\theta = \frac{A - C}{B} \Rightarrow \cot 2\theta = \frac{1 - 9}{6} = -\frac{4}{3}.$$

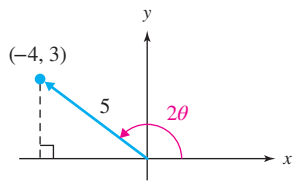


Figure 11-36

In order to apply rotation formulas (7) and (8), we need to know the value of $\sin\theta$ and $\cos\theta$. Since θ is an acute angle and $\cot 2\theta < 0$, angle 2θ is a second quadrant angle (Figure 11-36). Thus, $\cos 2\theta = -\frac{4}{5}$, and using the half-angle formulas, we have

$$\cos\theta = \sqrt{\frac{1 + \cos 2\theta}{2}} = \sqrt{\frac{1 + \left(-\frac{4}{5}\right)}{2}} = \sqrt{\frac{1}{10}} = \frac{\sqrt{10}}{10}$$

$$\sin\theta = \sqrt{\frac{1 - \cos 2\theta}{2}} = \sqrt{\frac{1 - \left(-\frac{4}{5}\right)}{2}} = \sqrt{\frac{9}{10}} = \frac{3\sqrt{10}}{10}$$

From the equation $\cos\theta = \frac{\sqrt{10}}{10}$, we have $\theta \approx 71.6°$.

We now apply rotation formulas (7) and (8).

$$x = x'\cos\theta - y'\sin\theta = \frac{\sqrt{10}}{10}x' - \frac{3\sqrt{10}}{10}y' = \frac{\sqrt{10}}{10}(x' - 3y')$$

$$y = x'\sin\theta + y'\cos\theta = \frac{3\sqrt{10}}{10}x' + \frac{\sqrt{10}}{10}y' = \frac{\sqrt{10}}{10}(3x' + y')$$

ISTUDY

Before substituting formulas (7) and (8) into the original equation, we will write expressions for x^2, y^2, and xy in terms of x' and y'.

$$x^2 = \left[\frac{\sqrt{10}}{10}(x' - 3y')\right]^2 = \frac{1}{10}(x'^2 - 6x'y' + 9y'^2)$$

$$y^2 = \left[\frac{\sqrt{10}}{10}(3x' + y')\right]^2 = \frac{1}{10}(9x'^2 + 6x'y' + y'^2)$$

$$xy = \left[\frac{\sqrt{10}}{10}(x' - 3y')\right]\left[\frac{\sqrt{10}}{10}(3x' + y')\right] = \frac{1}{10}(3x'^2 - 8x'y' - 3y'^2)$$

The equation $x^2 + 6xy + 9y^2 - 7\sqrt{10}x - 11\sqrt{10}y + 30 = 0$ becomes

$$\frac{1}{10}(x'^2 - 6x'y' + 9y'^2) + 6 \cdot \frac{1}{10}(3x'^2 - 8x'y' - 3y'^2)$$
$$+ 9 \cdot \frac{1}{10}(9x'^2 + 6x'y' + y'^2)$$
$$- 7\sqrt{10} \cdot \frac{\sqrt{10}}{10}(x' - 3y') - 11\sqrt{10} \cdot \frac{\sqrt{10}}{10}(3x' + y') + 30 = 0$$

Multiplying both sides by 10 gives

$$(x'^2 - 6x'y' + 9y'^2) + 6(3x'^2 - 8x'y' - 3y'^2) + 9(9x'^2 + 6x'y' + y'^2)$$
$$- 70(x' - 3y') - 110(3x' + y') + 300 = 0$$

Applying the distributive property and combining like terms gives

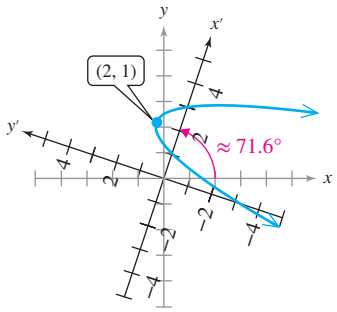
$$100x'^2 - 400x' + 100y' + 300 = 0$$

Dividing both sides by 100 results in $x'^2 - 4x' + y' + 3 = 0$.

c. We can find the vertex of the parabola by completing the square.

$$x'^2 - 4x' + 4 = -y' - 3 + 4$$
$$(x' - 2)^2 = -(y' - 1)$$

Draw the x'- and y'-axes 71.6° counterclockwise from the x- and y-axes. In the $x'y'$-plane, the vertex is (2, 1) and the axis of symmetry is parallel to the y'-axis.



Skill Practice 5 The equation $x^2 + 4xy + 4y^2 + 6\sqrt{5}x + 7\sqrt{5}y + 20 = 0$ is a conic section (nondegenerate case).

a. Determine the type of conic section represented by the equation.

b. Use a suitable rotation to eliminate the xy term.

c. Sketch the graph.

Answers

5. a. Parabola

b. $x'^2 + 4x' - y' + 4 = 0$

EXAMPLE 6 Graphing a Rotated Conic Section with a Graphing Utility

The equation $27x^2 - 120xy - 92y^2 - 96x + 40y + 520 = 0$ represents a conic section (nondegenerate case).

a. Identify the type of conic section.

b. Graph the equation on a graphing utility.

Solution:

a. $27x^2 - 120xy - 92y^2 - 96x + 40y + 520 = 0$

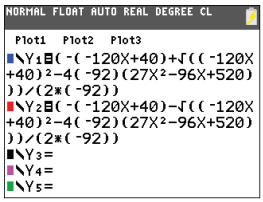
Since $B^2 - 4AC = (-120)^2 - 4(27)(-92) = 24{,}336 > 0$, the equation represents a hyperbola.

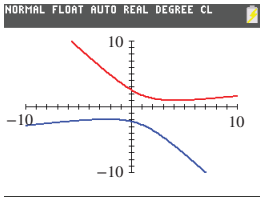
b. The equation is quadratic in the y variable, and we can write it in the form $ay^2 + by + c = 0$.

$-92y^2 + (-120x + 40)y + (27x^2 - 96x + 520) = 0$

Apply the quadratic formula with $a = -92$, $b = -120x + 40$, and $c = 27x^2 - 96x + 520$.

$$y = \frac{-(-120x + 40) \pm \sqrt{(-120x + 40)^2 - 4(-92)(27x^2 - 96x + 520)}}{2(-92)}$$





TIP For the purpose of entering the equation from Example 6 into a calculator, we do not need to simplify the radical.

Answers

6. a. Hyperbola

Skill Practice 6 The equation $44x^2 + 600xy - 551y^2 - 624x - 260y - 2028 = 0$ represents a conic section (nondegenerate case).

a. Identify the type of conic section.

b. Graph the equation on a graphing utility.

SECTION 11.4 Practice Exercises

Prerequisite Review

R.1. Given $\cos\alpha = \frac{12}{13}$ for $\frac{3\pi}{2} < \alpha < 2\pi$, find the exact values of the following.

a. $\sin\frac{\alpha}{2}$ **b.** $\cos\frac{\alpha}{2}$

R.2. Use a calculator to approximate the degree measure (to 1 decimal place) of θ subject to the given conditions.

$\sin\theta = \frac{12}{19}$ and $90° \le \theta \le 180°$

R.3. Find the exact value or state that the expression is undefined.

$\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right)$

R.4. Solve by using the quadratic formula.

$w^2 - 3w - 5 = 0$

R.5. Solve for the indicated variable.

$v = 2\pi rq + \pi r^2 q$ for r.

R.6. Determine the value of n that makes the polynomial a perfect square trinomial. Then factor as the square of a binomial.

$v^2 + 30v + n$

Concept Connections

1. Suppose that the equation $Ax^2 + Cy^2 + Dx + Ey + F = 0$ represents a conic section (nondegenerative case). In terms of A and C, the equation represents a circle if _____, an ellipse if _____, a hyperbola if _____, and a parabola if _____.
2. Suppose that the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ represents a conic section (nondegenerative case). In terms of the discriminant, $B^2 - 4AC$, the equation represents an ellipse if _____, a hyperbola if _____, and a parabola if _____.
3. Suppose that the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ represents a conic section (nondegenerative case). Which term determines whether the conic section is rotated?
4. The conic section defined by $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ will have no rotation relative to the new coordinate axes x' and y' if the x- and y-axes are rotated through an angle θ satisfying the relationship $\cot 2\theta =$ _____ (answer in terms of A, B, and C).

Objective 1: Identify Conic Sections with No Rotation

For Exercises 5–8, the given equation represents a conic section (nondegenerative case). Identify the type of conic section. (See Example 1)

5. **a.** $8x^2 - 2y^2 - 3x + 2y - 6 = 0$
   b. $-6y^2 + 4x - 12y - 24 = 0$
   c. $-9x^2 - 4y^2 - 18x + 12y = 0$
6. **a.** $-5x^2 + 8y + 4 = 0$
   b. $3x^2 + 3y^2 - 4x + 2y - 8 = 0$
   c. $-2x^2 + y^2 - 4y + 1 = 0$
7. **a.** $0.1x^2 + 0.6x - 1.6 = 0.2y - 0.1y^2$
   b. $2x^2 - 7xy = -y^2 + 4x - 2y - 1$
   c. $8x + 2y = y^2 + 4$
8. **a.** $6x^2 + 3x + 10y = 10y^2 + 8$
   b. $3x^2 + 18xy = 5x + 2y + 9$
   c. $4x^2 + 8x - 5 = -y^2 + 6y + 3$

Objective 2: Use the Rotation of Axes Formulas

For Exercises 9–14, assume that the x- and y-axes are rotated through angle θ about the origin to form the x'- and y'-axes. (See Example 2)

9. Given $\theta = 60°$ and $P(2, -10)$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.
10. Given $\theta = 30°$ and $P(-4, 8)$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.
11. Given $\theta = 45°$ and $P(-3, -6)$ in the $x'y'$-plane, find the coordinates of P in the xy-plane.
12. Given $\theta = 45°$ and $P(-\sqrt{2}, 5\sqrt{2})$ in the $x'y'$-plane, find the coordinates of P in the xy-plane.
13. Given $\cos\theta = \frac{4}{5}$ and $\sin\theta = \frac{3}{5}$ and $P(-5, -15)$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.
14. Given $\cos\theta = \frac{5}{13}$ and $\sin\theta = \frac{12}{13}$ and $P(-39, 26)$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.

Objective 3: Transform Equations by Rotation of Axes

For Exercises 15–18, assume that the x- and y-axes are rotated through angle θ about the origin to form the x'- and y'-axes. Write the equation in $x'y'$-coordinates. (See Example 3)

15. $xy + 2 = 0$, $\theta = 45°$
16. $xy - 4 = 0$, $\theta = 45°$
17. $7x^2 - 2\sqrt{3}xy + 5y^2 - 48 = 0$, $\theta = 60°$
18. $13x^2 + 6\sqrt{3}xy + 7y^2 - 32 = 0$, $\theta = 30°$

For Exercises 19–22, assume that $0 < 2\theta < \pi$. Find the exact values of $\cos\theta$ and $\sin\theta$. Then approximate the value of θ to the nearest tenth of a degree if necessary.

19. $\cot 2\theta = -\frac{\sqrt{3}}{3}$
20. $\cot 2\theta = \frac{\sqrt{3}}{3}$
21. $\cot 2\theta = \frac{24}{7}$
22. $\cot 2\theta = -\frac{8}{15}$

For Exercises 23–28,

a. Determine an acute angle of rotation to eliminate the xy term. (**See Example 4**)
b. Use a rotation of axes to eliminate the xy term to write the equation in the form $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$.
c. Identify the type of curve represented by the equation.
d. Write the equation in standard form and sketch the graph.

ISTUDY

23. $3x^2 - 2xy + 3y^2 - 16 = 0$

24. $2x^2 + 2xy + 2y^2 - 9 = 0$

25. $11x^2 - 10\sqrt{3}xy + y^2 - 16 = 0$

26. $3x^2 - 10\sqrt{3}xy + 13y^2 + 18 = 0$

27. $x^2 - 2\sqrt{3}xy + 3y^2 - 16\sqrt{3}x - 16y = 0$

28. $x^2 + 2\sqrt{3}xy + 3y^2 - 8\sqrt{3}x + 8y = 0$

Objective 4: Use the Discriminant to Identify Conic Sections Containing a *Bxy* Term

29. The equation $3x^2 + 6xy + 3y^2 - 9x + 12y - 4 = 0$ has coefficients $A = 3$ and $C = 3$. Although $A = C$, the graph of the equation is not a circle, but rather a parabola. Why?

30. The equation $9x^2 + 10xy + y^2 - 3x + 2y - 4 = 0$ has coefficients $A = 9$ and $C = 1$. Although $AC > 0$ (A and C have the same sign), the graph of the equation is not an ellipse, but rather a hyperbola. Why?

For Exercises 31–34, the given equation represents a conic section (nondegenerative case). Identify the type of conic section. (See Examples 5 and 6)

31. a. $4x^2 - 12xy + 6y^2 + 2x - 3y - 8 = 0$

b. $4x^2 - 12xy + 9y^2 + 2x - 3y - 8 = 0$

32. a. $-3x^2 + xy - 4y^2 + 2x - 4y - 4 = 0$

b. $-3x^2 + 10xy - 4y^2 + 2x - 4y - 4 = 0$

33. a. $x^2 + 6xy + 4x = 3y^2 - 2y + 10$

b. $6y^2 - 3y = 8 - 2x - 4x^2$

34. a. $x^2 - 3xy + 12x = -6y^2 - 12y + 1$

b. $-3x^2 + 12x = 4y + 4$

For Exercises 35–42, the equation represents a conic section (nondegenerative case).

a. Use the discriminant to determine the type of conic section represented. (**See Example 5**)

b. Use a rotation of axes to eliminate the xy term to write the equation in the form $A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0$.

c. Write the equation in standard form and sketch the graph.

35. $3x^2 + 26\sqrt{3}xy - 23y^2 - 144 = 0$

36. $13x^2 + 6\sqrt{3}xy + 7y^2 - 64 = 0$

37. $16x^2 - 24xy + 9y^2 + 140x - 230y + 625 = 0$

38. $4x^2 - 6xy - 4y^2 + \sqrt{10}x + 3\sqrt{10}y - 25 = 0$

39. $40x^2 + 20xy + 25y^2 + 24\sqrt{5}x - 48\sqrt{5}y = 0$

40. $x^2 + 6xy + 9y^2 - 9\sqrt{10}x - 17\sqrt{10}y + 90 = 0$

41. $5x^2 + 6xy + 5y^2 - 12\sqrt{2}x - 4\sqrt{2}y - 16 = 0$

42. $7x^2 + 50xy + 7y^2 + 78\sqrt{2}x + 114\sqrt{2}y - 18 = 0$

For Exercises 43–48, the equation represents a conic section (nondegenerative case).

a. Identify the type of conic section. (**See Example 6**)

b. Graph the equation on a graphing utility.

43. $4x^2 - 4xy + 5y^2 - 20 = 0$

44. $6x^2 + 4\sqrt{3}xy + 2y^2 - 18x + 18\sqrt{3}y - 72 = 0$

45. $2x^2 - 6xy + 3y^2 - 4x + 12y - 9 = 0$

46. $5x^2 - 3xy + 2y^2 - 6 = 0$

47. $4x^2 + 8xy + 4y^2 - 2x - 5y - 2 = 0$

48. $4x^2 + 8\sqrt{3}xy + 3y^2 + 2x - 12y - 6 = 0$

Mixed Exercises

49. Given $y = \frac{\sqrt{3}}{3}x$

a. What angle does the line $y = \frac{\sqrt{3}}{3}x$ make with the positive x-axis?

b. Suppose that the x- and y-axes are rotated through an angle of 30° to form the x'- and y'-axes. Write the equation $y = \frac{\sqrt{3}}{3}x$ in terms of x' and y'.

c. Suppose that the x- and y-axes are rotated through an angle of 60° to form the x'- and y'-axes. Write the equation $y = \frac{\sqrt{3}}{3}x$ in terms of x' and y'.

50. Given $y = \frac{\sqrt{2}}{2}x$

a. What angle does the line $y = \frac{\sqrt{2}}{2}x$ make with the positive x-axis?

b. Suppose that the x- and y-axes are rotated through an angle of 45° to form the x'- and y'-axes. Write the equation $y = \frac{\sqrt{2}}{2}x$ in terms of x' and y'.

c. Suppose that the x- and y-axes are rotated through an angle of 90° to form the x'- and y'-axes. Write the equation $y = \frac{\sqrt{2}}{2}x$ in terms of x' and y'.

ISTUDY

51. Solve the system for x' and y'. (*Hint*: Multiply the first equation by $\cos\theta$ and the second equation by $\sin\theta$ to eliminate the y' term.)

$x = x'\cos\theta - y'\sin\theta$

$y = x'\sin\theta + y'\cos\theta$

52. Consider the parabola with axis of symmetry $y = x$ and passing through the points (1, 0), (0, 1), and (1, 1) in the xy-plane. Find an equation of the parabola

a. In the $x'y'$-plane, where the x'-axis is aligned with the line $y = x$.

b. In the xy-plane.

53. Discuss the graph of $x^2 - 2xy + y^2 - 1 = 0$.

54. Discuss the graph of $x^2 - 8xy + y^2 = 0$.

Write About It

55. Given $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$, what effect does the term Bxy have on the graph of the equation?

56. Given $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$, explain how to find the sine and cosine of the angle θ by which the conic section is rotated.

57. Suppose that the x'- and y'-axes are formed by a 30°-counterclockwise rotation from the x- and y-axes. If a point $P(2, 1)$ is located in the xy-plane, in which quadrant in the $x'y'$-plane will P be located? Why?

58. Given an equation in x and y, many graphing utilities require that the y variable be isolated. Explain how to isolate the y variable in the equation $2x^2 + 3xy + 5y^2 - 4x + 2y - 6 = 0$.

Expanding Your Skills

59. Use the relationships between A, B, and C and A', B', and C' on page 1046 to show that $A + C$ is invariant under rotation. That is, show that $A + C = A' + C'$.

60. Show that the distance between two points $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$ is invariant under rotation. That is, show that the distance between $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$ equals the distance between $P_1(x_1', y_1')$ and $P_2(x_2', y_2')$.

61. For a positive real number r, explain why the equation $x^2 + y^2 = r^2$ is or is not invariant under rotation.

62. Show that $x^2 + y^2 = r^2$ is invariant under rotation.

63. Recall from Section 10.3 that a point $P(x, y)$ can be represented by the matrix $\begin{bmatrix} x \\ y \end{bmatrix}$. By applying matrix addition, subtraction, or multiplication, we can translate the point or rotate the point to a new location. Given $P(x, y)$, the product $\begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}\begin{bmatrix} x \\ y \end{bmatrix}$ gives the coordinates of the point rotated by an angle θ about the origin.

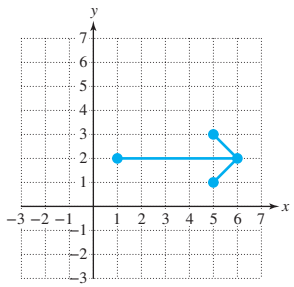
a. Write a product of matrices that rotates the point (6, 2) counterclockwise 60° about the origin.

b. Compute the product in part (a).

c. Graph the point (6, 2) and the point found in part (b) to illustrate the rotation. Round the coordinates of the rotated point to 1 decimal place.

64. The set of points (x_1, y_1), (x_2, y_2), … (x_n, y_n) can be represented as the matrix $\begin{bmatrix} x_1 & x_2 & \cdots & y_n \\ y_1 & y_2 & \cdots & y_n \end{bmatrix}$.

a. Write a matrix to represent the points defining the given figure.



b. Suppose a computer programmer wants to rotate the matrix 90° counterclockwise. Write a product of matrices that will perform this rotation and compute the result.

c. Plot the original points and arrow along with the rotated points and arrow.

ISTUDY

SECTION 11.5 Polar Equations of Conics

OBJECTIVES

1. Identify and Graph Conics in Polar Form
2. Rotate Conics in Polar Form

1. Identify and Graph Conics in Polar Form

In Section 11.3, we defined a parabola as the set of points in a plane equidistant from a fixed point (focus) and a fixed line (directrix). However, the ellipse and hyperbola were defined in terms of two points (their foci). We now give a unified approach in which all three categories of conics are defined in terms of a fixed point and fixed line.

Alternative Definitions of Conics

Let l be a fixed line (**directrix**) in a plane and let F be a fixed point (**focus**) in the plane, not on the line. A **conic** is the set of points P in the plane such that the ratio of the distance between P and F to the distance from P to l is a constant positive real number e (the **eccentricity**). That is,

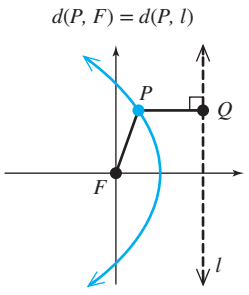
$$\frac{\text{Distance between } P \text{ and } F}{\text{Distance between } P \text{ and } l} = \frac{d(P, F)}{d(P, l)} = e \tag{1}$$

Furthermore,

***1.** If $e = 1$, the conic is a parabola.
2. If $e < 1$, the conic is an ellipse.
3. If $e > 1$, the conic is a hyperbola.

*We show that these statements are true in online appendix Section A.2.

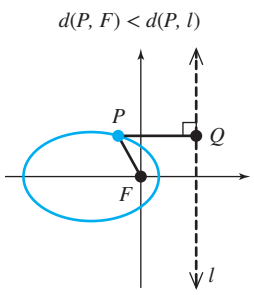
A polar coordinate system with the pole placed at the focus F is well suited to illustrate these alternative definitions of conics. For example, in Figures 11-37 through 11-39 we show a parabola, ellipse, and hyperbola with a vertical directrix. The point Q is the point on line l closest to P (that is, line segment $\overline{QP}$ is the perpendicular distance from P to l).



Parabola $e = 1$

$e = \frac{d(P, F)}{d(P, l)} = 1$

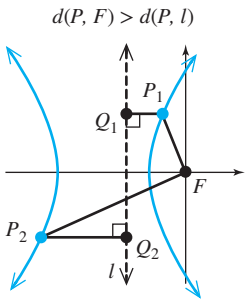
Figure 11-37



Ellipse $0 < e < 1$

$e = \frac{d(P, F)}{d(P, l)} < 1$

Figure 11-38



Hyperbola $e > 1$

$e = \frac{d(P, F)}{d(P, l)} > 1$

Figure 11-39

To develop polar equations of conics for the case of a vertical directrix, begin by placing the origin (pole) at the focus F. Then place the directrix l parallel to

Avoiding Mistakes

The graph shown in Figure 11-40 is a parabola. However, the same orientation of the directrix relative to points F, P, and Q holds true for the graphs of an ellipse and hyperbola.

the y-axis $\left(\text{line } \theta = \frac{\pi}{2}\right)$ at a distance of $d > 0$ units to the right of the y-axis (Figure 11-40). Let Q represent the point on l closest to P.

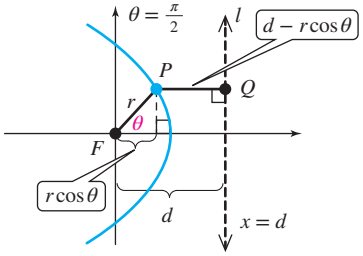


Figure 11-40

The directrix is perpendicular to the polar axis and is represented in rectangular coordinates as $x = d$. Suppose that point P has rectangular coordinates (x, y) and polar coordinates (r, θ). Then from Figure 11-40, $d(P, F) = r$ and $d(P, Q) = d - r\cos\theta$.

The condition $\dfrac{d(P, F)}{d(P, Q)} = e$ can be written as

$$d(P, F) = e \cdot d(P, Q) \text{ or as } r = e(d - r\cos\theta).$$

Solving for r gives $r = \dfrac{ed}{1 + e\cos\theta}$.

- If the directrix is a vertical line $d > 0$ units to the *left* of the pole, then an equation of the directrix is $x = -d$, and the equation of the conic is $r = \dfrac{ed}{1 - e\cos\theta}$.
- If the directrix is horizontal (parallel to the polar axis) $d > 0$ units above or below the pole, then $y = d$ and $y = -d$ are equations of the directrix, and the equation of the conic is

$$r = \frac{ed}{1 + e\sin\theta} \text{ or } r = \frac{ed}{1 - e\sin\theta}.$$

Polar Equations of Conics

A polar equation of the form

$$(2)\ r = \frac{ed}{1 \pm e\cos\theta} \qquad \text{or} \qquad (3)\ r = \frac{ed}{1 \pm e\sin\theta}$$

is a conic with focus at the pole and eccentricity $e > 0$. The value $|d|$ is the distance between the focus at the pole and the directrix. The conic is

1. A parabola if $e = 1$ (axis of symmetry perpendicular to the directrix).
2. An ellipse if $0 < e < 1$ (major axis perpendicular to the directrix).
3. A hyperbola if $e > 1$ (transverse axis perpendicular to the directrix).

Given a polar equation of a conic, the location of the directrix and the orientation of the curve for $d > 0$ are summarized in Figure 11-41. If $d < 0$, the curve is reflected across the pole.

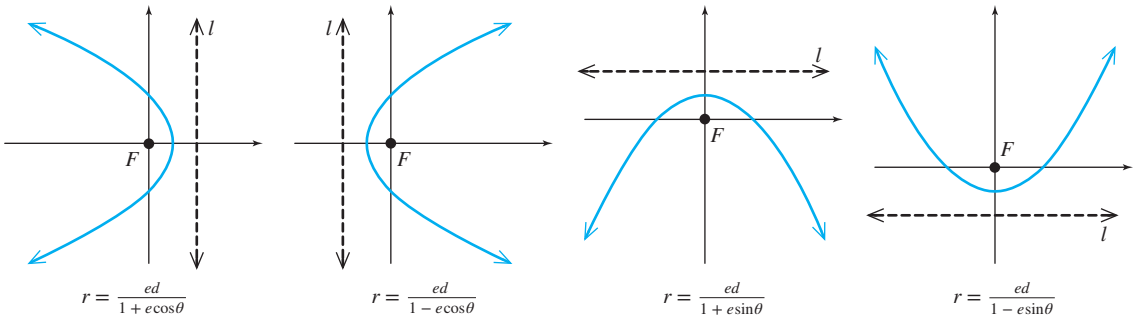

Figure 11-41 Location of directrix and orientation of conic ($d > 0$)

From the graphs of the equations in Figure 11-41, we make the following observations.

- If the equation contains $\cos\theta$, the directrix is vertical. If the equation contains $\sin\theta$, the directrix is horizontal.
- The axis of symmetry (parabola), major axis (ellipse), or transverse axis (hyperbola) is always perpendicular to the directrix.
- If the sign between terms in the denominator is positive, then the directrix is to the right of or above the pole.
- If the sign between terms in the denominator is negative, then the directrix is to the left of or below the pole.

TIP The graphs shown in Figure 11-41 are parabolas. However, the same orientation of the conic holds in each case for an ellipse and a hyperbola.

To graph a conic expressed in polar form, consider using the following guidelines.

Guidelines to Graph a Conic in Polar Form

1. Write the polar equation in the form $r = \dfrac{ed}{1 \pm e\cos\theta}$ or $r = \dfrac{ed}{1 \pm e\sin\theta}$.
2. Determine the value of the eccentricity e and identify the type of conic.
3. Determine the orientation of the conic.
4. Plot points at $\theta = 0$, $\dfrac{\pi}{2}$, π, and $\dfrac{3\pi}{2}$.
5. Identify key characteristics of the conic as desired (center, vertices, length of major/minor/transverse/conjugate axes, directrix).

EXAMPLE 1 Graphing a Parabola from Its Polar Form

Graph the equation. $r = \dfrac{4}{2 - 2\sin\theta}$

Solution:

$$r = \frac{4}{2 - 2\sin\theta} = \frac{\frac{1}{2} \cdot (4)}{\frac{1}{2} \cdot (2 - 2\sin\theta)} = \frac{2}{1 - \sin\theta}$$

We want 1 here.

$ed = 2$

$$r = \frac{2}{1 - 1\sin\theta}$$

$e = 1$

To fit the model of equation (3), $r = \frac{ed}{1 - e\sin\theta}$, we need a 1 as the constant term in the denominator. Multiply numerator and denominator by $\frac{1}{2}$.

The equation is in the form $r = \frac{ed}{1 - e\sin\theta}$ with $e = 1$, and $ed = 2$.

ISTUDY

- Since $e = 1$, the graph is a parabola.
- Substitute $e = 1$ into the equation $ed = 2$ to get $(1)d = 2$, or $d = 2$.
- The equation contains $\sin\theta$, which means that the directrix is horizontal.
- The subtraction sign in the denominator further indicates that the directrix is below the pole and has an equation in rectangular coordinates of $y = -d$ or $y = -2$.
- The axis of symmetry is perpendicular to the directrix, so the axis of symmetry is vertical and the parabola opens upward toward the focus.
- Evaluating $r = \dfrac{4}{2 - 2\sin\theta}$ for $\theta = 0, \dfrac{\pi}{2}, \pi$, and $\dfrac{3\pi}{2}$ gives the ordered pairs $(2, 0)$, $(2, \pi)$, and $\left(1, \dfrac{3\pi}{2}\right)$.

θ	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$
r	2	Undefined	2	1

A sketch of the equation is given in Figure 11-42. The focus is at the pole $(0, 0)$. The vertex is equidistant from the focus and the directrix, which implies that the vertex V is $\left(1, \dfrac{3\pi}{2}\right)$ or equivalently in rectangular coordinates $(0, -1)$.

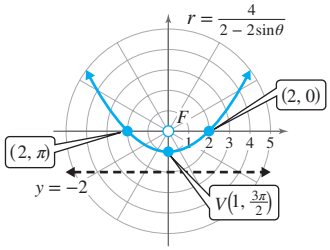

Figure 11-42

Skill Practice 1 Graph the equation. $r = \dfrac{8}{2 - 2\cos\theta}$

We can confirm the results of Example 1 by converting the equation $r = \dfrac{4}{2 - 2\sin\theta}$ to rectangular coordinates.

$$r = \frac{4}{2 - 2\sin\theta}$$

$2r - 2r\sin\theta = 4$	Multiply both sides by $2 - 2\sin\theta$.
$2r = 2r\sin\theta + 4$	Add $2r\sin\theta$ to both sides.
$r = r\sin\theta + 2$	Divide by 2.
$r^2 = (r\sin\theta + 2)^2$	Square both sides. The purpose of squaring both sides is to use the relationship $r^2 = x^2 + y^2$.
$r^2 = (r\sin\theta)^2 + 4r\sin\theta + 4$	Substitute $x^2 + y^2$ for r^2 and y for $r\sin\theta$.
$x^2 + y^2 = y^2 + 4y + 4$	
$x^2 = 4y + 4$	
$x^2 = 4(y + 1)$	Write the equation in the standard form of a parabola, $(x - h)^2 = 4p(y - k)$.

The equation $x^2 = 4(y + 1)$ is a parabola opening upward with vertex $(0, -1)$. To find the focal length $|p|$ we have $4|p| = 4$, which implies that $|p| = 1$. Thus, the focus is $(0, 0)$, and the directrix is the horizontal line 1 unit below the vertex, $y = -2$. The focal diameter (length of the latus rectum) is $4|p| = 4(1) = 4$, indicating that the points $(-2, 0)$ and $(2, 0)$ are on the parabola. The graph of the equation in rectangular coordinates is shown in Figure 11-43.

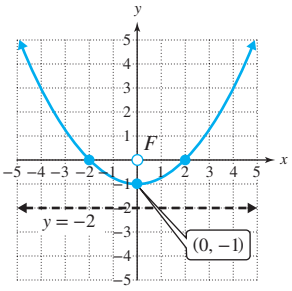

Figure 11-43

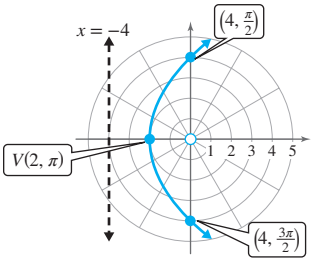
Answer
1.



EXAMPLE 2 Graphing a Hyperbola from Its Polar Form

Graph the equation. $r = \dfrac{12}{3 - 6\cos\theta}$

Solution:

$$r = \frac{12}{3 - 6\cos\theta} = \frac{\frac{1}{3} \cdot (12)}{\frac{1}{3} \cdot (3 - 6\cos\theta)} = \frac{4}{1 - 2\cos\theta}$$

We want 1 here.

$ed = 4$

$$r = \frac{4}{1 - 2\cos\theta}$$

$e = 2$

To fit the model of equation (2), $r = \frac{ed}{1 - e\cos\theta}$, we need a 1 as the constant term in the denominator. Multiply numerator and denominator by $\frac{1}{3}$.

The equation is in the form $r = \frac{ed}{1 - e\cos\theta}$ with $e = 2$ and $ed = 4$.

Since $ed = (2)d = 4$, we have $d = 2$.

- Since $e = 2 > 1$, the graph is a hyperbola.
- The equation contains $\cos\theta$, which means that the directrix is vertical.
- The subtraction sign in the denominator further indicates that the directrix is to the left of the pole.
- The transverse axis is perpendicular to the directrix, indicating that the transverse axis is horizontal and the branches of the hyperbola open to the left and right.
- Evaluating $r = \dfrac{12}{3 - 6\cos\theta}$ for $\theta = 0, \frac{\pi}{2}, \pi$, and $\frac{3\pi}{2}$ gives the ordered pairs $(-4, 0)$, $\left(4, \frac{\pi}{2}\right)$, $\left(\frac{4}{3}, \pi\right)$, and $\left(4, \frac{3\pi}{2}\right)$.

θ	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$
r	-4	4	$\frac{4}{3}$	4

- Since the transverse axis must pass through the focus at the pole, the transverse axis is the polar axis itself (the line $\theta = 0$).
- The vertices V_1 and V_2 are on the transverse axis, and thus, are the points on the hyperbola for which $\theta = 0$ or $\theta = \pi$. The vertices are $(-4, 0)$ and $\left(\frac{4}{3}, \pi\right)$.
- The center of the hyperbola is halfway between the vertices. Since the vertex $(-4, 0)$ is also represented by $(4, \pi)$, the center C is halfway between $(4, \pi)$ and $\left(\frac{4}{3}, \pi\right)$, which is $\left(\frac{8}{3}, \pi\right)$.

A sketch of the hyperbola is given in Figure 11-44.

The distance between the vertices $(4, \pi)$ and $\left(\frac{4}{3}, \pi\right)$ is the length of the transverse axis. Thus, $2a = 4 - \frac{4}{3} = \frac{8}{3}$, which means that $a = \frac{4}{3}$.

Since $e = \frac{c}{a}$, then $c = ae = \frac{4}{3} \cdot 2 = \frac{8}{3}$.

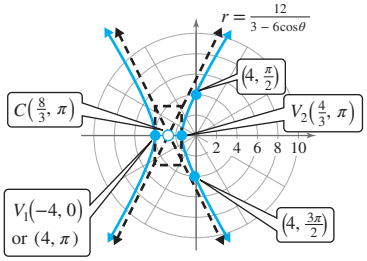


Figure 11-44

For a hyperbola, $c^2 = a^2 + b^2$, so $b = \sqrt{c^2 - a^2} = \sqrt{\left(\frac{8}{3}\right)^2 - \left(\frac{4}{3}\right)^2}$ $= \frac{4\sqrt{3}}{3} \approx 2.3$.

With the values of a and b known, we can sketch the representative rectangle through which the asymptotes of the graph are drawn (Figure 11-44).

TIP In Example 2, $r = \frac{4}{1 - 2\cos\theta}$ is a hyperbola with vertical directrix to the left of the pole. We know that $e = 2$ and $ed = 4$. Thus, $ed = (2)d = 4$ or $d = 2$.

An equation of the directrix in rectangular coordinates is $x = -d$, which is $x = -2$.

ISTUDY

Skill Practice 2 Graph the equation. $r = \dfrac{18}{3 + 6\sin\theta}$

The polar equation of the hyperbola from Example 2 can be converted to rectangular coordinates to verify the results of Example 2 (see Exercise 34).

EXAMPLE 3 Graphing an Ellipse from Its Polar Form

Graph the equation. $r = \dfrac{9}{5 + 4\sin\theta}$

Solution:

$$r = \frac{9}{5 + 4\sin\theta} = \frac{\frac{1}{5}\cdot(9)}{\frac{1}{5}\cdot(5 + 4\sin\theta)} = \frac{\frac{9}{5}}{1 + \frac{4}{5}\sin\theta}$$

We want 1 here.

$ed = \frac{9}{5}$

$$r = \frac{\frac{9}{5}}{1 + \frac{4}{5}\sin\theta}$$

$e = \frac{4}{5}$

To fit the model of equation (3), $r = \frac{ed}{1 + e\sin\theta}$, we need a 1 as the constant term in the denominator. Multiply numerator and denominator by $\frac{1}{5}$.

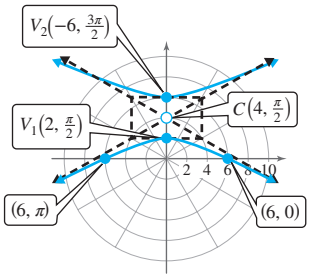
The equation is in the form $r = \frac{ed}{1 + e\sin\theta}$ with $e = \frac{4}{5}$ and $ed = \frac{9}{5}$.

- Since $e = \dfrac{4}{5} < 1$, the graph is an ellipse.
- The equation contains $\sin\theta$, which means that the directrix is horizontal.
- The addition sign in the denominator further indicates that the directrix is above the pole.
- The major axis is perpendicular to the directrix, and therefore must be vertical.
- Evaluating $r = \dfrac{9}{5 + 4\sin\theta}$ for $\theta = 0, \dfrac{\pi}{2}, \pi$, and $\dfrac{3\pi}{2}$ gives the ordered pairs $\left(\dfrac{9}{5}, 0\right)$, $\left(1, \dfrac{\pi}{2}\right)$, and $\left(\dfrac{9}{5}, \pi\right)$, $\left(9, \dfrac{3\pi}{2}\right)$.

θ	0	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$
r	$\frac{9}{5}$	1	$\frac{9}{5}$	9

- Since the major axis is vertical and must pass through the focus at the pole, the major axis is the line $\theta = \dfrac{\pi}{2}$ (y-axis).
- The vertices V_1 and V_2 are on the major axis, and thus are the points on the ellipse for which $\theta = \dfrac{\pi}{2}$ or $\theta = \dfrac{3\pi}{2}$. The vertices are $\left(1, \dfrac{\pi}{2}\right)$ and $\left(9, \dfrac{3\pi}{2}\right)$.
- The center of the ellipse is halfway between the vertices. Since the vertex $\left(9, \dfrac{3\pi}{2}\right)$ is also represented by $\left(-9, \dfrac{\pi}{2}\right)$, the center C is halfway between $\left(1, \dfrac{\pi}{2}\right)$ and $\left(-9, \dfrac{\pi}{2}\right)$, which is the point $\left(-4, \dfrac{\pi}{2}\right)$.

Answer 2.



TIP From Example 3, $r = \dfrac{\frac{9}{5}}{1 + \frac{4}{5}\sin\theta}$ is an ellipse with horizontal directrix above the pole.

We know that $e = \frac{4}{5}$ and $ed = \frac{9}{5}$. Thus, $\frac{4}{5}d = \frac{9}{5}$ or $d = \frac{9}{4}$.

An equation of the directrix in rectangular coordinates is $y = d$, which is $y = \frac{9}{4}$.

A sketch of the ellipse is given in Figure 11-45. The distance between the vertices $\left(1, \frac{\pi}{2}\right)$ and $\left(-9, \frac{\pi}{2}\right)$ is the length of the major axis. Thus, $2a = 1 - (-9) = 10$, which means that $a = 5$. Since $e = \dfrac{c}{a}$, then

$$c = ae = 5 \cdot \frac{4}{5} = 4.$$

For an ellipse, $c^2 = a^2 - b^2$, so

$$b = \sqrt{a^2 - c^2} = \sqrt{5^2 - 4^2} = 3.$$

Therefore, the length of the minor axis is $2b = 2(3) = 6$.

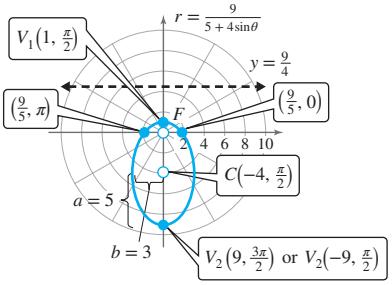


Figure 11-45

Skill Practice 3 Graph the equation. $r = \dfrac{16}{5 - 3\cos\theta}$

The polar equation of the ellipse from Example 3 can be converted to rectangular coordinates to verify the results of Example 3 (see Exercise 33).

2. Rotate Conics in Polar Form

The rotation of a conic about the origin is much more convenient when the conic is expressed in polar form versus rectangular form. Consider the graph of $r = f(\theta)$. Replacing θ by $(\theta - \alpha)$ results in

- A counterclockwise rotation (rotation through a positive angle) if $\alpha > 0$.
- A clockwise rotation (rotation through a negative angle) if $\alpha < 0$.

In Example 4, we rotate the ellipse from Example 3.

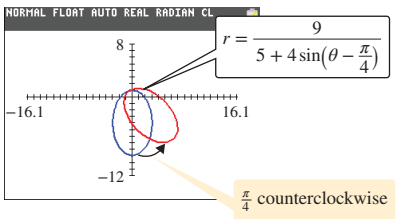
EXAMPLE 4 Rotating a Conic in Polar Form

Write an equation of the ellipse $r = \dfrac{9}{5 + 4\sin\theta}$ rotated about the origin through the given angle. Then graph the result on a graphing utility.

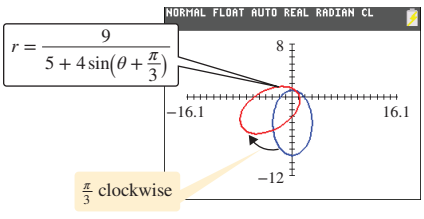
a. Counterclockwise $\frac{\pi}{4}$ **b.** Clockwise $\frac{\pi}{3}$

Solution:

a. Substitute $\theta - \frac{\pi}{4}$ for θ.



b. Substitute $\theta + \frac{\pi}{3}$ for θ.



Skill Practice 4 Rotate the ellipse $r = \dfrac{16}{5 - 3\cos\theta}$ and graph the result on a graphing utility.

a. Counterclockwise $\frac{2\pi}{3}$ **b.** Clockwise $\frac{\pi}{4}$

TIP Notice the similarity in the process to rotate a polar graph about the origin to the process to shift a graph horizontally or vertically in a rectangular coordinate system.

For example, consider an equation of an ellipse in rectangular form,

$$\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1$$

If $h > 0$, the ellipse is shifted horizontally in the positive x direction.

If $h < 0$, the ellipse is shifted horizontally in the negative x direction.

SECTION 11.5 Practice Exercises

Prerequisite Review

R.1. Given $5x^2 + 11y^2 + 40x - 132y + 421 = 0$,

a. Write the equation of the ellipse in standard form.

b. Identify the center, vertices, endpoints of the minor axis, and foci.

R.2. Given $11x^2 - 5y^2 + 22x + 20y - 64 = 0$,

a. Write the equation of the hyperbola in standard form.

b. Identify the center, vertices, and foci.

R.3. Given $y^2 - 2y + 4x - 15 = 0$,

a. Write the equation of the parabola in standard form.

b. Identify the vertex, focus, and directrix.

For Exercises R.4–R.5, convert the polar equation to rectangular form and identify the type of curve represented.

R.4. $r = -6\cos\theta$

R.5. $r = \dfrac{4}{\sin\theta}$

Concept Connections

1. Consider a conic defined by the set of points P satisfying the ratio $\dfrac{d(P, F)}{d(P, l)} = e$, where F is the focus at the pole and l is the directrix. The conic is a parabola if _____, an ellipse if _____, and a hyperbola if _____.

2. For a conic defined by $r = \dfrac{ed}{1 - e\cos\theta}$, the directrix is (horizontal/vertical) with equation _____.

3. For a conic defined by $r = \dfrac{ed}{1 + e\sin\theta}$, the directrix is (horizontal/vertical) with equation _____.

4. Given an equation of a conic in polar form $r = f(\theta)$, substituting $(\theta - \alpha)$ results in a (clockwise/counterclockwise) rotation about the origin if $\alpha > 0$. The rotation is (clockwise/counterclockwise) if $\alpha < 0$.

Objective 1: Identify and Graph Conics in Polar Form

For Exercises 5–10,

a. Determine the value of e and d.

b. Identify the type of conic represented by the equation.

c. Write an equation for the directrix in rectangular coordinates.

d. Match the equation with its graph. Choose from A–F.

5. $r = \dfrac{10}{5 + 5\sin\theta}$

6. $r = \dfrac{10}{2 - 5\sin\theta}$

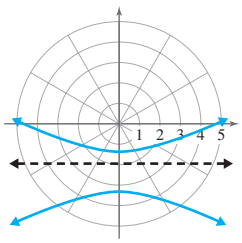
7. $r = \dfrac{10}{5 - 2\cos\theta}$

8. $r = \dfrac{5}{2 + 2\cos\theta}$

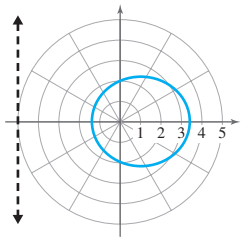
9. $r = \dfrac{5}{2 + 4\cos\theta}$

10. $r = \dfrac{5}{4 + 2\cos\theta}$

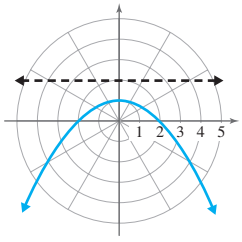
A.



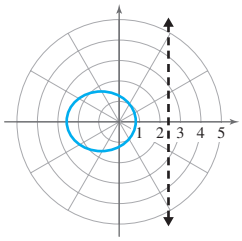
B.



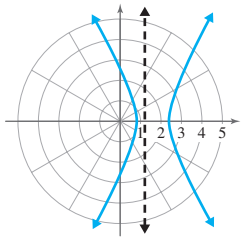
C.



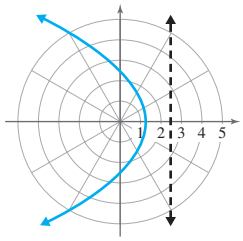
D.



E.



F.



For Exercises 11–22, graph the conic. (See Examples 1–3)

11. $r = \dfrac{5}{1 + \cos\theta}$

12. $r = \dfrac{3}{1 + \sin\theta}$

13. $r = \dfrac{5}{2 + 3\sin\theta}$

14. $r = \dfrac{8}{3 - 5\cos\theta}$

15. $r = \dfrac{6}{2 + \sin\theta}$

16. $r = \dfrac{9}{3 + \cos\theta}$

17. $r = \dfrac{-6}{-2 + 2\sin\theta}$

18. $r = \dfrac{-15}{5\cos\theta - 5}$

19. $r = \dfrac{10\sec\theta}{5\sec\theta - 3}$

20. $r = \dfrac{10\csc\theta}{4\csc\theta - 3}$

21. $5r\sin\theta + 3r = 16$

22. $4r - 5r\cos\theta = 9$

For Exercises 23–24, refer to the polar equation of the hyperbola.

a. Determine the center in rectangular coordinates.

b. Determine equations of the asymptotes in rectangular coordinates. (**See Example 2**)

23. $r = \dfrac{5}{2 + 3\sin\theta}$ (Exercise 13)

24. $r = \dfrac{8}{3 - 5\cos\theta}$ (Exercise 14)

For Exercises 25–26, refer to the polar equation of the ellipse.

a. Determine the center in rectangular coordinates.

b. Determine the length of the major axis.

c. Determine the length of the minor axis.

25. $r = \dfrac{10\sec\theta}{5\sec\theta - 3}$ (Exercise 19)

26. $r = \dfrac{10\csc\theta}{4\csc\theta - 3}$ (Exercise 20)

Objective 2: Rotate Conics in Polar Form

For Exercises 27–30, write an equation of the conic rotated about the origin through the given angle. Then graph the result on a graphing utility. (See Example 4)

27. $r = \dfrac{1}{1 - \sin\theta}$; Clockwise $\dfrac{\pi}{3}$

28. $r = \dfrac{8}{5 + 6\cos\theta}$; Clockwise $\dfrac{\pi}{4}$

29. $r = \dfrac{12}{4 - 3\cos\theta}$; Counterclockwise $\dfrac{7\pi}{6}$

30. $r = \dfrac{5}{2 + 2\sin\theta}$; Counterclockwise $\dfrac{4\pi}{3}$

31. a. Write a polar equation to represent the vertical line defined by $x = 2$ in rectangular form.

b. Use the polar equation from part (a) to write a polar equation of the line rotated about the origin 20° clockwise.

c. Graph the equations from parts (a) and (b).

32. a. Write a polar equation to represent the horizontal line defined by $y = 4$ in rectangular form.

b. Use the polar equation from part (a) to write a polar equation of the line rotated about the origin 15° counterclockwise.

c. Graph the equations from parts (a) and (b).

Mixed Exercises

For Exercises 33–36, convert the equation to rectangular coordinates. Compare the result to the indicated example or exercise.

33. $r = \dfrac{9}{5 + 4\sin\theta}$; Example 3

34. $r = \dfrac{12}{3 - 6\cos\theta}$; Example 2

35. $r = \dfrac{5}{1 + \cos\theta}$; Exercise 11

36. $r = \dfrac{6}{2 + \sin\theta}$; Exercise 15

ISTUDY

For Exercises 37–40, write a polar equation of a conic subject to the given conditions.

37. $e = 1$, Directrix $y = 2$

38. $e = \frac{5}{4}$, Directrix $x = -2$

39. $e = \frac{3}{5}$, Directrix is perpendicular to the polar axis and 10 units to the right of the pole.

40. $e = 1$, Directrix is parallel to the polar axis and 3 units below the pole.

Write About It

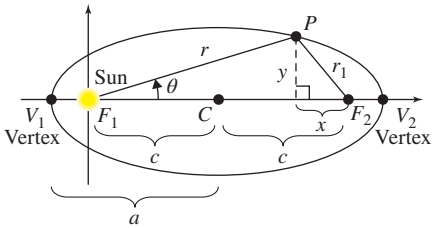
41. The equations $r_1 = \frac{6}{2 - 3\cos\theta}$ and $r_2 = \frac{6}{3 - 2\cos\theta}$ look similar. Discuss the difference in their graphs.

42. Discuss the difference between the graphs of $r_1 = \frac{8}{4 - \cos\theta}$ and $r_2 = \frac{8}{4 - \sin\theta}$.

Expanding Your Skills

43. Recall from Section 11.1 that the planets travel in elliptical orbits with the Sun at one focus. Assume that the Sun is located at the pole and the major axis of the ellipse is aligned with the polar axis as shown in the figure. We can represent the ellipse in polar form in terms of the eccentricity e and length of the semimajor axis a.

Let c represent the distance between the center C and either focus, F_1 and F_2. Let r and r_1 represent the distances between the foci and point P on the ellipse.



a. Show that $c = ea$.

b. Show that $r_1 = \sqrt{4e^2a^2 - 4ear\cos\theta + r^2}$.

c. From the definition of an ellipse, $r + r_1 = 2a$. Use this relationship to show that the ellipse is represented in polar form by $r = \frac{a(1 - e^2)}{1 - e\cos\theta}$.

44. Expressing a planet's elliptical orbit in polar form with the Sun at one focus is particularly convenient for finding the planet's distance at perihelion and aphelion (closest and farthest points between the planet and the Sun). Refer to the figure in Exercise 43. Write expressions in terms of a and e representing the distances R_p and R_a between the planet and Sun at perihelion and aphelion, respectively.

For Exercises 45–46, use the results of Exercises 43–44 to

a. Find a polar equation of the planet's orbit.

b. Find the distances R_p and R_a between the planet and Sun at perihelion and aphelion, respectively. Round to the nearest million kilometers.

45. Mercury: $a = 5.790 \times 10^7$ km, $e = 0.2056$

46. Mars: $a = 2.279 \times 10^8$ km, $e = 0.0935$

Technology Connections

47. Graph the equations $r_1 = \frac{2}{1 - 0.6\cos\theta}$ and $r_2 = \frac{-2}{1 - 0.6\cos\theta}$ on the same viewing window. How does the negative value of d affect the graph of the second equation?

48. Graph the equations $r = \frac{1}{1 - e\sin\theta}$ for $e = 0.2$, 0.4, 0.6, and 0.8 on the same viewing window. How does the value of e affect the ellipse?

49. Graph the equations $r = \frac{1}{1 - e\sin\theta}$ for $e = 0.8$, 1, and 1.2 on a viewing window with $-16.1 \le x \le 16.1$ and $-10 \le y \le 10$. Comment on the effect of e on the graph.

ISTUDY

SECTION 11.6 Plane Curves and Parametric Equations

OBJECTIVES

1. Graph a Plane Curve by Plotting Points
2. Eliminate the Parameter
3. Write Parametric Equations to Represent a Curve
4. Apply Parametric Equations

1. Graph a Plane Curve by Plotting Points

Suppose that a target in a video game starts at the lower left corner of the screen and moves across the screen along the path shown (Figure 11-46).

Placing the origin at the lower left corner of the screen, the path of the target is given by $y = 2x$. However, a player who wants to shoot the target must also know *when* the object is at a given point (x, y). That is, to adequately model the motion of the target, we must know its x- and y-coordinates at a given time t. The variable t is called a *parameter*. From the information given in Figure 11-46, we can express x and y (in pixels) in terms of $t \geq 0$ (in seconds) as follows:

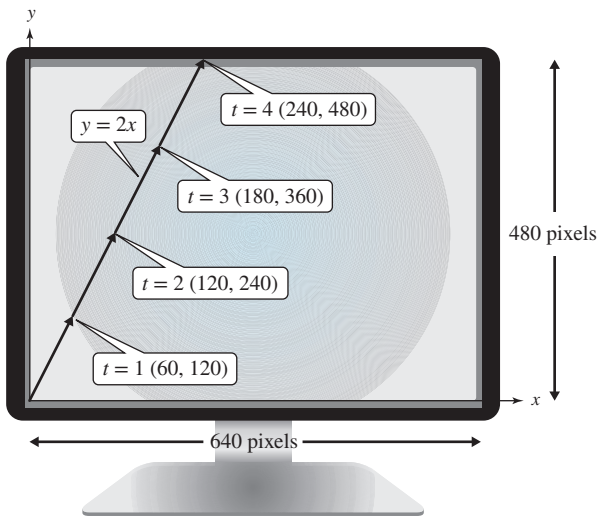


Figure 11-46

$$x = 60t \text{ and } y = 120t$$

These equations are called parametric equations because x and y are defined in terms of a parameter. Furthermore, the collection of points $(x(t), y(t))$ defined by these equations is called a plane curve.

TIP In many applications of parametric equations, the parameter often represents the time t during which an object is in motion or an angle θ through which an object moves.

Plane Curves and Parametric Equations

Let f and g be functions of t over an interval I. Then the set of points defined by $(x, y) = (f(t), g(t))$ is called a **plane curve.** The equations

$$x = f(t) \text{ and } y = g(t)$$

are called **parametric equations** of the curve, and t is called the **parameter.**

One method to graph a plane curve defined by parametric equations is to create a table of points. Choose arbitrary values of the parameter t and compute the corresponding values of x and y. Plot the points (x, y) in the order of increasing t and connect the points with a curve. Then use arrows to indicate the **orientation** of the curve. This is the direction of the path for increasing values of t.

EXAMPLE 1 Graphing a Plane Curve

Sketch the plane curve defined by the parametric equations over the given interval.

$$x = t^2 - 2t \text{ and } y = t - 2 \text{ over the interval } -2 \leq t < 3$$

Solution:

In Table 11-2, we have selected arbitrary values of t on the interval $[-2, 3)$ and have computed the corresponding values of x and y. After plotting the points, we draw a curve through the points and place arrows indicating the direction of increasing values of t (Figure 11-47).

Although the value $t = 3$ is not on the interval defining the curve, we evaluate x and y at $t = 3$ to determine the location of the open dot at the upper endpoint.

t	x	y
-2	8	-4
-1	3	-3
0	0	-2
1	-1	-1
2	0	0
3	3	1

Table 11-2

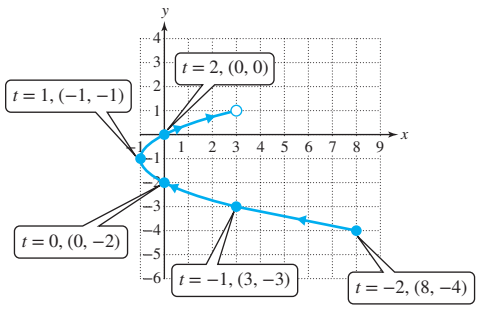

Figure 11-47

Skill Practice 1 Sketch the plane curve defined by the parametric equations $x = |t| - 2$ and $y = \frac{t}{2}$ over the interval $-4 < t \leq 4$.

In Example 1, the interval for t was restricted to $[-2, 3)$. If no interval is given, we will assume that t can be any real number for which x and y are defined. In Example 1, if the restriction of t were lifted, the parametric equations would define an entire parabola rather than just the part shown.

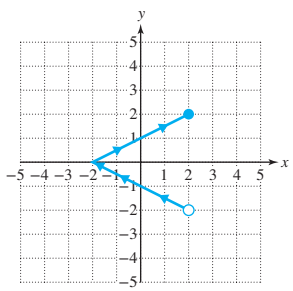
2. Eliminate the Parameter

Sometimes we can convert parametric equations to an equation in rectangular coordinates by a process called eliminating the parameter. The purpose of eliminating the parameter is to make use of our familiarity with the graphs of many equations and functions expressed in rectangular coordinates.

One way to eliminate a parameter t is to solve for t or an expression involving t in one equation. Then substitute the result in the other equation. However, we must also note restrictions on the domain of the rectangular equation so that the resulting graph is consistent with the restrictions on x and y in the parametric equations. This is illustrated in Example 2.

Given parametric equations: → Solve for t or an expression involving t in one equation. → Substitute the result in the other equation. → Identify domain restrictions on the resulting rectangular equation.

Answer
1.



EXAMPLE 2 Eliminating a Parameter

Given $x = \sqrt{t}$ and $y = -t + 4$,

a. Eliminate the parameter and write an equation in rectangular coordinates.

b. Sketch the curve and indicate its orientation.

Solution:

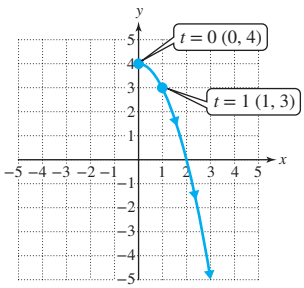
First note that $x = \sqrt{t}$ has the implied restriction that $t \geq 0$. Furthermore, x is equated to the principal square root of t, which implies that $x \geq 0$. Given the equation $y = -t + 4$, for $t \geq 0$, we have the restriction to $y \leq 4$.

a. From the equation $x = \sqrt{t}$, we have $t = x^2$ for $x \geq 0$. Substituting $t = x^2$ into the equation $y = -t + 4$ gives

$$y = -x^2 + 4 \text{ for } x \geq 0$$

b. The equation $y = -x^2 + 4$ is a parabola opening downward with vertex at (0, 4). Since $x \geq 0$, we take only the right branch of the parabola.

To determine the orientation of the curve, substitute two values of t into the parametric equations. Plot the corresponding points and draw arrows indicating the direction of increasing values of t.



When $t = 0$, $x = \sqrt{0} = 0$, $y = -(0) + 4 = 4$. The point is (0, 4).
When $t = 1$, $x = \sqrt{1} = 1$, $y = -(1) + 4 = 3$. The point is (1, 3).

The curve is oriented downward for increasing values of t.

Skill Practice 2 Repeat Example 2 with the equations $x = \sqrt{t - 1}$ and $y = t - 1$.

Another method to eliminate a parameter is to combine the equations by using an identity such as $\sin^2\theta + \cos^2\theta = 1$.

EXAMPLE 3 Eliminating a Parameter

Given $x = -2\sin\theta$ and $y = 2\cos\theta$,

a. Eliminate the parameter and write an equation in rectangular coordinates.

b. Sketch the curve and indicate its orientation.

Solution:

The sine and cosine functions are defined for all real numbers θ. Since $-1 \leq \sin\theta \leq 1$ and $-1 \leq \cos\theta \leq 1$, the values of x and y are between -2 and 2.

a. Solving for θ in either equation would require an inverse trigonometric function. Instead, we make use of the fact that $\sin^2\theta + \cos^2\theta = 1$. Squaring both sides of the two equations and taking the sum $x^2 + y^2$ gives

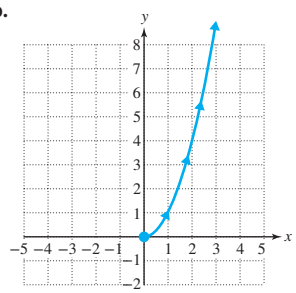
$$\begin{aligned} x^2 + y^2 &= (-2\sin\theta)^2 + (2\cos\theta)^2 \\ &= 4\sin^2\theta + 4\cos^2\theta \\ &= 4(\sin^2\theta + \cos^2\theta) \\ &= 4(1) \\ &= 4 \end{aligned}$$

The curve represented in rectangular coordinates is $x^2 + y^2 = 4$.

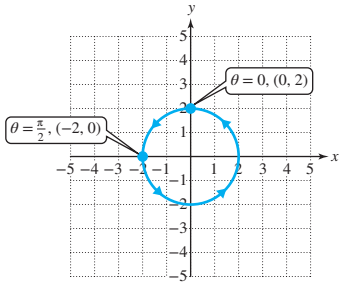
Answers

2. a. $y = x^2$ for $x \geq 0$

b.



b. The graph of $x^2 + y^2 = 4$ is a circle centered at the origin with radius 2.



To determine the orientation of the curve, substitute two values of θ into the parametric equations. Plot the corresponding points and draw arrows indicating the direction of increasing values of θ.

When $\theta = 0$, $x = -2\sin(0) = 0$,
$y = 2\cos(0) = 2$.

When $\theta = \frac{\pi}{2}$, $x = -2\sin\left(\frac{\pi}{2}\right) = -2$, $y = 2\cos\left(\frac{\pi}{2}\right) = 0$.

The orientation of the curve is counterclockwise.

Skill Practice 3 Repeat Example 3 with the equations $x = 4\cos\theta$ and $y = -4\sin\theta$.

In Example 3, the implied domain of the parametric equations is $(-\infty, \infty)$. Thus, the circle is traced repeatedly for θ values on intervals of 2π. For example:

- For θ on the interval $[0, 2\pi]$, the curve starts at (0, 2) and is traced one time counterclockwise.
- For θ on the interval $[0, 4\pi]$, the curve starts at (0, 2) and is traced two times counterclockwise.
- For θ on the interval $\left[\frac{\pi}{2}, \frac{13\pi}{2}\right]$, the curve starts at (−2, 0) and is traced three times counterclockwise.

It is also important to note that the orientation of a curve defined by parametric equations may change over the interval defining the parameter. In Exercises 21–22, we show a situation where a curve is traversed back and forth in an oscillating manner.

3. Write Parametric Equations to Represent a Curve

An equation in x and y in rectangular coordinates defines a set of points (x, y). Suppose that a parameter t is introduced to represent time. Different parametric equations (that is, different parameterizations) can be used to traverse the curve at different speeds and in different directions. This is demonstrated in Example 4.

EXAMPLE 4 Writing Parametric Equations to Represent an Equation in Rectangular Coordinates

Write parametric equations for the curve defined by $y = x + 2$ with the given definition for x.

a. $x = t$ **b.** $x = 3t$ **c.** $x = -\frac{t}{2}$

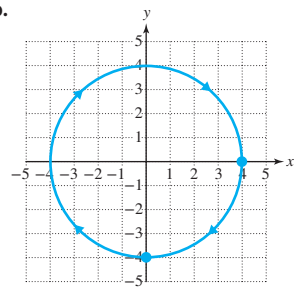
Solution:

a. Substituting $x = t$ into the equation $y = x + 2$ yields $y = t + 2$.
The parametric equations are $x = t$ and $y = t + 2$.

Answers

3. a. $x^2 + y^2 = 16$

b.



b. Substituting $x = 3t$ into the equation $y = x + 2$ yields $y = 3t + 2$.
The parametric equations are $x = 3t$ and $y = 3t + 2$.

c. Substituting $x = -\frac{t}{2}$ into the equation $y = x + 2$ yields $y = -\frac{t}{2} + 2$.
The parametric equations are $x = -\frac{t}{2}$ and $y = -\frac{t}{2} + 2$.

Skill Practice 4 Write parametric equations for the curve defined by $y = 2x - 3$ with the given definition for x.

a. $x = t$ **b.** $x = -4t$ **c.** $x = \frac{t}{5}$

The graphs of the three parametric representations of the line $y = x + 2$ are shown in Figures 11-48 through 11-50.

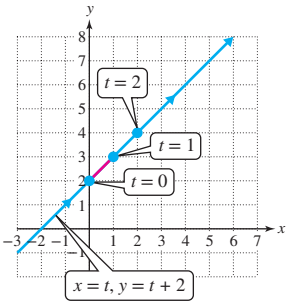


Figure 11-48

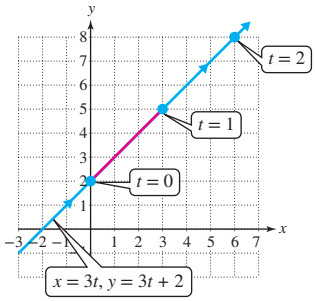

Figure 11-49

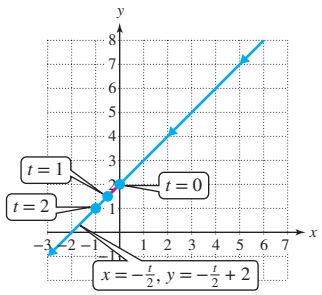

Figure 11-50

For a given interval of t, the different parameterizations traverse different parts of the curve. Notice that for the interval $0 \le t \le 1$, different portions of the line (shown in red) are traversed for each parameterization. Furthermore, if t represents time, then the curve in Figure 11-49 is traversed most quickly because over a 1-sec interval, a longer portion of the curve is represented. Also notice that the curve defined by the parameterization in Figure 11-50 is traversed in the opposite direction than the other two curves.

It is also important to note that a parameterization must be chosen carefully to represent the entire curve defined in rectangular coordinates. For example, the parameterization $x = \sqrt{t}$ and $y = \sqrt{t} + 2$ would not represent the entire line $y = x + 2$. This parameterization would only define the portion of the line from the point (0, 2) to the right.

4. Apply Parametric Equations

Parametric equations are particularly well suited for describing objects in motion because curves can be expressed using time as the parameter. Two common applications and the associated parametric equations are summarized as follows.

Answers

4. **a.** $x = t$ and $y = 2t - 3$
b. $x = -4t$ and $y = -8t - 3$
c. $x = \frac{t}{5}$ and $y = \frac{2t}{5} - 3$

ISTUDY

Modeling Motion Using Parametric Equations

Let $t \geq 0$ represent the time under which an object is in motion along a plane curve, and let (x_0, y_0) represent the initial position of the object at $t = 0$.

Uniform linear motion $x = x_0 + at$ $y = y_0 + bt$	The values of a and b are the horizontal and vertical components of velocity, respectively.
Projectile motion* $x = (v_0 \cos\theta)t + x_0$ $y = -\frac{1}{2}gt^2 + (v_0 \sin\theta)t + y_0$ *Assuming negligible air resistance.	θ is the angle of launch relative to the horizontal, and v_0 is the initial speed (magnitude of the initial velocity). The value of g is the acceleration due to gravity, where $g = 32$ ft/sec^2 or $g = 9.8$ m/sec^2 on the surface of the Earth.

In Example 5, we investigate an application of motion along a straight path.

EXAMPLE 5 An Application of Motion Along a Straight Path

An ant walks across a 72-in. by 36-in. picnic table along a straight path as shown in Figure 11-51. The origin of a rectangular coordinate system is placed at the lower left corner of the table.

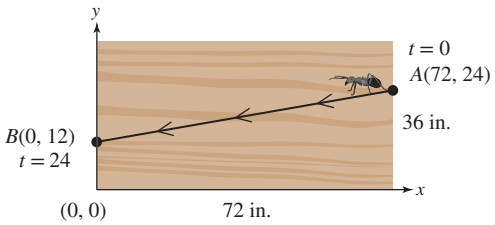

Figure 11-51

a. If the ant walks from point $A(72, 24)$ to point $B(0, 12)$ in 24 sec, write parametric equations to represent the ant's path, as a function of the time t (in sec). Assume that the distances in the figure are in inches.

b. Determine the ant's location 8 sec after leaving point A.

TIP For an object moving under uniform linear motion from point (x_1, y_1) to point (x_2, y_2) in time Δt, the horizontal and vertical components of velocity are given by

$$a = \frac{x_2 - x_1}{\Delta t} \text{ and}$$

$$b = \frac{y_2 - y_1}{\Delta t}$$

In each case, notice that the pattern is

$$\frac{\left(\begin{matrix}\text{final}\\ \text{position}\end{matrix}\right) - \left(\begin{matrix}\text{initial}\\ \text{position}\end{matrix}\right)}{\Delta t}$$

Solution:

a. For a straight path we use the equations $x = x_0 + at$ and $y = y_0 + bt$. The initial position (x_0, y_0) of the ant is $(72, 24)$. Thus, $x_0 = 72$ and $y_0 = 24$. The ant moves from $x = 72$ to $x = 0$ in 24 sec. Therefore, the ant's horizontal component of velocity is

$$a = \frac{0 - 72}{24} = -3 \text{ in./sec}$$

TIP The horizontal component of velocity is negative because the ant is moving from right to left.

The ant moves from $y = 24$ to $y = 12$ in 24 sec. Thus, the vertical component of velocity is

$$b = \frac{12 - 24}{24} = -\frac{1}{2} \text{ in./sec}$$

TIP The vertical component of velocity is negative because the ant is moving downward.

The ant's path is given by

$x = x_0 + at = 72 + (-3)t$ and $y = y_0 + bt = 24 + \left(-\frac{1}{2}\right)t$. Thus,

$x = 72 - 3t$ and $y = 24 - \frac{1}{2}t$.

b. The ant's location at $t = 8$ sec is given by

$x = 72 - 3(8) = 48$ and $y = 24 - \frac{1}{2}(8) = 20$.

The location is (48, 20).

Skill Practice 5 Repeat Example 5 with an ant that begins at $A(72, 10)$ and walks to $B(20, 36)$ in 13 sec.

In Example 6, we use parametric equations to model the path of a projectile.

EXAMPLE 6 An Application of Projectile Motion

The shot put is a track-and-field event in the Olympics in which competitors throw an iron ball (the shot) as far as they can. The weight of the shot is 7.26 kg (16 lb) for men and 4 kg (8.8 lb) for women. Suppose that a male competitor throws the shot from an initial height of 2 m, at an angle of 38° to the horizontal, with an initial speed of 12 m/sec (Figure 11-52).

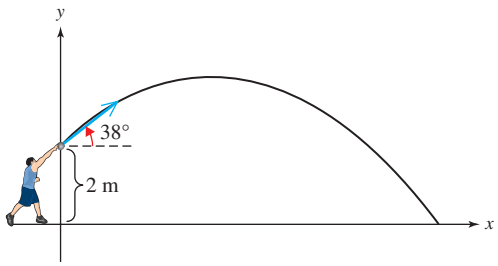

Figure 11-52

a. Write parametric equations to model the path of the shot as a function of the time t (in sec).

b. For how many seconds is the shot in the air? Round to the nearest hundredth of a second.

c. Determine the horizontal distance traveled by the shot. Round to the nearest hundredth of a foot.

d. When does the shot reach its maximum height? Find the exact value and round to the nearest hundredth of a second.

e. Determine the maximum height. Round to the nearest hundredth of a foot.

Solution:

a. To begin, we choose a coordinate system with the origin placed at ground level, directly below the point of release. Thus, $x_0 = 0$ m, $y_0 = 2$ m, $\theta = 38°$, $v_0 = 12$ m/sec, and $g = 9.8$ m/sec^2.

Using the model for projectile motion, we have

$$x = (v_0 \cos\theta)t + x_0 = (12\cos 38°)t + 0$$
$$y = -\frac{1}{2}gt^2 + (v_0 \sin\theta)t + y_0 = -\frac{1}{2}(9.8)t^2 + (12\sin 38°)t + 2.$$

Simplifying, we have $x = 12\cos 38°t$ and $y = -4.9t^2 + 12\sin 38°t + 2$, where x and y are in meters and t is in seconds.

Point of Interest

In Section 6.3, we learned that launching a projectile at a 45° angle results in the maximum horizontal distance. However, experiments performed on world-class shot putters show that the initial speed that an athlete can generate throwing the shot decreases with increasing projection angle. Based on empirical data, the optimum projection angle for the shot put is approximately 35°. (*Source*: Journal of Sports Sciences)

Answers

5. a. $x = 72 - 4t$ and $y = 10 + 2t$.
b. At $t = 8$ sec, the ant's location is (40, 26).

b. The shot will hit the ground when $y = 0$.

$$-4.9t^2 + 12\sin 38°t + 2 = 0$$

$$t = \frac{-12\sin 38° \pm \sqrt{(12\sin 38°)^2 - 4(-4.9)(2)}}{2(-4.9)}$$

$t \approx 1.74$ sec and $t \approx -0.23$ sec.

Reject the negative solution.

The shot will hit the ground in approximately 1.74 sec.

c. The horizontal distance traveled by the shot is the x value at the time the shot hits the ground. Compute x at $t \approx 1.74$.

$$x \approx 12\cos 38°(1.74) \approx 16.45 \text{ m}$$

The shot travels approximately 16.45 m. This is the length of the throw and score for the competitor.

d. The path of the shot is parabolic. The maximum height is reached at the vertex. To find the time t at which the shot reaches its maximum height, use the vertex formula with $y = -4.9t^2 + 12\sin 38°t + 2$.

$$t = \frac{-b}{2a} = \frac{-12\sin 38°}{2(-4.9)} \approx 0.75$$

The shot will reach its maximum height approximately 0.75 sec after release.

e. The maximum height is the y value at the vertex. Compute y at $t \approx 0.75$.

$$y = -4.9(0.75)^2 + 12\sin 38°(0.75) + 2 \approx 4.78$$

The maximum height is approximately 4.78 m.

Skill Practice 6 Repeat Example 6 with a cannonball launched from a cannon at an initial height of 1 m, at an angle of 30° to the horizontal, with an initial speed of 200 m/sec. Round values to 1 decimal place.

TIP The value of Tstep in the WINDOW menu affects the speed at which the calculator graphs the curve. Small values of Tstep result in more points being plotted and the curve graphed more slowly. This can be a helpful feature when you want to identify the orientation of a curve.

d. 10.2 sec **e.** 511.2 m

We conclude this section with a discussion of a special curve with interesting physical properties. Suppose that a circle rolls along a straight path in a plane. The curve traced out by a fixed point P on the circumference of the circle is called a **cycloid** (Figure 11-53).

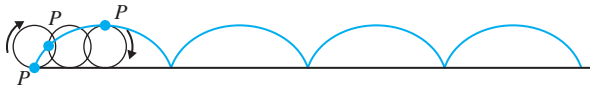

Figure 11-53

An equation of a cycloid in rectangular coordinates is quite cumbersome. Fortunately, the curve is defined nicely with parametric equations using the angle of rotation as the parameter.

Consider a circle with center C and radius r that rolls along the x-axis. Choose the origin to be one of the points where the fixed point $P(x, y)$ on the circumference of the circle touches the x-axis. In Figure 11-54, we show the position of the circle after it has rolled to the right through an angle of $0 < \theta < \frac{\pi}{2}$ radians.

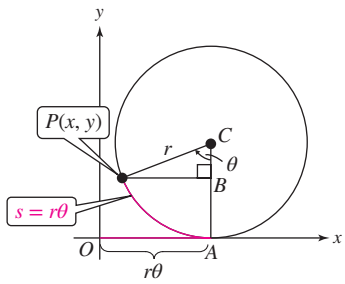

Figure 11-54

The distance $d(O, A)$ that the circle rolls along the x-axis equals the arc length s between A and P. Furthermore, recall that arc length is computed as $s = r\theta$ for θ in radians.

Thus, $d(O, A) = r\theta$. The x-coordinate of point P is given by

$$x = d(O, A) - d(P, B). \text{ Thus, } x = r\theta - r\sin\theta.$$

The y-coordinate of P is given by

$$y = d(C, A) - d(C, B). \text{ Thus, } y = r - r\cos\theta.$$

In summary, the cycloid is represented by $x = r(\theta - \sin\theta)$ and $y = r(1 - \cos\theta)$.

TIP The word "brachistochrone" is derived from the Greek (*brachistos*) meaning "shortest" and (*chronos*) meaning "time."

An inverted cycloid is generated by the same equations with a negative value of r (Figure 11-55). This curve has the interesting physical property that it is a solution to the *brachistochrone* problem posed in 1696 by Swiss mathematician Johann Bernoulli. Suppose that two points A and B lie in a vertical plane with A higher than B, but not directly above B (Figure 11-56). The brachistochrone problem asks what curve would minimize the time required for an object to slide from A to B with only the force of gravity to move it? The answer is a half-arch of an inverted cycloid. In Figure 11-56, we show several paths from A to B. Note that although a line is the shortest *distance* between points A and B, the shortest *time* to move from A to B under the influence of gravity occurs along the path of an inverted cycloid.

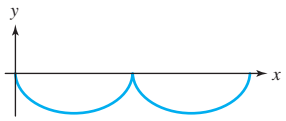

Figure 11-55 Inverted cycloid

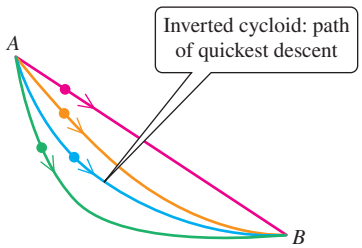

Figure 11-56

ISTUDY

TIP The word "tautochrone" is derived from the Greek (*tauto*) meaning "same" and (*chronos*) meaning "time."

The inverted cycloid also satisfies the *tautochrone* property (property of equal time). Let Q be the lowest point on one arch of an inverted cycloid. If several objects are placed at different points along the cycloid and allowed to slide down the curve under the influence of gravity, they will all reach point Q at the same time (Figure 11-57). This discovery intrigued seventeenth-century clockmakers.

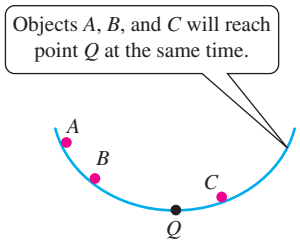

Figure 11-57

A clock made from a simple pendulum (a bob hanging from a thread swinging back and forth) has slight variations in the period with increasing amplitude of the swing. To address this problem, Dutch mathematician Christiaan Huygens constrained the swing of the pendulum between two metal plates in the shape of an inverted cycloid. As the pendulum swings, the thread wraps and unwraps around the cycloid, causing the bob to follow the path of a cycloid (Figure 11-58). Theoretically, in the absence of friction, this design would ensure equal times for each back-and-forth swing.

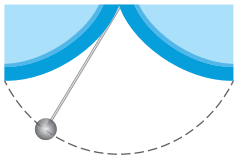

Figure 11-58

SECTION 11.6 Practice Exercises

Prerequisite Review

R.1. Solve the equation.
$5w^2 + 2w - 1 = 0$

R.2. Find the vertex by using the vertex formula.
$T(x) = x^2 - 8x + 7$

Concept Connections

1. If f and g are continuous functions of t over an interval I, then the set of points $(f(t), g(t))$ is called a _____ curve. The equations $x = f(t)$ and $y = g(t)$ are called _____ equations, and t is called the _____.

2. The parametric equations $x = 5\cos\theta$ and $y = -5\sin\theta$ define a circle. In which direction is the curve oriented? (clockwise or counterclockwise)

3. Identify the endpoints of the curve defined by $x = 3 - t$ and $y = 2t + 1$ on the interval $-2 \le t \le 1$.

4. Suppose that an object travels along a straight path in a rectangular coordinate system with units of distance in feet. If the object moves from the point (12, 18) to (36, 16) in 4 sec, the horizontal component of velocity is _____ and the vertical component of velocity is _____.

Objective 1: Graph a Plane Curve by Plotting Points

For Exercises 5–6,

a. Use the parametric equations to compute x and y for the given values of t.

b. Plot the points, sketch the curve, and indicate the orientation of the curve.

5. $x = 2t$ and $y = t + 1$ for $-3 \le t \le 1$

t	-3	-2	-1	0	1
x					
y					

6. $x = -t$ and $y = 3t - 1$ for $0 \le t \le 4$

t	0	1	2	3	4
x					
y					

For Exercises 7–10, sketch the plane curve by plotting points. Indicate the orientation of the curve. (See Example 1)

7. $x = -t^2$ and $y = t + 3$ for $-1 < t \le 3$

8. $x = t^2 - 4$ and $y = t - 1$ for $-2 \le t < 2$

9. $x = t - 4$ and $y = \sqrt{t}$

10. $x = -t - 3$ and $y = |t|$

ISTUDY

Objective 2: Eliminate the Parameter

For Exercises 11–26,

a. Eliminate the parameter and write an equation in rectangular coordinates.

b. Sketch the curve and indicate its orientation. (**See Examples 2–3**)

11. $x = t + 2$ and $y = t^2 + t$

12. $x = t - 1$ and $y = t^2 - 2t$

13. $x = t - 1$ and $y = \dfrac{t}{t-1}$

14. $x = t + 2$ and $y = \dfrac{t}{t+2}$

15. $x = |t + 3|$ and $y = 1 + t$

16. $x = |t - 3|$ and $y = t - 2$

17. $x = e^{-t}$ and $y = e^t$

18. $x = 2e^t$ and $y = e^t - 2$

19. $x = \sqrt{t}$ and $y = \sqrt{16 - t}$

20. $x = -\sqrt{9 - t}$ and $y = \sqrt{t}$

21. $x = \cos t$ and $y = \sin^2 t - 4$
(*Hint*: Use the identity $\sin^2 t + \cos^2 t = 1$.)

22. $x = -\sin t$ and $y = 1 + \cos^2 t$

23. $x = 5\cos\theta$ and $y = -5\sin\theta$

24. $x = 4\sin\theta$ and $y = -4\cos\theta$

25. $x = 1 + 2\cos\theta$ and $y = -2 + 3\sin\theta$
(*Hint*: Solve for $\sin\theta$ and $\cos\theta$. Square the results and apply the identity $\sin^2\theta + \cos^2\theta = 1$.)

26. $x = 5 + 4\sin\theta$ and $y = -3 + 2\cos\theta$

For Exercises 27–30, eliminate the parameter and write an equation in rectangular coordinates to represent the given curve.

27. Circle: $x = h + r\cos\theta$ and $y = k + r\sin\theta$ (*Hint*: Solve for $\cos\theta$ and $\sin\theta$. Then square both equations and use a Pythagorean identity.)

28. Line through the points (x_1, y_1) and (x_2, y_2): $x = x_1 + t(x_2 - x_1)$ and $y = y_1 + t(y_2 - y_1)$

29. Ellipse: $x = h + a\cos\theta$ and $y = k + b\sin\theta$

30. Hyperbola: $x = h + a\sec\theta$ and $y = k + b\tan\theta$

Objective 3: Write Parametric Equations to Represent a Curve

For Exercises 31–34, write parametric equations for the given curve for the given definitions of x. (See Example 4)

31. $y = 2x - 4$

a. $x = t$ **b.** $x = \dfrac{t}{3}$ **c.** $x = -3t$

32. $y = -4x + 1$

a. $x = t$ **b.** $x = \dfrac{t}{2}$ **c.** $x = -4t$

33. $y = x + 4$, $x > 0$

a. $x = t$, $t > 0$ **b.** $x = e^t$

34. $y = -2x$, $x \geq 0$

a. $x = t$, $t \geq 0$ **b.** $x = t^2$

For Exercises 35–42, use the results of Exercises 27–30 and use the parameter t to write parametric equations representing the given curve. Answers may vary.

35. Line passing through (0, 2) and (3, 1)

36. Line passing through (0, −1) and (4, 2)

37. Circle with center (4, −3) and radius 5

38. Circle with center $\left(-\dfrac{1}{2}, 1\right)$ and radius $\dfrac{1}{2}$

39. Hyperbola with center (0, 0), vertices (0, ±2), and asymptotes $y = \pm\dfrac{2}{3}x$

40. Hyperbola with center (1, 3), vertices (−2, 3) and (4, 3), and foci (−4, 3) and (6, 3)

41. Ellipse with center (−2, 1), vertices (1, 1) and (−5, 1), and endpoints of the minor axis (−2, 3) and (−2, −1)

42. Ellipse with center (0, 0), vertices (0, ±5), and foci (0, ±4)

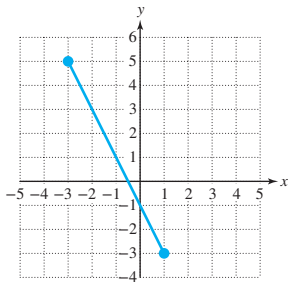
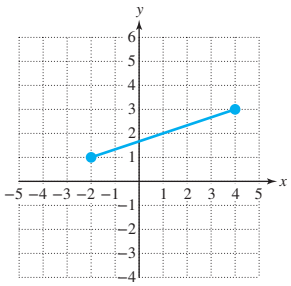
For Exercises 43–46, write parametric equations on a restricted interval for t to define the given graph.

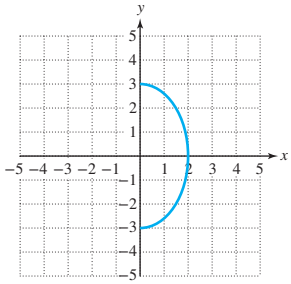
43.



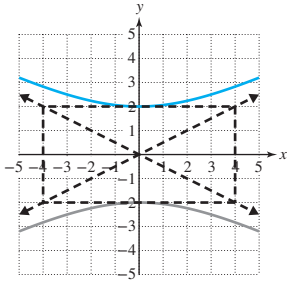
44.



45. Right half of an ellipse



46. Top branch of a hyperbola



Objective 4: Apply Parametric Equations

For Exercises 47–48, an object undergoes uniform linear motion on a straight path from point A to point B in Δt sec. Write parametric equations over an interval I that describe the motion along the path.

47. $A = (1, 5)$, $B = (7, 3)$, and $\Delta t = 2$ sec

48. $A = (10, 7)$, $B = (-14, 1)$, and $\Delta t = 6$ sec

49. Suppose that the origin on a computer screen is in the lower left corner of the screen. A target moves along a straight line at a constant speed from point $A(670, 450)$ to point $B(250, 210)$ in 4 sec. (**See Example 5**)

a. Write parametric equations to represent the target's path as a function of the time t (in sec) after the target leaves its initial position.

b. Where is the target located 1.4 sec after motion starts?

50. A hospital is located 3 mi west and 4 mi north of the center of town. Suppose that a Medi-Vac helicopter flies at a constant speed from the hospital to the location of an accident 15 mi east and 20 mi south of the center of town in 15 min $\left(\frac{1}{4}\text{ hr}\right)$. Choose a coordinate system with the origin at the center of town.

a. Write parametric equations to represent the path of the helicopter as a function of the time t (in hr) after the helicopter leaves the hospital.

b. Where is the helicopter located 10 min after leaving the hospital?

51. An artillery specialist practicing at a firing range on a flat stretch of ground fires a shell from 1 m above the ground, with a muzzle velocity of 96 m/sec at an angle of 16° from the horizontal. Choose a coordinate system with the origin at ground level directly below the launch position. (**See Example 6**)

a. Write parametric equations that model the path of the shell as a function of time t (in sec) after launch.

b. Approximate the time required for the shell to hit the ground. Round to the nearest hundredth of a second.

c. Approximate the horizontal distance that the shell travels before it hits the ground. Round to the nearest meter.

d. When is the shell at its maximum height? Find the exact value and an approximation to the nearest hundredth of a second.

e. Determine the maximum height. Round to the nearest meter.

52. A golfer tees off on level ground and hits the ball with an initial speed of 52 m/sec at an angle of 34° above the horizontal. Choose a coordinate system with the origin at the point where the ball is struck.

a. Write parametric equations that model the path of the ball as a function of time t (in sec).

b. For how long will the ball be in the air before it hits the ground? Round to the nearest hundredth of a second.

c. Approximate the horizontal distance that the ball travels before it hits the ground. Round to the nearest foot.

d. When is the ball at its maximum height? Find the exact value and an approximation to the nearest hundredth of a second.

e. What is the maximum height? Round to the nearest foot.

ISTUDY

53. Anna hits a softball at a height of 3 ft from the ground. The softball leaves the bat traveling with an initial speed of 80 ft/sec, at an angle of 30° from the horizontal. Choose a coordinate system with the origin at ground level directly under the point where the ball is struck.

a. Write parametric equations that model the path of the ball as a function of time t (in sec).

b. When is the ball at its maximum height?

c. What is the maximum height? Round to the nearest foot.

d. If an outfielder catches the ball at a height of 5 ft, how long was the ball in the air after being struck? Give the exact answer and the answer rounded to the nearest hundredth of a second.

e. How far is the outfielder from home plate when the ball is caught? Round to the nearest foot.

54. Tony hits a baseball at a height of 3 ft from the ground. The ball leaves the bat traveling with an initial speed of 120 ft/sec at an angle of 45° from the horizontal. Choose a coordinate system with the origin at ground level directly under the point where the ball is struck.

a. Write parametric equations that model the path of the ball as a function of time t (in sec).

b. When is the ball at its maximum height? Give the exact value and round to the nearest hundredth of a second.

c. What is the maximum height?

d. If an outfielder catches the ball at a height of 6 ft, for how long was the ball in the air after being struck? Give the exact answer and the answer rounded to the nearest hundredth of a second.

e. How far is the outfielder from home plate when the ball is caught? Round to the nearest foot.

Mixed Exercises

55. Two cars approach an intersection. Car A is 25 mi west of the intersection traveling 40 mph. Car B is 30 mi north of the intersection traveling 50 mph. Place the origin of a rectangular coordinate system at the intersection.

a. Write parametric equations that model the path of each car as a function of the time $t \geq 0$ (in hr).

b. Determine the times required for each car to reach the intersection. Based on these results, will the cars crash?

c. Write the distance between the cars as a function of the time t.

d. Determine the time at which the two cars are at their closest point. [*Hint*: The function from part (c) is minimized when the radicand is minimized.]

e. How close are the cars at their closest point? Round to the nearest hundredth of a mile.

56. Two planes flying at the same altitude are on a course to fly over a control tower. Plane A is 50 mi east of the tower flying 125 mph. Plane B is 90 mi south of the tower flying 200 mph. Place the origin of a rectangular coordinate system at the intersection.

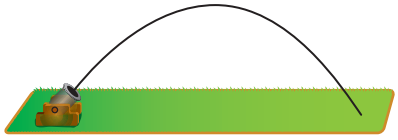
a. Write parametric equations that model the path of each plane as a function of the time $t \geq 0$ (in hr).

b. Determine the times required for each plane to reach a point directly above the tower. Based on these results, will the planes crash?

c. Write the distance between the planes as a function of the time t.

d. How close do the planes pass? Round to the nearest tenth of a mile.

57. Suppose that a mortar is fired from ground level at an angle of 45° with an initial speed of 200 ft/sec. Choose a coordinate system with the origin at the point of launch.



a. Write parametric equations to define the path of the mortar as a function of the time t (in sec).

b. What is the range of the mortar? That is, what is the horizontal distance traveled from the point of launch to the point where the mortar lands?

c. What are the coordinates of the mortar at its maximum height?

d. Eliminate the parameter and write an equation in rectangular coordinates to represent the path.

e. If a drone will be at position (848.5, 272.5) at a time 6 sec after the mortar is launched, will the mortar hit the drone? Assume a 1-ft margin of error.

58. A daredevil wants to jump over a canyon on a motorcycle. When the motorcycle leaves the ramp at the edge of the canyon, it travels approximately 88 ft/sec (60 mph) at an angle of 30°. Choose a coordinate system with the origin at the end of the take-off ramp, and assume that the motorcycle lands at the same height.

a. Write parametric equations to define the path of the motorcycle as a function of the time t (in sec) after leaving the ramp.

b. If a bird is at a position (90, 26) at a time 1.2 sec after the motorcycle leaves the ramp, will the motorcycle hit the bird? Assume a 1-ft margin of error.

c. What is the horizontal distance across the canyon from the point of take-off to the point of landing? Round to the nearest foot.

d. What are the coordinates (to the nearest foot) of the motorcycle at its maximum height?

e. Eliminate the parameter and write an equation in rectangular coordinates to represent the path.

ISTUDY

Recall from Section 8.1 that a point (x, y) in rectangular coordinates and a point (r, θ) in polar coordinates are related by the equations $x = r\cos\theta$ and $y = r\sin\theta$. Thus, the graph of the polar equation $r = f(\theta)$ is the same as the graph of the parametric equations $x = f(\theta)\cos\theta$ and $y = f(\theta)\sin\theta$. For Exercises 59–60, a polar equation is given.

a. Use a graphing utility in "polar" mode to graph the polar equation.

b. Write parametric equations to represent the graph of the polar equation.

c. Use a graphing utility in "parametric" mode to graph the parametric equations from part (b).

59. $r = 4\sin 2\theta$ for $0 \le \theta \le 2\pi$

60. $r = 3 - 4\cos\theta$ for $0 \le \theta \le 2\pi$

Write About It

For Exercises 61–62, describe the differences in the graphs of C_1 through C_3.

61. C_1: $x = t$ and $y = t^2 - 1$

C_2: $x = e^t$ and $y = e^{2t} - 1$

C_3: $x = \cos t$ and $y = \cos^2 t - 1$

62. C_1: $x = t$ and $y = \sqrt{25 - t^2}$

C_2: $x = e^t$ and $y = \sqrt{25 - e^{2t}}$

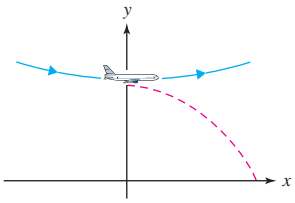
C_3: $x = \cos t$ and $y = \sqrt{25 - \cos^2 t}$

63. Do the parametric equations $x = \sqrt{t}$ and $y = t + 5$ define a parabola? Why or why not?

64. Is the point (16, 12) on the curve defined by $x = 2t$ and $y = t + 1$? Why or why not?

Expanding Your Skills

65. For a short interval of time, a military supply plane flies on a hyperbolic path given by the equation $\dfrac{y^2}{122.5^2} - \dfrac{x^2}{100^2} = 1;\ y \ge 0$, where x and y are measured in meters.



a. What are the coordinates of the point on the flight path closest to the ground?

b. When the plane reaches its closest point to the ground, it drops a bag of supplies to people on the ground. Assuming that the plane is traveling 200 m/sec due east at the time of the drop, write parametric equations representing the path of the bag as a function of the time t (in sec) after the drop.

c. Determine the coordinates of the point where the bag hits the ground.

66. Suppose that the position of one particle at time t is given by

$$x_1 = 3 + 3\cos t \text{ and } y_1 = 5\sin t \text{ for } 0 \le t \le 2\pi$$

Suppose that the position of a second particle is given by

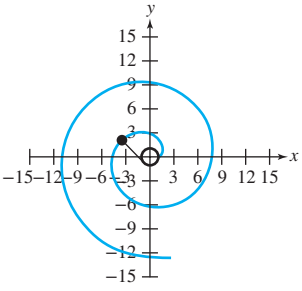
$$x_2 = \frac{6}{\pi}t \text{ and } y_2 = \frac{10}{\pi}t \text{ for } 0 \le t \le 2\pi$$

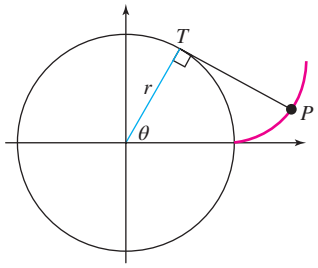
a. Use a graphing utility to graph the paths of both particles simultaneously.

b. In how many points do the graphs intersect?

c. Will the particles ever collide? If so, where and at what time?

67. Suppose that an imaginary string of unlimited length is attached to a point on a circle and pulled taut so that it is tangent to the circle. Keeping the string pulled tight, wind (or unwind) the string around the circle. The path traced out by the end of the string as it moves is called an *involute* of the circle (shown in blue).





Given a circle of radius r with parametric equations $x = r\cos\theta$, $y = r\sin\theta$, show that the parametric equations of the involute of the circle are $x = r(\cos\theta + \theta\sin\theta)$ and $y = r(\sin\theta - \theta\cos\theta)$.

ISTUDY

Technology Connections

For Exercises 68–70, use a graphing utility to graph the given curve on the recommended viewing window.

68. Witch of Agnesi:

$x = 2\cot t$ and $y = 2\sin^2 t$

t: $[0, 2\pi, 0.1]$, x: $[-6.4, 6.4, 1]$, y: $[-4, 4, 1]$

69. Lissajous curve:

$x = 3\cos 3\theta$ and $y = 3\sin 4\theta$

t: $[0, 2\pi, 0.1]$, x: $[-6.4, 6.4, 1]$, y: $[-4, 4, 1]$

70. Involute of a circle:

$x = \cos t + t\sin t$ and $y = \sin t - t\cos t$

t: $[0, 6\pi, 0.1]$, x: $[-32, 32, 4]$, y: $[-20, 20, 4]$

A cycloid is a curve created by rolling a circle along a line. We can also create families of curves by rolling a circle around another *circle*. If a circle of radius r rolls around the *interior* of a larger circle of radius R, a fixed point on the smaller circle traces out a curve called a hypocycloid. For Exercises 71–72, use the following parametric equations for a hypocycloid.

$$x = (R - r)\cos t + r\cos\left[\left(\frac{R - r}{r}\right)t\right] \text{ and } y = (R - r)\sin t - r\sin\left[\left(\frac{R - r}{r}\right)t\right]$$

71. a. Write parametric equations for a hypocycloid with $R = 3$ and $r = 1$. The curve defined by these equations is called a *deltoid*.

b. Graph the exterior circle given by $x = 3\cos t$ and $y = 3\sin t$ and the deltoid from part (a). Use $0 \le t \le 2\pi$ and a viewing window of $[-4.8, 4.8, 1]$ by $[-3, 3, 1]$.

c. For what values of t on the interval $[0, 2\pi)$ do the deltoid curve and circle intersect?

72. a. Write parametric equations for a hypocycloid with $R = 4$ and $r = 1$. The curve defined by these equations is called an *astroid* (not to be confused with asteroid).

b. Graph the exterior circle given by $x = 4\cos t$ and $y = 4\sin t$ and the astroid from part (a). Use $0 \le t \le 2\pi$ and a viewing window of $[-6.4, 6.4, 1]$ by $[-4, 4, 1]$.

c. For what values of t on the interval $[0, 2\pi)$ do the astroid curve and circle intersect?

If a circle of radius r rolls around the *exterior* of a circle of radius $R \ge r$, a fixed point on the outer circle traces out a curve called an epicycloid. For Exercises 73–74, use the following parametric equations for an epicycloid.

$$x = (R + r)\cos t - r\cos\left[\left(\frac{R + r}{r}\right)t\right] \text{ and } y = (R + r)\sin t - r\sin\left[\left(\frac{R + r}{r}\right)t\right]$$

73. a. Write parametric equations for a epicycloid with $R = 1$ and $r = 1$. The curve defined by these equations is called a *cardioid*.

b. Graph the circle given by $x = \cos t$ and $y = \sin t$ and the *cardioid* from part (a). Use $0 \le t \le 2\pi$ and a viewing window of $[-6.4, 6.4, 1]$ by $[-4, 4, 1]$.

74. a. Write parametric equations for a epicycloid with $R = 2$ and $r = 1$. The curve defined by these equations is called a *nephroid*, meaning "kidney-shaped."

b. Graph the circle given by $x = 2\cos t$ and $y = 2\sin t$ and the *nephroid* from part (a). Use $0 \le t \le 2\pi$ and a viewing window of $[-6.4, 6.4, 1]$ by $[-4, 4, 1]$.

75. Suppose that a projectile is fired at an angle of inclination θ, where $0 < \theta < \frac{\pi}{2}$, with an initial speed of v_0. The parametric equations representing the path of points (x, y) at time t are given by:

$$x = v_0 t\cos\theta$$
$$y = v_0 t\sin\theta - \frac{gt^2}{2}$$

where g is the acceleration due to gravity.

a. Find the value of t when the projectile hits the ground.

b. If $\theta = \frac{\pi}{6}$, $v_0 = 128$ ft/sec, and $g = 32$ ft/sec^2, how long will it take for the projectile to hit the ground? What is the maximum height of the projectile over its path?

c. Eliminate the parameter t to isolate the y variable.

d. Use a graphing utility to graph the path of the projectile with the values of θ, v_0, and g given in part (b).

ISTUDY

CHAPTER 11 KEY CONCEPTS

SECTION 11.1 The Ellipse

Reference

An **ellipse** is the set of all points (x, y) in a plane such that the sum of the distances between (x, y) and two fixed points is a constant. The fixed points are called the **foci** of the ellipse. p. 990

Standard forms of an equation of an ellipse: p. 995

- Major axis horizontal:

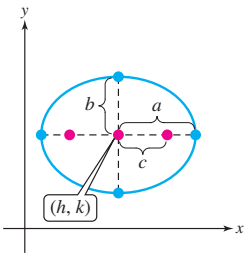
  Equation: $\dfrac{(x-h)^2}{a^2}+\dfrac{(y-k)^2}{b^2}=1 \qquad a>b>0;\ c^2=a^2-b^2\ (c>0)$

  Center: (h, k)

  Vertices: $(h+a, k), (h-a, k)$

  Foci: $(h+c, k), (h-c, k)$

  Minor axis endpoints: $(h, k+b), (h, k-b)$



- Major axis vertical:

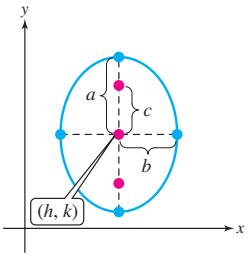
  Equation: $\dfrac{(x-h)^2}{b^2}+\dfrac{(y-k)^2}{a^2}=1 \qquad a>b>0;\ c^2=a^2-b^2\ (c>0)$

  Center: (h, k)

  Vertices: $(h, k+a), (h, k-a)$

  Foci: $(h, k+c), (h, k-c)$

  Minor axis endpoints: $(h+b, k), (h-b, k)$



$2a$ is the length of the major axis.
$2b$ is the length of the minor axis. p. 995

The **eccentricity** $e=\frac{c}{a}$ of an ellipse measures the degree of elongation. Note that for an ellipse, $0<e<1$. p. 999

SECTION 11.2 The Hyperbola

Reference

A **hyperbola** is the set of all points (x, y) in a plane such that the difference in distances between (x, y) and two fixed points (foci) is a positive constant. p. 1008

Standard forms of an equation of a hyperbola: p. 1013

- Transverse axis horizontal:

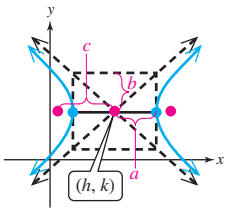
  Equation: $\dfrac{(x-h)^2}{a^2}-\dfrac{(y-k)^2}{b^2}=1 \qquad a>0, b>0;\ c^2=a^2+b^2\ (c>0)$

  Center: (h, k)

  Vertices: $(h+a, k), (h-a, k)$

  Foci: $(h+c, k), (h-c, k)$

  Asymptotes: $y-k=\pm\frac{b}{a}(x-h)$



- Transverse axis vertical:

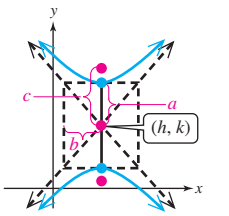
  Equation: $\dfrac{(y-k)^2}{a^2}-\dfrac{(x-h)^2}{b^2}=1 \qquad a>0, b>0;\ c^2=a^2+b^2\ (c>0)$

  Center: (h, k)

  Vertices: $(h, k+a), (h, k-a)$

  Foci: $(h, k+c), (h, k-c)$

  Asymptotes: $y-k=\pm\frac{a}{b}(x-h)$



$2a$ is the length of the transverse axis.
$2b$ is the length of the conjugate axis. p. 1013

The **eccentricity** of a hyperbola is given by $e=\frac{c}{a}$. Note that for a hyperbola, $e>1$. p. 1016

SECTION 11.3 The Parabola

	Reference
A **parabola** is the set of all points in a plane that are equidistant from a fixed line (called the **directrix**) and a fixed point (called the **focus**).	p. 1026

Standard forms of an equation of a parabola: p. 1030

- Vertical axis of symmetry:
  Equation: $(x-h)^2 = 4p(y-k)$
  Vertex: (h, k)
  Focus: $(h, k+p)$
  Directrix: $y = k-p$
  Axis of symmetry: $x = h$

  - If $p > 0$, the parabola opens upward as shown.
  - If $p < 0$, the parabola opens downward.

- Horizontal axis of symmetry:
  Equation: $(y-k)^2 = 4p(x-h)$
  Vertex: (h, k)
  Focus: $(h+p, k)$
  Directrix: $x = h-p$
  Axis of symmetry: $y = k$

  - If $p > 0$, the parabola opens to the right as shown.
  - If $p < 0$, the parabola opens to the left.

The value of $\lvert p \rvert$ is the focal length (distance between the vertex and focus).	p. 1028
The **latus rectum** is the line segment perpendicular to the axis of symmetry, through the focus, with endpoints on the parabola.	p. 1028
The value of $4\lvert p \rvert$ is the focal diameter (length of the latus rectum).	p. 1028

SECTION 11.4 Rotation of Axes

Rotation of axes: p. 1044

Suppose that the x- and y-axes in a rectangular coordinate system are rotated about the origin through an angle θ to form the x'- and y'-axes.

x and y in terms of x' and y'	x' and y' in terms of x and y
$x = x'\cos\theta - y'\sin\theta$	$x' = x\cos\theta + y\sin\theta$
$y = x'\sin\theta + y'\cos\theta$	$y' = -x\sin\theta + y\cos\theta$

Determine the angle of rotation: p. 1046

To write the general second-degree polynomial equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

with no xy term, rotate the axes through an acute angle θ given by

$$\cot 2\theta = \frac{A-C}{B}$$

Graphing a rotated conic: p. 1046

1. Determine the angle of rotation.
2. Substitute $x = x'\cos\theta - y'\sin\theta$ and $y = x'\sin\theta + y'\cos\theta$ into the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$. The resulting equation will have no xy term.
3. Write the equation from Step 2 in standard form and graph the conic relative to the x'- and y'-axes.

Identify conics by the discriminant of the equation, $B^2 - 4AC$: p. 1049

Excluding degenerate cases, the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ represents

An ellipse (or a circle) if $B^2 - 4AC < 0$.

A hyperbola if $B^2 - 4AC > 0$.

A parabola if $B^2 - 4AC = 0$.

ISTUDY

SECTION 11.5 Polar Equations of Conics	Reference
Alternative definition of conics: Let l be a fixed line (**directrix**) in a plane and let F be a fixed point (**focus**) in the plane, not on the line. A **conic** is the set of points P in the plane such that the ratio of the distance between P and F to the distance from P to l is a constant positive real number e (the **eccentricity**). That is, $\frac{d(P, F)}{d(P, l)} = e$.	p. 1055
Polar equations of conics: A polar equation of the form $r = \frac{ed}{1 \pm e\cos\theta}$ or $r = \frac{ed}{1 \pm e\sin\theta}$ is a conic with focus at the pole and eccentricity $e > 0$. The value $\lvert d \rvert$ is the distance between the focus at the pole and the directrix. The conic is 1. A parabola if $e = 1$ (axis of symmetry perpendicular to the directrix). 2. An ellipse if $0 < e < 1$ (major axis perpendicular to the directrix). 3. A hyperbola if $e > 1$ (transverse axis perpendicular to the directrix). The location of the directrix and orientation of the curve for $d > 0$ are summarized in Figure 11-41 on page 1057.	p. 1056
Guidelines to graph a conic in polar form: 1. Write the polar equation in the form $r = \frac{ed}{1 \pm e\cos\theta}$ or $r = \frac{ed}{1 \pm e\sin\theta}$. 2. Determine the value of the eccentricity e and identify the type of conic. 3. Determine the orientation of the conic. 4. Plot points at $\theta = 0, \frac{\pi}{2}, \pi$, and $\frac{3\pi}{2}$. 5. Identify key characteristics of the conic as desired (center, vertices, length of major/minor/transverse/conjugate axes, directrix).	p. 1057
Rotation of conics in polar form: The rotation of a conic about the origin is much more convenient when the conic is expressed in polar versus rectangular form. Consider the graph of $r = f(\theta)$. Replacing θ by $(\theta - \alpha)$ results in • A counterclockwise rotation (rotation through a positive angle) if $\alpha > 0$. • A clockwise rotation (rotation through a negative angle) if $\alpha < 0$.	p. 1061
SECTION 11.6 Plane Curves and Parametric Equations	**Reference**
Plane curves: Let f and g be functions of t over an interval I. Then the set of points defined by $(x, y) = (f(t), g(t))$ is called a plane curve. The equations $x = f(t)$ and $y = g(t)$ are called parametric equations of the curve, and t is called the parameter.	p. 1065
Graphing a plane curve: • One method to graph a plane curve defined by parametric equations is to create a table of points. • Another method to graph a plane curve is to eliminate the parameter t, by solving for t or an expression involving t in one equation. Then substitute the result in the other equation. Note any restrictions on the domain of the rectangular equation so that the resulting graph is consistent with the restrictions on x and y in the parametric equations.	pp. 1065–1067

ISTUDY

Applications of parametric equations:
Parametric equations are particularly well suited for describing objects in motion. Let $t \geq 0$ represent the time under which an object is in motion along a plane curve, and let (x_0, y_0) represent the initial position of the object at $t = 0$.

p. 1070

Uniform linear motion

$x = x_0 + at$
$y = y_0 + bt$

The values of a and b are the horizontal and vertical components of velocity, respectively.

Projectile motion*

$x = (v_0 \cos\theta)t + x_0$

$y = -\frac{1}{2}gt^2 + (v_0 \sin\theta)t + y_0$

*Assuming negligible air resistance.

θ is the angle of launch relative to the horizontal, and v_0 is the initial speed (magnitude of the initial velocity). The value of g is the acceleration due to gravity, where $g = 32$ ft/sec^2 or $g = 9.8$ m/sec^2 on the surface of the Earth.

Detailed Chapter Summaries are available with the online resources.

CHAPTER 11 Review Exercises

SECTION 11.1

1. How are the graphs of these ellipses similar and how are they different?

$$\frac{x^2}{100} + \frac{y^2}{225} = 1 \qquad \frac{(x-1)^2}{100} + \frac{(y+7)^2}{225} = 1$$

For Exercises 2–5, an equation of an ellipse is given.

a. Identify the center.
b. Identify the vertices.
c. Identify the endpoints of the minor axis.
d. Identify the foci.
e. Determine the eccentricity.
f. Graph the ellipse.

2. $\frac{x^2}{289} + \frac{y^2}{64} = 1$

3. $15x^2 + 9y^2 = 135$

4. $\frac{(x+1)^2}{9} + \frac{(y-4)^2}{25} = 1$

5. $\frac{(x-1)^2}{16} + \frac{(y-2)^2}{9} = 1$

For Exercises 6–7,

a. Write the equation of the ellipse in standard form.
b. Identify the center, vertices, endpoints of the minor axis, and foci.

6. $5x^2 + 8y^2 + 40x - 16y + 48 = 0$

7. $100x^2 + 64y^2 - 100x - 1575 = 0$

For Exercises 8–10, write the standard form of an equation of the ellipse subject to the given conditions.

8. Vertices: $(4, 0)$ and $(-4, 0)$;
Foci: $(\sqrt{11}, 0)$ and $(-\sqrt{11}, 0)$

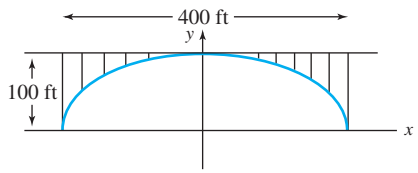
9. Endpoints of minor axis: $(0, 1)$ and $(6, 1)$;
Foci: $(3, 5)$ and $(3, -3)$

10. Minor axis parallel to x-axis; Center: $(2, -4)$;
Length of major axis: 20 units;
Length of minor axis: 12 units

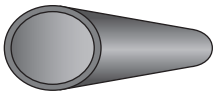
11. Suppose that one ellipse has an eccentricity of $\frac{4}{7}$ and a second ellipse has an eccentricity of $\frac{5}{7}$. Which ellipse is more elongated?

12. Jupiter orbits the Sun in an elliptical path with the Sun at one focus. At perihelion, Jupiter is closest to the Sun at 7.4052×10^8 km. If the eccentricity of the orbit is 0.0489, determine the distance at aphelion (farthest point between Jupiter and the Sun). Round to the nearest million km.

13. A bridge over a gorge is supported by an arch in the shape of a semiellipse. The length of the bridge is 400 ft and the maximum height is 100 ft. Find the height of the arch 50 ft from the center. Round to the nearest foot.



14. Elliptical concrete pipes have a greater capacity for shallow flow than circular pipes. For this reason, elliptical pipes are often used in storm drains, culverts, and sewers.



An engineer wants to design an elliptical concrete pipe with a maximum horizontal opening of 4 ft and a maximum vertical opening of 3 ft.

a. Write an equation for an elliptical cross section of the pipe. For convenience, place the coordinate system with (0, 0) at the center of the pipe.

b. To construct the pipe, the engineer needs to know the location of the foci. How far from the center are the foci?

SECTION 11.2

For Exercises 15–16, an equation of a hyperbola is given. Determine whether the transverse axis is horizontal or vertical.

15. $\frac{x^2}{11} - \frac{y^2}{16} = 1$ **16.** $-\frac{x^2}{11} + \frac{y^2}{16} = 1$

For Exercises 17–20, an equation of a hyperbola is given.

a. Identify the center.
b. Identify the vertices.
c. Identify the foci.
d. Write equations for the asymptotes.
e. Graph the hyperbola.

17. $\frac{x^2}{9} - \frac{y^2}{4} = 1$ **18.** $-3x^2 + 2y^2 = 18$

19. $-\frac{(x+3)^2}{16} + \frac{(y-2)^2}{9} = 1$

20. $\frac{(x-1)^2}{4} - (y+5)^2 = 1$

For Exercises 21–22,

a. Write the equation of the hyperbola in standard form.
b. Identify the center, vertices, and foci.

21. $11x^2 - 7y^2 + 44x - 56y - 145 = 0$

22. $-9x^2 + y^2 + 2y - 8 = 0$

For Exercises 23–25, write the standard form of an equation of a hyperbola subject to the given conditions.

23. Vertices: (4, 0), (−4, 0);
Foci: (5, 0), (−5, 0)

24. Vertices (0, 13), (0, −11);
Slope of asymptotes: $\pm\frac{12}{5}$

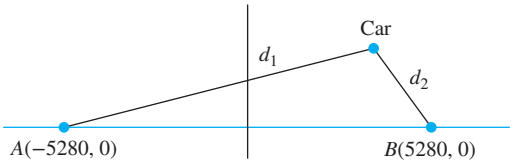
25. Corners of reference rectangle:
(19, 15), (19, −1), (−15, −1), (−15, 15);
Horizontal transverse axis

26. Suppose that one hyperbola has an eccentricity of $\frac{41}{40}$ and a second hyperbola has an eccentricity of $\frac{41}{9}$. For which hyperbola do the branches open "wider"?

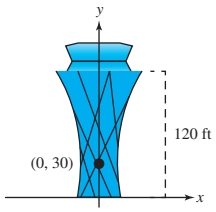
27. Solve the system of equations.

$$6x^2 - 2y^2 = -12$$
$$2x^2 + y^2 = 11$$

28. Suppose that two people standing 2 mi (10,560 ft) apart at points A and B hear a car backfire. The time difference between the sound heard at point A and the sound heard at point B is 8 sec. If sound travels 1100 ft/sec, find an equation of the hyperbola (with foci at A and B) on which the point of origination of the sound must lie.



29. A 120-ft flight control tower in the shape of a hyperboloid has hyperbolic cross sections perpendicular to the ground. Placing the origin at the bottom and center of the tower, the center of a hyperbolic cross section is (0, 30) with one focus at $(15\sqrt{10}, 30)$ and one vertex at (15, 30). All units are in feet.



a. Write an equation of a hyperbolic cross section through the origin. Assume that there are no restrictions on x or y.

b. Determine the diameter of the tower at the base. Round to the nearest foot.

c. Determine the diameter of the tower at the top. Round to the nearest foot.

SECTION 11.3

For Exercises 30–33, an equation of a parabola is given in standard form.

a. Determine the value of p.
b. Identify the vertex.
c. Identify the focus.
d. Determine the focal diameter.
e. Determine the endpoints of the latus rectum.
f. Write an equation of the directrix.
g. Write an equation for the axis of symmetry.
h. Graph the parabola.

30. $x^2 = -2y$ **31.** $\frac{1}{10}y^2 = 2x$

32. $(y+2)^2 = -4(x-3)$ **33.** $(x-\frac{1}{2})^2 = 6(y-3)$

For Exercises 34–35, an equation of a parabola is given.

a. Write the equation of the parabola in standard form.
b. Identify the vertex, focus, and directrix.

34. $x^2 - 10x - 4y + 17 = 0$

35. $4y^2 - 12y + 56x + 177 = 0$

ISTUDY

For Exercises 36–37, fill in the blank. Let $|p|$ represent the focal length (distance between the vertex and focus).

36. If the directrix of a parabola is given by $y = 3$ and the focus is $(4, 1)$, then the vertex is given by the ordered pair _____, and the value of p is _____.

37. If the vertex of a parabola is $(10, -4)$ and the focus is $(2, -4)$, then the directrix is given by the equation _____, and the value of p is _____.

For Exercises 38–40, determine the standard form of the parabola subject to the given conditions.

38. Vertex: $(3, 2)$; Directrix: $x = 5$

39. Vertex: $(-4, 7)$; Focus $(-4, -1)$

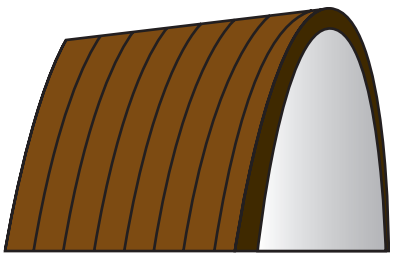
40. Focus: $(0, -3)$; Directrix: $y = -6$

41. Solve the system of equations.

$$(y + 2)^2 = 3(x - 5)$$
$$x - y = 7$$

42. The longest span of the Brooklyn Bridge is suspended from cables supported by two towers approximately 1596 ft apart. The tops of the towers are 142 ft above the road. Assuming that the cables are parabolic and are at road level halfway between the towers, find the height of the cables above the roadway 200 ft from either end. Round to the nearest foot.

43. Two large airship hangars were built in Orly, France, in the early 1900s but were destroyed in World War II by American aircraft. The hangars were 175 m in length, 90 m wide, and 60 m high and were formed by a series of parabolic arches.



a. Set up a coordinate system with $(0, 0)$ at the vertex of one of the arches and write an equation of the parabola.

b. What is the focal length of an arch?

SECTION 11.4

For Exercises 44–45, the given equation represents a conic section (nondegenerative case). Identify the type of conic section.

44. a. $3x^2 + 6xy + 2y^2 - 4x + y - 4 = 0$

b. $3x^2 + 2y^2 - 4x + y - 4 = 0$

c. $9x^2 - 12xy = -4y^2 - 4y + 8$

45. a. $2x^2 + xy + 6y^2 + 4x - 12y - 10 = 0$

b. $2x^2 + 10x = y^2 + 8y - 6$

c. $x^2 + 4y^2 = 4xy - x + 6y + 3$

For Exercises 46–48, assume that the x- and y-axes are rotated through angle θ about the origin to form the x'- and y'-axes.

46. Given $\theta = 60°$ and $P(-8, -10)$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.

47. Given $\theta = 45°$ and $P(8\sqrt{2}, -4\sqrt{2})$ in the $x'y'$-plane, find the coordinates of P in the xy-plane.

48. Given $\theta = 45°$, write the equation $xy + 10 = 0$ in $x'y'$-coordinates.

For Exercises 49–51, an equation of a conic section (nondegenerative case) is given.

a. Identify the type of conic section.

b. Determine an acute angle of rotation to eliminate the xy term.

c. Use a rotation of axes to eliminate the xy term in the equation.

d. Sketch the graph.

49. $47x^2 + 34\sqrt{3}xy + 13y^2 - 64 = 0$

50. $5x^2 - 6xy + 5y^2 - 34\sqrt{2}x + 30\sqrt{2}y + 122 = 0$

51. $16x^2 - 24xy + 9y^2 + 60x + 80y = 0$

For Exercises 52–53, the equation represents a conic section (nondegenerative case).

a. Identify the type of conic section.

b. Graph the equation on a graphing utility.

52. $4x^2 + 3xy - 2y^2 + 8x - 12y - 10 = 0$

53. $2x^2 - 2xy + 3y^2 + 8x - 6y - 4 = 0$

SECTION 11.5

For Exercises 54–59,

a. Identify the type of conic represented by the equation.

b. Give the eccentricity and write an equation for the directrix in rectangular coordinates.

c. Give the coordinates of the vertex or vertices in polar coordinates.

d. Sketch the graph.

54. $r = \dfrac{3}{2 - 2\sin\theta}$ **55.** $r = \dfrac{2}{3 - 2\sin\theta}$

56. $r = \dfrac{2}{2 - 3\sin\theta}$ **57.** $r = \dfrac{1}{1 + 2\cos\theta}$

58. $r = \dfrac{1}{2 + \cos\theta}$ **59.** $r = \dfrac{2}{1 + \cos\theta}$

60. Write an equation of the parabola $r = \dfrac{10}{4 + 4\sin\theta}$ rotated about the origin through the given angle.

a. Counterclockwise $\dfrac{2\pi}{3}$ **b.** Clockwise $\dfrac{3\pi}{4}$

ISTUDY

61. Write an equation of the hyperbola $r = \dfrac{8}{4 - 5\cos\theta}$ rotated about the origin through the given angle.

a. Counterclockwise $\frac{\pi}{3}$ **b.** Clockwise $\frac{\pi}{2}$

For Exercises 62–63, write a polar equation of a conic subject to the given conditions.

62. $e = \frac{3}{4}$, Directrix $x = 4$

63. $e = 1$, Directrix is parallel to the polar axis and 3 units below the pole.

SECTION 11.6

64. $x = |4 - t|$ and $y = t - 2$ for $1 \le t < 5$

a. Use the parametric equations to compute x and y for the given values of t.

t	1	2	3	4	5
x					
y					

b. Plot the points, sketch the curve, and indicate the orientation of the curve.

65. $x = 4 - t^2$ and $y = -2t$ for $-2 \le t < 2$

Sketch the plane curve by plotting points. Indicate the orientation of the curve.

For Exercises 66–70,

a. Eliminate the parameter and write an equation in rectangular coordinates.

b. Sketch the curve and indicate its orientation.

66. $x = t^4 + 1$ and $y = t^2$

67. $x = 2\sqrt{t} - 4$ and $y = \sqrt{t} + 1$

68. $x = -7\sin\theta$ and $y = 7\cos\theta$

69. $x = 2 + 3\cos\theta$ and $y = -1 + 4\sin\theta$

70. $x = 4\cos^2 t$ and $y = 4\sin^2 t$

71. For each given curve, the parameter t represents the time over which an object traverses the curve. Describe the curves and discuss the motion along the curves.

C_1: $x = 2\cos\theta$ and $y = 4\sin\theta$, $0 \le \theta \le \pi$

C_2: $x = -2\sin\theta$ and $y = -4\cos\theta$, $0 \le \theta \le \pi$

72. An object undergoes uniform linear motion on a path from point $A(10, -2)$ to point $B(-6, 6)$ in 4 sec. Write parametric equations over an interval I that describe the motion along the path.

73. Suppose that the origin on a computer screen is at the lower left corner of the screen. A target moves along a straight line at a constant speed from point $A(52, 410)$ to point $B(412, 140)$ in 3 sec.

a. Write parametric equations to represent the target's path as a function of the time t (in sec) after the target leaves its initial position. All distances are in pixels.

b. Where is the target located 0.8 sec after motion starts?

c. Suppose that a bullet is fired from a gun at a position of (212, 150). Suppose the bullet travels with uniform speed where both the horizontal component of velocity and vertical component of velocity is 40 pixels per second in the positive direction. Write parametric equations to represent the path of the bullet.

d. If the bullet leaves the gun at the same time that the target begins its motion, will the bullet hit the target? If so, when and where?

74. A stunt driver steers a car off a 10-m cliff at a speed of 25 m/sec. The road leading to the edge of the cliff is inclined upward at an angle of 16°. Choose a coordinate system with the origin at the base of the cliff directly under the point where the car leaves the edge.

a. Write parametric equations defining the path of the car.

b. How long is the car in the air? Round to the nearest tenth of a second.

c. How far from the base of the cliff will the car land? Round to the nearest foot.

75. Suppose that a baseball is thrown at an angle of 30° with an initial speed of 88 ft/sec from an initial height of 3 ft. Choose a coordinate system with the origin at ground level directly under the point of release.

a. Write parametric equations defining the path of the ball.

b. When will the ball reach its highest point?

c. Determine the coordinates of the ball at its highest point. Give the exact values and the coordinates rounded to the nearest tenth of a foot.

d. If another player catches the ball at a height of 4 ft on the way down, how long was the ball in the air? Round to the nearest hundredth of a second.

e. How far apart are the two players? Round to the nearest foot.

f. Eliminate the parameter and write an equation in rectangular coordinates to represent the path of the ball.

ISTUDY

CHAPTER 11 Test

1. How are the graphs of these ellipses similar, and how are they different?

$$\frac{x^2}{36}+\frac{y^2}{144}=1 \qquad \frac{x^2}{144}+\frac{y^2}{36}=1$$

2. Write the standard form of an equation of a circle with center (h, k) and radius r.
3. Write the standard form of an equation of an ellipse with center (h, k) and major axis horizontal.
4. Write the standard form of an equation of an ellipse with center (h, k) and major axis vertical.
5. Write the standard form of an equation of a hyperbola with center (h, k) and transverse axis vertical.
6. Write the standard form of an equation of a hyperbola with center (h, k) and transverse axis horizontal.
7. Write the standard form of an equation of a parabola with vertex (h, k) and vertical axis of symmetry.
8. Write the standard form of an equation of a parabola with vertex (h, k) and horizontal axis of symmetry.

For Exercises 9–16,

a. Identify the equation as representing a circle, an ellipse, a hyperbola, or a parabola.

b. Graph the curve.

c. Identify key features of the graph. That is,

- If the equation represents a circle, identify the center and radius.
- If the equation represents an ellipse, identify the center, vertices, endpoints of the minor axis, foci, and eccentricity.
- If the equation represents a hyperbola, identify the center, vertices, foci, equations of the asymptotes, and eccentricity.
- If the equation represents a parabola, identify the vertex, focus, endpoints of the latus rectum, equation of the directrix, and equation of the axis of symmetry.

9. $\dfrac{(x-2)^2}{9}+\dfrac{y^2}{16}=1$

10. $\dfrac{(x-2)^2}{9}-\dfrac{y^2}{16}=1$

11. $\dfrac{(x-2)^2}{16}+y=0$

12. $x^2+y^2-4x-6y+1=0$

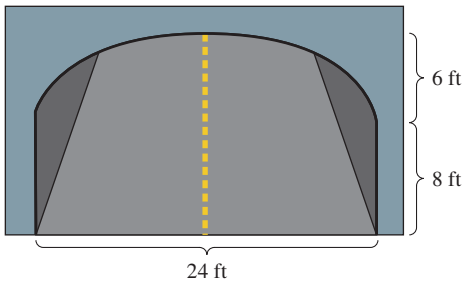
13. $-9x^2+16y^2+64y-512=0$

14. $9x^2+25y^2+72x-50y-731=0$

15. $\dfrac{(x+4)^2}{4}+\dfrac{(y-1)^2}{4}=1$

16. $y^2-8y-8x+40=0$

17. The entrance to a tunnel is in the shape of a semiellipse over a 24-ft by 8-ft rectangular opening. The height at the center of the opening is 14 ft.



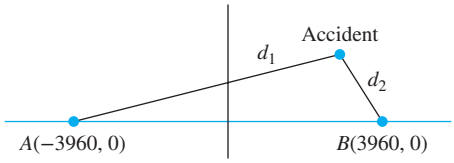
a. Determine the height of the opening at a point 6 ft from the edge of the tunnel. Round to 1 decimal place.

b. Can a 10-ft-high truck pass through the opening if the truck's outer wheel passes at a point 3 ft from the edge of the tunnel?

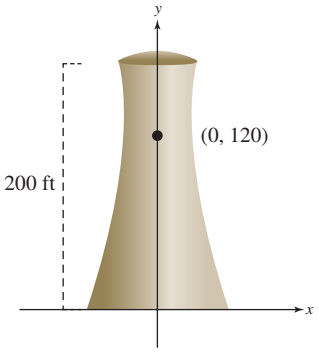
c. Set up a coordinate system with the origin placed on the ground in the center of the roadway. Write a function that represents the height of the opening $h(x)$ (in ft) as a function of the horizontal distance x (in ft) from the center.

18. Neptune orbits the Sun in an elliptical path with the Sun at one focus. At aphelion, Neptune is farthest from the Sun at 4.546×10^9 km. If the eccentricity of the orbit is 0.0113, determine the distance at perihelion (closest point between Neptune and the Sun). Round to the nearest million km.

19. Suppose that two people standing 1.5 mi (7920 ft) apart at points A and B hear a car accident. The time difference between the sound heard at point A and the sound heard at point B is 6 sec. If sound travels 1100 ft/sec, find an equation of the hyperbola (with foci at A and B) at which the accident occurred.



20. A building in the shape of a hyperboloid has hyperbolic cross sections perpendicular to the ground. Placing the origin at the bottom and center of the building, the center of a hyperbolic cross section is (0, 120) with one vertex at (12, 120) and one focus at $(12\sqrt{10}, 120)$. All units are in feet.



a. Write an equation of a hyperbolic cross section through the origin. Assume that there are no restrictions on x or y.

b. Determine the diameter of the building at the base. Round to the nearest tenth of a foot.

c. Determine the diameter of the building at the top. Round to the nearest tenth of a foot.

21. The middle span of the Golden Gate Bridge in San Francisco is supported by cables from two towers 4200 ft apart. The tops of the towers are 500 ft above the roadway. Assuming that the cables are parabolic and are at road level halfway between the towers, find the height of the cables 1000 ft from the center of the bridge. Round to the nearest foot.

22. Write the standard form of an equation of a parabola with focus (1, 6) and directrix $y = -2$.

23. Write the standard form of an equation of an ellipse with vertices (2, −3) and (6, −3) and foci (3, −3) and (5, −3).

24. Write the standard form of an equation of a hyperbola with vertices (4, −1) and (4, 7) and foci (4, −3) and (4, 9).

25. Write the standard form of an equation of a hyperbola with vertices (−1, −3) and (5, −3) and slope of one asymptote $\frac{4}{3}$.

26. If the major axis of an ellipse is 26 units in length and the minor axis is 10 units in length, determine the eccentricity of the ellipse.

27. If the transverse axis of a hyperbola is 20 units and the conjugate axis is 12 units, determine the eccentricity of the hyperbola.

28. If the directrix of a parabola is $x = 2$, and the focus is (−4, 0), determine the focal length and the focal diameter.

29. If the asymptotes of a hyperbola are $y = \frac{3}{5}x + 1$ and $y = -\frac{3}{5}x + 1$, identify the center of the hyperbola.

30. Solve the system of equations.

$$3x^2 - 4y^2 = -13$$
$$5x^2 + 2y^2 = 13$$

31. Describe the graph of the equation.

$$x = -4\sqrt{1 - \frac{y^2}{9}}$$

32. Each equation represents a conic section (nondegenerative case). Identify the type of conic section.

a. $50x^2 - 20xy + 2y^2 - 100x + 8y - 9 = 0$

b. $4x^2 - 16x = -9y^2 + 18y + 4$

c. $x^2 + 4xy = -2y^2 + 2x - 16y + 4$

33. Identify the conic each equation represents and give the eccentricity.

a. $r = \dfrac{6}{2 + 3\sin\theta}$

b. $r = \dfrac{10}{3 - 3\sin\theta}$

c. $r = \dfrac{12}{6 + 3\cos\theta}$

For Exercises 34–35, assume that the x- and y-axes are rotated through angle θ about the origin to form the x'- and y'-axes.

34. Given $\theta = 30°$ and $P(8\sqrt{3}, -2\sqrt{3})$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.

35. Given $\theta = 45°$, write the equation $x^2 + 2xy + y^2 + 3\sqrt{2}x + \sqrt{2}y + 2 = 0$ in $x'y'$-coordinates.

For Exercises 36–37, an equation of a conic (nondegenerative case) is given.

a. Identify the type of conic.

b. Determine an acute angle of rotation to eliminate the xy term. Round to the nearest tenth of a degree if necessary.

c. Use a rotation of axes to eliminate the xy term in the equation.

d. Sketch the graph.

36. $13x^2 - 10xy + 13y^2 - 24\sqrt{2}x - 24\sqrt{2}y = 0$

37. $8x^2 + 6xy + 9 = 0$

For Exercises 38–39, an equation of a conic is given.

a. Identify the type of conic represented by the equation.

b. Give the eccentricity and write an equation of the directrix in rectangular coordinates.

c. Give the coordinates of the vertex or vertices in polar coordinates.

d. Sketch the graph.

38. $r = \dfrac{8}{4 + 6\sin\theta}$

39. $r = \dfrac{14}{6 - 6\cos\theta}$

40. Write a polar equation of a conic with $e = 2$ directrix $y = 3$.

ISTUDY

For Exercises 41–42,

a. Eliminate the parameter.

b. Sketch the curve and show the orientation of the curve.

41. $x = 2 - t$ and $y = -2 + 3t$ for $-1 \le t < 2$

42. $x = 2 - 3\sin\theta$ and $y = 3\cos\theta$

43. Write parametric equations describing the motion of a particle moving under uniform linear motion from point $A(3, 4)$ to point $B(12, -2)$ in 3 sec.

44. A pyrotechnic rocket is fired from a platform 2 ft high at an angle of 60° from the horizontal with an initial speed of 72 ft/sec. Choose a coordinate system with the origin at ground level directly below the launch position.

a. Write parametric equations that model the path of the shell as a function of the time t (in sec) after launch.

b. Approximate the time required for the shell to hit the ground. Round to the nearest hundredth of a second.

c. Approximate the horizontal distance that the shell travels before it hits the ground. Round to the nearest foot.

d. When is the shell at its maximum height? Find the exact value and an approximation to the nearest hundredth of a second.

e. Determine the maximum height.

45. The equation $5x^2 - 10xy + 5y^2 + 10x - 15y - 9 = 0$ represents a conic section (nondegenerative case).

a. Identify the type of conic section.

b. Graph the equation on a graphing utility.

46. The equation $r = \dfrac{8}{4 - 2\cos\theta}$ represents a conic.

a. Identify the type of conic.

b. Give a new equation if the graph of the conic is rotated clockwise about the origin through the angle $\theta = \dfrac{5\pi}{6}$.

c. Graph both equations on a graphing utility.

47. Use the parametric mode to graph the curve on a graphing utility.

$x = \sin 4t$ and $y = 3\cos t$, $0 \le t \le 2\pi$

CHAPTER 11 Cumulative Review Exercises

1. Use long division to divide.
$(3x^4 - 2x^3 - 5x + 1) \div (x^2 + 3)$

2. Is -4 a zero of the polynomial $f(x) = 3x^4 - 6x^3 + 5x - 12$?

3. Is $(x - 3)$ a factor of $2x^4 - 7x^3 + 8x^2 - 17x + 6$?

For Exercises 4–5, simplify completely.

4. $\dfrac{\sqrt[3]{54x^4}}{\sqrt[3]{2x^5}}$

5. $\left(\dfrac{-2x^2y^{-1}}{z^3}\right)^{-4}\left(\dfrac{4x^{-5}}{y^7}\right)^2$

6. Find the midpoint of the line segment with endpoints $(-362, 147)$ and $(118, 24)$.

7. Given $f(x) = \sqrt[3]{x - 7}$, write an equation defining $f^{-1}(x)$.

8. A boat travels 10 mph at a bearing of N30°E in still water. A 2-mph current is directed due west. Determine the actual speed of the boat. Write the exact value and the speed rounded to the nearest tenth of a mph.

9. Determine the asymptotes of the graph of $y = \csc\left(2x - \dfrac{\pi}{2}\right)$.

For Exercises 10–15, solve the equation or inequality. Write the solution set to the inequalities in interval notation if possible.

10. $e^{3x+2} = 22$

11. $2 - 3\{4 - [x + 2(x - 1) - 3] + 4\} > 0$

12. $21 \le 9 - 2|x + 1|$

13. $2x^2 - 8x + 3 \ge 0$

14. $\log_3 x + \log_3(x - 6) = 3$

15. $e^{2x} - 8e^x + 15 = 0$

16. Graph the solution set.

$x^2 + (y - 1)^2 \le 9$

17. Graph $y = 2\sin\left(x - \dfrac{\pi}{4}\right)$ over one completed period.

18. Find the partial fraction decomposition for

$\dfrac{8x - 27}{x^2 - 7x + 12}$

19. Given $f(x) = \dfrac{1}{x - 2}$ and $g(x) = \sqrt{x - 1}$,

a. Find $(f \circ g)(x)$.

b. Write the domain of $(f \circ g)(x)$ in interval notation.

ISTUDY

20. Given $f(x) = \dfrac{x^2 - 4x}{x + 3}$,

a. Determine the x-intercept(s) of the graph of f.

b. Determine the y-intercept.

c. Find the vertical asymptote(s).

d. Find the horizontal asymptote.

e. Find the slant asymptote.

For Exercises 21–24, graph the equations and functions.

21. $\dfrac{x^2}{4} + \dfrac{(y-1)^2}{9} = 1$

22. $\dfrac{x^2}{4} - \dfrac{(y-1)^2}{9} = 1$

23. $x^2 = 4(y - 2)$

24. $f(x) = \left(\dfrac{1}{2}\right)^x + 2$

For Exercises 25–26, solve the system.

25.
$$\begin{aligned} 3x - 4y + 2z &= 5 \\ 5y - 3z &= -12 \\ 7x + 2z &= 1 \end{aligned}$$

26.
$$\begin{aligned} x^2 - 5y^2 &= 4 \\ 4x^2 + y^2 &= 37 \end{aligned}$$

For Exercises 27–29, refer to the matrices A and B. Simplify each expression.

$$A = \begin{bmatrix} 2 & 4 \\ -1 & 6 \end{bmatrix} \quad B = \begin{bmatrix} -3 & 8 \\ 0 & 4 \end{bmatrix}$$

27. $2AB$

28. A^{-1}

29. $|B|$

30. Use Cramer's rule to solve for z.

$$\begin{aligned} 3x - 4y + z &= 3 \\ 2x + 3y &= 8 \\ 5y + 8z &= 11 \end{aligned}$$

Have you ever wondered why one individual pays more than another for car insurance? Insurance rates are based on a number of variables including age, gender, Zip code, past driving and claims history, and even grades in school. Insurance companies hire actuaries, special statisticians who analyze data to estimate the probability and cost of accidents for people in various demographic groups. In turn, premiums are established to offset the theoretical cost to cover a customer based on the customer's risk factors.

In this chapter, we study sequences and series, the binomial theorem, and a technique of proof called mathematical induction. We complete the chapter by presenting several methods of counting that will ultimately enable us to calculate simple probabilities. The study of probability is the first step toward unraveling the mystery of car insurance premiums.

SECTION 12.1 Sequences and Series

OBJECTIVES

1. Write Terms of a Sequence from the *n*th Term
2. Write Terms of a Sequence Defined Recursively
3. Use Factorial Notation
4. Use Summation Notation

1. Write Terms of a Sequence from the *n*th Term

In day-to-day life, we think of a **sequence** as a progression of elements with some order or pattern. For example, suppose that a new college graduate has to choose between two job offers. Job 1 offers \$75,000 the first year with a \$4000 raise each year thereafter. Job 2 offers \$75,000 with a 5% raise each year. The sequences in Table 12-1 represent the salaries (rounded to the nearest dollar) for each job as a function of the year number.

David Lees/Digital Vision/Getty Images

Table 12-1

	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6
Job 1	\$75,000	\$79,000	\$83,000	\$87,000	\$91,000	\$95,000
Job 2	\$75,000	\$78,750	\$82,688	\$86,822	\$91,163	\$95,721

By studying the two sequences, we see that by year 5, job 2 has a better salary. If we take the *sum* of the first n terms of a sequence, we have a **finite series.** The total salary through the first 5 yr favors job 1 (\$415,000 for job 1 versus \$414,423 for job 2). However, by the end of year 6, job 2 not only pays more each year, but it also has a greater total salary for the 6-yr period (\$510,144 for job 2 versus \$510,000 for job 1).

From Table 12-1, we can think of a sequence as a function pairing the year number (a positive integer) with the salary. For this reason, it makes sense to define a sequence mathematically as a function whose domain is the set of positive integers.

TIP In this text, we address sequences with real-valued terms only.

Finite and Infinite Sequences

An **infinite sequence** is a function whose domain is the set of positive integers. A **finite sequence** is a function whose domain is the set of the first n positive integers.

TIP Lowercase letters such as a, b, c, and so on are often used to represent the terms of a sequence.

Although a sequence is defined as a function, we typically do not use function notation to denote the terms of a sequence. Instead, the terms of the sequence are denoted by the letter a with a subscript representing the term number. The sequence of salaries for job 1 would be denoted by

$$\underbrace{a_1 = 75{,}000}_{\text{term 1}} \qquad \underbrace{a_2 = 79{,}000}_{\text{term 2}} \qquad \underbrace{a_3 = 83{,}000}_{\text{term 3}} \qquad \text{and so on.}$$

The notation $a_1 = 75{,}000$ is used in place of function notation $f(1) = 75{,}000$. Likewise $a_2 = 79{,}000$ is used instead of $f(2) = 79{,}000$ and so on. For a positive integer n, the value a_n is called the ***n*th term** or **general term** of the sequence. The notation $\{a_n\}$ represents the entire sequence.

$$\{a_n\} = a_1, a_2, a_3, \ldots, a_n, \ldots$$

EXAMPLE 1 Writing Several Terms of a Sequence

Write the first four terms of the sequence defined by the nth term.

a. $a_n = 3n^2 - 4$ **b.** $c_n = 9\left(-\frac{1}{3}\right)^n$

Solution:

a. $a_n = 3n^2 - 4$ To find the first four terms, substitute $n = 1, 2, 3,$ and 4.

$a_1 = 3(1)^2 - 4 = -1$

$a_2 = 3(2)^2 - 4 = 8$

$a_3 = 3(3)^2 - 4 = 23$

$a_4 = 3(4)^2 - 4 = 44$ The first four terms are $-1, 8, 23, 44$.

b. $c_n = 9\left(-\frac{1}{3}\right)^n$ To find the first four terms, substitute $n = 1, 2, 3,$ and 4.

$c_1 = 9\left(-\frac{1}{3}\right)^1 = -3$

$c_2 = 9\left(-\frac{1}{3}\right)^2 = 1$

$c_3 = 9\left(-\frac{1}{3}\right)^3 = -\frac{1}{3}$

$c_4 = 9\left(-\frac{1}{3}\right)^4 = \frac{1}{9}$ The first four terms are $-3, 1, -\frac{1}{3}, \frac{1}{9}$.

Skill Practice 1 Write the first four terms of the sequence defined by the nth term.

a. $b_n = 2n + 3$ **b.** $d_n = (-1)^n \cdot n^2$

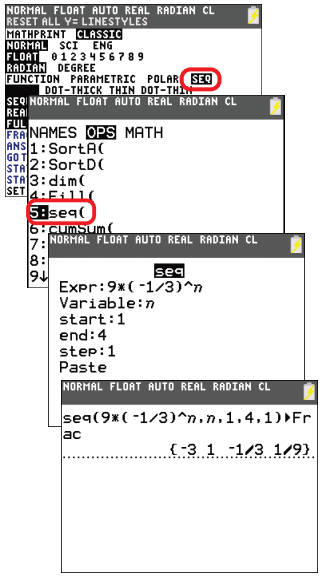
TECHNOLOGY CONNECTIONS

Displaying Terms of a Sequence

If the nth term of a sequence is known, a seq function on a graphing utility can display a list of terms. Finding the first four terms of the sequence from Example 1(b) is outlined here.

- Select the MODE key and highlight SEQ.
- Then access the seq function from the catalog or from the LIST menu (OPS submenu) and enter the parameters as prompted.
- Paste the seq command on the home screen and select ENTER.

seq(9*(–1/3)^n, n, 1, 4, 1) > Frac



Notice that the terms of the sequence given in Example 1(b) alternate in signs. Such a sequence is called an **alternating sequence.** The alternation in signs can be represented in the nth term by a factor of -1 raised to a variable power that alternates between an even and an odd integer. For example:

$a_n = (-1)^n$ odd-numbered terms, negative; even-numbered terms, positive

$b_n = (-1)^{n+1}$ odd-numbered terms, positive; even-numbered terms, negative

Answers

1. a. 5, 7, 9, 11 **b.** –1, 4, –9, 16

Because a sequence is defined only for positive integers, its graph is a discrete set of points (the points are not connected). Compare the graphs of the sequence defined by $a_n = 8\left(\frac{1}{2}\right)^n$ (see Figure 12-1) versus the function defined by $f(x) = 8\left(\frac{1}{2}\right)^x$ (see Figure 12-2).

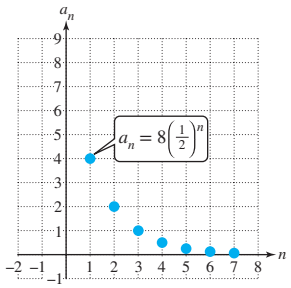


Figure 12-1

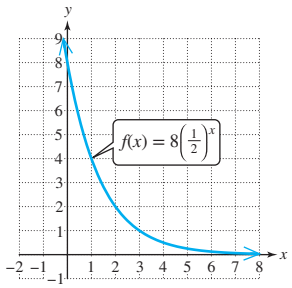

Figure 12-2

TIP In some cases, we may define a sequence with a domain beginning at zero or some other whole number.

For example, $a_n = \dfrac{4}{n-1}$ is not defined for $n = 1$. Therefore, we might restrict the domain to the set of integers greater than or equal to 2.

The graph of $\{a_n\}$ consists of a discrete set of points that correspond to points on the graph of $f(x) = 8\left(\frac{1}{2}\right)^x$ for positive integers x.

2. Write Terms of a Sequence Defined Recursively

The sequences in Example 1 were defined as a function of the nth term. Now we look at sequences defined *recursively*, using a recursive formula. A **recursive formula** defines the nth term of a sequence as a function of one or more terms preceding it. This is demonstrated in Example 2.

EXAMPLE 2 Writing Terms of a Sequence Defined Recursively

Write the first five terms of the sequence defined by $a_1 = 4$ and $a_n = 2a_{n-1} + 1$ for $n > 1$.

Solution:

The first term is given: $a_1 = 4$.

Every term thereafter is defined by $a_n = 2a_{n-1} + 1$

Value of the nth term is

two times the value of the preceding term, plus 1.

$a_1 = 4$

$a_2 = 2a_1 + 1 = 2(4) + 1 = 9$ Substitute $a_1 = 4$.

$a_3 = 2a_2 + 1 = 2(9) + 1 = 19$ Substitute $a_2 = 9$.

$a_4 = 2a_3 + 1 = 2(19) + 1 = 39$ Substitute $a_3 = 19$.

$a_5 = 2a_4 + 1 = 2(39) + 1 = 79$ The first five terms are 4, 9, 19, 39, 79.

Skill Practice 2 Write the first five terms of the sequence defined by:

$c_1 = 5$, $c_n = 3c_{n-1} - 4$

Perhaps the most famous sequence is the Fibonacci sequence, named after the twelfth-century Italian mathematician Leonardo of Pisa (known as Fibonacci). The Fibonacci sequence is defined recursively as

$$a_1 = 1, \quad a_2 = 1, \quad a_n = a_{n-2} + a_{n-1}$$

Answer

2. 5, 11, 29, 83, 245

The first two terms of the Fibonacci sequence are 1, and each term thereafter is the sum of its two predecessors. We have:

Fibonacci sequence: 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, …

Point of Interest

The Fibonacci sequence is of particular interest because it is often observed in nature. For example, male honeybees hatch from eggs that have not been fertilized, so each male honeybee has only 1 parent, a female. A female honeybee hatches from a fertilized egg, so she has two parents: one male and one female. Notice that the number of ancestors for n generations for a male honeybee follows the Fibonacci sequence (Figure 12-3).

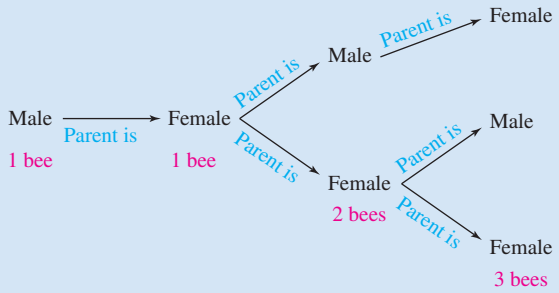

Figure 12-3

3. Use Factorial Notation

We now introduce factorial notation to denote the product of the first n positive integers.

Definition of $n!$

- Let n be a positive integer. The expression $n!$ (read as "n factorial") is defined as $n! = (n)(n-1)(n-2)\cdots(2)(1)$
- Zero factorial is defined as $0! = 1$.

Examples:

$0! = 1$
$1! = 1$
$2! = 2 \cdot 1 = 2$
$3! = 3 \cdot 2 \cdot 1 = 6$
$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$
$5! = 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 120$
$6! = 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 720$
$7! = 7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 5040$

EXAMPLE 3 Evaluating Expressions with Factorial Notation

Evaluate.

a. $\dfrac{8!}{3! \cdot 5!}$ **b.** $\dfrac{n!}{(n+2)!}$

Solution:

a. $\dfrac{8!}{3! \cdot 5!} = \dfrac{8 \cdot 7 \cdot \overset{1}{\cancel{6}} \cdot \overset{1}{\cancel{5!}}}{(\cancel{3} \cdot \cancel{2} \cdot 1)(\cancel{5!})} = 56$

b. $\dfrac{n!}{(n+2)!} = \dfrac{\overset{1}{\cancel{n!}}}{(n+2)(n+1)(\cancel{n!})} = \dfrac{1}{(n+2)(n+1)}$

Skill Practice 3 Evaluate.

a. $\dfrac{9!}{2! \cdot 7!}$ **b.** $\dfrac{(n-1)!}{n!}$

Answers

3. a. 36 **b.** $\frac{1}{n}$

ISTUDY

In Example 4, we find a specific term of a sequence in which the expression for the nth term contains factorial notation.

EXAMPLE 4 **Finding a Specific Term of a Sequence**

Given the sequence defined by $b_n = \dfrac{n^2}{(n+1)!}$, find b_6.

Solution:

$$b_n = \frac{n^2}{(n+1)!} \xrightarrow[6 \text{ for } n.]{\text{Substitute}} b_6 = \frac{(6)^2}{(6+1)!} = \frac{36}{7!} = \frac{36}{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = \frac{1}{140}$$

Skill Practice 4 Given the sequence defined by $c_n = \dfrac{2^n}{(n+1)!}$, find c_4.

Sometimes we are presented with several terms of a sequence and are asked to find a formula for the nth term. In such a case, the goal is to look for a pattern that can be expressed mathematically as a function of the term number.

EXAMPLE 5 **Finding the *n*th Term of a Sequence**

Find the nth term a_n of a sequence whose first four terms are given.

a. $\frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \ldots$ **b.** $\frac{1}{5}, -\frac{4}{25}, \frac{9}{125}, -\frac{16}{625}, \ldots$

Solution:

a. Term number: $n = 1 \quad 2 \quad 3 \quad 4$

$\frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \cdots$

$a_n = \dfrac{n+1}{n+2}$

The numerator is 1 more than the term number: $n+1$

The denominator is 2 more than the term number: $n+2$

b. Term number: $n = 1 \quad 2 \quad 3 \quad 4$

$\frac{1}{5}, -\frac{4}{25}, \frac{9}{125}, -\frac{16}{625}, \cdots$

$a_n = (-1)^{n+1} \cdot \dfrac{n^2}{5^n}$

Terms in the numerator are perfect squares: $1^2, 2^2, 3^2, 4^2, \ldots, n^2$

Terms in the denominator are powers of 5: $5^1, 5^2, 5^3, 5^4, \ldots, 5^n$

The signs are positive for odd-numbered terms. Therefore, we want a factor of -1 raised to an even exponent on odd-numbered terms and an odd exponent for even-numbered terms: $(-1)^{n+1}$

Skill Practice 5 Find the nth term a_n of a sequence whose first four terms are given.

a. $-5, 6, -7, 8, \ldots$ **b.** $\frac{1}{3}, \frac{1 \cdot 2}{9}, \frac{1 \cdot 2 \cdot 3}{27}, \frac{1 \cdot 2 \cdot 3 \cdot 4}{81}, \ldots$

Answers

4. $\frac{2}{15}$

5. a. $a_n = (-1)^n(n+4)$

b. $a_n = \frac{n!}{3^n}$

4. Use Summation Notation

Consider an infinite sequence $\{a_n\} = a_1, a_2, a_3, \ldots$. The sum S of such a sequence is called an **infinite series** and is represented by $S = a_1 + a_2 + a_3 + \cdots$. The sum of the first n terms of the sequence is called the ***n*th partial sum** of the sequence and is denoted by S_n. The nth partial sum of a sequence is a **finite series.**

ISTUDY

In mathematics, the Greek letter Σ (sigma) is used to represent summations.

TIP The summation $\sum_{i=1}^{n} a_i$ is read as the sum of a_i for i equals 1 to n.

Summation Notation

Given a sequence $a_1, a_2, a_3, \ldots$, the nth partial sum S_n is a finite series and is represented by

$$S_n = \sum_{i=1}^{n} a_i = a_1 + a_2 + a_3 + \cdots + a_n$$

(n is the upper limit of summation. i is the index of summation. 1 is the lower limit of summation.)

The sum of *all* terms in the sequence is an infinite series and is given by

$$\sum_{i=1}^{\infty} a_i = a_1 + a_2 + a_3 + \cdots$$

Any letter such as i, j, k, and n may be used for the index of summation. However, if i is used for the index of summation, do not confuse it with the imaginary number $i = \sqrt{-1}$.

EXAMPLE 6 Using Summation Notation

Write the terms for each series and evaluate the sum.

a. $\sum_{i=1}^{5}(2i + 3)$ **b.** $\sum_{k=3}^{6}(-1)^k\left(\frac{1}{k}\right)$ **c.** $\sum_{n=1}^{6} 3$

Solution:

a. $\sum_{i=1}^{5}(2i + 3) = \underset{i=1}{[2(1) + 3]} + \underset{i=2}{[2(2) + 3]} + \underset{i=3}{[2(3) + 3]} + \underset{i=4}{[2(4) + 3]} + \underset{i=5}{[2(5) + 3]}$

$= 5 + 7 + 9 + 11 + 13$

$= 45$

b. $\sum_{k=3}^{6}(-1)^k\left(\frac{1}{k}\right) = \left[(-1)^3\left(\frac{1}{3}\right)\right] + \left[(-1)^4\left(\frac{1}{4}\right)\right] + \left[(-1)^5\left(\frac{1}{5}\right)\right] + \left[(-1)^6\left(\frac{1}{6}\right)\right]$

$= -\frac{1}{3} + \frac{1}{4} - \frac{1}{5} + \frac{1}{6}$

$= -\frac{7}{60}$

c. $\sum_{n=1}^{6} 3 = \underbrace{3 + 3 + 3 + 3 + 3 + 3}_{6 \text{ terms}} = 18$

Skill Practice 6 Evaluate the sum.

a. $\sum_{i=1}^{5}(3i + 1)$ **b.** $\sum_{n=2}^{5}(-1)^{n+1}\frac{1}{2^n}$ **c.** $\sum_{k=1}^{5} 4$

Answers

6. a. 50 **b.** $-\frac{5}{32}$ **c.** 20

TECHNOLOGY CONNECTIONS

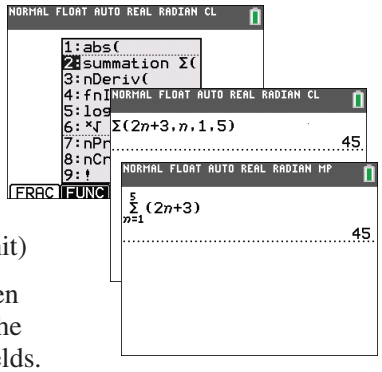
Evaluating a Finite Series

A graphing utility can be used to evaluate a finite series if the nth term of the corresponding sequence is known. The Σ symbol can be accessed by selecting ALPHA F2.

- If the calculator is in "Classic" mode, the sum can be evaluated by entering

  Σ (nth term, variable, lower limit, upper limit)

- If the calculator is in "Mathprint" mode, then the user is prompted to enter the nth term, the variable, and limits of summation in text fields.



Point of Interest

Swiss mathematician and physicist Leonhard Euler (1707–1783) is credited with the use of the modern symbol Σ to represent a sum, i to represent the imaginary unit, and e to represent the base of the natural logarithmic function.

It is important to note that the lower limit of summation need not be 1. In Example 6(b) for instance, the index of summation ranges from 3 to 6. In fact, sometimes we adjust the limits of summation and the expression being summed to write the summation in a more convenient form. For example, the following three series are all equivalent.

$$\sum_{i=1}^{5} 3i = 3(1) + 3(2) + 3(3) + 3(4) + 3(5)$$
$$= 3 + 6 + 9 + 12 + 15 = 45$$

$$\sum_{j=0}^{4} 3(j+1) = 3(0+1) + 3(1+1) + 3(2+1) + 3(3+1) + 3(4+1)$$
$$= 3 + 6 + 9 + 12 + 15 = 45$$

$$\sum_{k=2}^{6} 3(k-1) = 3(2-1) + 3(3-1) + 3(4-1) + 3(5-1) + 3(6-1)$$
$$= 3 + 6 + 9 + 12 + 15 = 45$$

EXAMPLE 7 Write a Series Using Summation Notation

Write each sum using summation notation.

a. $\frac{\sqrt{3}}{1!} + \frac{\sqrt{4}}{2!} + \frac{\sqrt{5}}{3!} + \cdots + \frac{\sqrt{n+2}}{n!}$ **b.** $\frac{2}{1} - \frac{3}{4} + \frac{4}{9} - \frac{5}{16} + \frac{6}{25}$

Solution:

a. $\frac{\sqrt{3}}{1!} + \frac{\sqrt{4}}{2!} + \frac{\sqrt{5}}{3!} + \cdots + \frac{\sqrt{n+2}}{n!}$

The series consists of n terms where a formula for the nth term is given.

$$= \sum_{i=1}^{n} \frac{\sqrt{i+2}}{i!}$$

We have used n as the upper limit of summation. Therefore, use a different variable for the index of summation. We have chosen i.

b.

Look for a relationship between the term number and the values in the numerator and denominator. Choose a variable such as i for the index of summation.

Term: 1 2 3 4 5

$\frac{2}{1} - \frac{3}{4} + \frac{4}{9} - \frac{5}{16} + \frac{6}{25}$ ← The numerator is 1 more than the term number: $(i+1)$
← The denominator is the square of the term number: i^2

$$\sum_{i=1}^{5} (-1)^{i+1} \cdot \frac{i+1}{i^2}$$

The odd-numbered terms are positive. This can be generated by the factor $(-1)^{i+1}$.

ISTUDY

Skill Practice 7 Write each sum using summation notation.

a. $\frac{2!}{7} + \frac{3!}{14} + \frac{4!}{21} + \cdots + \frac{(n+1)!}{7n}$ **b.** $-\frac{1}{5} + \frac{8}{25} - \frac{27}{125} + \frac{64}{625}$

Several important properties of summation are given in Table 12-2.

Table 12-2 Properties of Summation

If $\{a_n\}$ and $\{b_n\}$ are sequences, and c is a real number, then:

1. $\sum_{i=1}^{n} c = cn$	Adding a constant c a total of n times equals cn.
2. $\sum_{i=1}^{n} ca_i = c\sum_{i=1}^{n} a_i$	A constant factor can be factored out of a summation.
3. $\sum_{i=1}^{n} (a_i \pm b_i) = \sum_{i=1}^{n} a_i \pm \sum_{i=1}^{n} b_i$	A single sum or difference can be regrouped as two sums or differences.

The proof of Property 2 follows from the distributive property of real numbers.

$$\sum_{i=1}^{n} ca_i = ca_1 + ca_2 + ca_3 + \cdots + ca_n \qquad \text{Expand the terms in the series.}$$

$$= c(a_1 + a_2 + a_3 + \cdots + a_n) \qquad \text{Apply the distributive property.}$$

$$= c\sum_{i=1}^{n} a_i \qquad \text{Write the sum using summation notation.}$$

The proofs of properties 1 and 3 are examined in Exercises 89 and 90.

Answers

SECTION 12.1 Practice Exercises

Prerequisite Review

For Exercises R.1–R.3, evaluate the function for the given value.

R.1. $g(x) = \frac{5}{x}$; $g(15)$ **R.2.** $f(x) = 5$; $f(4)$ **R.3.** $h(x) = x^2 + 3x$; $h(3)$

For Exercises R.4–R.5, simplify the rational expression.

R.4. $\frac{(r-2)^2(2r-1)^4}{(r-2)^4(2r-1)}$ **R.5.** $\frac{p^2(p-6)^5}{p^5(p-6)^2}$

Concept Connections

1. An infinite _____ is a function whose domain is the set of positive integers. A _____ sequence is a function whose domain is the set of the first n positive integers.

2. An _____ sequence is a sequence in which consecutive terms alternate in sign.

3. A _____ formula defines the nth term of a sequence as a function of one or more terms preceding it.

4. For $n \geq 1$, the expression _____ represents the product of the first n positive integers $n(n-1)(n-2)\cdots(2)(1)$. Furthermore, by definition, $0!$ = _____.

ISTUDY

5. Given $\sum_{i=1}^{n} a_i$, the variable i is called the _____ of _____. The value 1 is called the _____ limit of summation. The value n is called the upper _____ of summation.

6. One property of summation indicates that $\sum_{i=1}^{n} c =$ _____.

Objective 1: Write Terms of a Sequence from the *n*th Term

For Exercises 7–14, the *n*th term of a sequence is given. Write the first four terms of the sequence. (See Example 1)

7. $a_n = 2n^2 + 3$ **8.** $b_n = -n^3 + 5$ **9.** $c_n = 12\left(-\frac{1}{2}\right)^n$

10. $d_n = 64\left(-\frac{1}{4}\right)^n$ **11.** $a_n = \sqrt{n+3}$ **12.** $b_n = \sqrt{n-1}$

13. $a_n = e^{3\ln n}$ **14.** $c_n = \ln e^{2n}$

15. If the nth term of a sequence is $(-1)^n n^2$, which terms are positive and which are negative?

16. If the nth term of a sequence is $(-1)^{n+1}\frac{1}{n}$, which terms are positive and which are negative?

For Exercises 17–20, the *n*th term of a sequence is given. Find the indicated term.

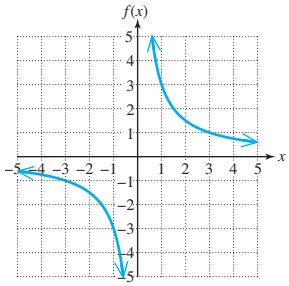
17. $a_n = 2^n - 1$; find a_{10} **18.** $b_n = \frac{5}{n} - 1$; find b_{20}

19. $c_n = 5n - 4$; find c_{157} **20.** $d_n = 6n + 7$; find d_{204}

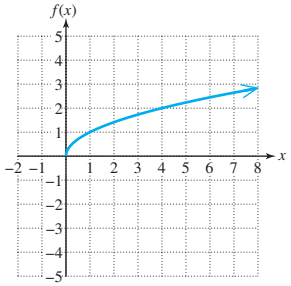
For Exercises 21–24, match the sequence or function with its graph.

21. $a_n = \sqrt{n}$ **22.** $f(x) = \sqrt{x}$ **23.** $f(x) = \frac{3}{x}$ **24.** $a_n = \frac{3}{n}$

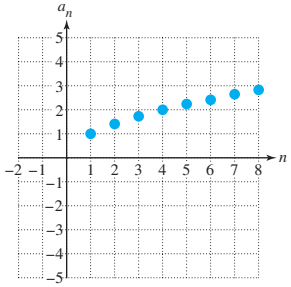
a.



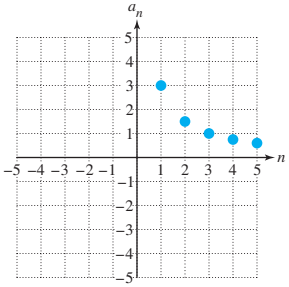
b.



c.



d.



Objective 2: Write Terms of a Sequence Defined Recursively

For Exercises 25–30, write the first five terms of the sequence defined recursively. (See Example 2)

25. $b_1 = -3$; $b_n = 3b_{n-1} + 4$ **26.** $a_1 = 11$; $a_n = 4a_{n-1} + 3$ **27.** $c_1 = 4$; $c_n = \frac{1}{2}c_{n-1} + 4$

28. $d_1 = 30$; $d_n = \frac{1}{3}d_{n-1} - 1$ **29.** $a_1 = 5$; $a_n = \frac{1}{a_{n-1}}$ **30.** $b_1 = 10$; $b_n = -\frac{1}{b_{n-1}}$

31. a. The Fibonacci sequence is defined by $a_1 = 1$, $a_2 = 1$, $a_n = a_{n-2} + a_{n-1}$. Write the first 10 terms of the Fibonacci sequence.

b. The formula $F_n = \frac{1}{\sqrt{5}}\left(\frac{1+\sqrt{5}}{2}\right)^n - \frac{1}{\sqrt{5}}\left(\frac{1-\sqrt{5}}{2}\right)^n$ gives the nth term of the Fibonacci sequence. Use a calculator to verify this statement for $n = 1$, $n = 2$, and $n = 3$.

32. The numbers in the sequence defined by $a_1 = 1$, $a_2 = 3$, and $a_n = a_{n-1} + a_{n-2}$ for $n \geq 3$ are referred to as Lucas numbers in honor of French mathematician Edouard Lucas (1842–1891).

a. Find the first eight Lucas numbers.

b. The formula $L_n = \left(\frac{1+\sqrt{5}}{2}\right)^n + \left(\frac{1-\sqrt{5}}{2}\right)^n$ gives the nth Lucas number. Use a calculator to verify this statement for $n = 1$, $n = 2$, and $n = 3$.

ISTUDY

Objective 3: Use Factorial Notation

For Exercises 33–44, evaluate the expression. (See Example 3)

33. $7!$ **34.** $8!$ **35.** $0!$ **36.** $1!$

37. $\dfrac{8!}{6!}$ **38.** $\dfrac{12!}{9!}$ **39.** $\dfrac{9!}{5! \cdot 4!}$ **40.** $\dfrac{10!}{6! \cdot 4!}$

41. $\dfrac{(n-1)!}{(n+1)!}$ **42.** $\dfrac{(n-2)!}{n!}$ **43.** $\dfrac{(2n)!}{(2n+1)!}$ **44.** $\dfrac{(2n-1)!}{(2n)!}$

For Exercises 45–48, the nth term of a sequence is given. Find the indicated term. (See Example 4)

45. $a_n = \dfrac{2^n}{(n+2)!}$; find a_5 **46.** $b_n = \dfrac{4n}{(n+1)!}$; find b_3 **47.** $c_n = \dfrac{(3n)!}{5n}$; find c_3 **48.** $d_n = \dfrac{(n+3)!}{3^n}$; find d_3

For Exercises 49–56, find the nth term a_n of a sequence whose first four terms are given. (See Example 5)

49. $2, 4, 8, 16, \ldots$ **50.** $3, 9, 27, 81, \ldots$ **51.** $-\dfrac{2}{3}, -\dfrac{3}{6}, -\dfrac{4}{9}, -\dfrac{5}{12}, \ldots$

52. $-\dfrac{8}{11}, -\dfrac{9}{22}, -\dfrac{10}{33}, -\dfrac{11}{44}, \ldots$ **53.** $-1, 4, -9, 16, \ldots$ **54.** $1, -8, 27, -64, \ldots$

55. $\dfrac{1 \cdot 2}{2}, \dfrac{1 \cdot 2 \cdot 3}{4}, \dfrac{1 \cdot 2 \cdot 3 \cdot 4}{6}, \dfrac{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5}{8}, \ldots$ **56.** $\dfrac{5}{4}, \dfrac{10}{9}, \dfrac{15}{16}, \dfrac{20}{25}, \ldots$

Objective 4: Use Summation Notation

For Exercises 57–70, find the sum. (See Example 6)

57. $\displaystyle\sum_{i=1}^{6}(3i-4)$ **58.** $\displaystyle\sum_{i=1}^{5}(2i+7)$ **59.** $\displaystyle\sum_{j=1}^{5}(-2j^2)$ **60.** $\displaystyle\sum_{k=1}^{3}(-3k^3)$

61. $\displaystyle\sum_{j=2}^{5}\left(\frac{1}{2}\right)^j$ **62.** $\displaystyle\sum_{n=2}^{4}\left(\frac{1}{3}\right)^n$ **63.** $\displaystyle\sum_{j=1}^{20}6$ **64.** $\displaystyle\sum_{i=1}^{50}4$

65. $\displaystyle\sum_{k=3}^{7}(-1)^k(6k)$ **66.** $\displaystyle\sum_{n=3}^{8}(-1)^{n-1}(2n)$ **67.** $\displaystyle\sum_{m=1}^{3}\frac{m+1}{m}$ **68.** $\displaystyle\sum_{n=1}^{4}\frac{n-1}{n}$

69. $\displaystyle\sum_{k=1}^{3}(k+2)(k+3)$ **70.** $\displaystyle\sum_{j=1}^{4}(j+1)(j-1)$

71. a. Evaluate $\displaystyle\sum_{i=1}^{n}(-1)^i$ if n is even.

b. Evaluate $\displaystyle\sum_{i=1}^{n}(-1)^i$ if n is odd.

72. a. Evaluate $\displaystyle\sum_{i=1}^{n}(-1)^{i+1}$ if n is even.

b. Evaluate $\displaystyle\sum_{i=1}^{n}(-1)^{i+1}$ if n is odd.

73. Given the sequence defined by $a_n = n^2 - 2n$, find the fifth partial sum.

74. Given the sequence defined by $b_n = n^3 - 3n^2$, find the fourth partial sum.

For Exercises 75–86, write the sum using summation notation. There may be multiple representations. Use i as the index of summation. (See Example 7)

75. $\dfrac{1}{2} + \dfrac{4}{3} + \dfrac{9}{4} + \dfrac{16}{5} + \cdots + \dfrac{n^2}{n+1}$ **76.** $3 + \dfrac{1}{2} + \dfrac{5}{27} + \dfrac{3}{32} + \cdots + \dfrac{n+2}{n^3}$ **77.** $1 + 2 + 3 + 4 + 5$

78. $2 + 4 + 6 + 8 + 10 + 12$ **79.** $8 + 8 + 8 + 8$ **80.** $11 + 11 + 11 + 11 + 11$

81. $\dfrac{1}{3} - \dfrac{1}{9} + \dfrac{1}{27} - \dfrac{1}{81}$ **82.** $-\dfrac{1}{2} + \dfrac{1}{4} - \dfrac{1}{8} + \dfrac{1}{16} - \dfrac{1}{32}$

83. $c^3 + c^4 + c^5 + \cdots + c^{20}$ **84.** $a + ar + ar^2 + \cdots + ar^{12}$

85. $\dfrac{x}{1} + \dfrac{x^2}{2} + \dfrac{x^3}{6} + \dfrac{x^4}{24}$ (*Hint*: Note the pattern produced by $n!$ for $n = 1$, $n = 2$, and so on.)

86. $\dfrac{1}{x+1} + \dfrac{2}{x+2} + \dfrac{6}{x+3} + \dfrac{24}{x+4} + \dfrac{120}{x+5}$

ISTUDY

For Exercises 87–88, rewrite each series as an equivalent series with the new index of summation.

87. $\sum_{i=1}^{8} i^2 = \sum_{j=0}^{\square} \square = \sum_{k=2}^{\square} \square$

88. $\sum_{i=1}^{5} (4i) = \sum_{j=0}^{\square} \square = \sum_{k=2}^{\square} \square$

Mixed Exercises

89. Prove that $\sum_{i=1}^{n} c = cn$.

90. Prove that $\sum_{i=1}^{n} (a_i + b_i) = \sum_{i=1}^{n} a_i + \sum_{i=1}^{n} b_i$.

For Exercises 91–94, use the sums $\sum_{i=1}^{50} i^2 = 42{,}925$ and $\sum_{i=1}^{50} i = 1275$ and the properties of summation given on page 1099 to evaluate the given expression.

91. $\sum_{i=1}^{50} (i^2 + 3i)$

92. $\sum_{i=1}^{50} (2i^2 - i)$

93. $\sum_{i=1}^{50} (5i + 4)$

94. $\sum_{i=1}^{50} (6i - 7)$

For Exercises 95–98, determine whether the statement is true or false. If a statement is false, explain why.

95. $\sum_{i=1}^{n} (3i + 7) = 3\sum_{i=1}^{n} i + 7n$

96. $\sum_{i=1}^{n} (i^2 - 4i + 5) = \sum_{i=1}^{n} i^2 - 4\sum_{i=1}^{n} i + 5n$

97. $\sum_{i=1}^{n} a_i b_i = \sum_{i=1}^{n} a_i \sum_{i=1}^{n} b_i$

98. $\sum_{i=1}^{n} \frac{a_i}{b_i} = \frac{\sum_{i=1}^{n} a_i}{\sum_{i=1}^{n} b_i}$

99. Expenses for a company for year 1 are \$24,000. Every year thereafter, expenses increase by \$1000 plus 3% of the cost of the prior year. Let a_1 represent the original cost for year 1; that is, $a_1 = 24{,}000$. Use a recursive formula to find the cost a_n in terms of a_{n-1} for each subsequent year, $n \geq 2$.

100. A retirement account initially has \$500,000 and grows by 5% per year. Furthermore, the account owner adds \$12,000 to the account each year after the first. Let a_1 represent the original amount in the account; that is, $a_1 = 500{,}000$. Use a recursive formula to find the amount in the account a_n in terms of a_{n-1} for each subsequent year, $n \geq 2$.

101. In a business meeting, every person at the meeting shakes every other person's hand exactly one time. The total number of handshakes for n people at the meeting is given by $a_n = \frac{1}{2}n(n - 1)$. Evaluate a_{12} and interpret its meaning in the context of this problem.

102. Given a polygon of $n \geq 3$ sides, the sum of the interior angles within the polygon is given by $s_n = 180(n - 2)$. Evaluate s_{10} and interpret its meaning in the context of this problem.

Given a sequence $a_1, a_2, a_3, \ldots, a_n$, the arithmetic mean $\bar{a}$ is given by $\bar{a} = \frac{1}{n}\sum_{i=1}^{n} a_i$. Use the arithmetic mean for Exercises 103–104.

103. Consider the sequence defined by $\{a_n\} = 18, 32, 44, 20, 36, 28, 32, 38$. Evaluate $\sum_{i=1}^{8} (a_i - \bar{a})^2$.

104. Show that $\sum_{i=1}^{n} (a_i - \bar{a}) = 0$.

For Exercises 105–108, write the first four terms for each sequence.

105. **a.** $a_n = 2n + 5$

b. $b_1 = 7$, $b_n = 2b_{n-1} + 5$

106. **a.** $a_n = (-1)^n(n + 3)$

b. $b_1 = -4$, $b_n = (-1)^n(b_{n-1} + 3)$

107. **a.** $a_n = \frac{n}{n + 1}$

b. $b_n = \frac{n!}{(n + 1)!}$

108. **a.** $a_n = \frac{3^n}{n + 3}$

b. $b_n = \frac{3^n}{(n + 3)!}$

For Exercises 109–112, write the sum using the given summation notation.

109. $1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16}$

a. $\sum_{n=1}^{4}$ **b.** $\sum_{n=0}^{3}$

110. $\frac{3}{2} + 1 + \frac{3}{4} + \frac{3}{5}$

a. $\sum_{n=1}^{4}$ **b.** $\sum_{n=3}^{6}$

111. $1 + (-1) + (-3) + (-5)$

a. $\sum_{n=0}^{3}$ **b.** $\sum_{n=5}^{8}$

112. $3 + 3 + 3 + 3$

a. $\sum_{n=12}^{15}$ **b.** $\sum_{n=23}^{26}$

Write About It

113. Explain the difference between the graph of $a_n = n^2$ and $f(x) = x^2$.

114. What is the difference between a sequence and a series?

115. Given the sequence defined by $a_n = \frac{n}{n-1}$, explain why the domain must be restricted to positive integers $n \geq 2$.

116. The value 1206! is too large to evaluate on most calculators. Explain how you would evaluate $\frac{1206!}{1204!}$ on a calculator.

Expanding Your Skills

117. For $i = \sqrt{-1}$, find the first eight terms of the sequence defined by $a_n = i^n$.

118. For $i = \sqrt{-1}$, find the first eight terms of the sequence defined by $a_n = 1 - i^n$.

119. The terms of the sequence defined by $a_1 = x$ and $a_n = \frac{1}{2}\left(a_{n-1} + \frac{x}{a_{n-1}}\right)$ for $n > 1$ give successively better approximations of $\sqrt{x}$ for $x > 1$. Approximate $\sqrt{2}$ by substituting 2 for x and finding the first four terms of the sequence. Round to 4 decimal places if necessary.

120. Find a formula for the nth term of the sequence. $\sqrt{3}$, $\sqrt{\sqrt{3}}$, $\sqrt{\sqrt{\sqrt{3}}}$, …

The On-Line Encyclopedia of Integer Sequences (oeis.org) is a vast repository of named and unnamed sequences. The OEIS not only gives numerical information about a sequence, but also enables you to *listen* to a sequence by converting the numbers to musical notes. After completing exercises 121–122, take a minute to visit the site.

121. The **Look and Say sequence** begins with any single digit from 0 to 9. Subsequent terms are defined by reading the previous term from left to right and "saying" the number of consecutive times a digit occurs in a group followed by the digit. For example, suppose we begin with $a_1 = 2$. To find a_2, we describe the previous term. We would *say* there is "one 2." Thus, $a_2 = 12$.

To find a_3, describe a_2: One 1 and one 2. Therefore $a_3 = 1112$.

To find a_4, describe a_3: Three 1s and one 2. Therefore $a_4 = 3112$.

Thus, the Look and Say sequence beginning with 2 is: 2, 12, 1112, 3112, …

a. Write the first five terms in the Look and Say sequence beginning with 5.

b. Make your own variation of a Look and Say sequence beginning with any positive integer. (Answers will vary.)

122. A **Hailstone sequence** is named for the behavior of the numbers in the sequence. The numbers seem to "rise and fall" like hailstones forming in a cloud. The sequence begins with a positive integer "seed." This is the first term, a_1. Subsequent terms are found as follows: If the previous term is *even*, divide it by 2; if the previous term is *odd*, multiply by 3 and add 1.

For example, begin with $a_1 = 3$. Because 3 is odd, multiply it by 3 and add 1 to obtain $a_2 = 10$. Because 10 is even, divide it by 2 to obtain $a_3 = 5$. Thus, the Hailstone sequence beginning with 3 is: 3, 10, 5, …

a. What are the next 8 numbers in the sequence?

b. Use the seed $n = 6$ and write the first 12 terms in the sequence.

An open question in mathematics is whether every Hailstone sequence eventually reaches 1 (cycling 4, 2, 1, 4, 2, 1, …). This is known as the Collatz conjecture (or the $3n + 1$ problem), introduced in 1937 by Lothar Collatz. As of the year 2020, values up to 2^{68} have been checked by a computer, and all end in 1. But no one has been able to formally prove the conjecture.

Technology Connections

For Exercises 123–124, use a graphing utility to find the first four terms of the sequence.

123. $a_n = 12\left(-\frac{1}{2}\right)^n$ (Exercise 9)

124. $a_n = 64\left(-\frac{1}{4}\right)^n$ (Exercise 10)

For Exercises 125–126, use a graphing utility to find the sum.

125. $\sum_{k=3}^{7}(-1)^k(6k)$ (Exercise 65)

126. $\sum_{n=3}^{8}(-1)^{n-1}(2n)$ (Exercise 66)

127. Using calculus, we can show that the series $\sum_{k=0}^{n}\frac{1}{k!}$ approaches e as n approaches infinity. Investigate this statement by evaluating the sum for $n = 10$ and $n = 50$.

128. Using calculus, we can show that the series $\sum_{k=1}^{n}(-1)^{k-1}\frac{(0.5)^k}{k}$ approaches ln 1.5 as n approaches infinity. Investigate this statement by evaluating the sum for $n = 10$ and $n = 50$.

ISTUDY

Point of Interest

Recamán's sequence is named after its inventor, Columbian mathematician Bernardo Recamán Santos, and is defined as follows: Begin with $a_0 = 0$. Each subsequent term will either be

- The value of the previous term *minus* the term number, provided that this value is positive and not already in the sequence.
- Otherwise, the value of the previous term *plus* the term number.

In summary:

$$a_n = \begin{cases} 0 & \text{if } n = 0 \\ a_{n-1} - n & \text{if } a_{n-1} - n > 0 \text{ and is not already in the sequence} \\ a_{n-1} + n & \text{otherwise} \end{cases}$$

Thus, $a_1 = \begin{cases} a_0 - 1 & \text{if this is positive and is not already in the sequence} \\ a_0 + 1 & \text{otherwise} \end{cases}$; $a_1 = 1$

$a_2 = \begin{cases} a_1 - 2 & \text{if this is positive and is not already in the sequence} \\ a_1 + 2 & \text{otherwise} \end{cases}$; $a_2 = 3$

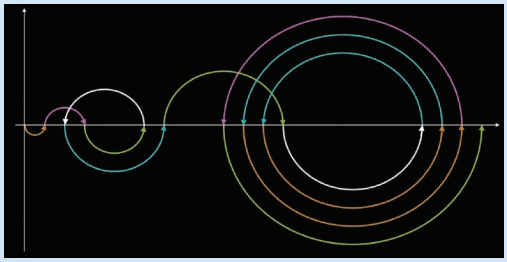
$a_3 = \begin{cases} a_2 - 3 & \text{if this is positive and is not already in the sequence} \\ a_2 + 3 & \text{otherwise} \end{cases}$; $a_3 = 6$

Bernardo Recamán Santos

129. Write the next 10 terms in Recamán's sequence.

For Further Study

A visual representation of Recamán's sequence uses the number line and semicircles to illustrate the backward and forward movement of the numbers in the sequence. Visit *The Slightly Spooky Recamán Sequence* (June 2018) video from Numberphile on YouTube.



SECTION 12.2 Arithmetic Sequences and Series

OBJECTIVES

1. Identify Specific and General Terms of an Arithmetic Sequence
2. Evaluate a Finite Arithmetic Series
3. Apply Arithmetic Sequences and Series

1. Identify Specific and General Terms of an Arithmetic Sequence

In this section and Section 12.3, we study two special types of sequences. The first is called an arithmetic sequence. For example, consider the salary plan for a job that pays \$75,000 the first year with a \$4000 raise each year thereafter. The sequence of salaries for the first 5 yr is

Year 1	Year 2	Year 3	Year 4	Year 5
\$75,000	\$79,000	\$83,000	\$87,000	\$91,000

Notice that each term after the first results from adding a fixed constant (\$4000) to its predecessor. This is the characteristic that makes this sequence arithmetic.

Arithmetic Sequence

An **arithmetic sequence** $\{a_n\}$ is a sequence of the form

$$a_1, a_1 + d, a_1 + 2d, a_1 + 3d, a_1 + 4d, \ldots$$

- The value a_1 is the first term, and d is called the **common difference** of the sequence.
- The value of d is the difference of any term after the first and its predecessor. $d = a_{n+1} - a_n$
- The nth term of the sequence is given by $a_n = a_1 + (n - 1)d$.
- The sequence can be defined recursively as a_1, $a_n = a_{n-1} + d$ for $n \geq 2$.

EXAMPLE 1 Identifying an Arithmetic Sequence and the Common Difference

Determine whether the sequence is arithmetic. If so, identify the common difference.

a. 35, 25, 15, 5, −5, … **b.** 1, 5, 10, 16, 23, …

Solution:

a. 35, 25, 15, 5, −5, …

$a_2 - a_1 = 25 - 35 = -10$
$a_3 - a_2 = 15 - 25 = -10$

The sequence is arithmetic because the difference between each term and its predecessor is the same constant.

$a_4 - a_3 = 5 - 15 = -10$
$a_5 - a_4 = -5 - 5 = -10$

The common difference is $d = -10$.

b. 1, 5, 10, 16, 23, …

$a_2 - a_1 = 5 - 1 = 4$
$a_3 - a_2 = 10 - 5 = 5$

The sequence is *not* arithmetic because the difference between a_2 and a_1 is different than the difference between a_3 and a_2. That is, the difference between consecutive terms is not the same.

Skill Practice 1 Determine whether the sequence is arithmetic. If so, identify the common difference.

a. 12, 5, −2, −9, −16, … **b.** 1, 4, 9, 16, 25, …

EXAMPLE 2 Writing the Terms of a Sequence

a. Write the first five terms of an arithmetic sequence with first term −5 and common difference 4.

b. Write a recursive formula to define the sequence.

Solution:

a. −5, −1, 3, 7, 11

+4 +4 +4 +4

Because the common difference is 4, each term after the first must be 4 *more than* its predecessor.

b. The recursive formula for an arithmetic sequence is a_1, $a_n = a_{n-1} + d$ for $n \geq 2$.

The sequence is defined by $a_1 = -5$ and $a_n = a_{n-1} + 4$ for $n \geq 2$.

Skill Practice 2

a. Write the first four terms of an arithmetic sequence with first term 8 and common difference −3.

b. Write a recursive formula to define the sequence.

EXAMPLE 3 Applying an Arithmetic Sequence

A park ranger in Everglades National Park measures the water level in one region of the park for a 5-day period during a drought.

Day number	1	2	3	4	5
Water level (in.)	54.0	53.2	52.4	51.6	50.8

Courtesy of Julie Miller

Answers

1. **a.** Arithmetic; $d = -7$
   b. Not arithmetic
2. **a.** 8, 5, 2, −1
   b. $a_1 = 8$ and $a_n = a_{n-1} - 3$ for $n \geq 2$.

ISTUDY

a. Based on the given data, does the water level follow an arithmetic progression?

b. Write an expression for the nth term of the sequence where n represents the day number.

c. Predict the water level on day 30 if this trend continues.

Solution:

a. $a_2 - a_1 = 53.2 - 54.0 = -0.8$
$a_3 - a_2 = 52.4 - 53.2 = -0.8$
$a_4 - a_3 = 51.6 - 52.4 = -0.8$
$a_5 - a_4 = 50.8 - 51.6 = -0.8$

The sequence is arithmetic because the difference between each term and its predecessor is the same constant.

The common difference is $d = -0.8$ in.

b. $a_n = a_1 + (n - 1)d$

Formula for the nth term of an arithmetic sequence

$a_n = 54 + (n - 1)(-0.8)$

Substitute 54 for a_1 and -0.8 for d.

c. $a_{30} = 54 + (30 - 1)(-0.8)$
$= 30.8$

To find a_{30}, substitute 30 for n.

The water level on day 30 will be 30.8 in. if this trend continues.

Skill Practice 3 A homeowner has kept records of the average monthly electric bill for 4 yr.

Year	1	2	3	4
Amount ($)	102.60	108.00	113.40	118.80

a. Do the average monthly electric bills follow an arithmetic progression?

b. Write an expression for the nth term of the sequence.

c. Predict the average monthly bill for year 6 if this trend continues.

The nth term of the sequence from Example 3 can be written in several equivalent algebraic forms.

$a_n = 54 + (n - 1)(-0.8)$
$a_n = 54 - 0.8n + 0.8$ Apply the distributive property.
$a_n = -0.8n + 54.8$

The expression $a_n = -0.8n + 54.8$ resembles the slope-intercept form of a linear function $f(x) = mx + b$. In fact, an arithmetic sequence is a linear function whose domain is the set of positive integers. The graph of the sequence from Example 3 is shown in Figure 12-4. The value of the common difference is negative ($d = -0.8$), indicating that the progression of points slopes downward.

In Example 4, we find specific terms of an arithmetic sequence given information about the sequence.

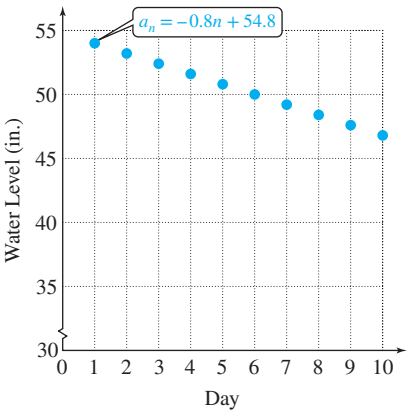


Figure 12-4

Answers

3. a. Yes
b. $a_n = 102.6 + (n - 1)(5.4)$
c. $129.60

EXAMPLE 4 Finding a Specific Term of an Arithmetic Sequence

Find the ninth term of the arithmetic sequence in which $a_1 = -4$ and $a_{22} = 164$.

Solution:

To find the value of a_9, we need to determine the common difference d. To find d, substitute $a_1 = -4$, $n = 22$, and $a_{22} = 164$ into the formula for the nth term.

$$\begin{aligned} a_n &= a_1 + (n-1)d \\ 164 &= -4 + (22-1)d \\ 164 &= -4 + 21d \\ d &= 8 \end{aligned}$$

Therefore, $a_n = -4 + (n-1)(8)$. With the values of a_1 and d known, the nth term is represented by $a_n = -4 + (n-1)(8)$.

$$\begin{aligned} a_n &= -4 + 8n - 8 && \text{Simplify.} \\ a_n &= 8n - 12 \\ a_9 &= 8(9) - 12 && \text{To find } a_9 \text{ substitute } n = 9. \\ &= 60 \end{aligned}$$

Skill Practice 4 Find the tenth term of the arithmetic sequence in which $a_1 = 12$ and $a_{30} = 128$.

In Example 5, we use the general formula for the nth term of an arithmetic sequence to find the number of terms in an arithmetic sequence.

EXAMPLE 5 Finding the Number of Terms in an Arithmetic Sequence

Find the number of terms of the finite arithmetic sequence $7, 3, -1, -5, \ldots, -113$.

Solution:

$a_n = a_1 + (n-1)d$ The first term of the sequence is 7. The nth term is -113. The common difference is $d = -4$.

$$\begin{aligned} -113 &= 7 + (n-1)(-4) \\ -113 &= 7 - 4n + 4 \\ -113 &= 11 - 4n \\ 4n &= 124 \\ n &= 31 \end{aligned}$$

To find the number of terms n, substitute $a_1 = 7$, $d = -4$, and $a_n = -113$ into the formula for the nth term.

There are 31 terms.

Skill Practice 5 Find the number of terms of the finite arithmetic sequence $16, 11, 6, 1, \ldots, -239$.

Answers

4. $a_{10} = 48$

5. 52 terms

ISTUDY

EXAMPLE 6 **Finding a Specific Term of an Arithmetic Sequence**

For an arithmetic sequence, $a_{15} = 49$ and $a_{27} = 85$. Find the 500th term.

Solution:

Substituting $a_{15} = 49$ and $a_{27} = 85$ into the formula $a_n = a_1 + (n - 1)d$, we can set up a system of linear equations to solve for a_1 and d.

$$\begin{aligned} a_n &= a_1 + (n-1)d \\ 49 &= a_1 + (15-1)d \\ 49 &= a_1 + 14d \end{aligned} \qquad \begin{aligned} a_n &= a_1 + (n-1)d \\ 85 &= a_1 + (27-1)d \\ 85 &= a_1 + 26d \end{aligned}$$

Substitute $a_{15} = 49$ and $a_{27} = 85$ into the formula for the nth term.

The two equations form a system of linear equations in two variables.

$$\begin{aligned} 49 &= a_1 + 14d \\ 85 &= a_1 + 26d \end{aligned} \xrightarrow{\text{Multiply by } -1} \begin{aligned} -49 &= -a_1 - 14d \\ 85 &= a_1 + 26d \\ \hline 36 &= 12d \\ 3 &= d \end{aligned} \qquad \begin{aligned} 49 &= a_1 + 14d \\ 49 &= a_1 + 14(3) \\ 7 &= a_1 \end{aligned}$$

With $d = 3$ and $a_1 = 7$, we have an nth term of $a_n = 7 + (n - 1)3$. Thus, the 500th term is given by $a_{500} = 7 + (500 - 1)3 = 1504$.

Skill Practice 6 For an arithmetic sequence, $a_{11} = 65$ and $a_{25} = 149$. Find the 400th term.

TIP In Example 6, we can also find the value of d by dividing the difference of a_{27} and a_{15} by the number of terms between a_{27} and a_{15}. That is,

$$d = \frac{85 - 49}{27 - 15} = 3$$

2. Evaluate a Finite Arithmetic Series

Consider the finite arithmetic sequence 1, 4, 7, 10, 13. The sum of the first n terms of the sequence is called the ***n*th partial sum** and is denoted by S_n. In this case, we have

$$\begin{aligned} S_1 &= 1 && = 1 \\ S_2 &= 1 + 4 && = 5 \\ S_3 &= 1 + 4 + 7 && = 12 \\ S_4 &= 1 + 4 + 7 + 10 && = 22 \\ S_5 &= 1 + 4 + 7 + 10 + 13 && = 35 \end{aligned}$$

TIP The sum of the first n terms of an arithmetic sequence is called a **finite arithmetic series.**

For a large number of terms, adding the terms individually would be a cumbersome process, so instead, we observe the following pattern. We write the sum of the first five terms of the sequence in both ascending and descending order.

$$\begin{aligned} \text{Ascending order:} \quad S_5 &= 1 + 4 + 7 + 10 + 13 \\ \text{Descending order:} \quad S_5 &= 13 + 10 + 7 + 4 + 1 \\ \hline 2S_5 &= 14 + 14 + 14 + 14 + 14 \end{aligned}$$

Now add to get $2S_5$.

$$\begin{aligned} 2S_5 &= 5(14) \\ \frac{2S_5}{2} &= \frac{5(14)}{2} \\ S_5 &= 35 \checkmark \end{aligned}$$

Answer

6. $a_{400} = 2399$

ISTUDY

By adding the terms in ascending and descending order, we double the sum but create a pattern that is easily added. We can use a similar process to find the sum S_n of the first n terms of an arithmetic sequence: $a_1 + a_2 + a_3 + \cdots + a_{n-1} + a_n$.

$$\begin{array}{lll} S_n = a_1 & +(a_1 + d) + (a_1 + 2d) + \cdots + a_n & \text{Ascending order} \\ S_n = a_n & +(a_n - d) + (a_n - 2d) + \cdots + a_1 & \text{Descending order} \\ \hline 2S_n = (a_1 + a_n) + (a_1 + a_n) + (a_1 + a_n) + \cdots + (a_1 + a_n) & & \end{array}$$

$$2S_n = n(a_1 + a_n)$$

$$S_n = \frac{n}{2}(a_1 + a_n)$$

*n*th Partial Sum of an Arithmetic Sequence

The sum S_n of the first n terms of an arithmetic sequence is given by

$$S_n = \frac{n}{2}(a_1 + a_n)$$

where a_1 is the first term of the sequence, and a_n is the nth term of the sequence.

In Example 7, we use the formula for the nth partial sum of an arithmetic sequence to find the sum of the first 50 positive even integers.

EXAMPLE 7 Finding an *n*th Partial Sum of an Arithmetic Sequence

Find the sum of the first 50 terms of the sequence. 2, 4, 6, 8, 10, …

Solution:

The sequence is arithmetic because each term is 2 more than its predecessor. The common difference is 2. To find the sum of the first 50 terms, we need to know the values of a_1 and a_{50}. To find a_{50}, we write a formula for the nth term and then evaluate the expression for $n = 50$.

$$\begin{array}{ll} a_n = a_1 + (n - 1)d & \text{General expression for the } n\text{th term} \\ a_n = 2 + (n - 1)(2) & \text{Substitute } a_1 = 2 \text{ and } d = 2. \\ a_n = 2n & \end{array}$$

$$\begin{array}{ll} a_{50} = 2(50) & \text{To find } a_{50}\text{, substitute } 50 \text{ for } n. \\ a_{50} = 100 & \end{array}$$

$$\begin{array}{ll} S_n = \frac{n}{2}(a_1 + a_n) & \text{Now find the sum of the first 50 terms.} \\ S_{50} = \frac{50}{2}(2 + 100) & \text{Substitute } n = 50,\ a_1 = 2, \text{ and } a_{50} = 100. \\ S_{50} = 2550 & \text{The sum of the first 50 positive even integers is 2550.} \end{array}$$

Skill Practice 7 Find the sum of the first 50 terms of the sequence. 1, 3, 5, 7, 9, …

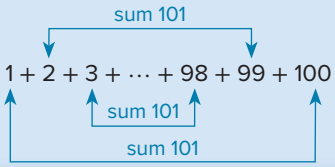
Answer
7. 2500

ISTUDY

Point of Interest

An old story suggests that at the age of 7, German mathematician Carl Friedrich Gauss (1777–1855) amazed his teachers by quickly computing the sum of the first 100 positive integers. Gauss realized that the sum of the integers from 1 to 100 was the same as 50 pairs of numbers each summing to 101. As the story goes, Gauss returned the correct sum of 5050 within minutes by taking the product of 50(101).

Sum of the first 100 positive integers:
50 pairs, each summing to 101.



In Example 8, we evaluate an arithmetic series written in summation notation.

EXAMPLE 8 Evaluating a Finite Arithmetic Series

Find the sum. $\sum_{i=1}^{60}(3i + 5)$

Solution:

The expression $3i + 5$ is linear in the variable i. This tells us that the terms of the series form an arithmetic progression. To verify, we can write several terms of the sum.

$$\sum_{i=1}^{60}(3i + 5) = [3(1) + 5] + [3(2) + 5] + [3(3) + 5] + \cdots + [3(60) + 5]$$
$$= 8 + 11 + 14 + \cdots + 185$$

The individual terms in the series 8, 11, 14, … , 185 form an arithmetic sequence $\{a_n\}$ with a common difference of 3. The first term is $a_1 = 8$, and the 60th term is $a_{60} = 185$. The value of the series is equal to the 60th partial sum of the sequence of terms.

$$S_n = \frac{n}{2}(a_1 + a_n)$$
$$S_{60} = \frac{60}{2}(8 + 185) \qquad \text{Substitute } n = 60,\ a_1 = 8, \text{ and } a_{60} = 185.$$
$$S_{60} = 5790$$

Skill Practice 8 Find the sum. $\sum_{i=1}^{80}(4i + 3)$

Avoiding Mistakes

When we apply the formula $S_n = \frac{n}{2}(a_1 + a_n)$ to find the sum $\sum_{i=1}^{n} a_n$, the index of summation, i, must begin at 1.

3. Apply Arithmetic Sequences and Series

In Example 9, we use an arithmetic sequence and series in an application.

EXAMPLE 9 Applying an Arithmetic Sequence and Series

Suppose that a job offers a starting salary of $75,000 with a raise of $4000 every year thereafter.

a. Write an expression for the nth term of an arithmetic sequence that represents the salary as a function of the number of years of employment, n.

b. Find the total income for an employee who works at the job for 20 yr.

Answer
8. 13,200

Solution:

a. $a_n = a_1 + (n - 1)d$

$a_n = 75{,}000 + (n - 1)(4000)$ Substitute $a_1 = 75{,}000$ and $d = 4000$.

$a_n = 75{,}000 + 4000n - 4000$ Simplify.

$a_n = 4000n + 71{,}000$

b. $a_{20} = 75{,}000 + (20 - 1)(4000)$ To find the total income over 20 yr, we need to know a_1 and a_{20}. Use the nth term to find a_{20}.

$a_{20} = 151{,}000$

$S_n = \frac{n}{2}(a_1 + a_n)$

$S_{20} = \frac{20}{2}(75{,}000 + 151{,}000)$ Substitute $n = 20$, $a_1 = 75{,}000$, and $a_{20} = 151{,}000$.

$S_{20} = 2{,}260{,}000$

Skill Practice 9 A teaching position has a starting salary of \$60,000 with a raise of \$3000 every year thereafter.

a. Write an expression for the nth term of an arithmetic sequence that represents the salary as a function of the number of years of employment, n.

b. Find the total income for an employee who works at the job for 30 yr.

Answers

9. a. $a_n = 3000n + 57{,}000$

b. \$3,105,000

SECTION 12.2 Practice Exercises

Prerequisite Review

R.1. Given $f(x) = 7x - 9$, evaluate $f(2)$.

R.2. Determine the slope and y-intercept of the line $y = -\frac{1}{4}x + 8$.

For Exercises R.3–R.4, solve the system.

R.3. $6x - 2y = 10$
$2x - 10y = 22$

R.4. $0.3x - 0.4y = -1.6$
$0.9x + 0.1y = -3.5$

Concept Connections

1. A(n) _____ sequence is a sequence in which each term after the first is found by adding a fixed constant to its predecessor.

2. The difference between any term after the first and its predecessor in an arithmetic sequence is called the _____ _____ and is denoted by d.

3. Given an arithmetic sequence with first term a_1 and common difference d, the nth term is represented by the formula $a_n =$ _____ or by the recursive formula $a_n =$ _____ for $n \geq 2$.

4. An arithmetic sequence is a linear function whose domain is the set of _____ integers.

5. The sum of the first n terms of a sequence is called the nth _____ sum and is denoted by S_n.

6. Given an arithmetic sequence with first term a_1 and nth term a_n, the nth partial sum is given by the formula $S_n =$ _____.

ISTUDY

Objective 1: Identify Specific and General Terms of an Arithmetic Sequence

For Exercises 7–14, determine whether the sequence is arithmetic. If so, find the common difference. (See Example 1)

7. 15, 19, 23, 27, …

8. 256, 268, 280, 292, …

9. 9, −2, −13, −24, …

10. 8, 0, −8, −16, …

11. 18, 22, 27, 33, …

12. 2, 4, 8, 16, …

13. $4, \frac{14}{3}, \frac{16}{3}, 6, \ldots$

14. $3, \frac{15}{4}, \frac{9}{2}, \frac{21}{4}, \ldots$

For Exercises 15–18,

a. Write the first five terms of an arithmetic sequence with the given first term and common difference.

b. Write a recursive formula to define the sequence. (**See Example 2**)

15. $a_1 = 3$, $d = 10$

16. $a_1 = 6$, $d = 5$

17. $a_1 = 4$, $d = -2$

18. $a_1 = 5$, $d = -3$

For Exercises 19–24,

a. Write a nonrecursive formula for the nth term of the arithmetic sequence $\{a_n\}$ based on the given information.

b. Find the indicated term.

19. a. $a_1 = 7$, $d = 10$
b. Find a_{22}.

20. a. $a_1 = 102$, $d = 4$
b. Find a_{43}.

21. a. $a_1 = -12$, $d = 5$
b. Find a_{20}.

22. a. $a_1 = -4$, $d = 6$
b. Find a_{18}.

23. a. $a_1 = \frac{1}{2}$, $d = \frac{1}{3}$
b. Find a_{10}.

24. a. $a_1 = \frac{2}{3}$, $d = \frac{1}{2}$
b. Find a_8.

25. K'yeon has 8 unread emails in his inbox before going on vacation. While on vacation, K'yeon does not read email. If he receives an average of 22 emails each day, write the nth term of a sequence defining the number of unread emails in his box at the end of day n of K'yeon's vacation.

26. Lita has a personal trainer who encourages cardiovascular exercise. In the first week of training, Lita walks for 10 min on a treadmill every day. Each week thereafter, Lita increases the time on the treadmill by 5 min. Write the nth term of a sequence defining the number of minutes spent on the treadmill per day for Lita's nth week at the gym.

27. A new drug and alcohol rehabilitation program performs outreach for members of the community. The number of participants for a 4-week period is given in the table. **(See Example 3)**

Week number	1	2	3	4
Number of participants	34	50	66	82

a. Based on the data given, does the number of participants follow an arithmetic progression?

b. Write an expression for the nth term of the sequence representing the number of participants, where n represents the week number.

c. Predict the number of participants in week 10 if this trend continues.

28. A student studying to be a veterinarian's assistant keeps track of a kitten's weight each week for a 5-week period after birth.

Week number	1	2	3	4	5
Weight (lb)	0.6	0.88	1.16	1.44	1.72

a. Based on the data given, does the weight of the kitten follow an arithmetic progression?

b. Write an expression for the nth term of the sequence representing the kitten's weight, n weeks after birth.

c. If the weight of the kitten continues to increase linearly for 3 months, predict the kitten's weight 12 weeks after birth.

29. Suppose that an object starts with an initial velocity of v_0 (in ft/sec) and moves under a constant acceleration a (in ft/sec^2). Then the velocity v_n (in ft/sec) after n seconds is given by $v_n = v_0 + an$. Show that this sequence is arithmetic. (*Hint*: Show that $v_{n+1} - v_n$ is constant.)

30. Suppose that an object is dropped from rest from an airplane. Assuming negligible air resistance, the vertical acceleration is 32 ft/sec^2. Using the formula for v_n given in Exercise 29,

a. Write the nth term v_n of the sequence representing the velocity in the downward direction after n seconds.

b. Determine the vertical velocity 1 sec after release and 5 sec after release.

31. Find the 8th term of an arithmetic sequence with $a_1 = -2$ and $a_{15} = 68$. (**See Example 4**)

32. Find the 19th term of an arithmetic sequence with $a_1 = -11$ and $a_{30} = 163$.

33. Find the 35th term of an arithmetic sequence with $a_1 = 50$ and $a_{22} = -265$.

34. Find the 46th term of an arithmetic sequence with $a_1 = 210$ and $a_{60} = -262$.

ISTUDY

For Exercises 35–38, find the number of terms of the finite arithmetic sequence. (See Example 5)

35. 8, 14, 20, 26, … , 320

36. 7, 16, 25, 34, … , 574

37. 11, 10.7, 10.4, 10.1, … , −3.4

38. 9, 8.4, 7.8, 7.2, … , −39

39. Given an arithmetic sequence with $a_{14} = 148$ and $a_{35} = 316$, find a_1 and d.

40. Given an arithmetic sequence with $a_{12} = -76$ and $a_{51} = -193$, find a_1 and d.

For Exercises 41–46, two terms of an arithmetic sequence are given. Find the indicated term. (See Example 6)

41. $a_{15} = 86$, $a_{34} = 200$; Find a_{150}.

42. $a_{12} = 52$, $a_{51} = 208$; Find a_{172}.

43. $b_{32} = -303$, $b_{54} = -567$; Find b_{214}.

44. $b_{64} = -456$, $b_{81} = -575$; Find b_{105}.

45. $c_{14} = 7.5$, $c_{101} = 29.25$; Find c_{400}.

46. $c_{21} = -11.16$, $c_{116} = -7.36$; Find c_{505}.

47. If the third and fourth terms of an arithmetic sequence are −6 and −9, what are the first and second terms?

48. If the third and fourth terms of an arithmetic sequence are 12 and 16, what are the first and second terms?

Objective 2: Evaluate a Finite Arithmetic Series

For Exercises 49–50, find the sum.

49. $4 + 7 + 10 + 13 + 16 + 19 + 22 + 25 + 28 + 31 + 34 + 37$

50. $8 + 12 + 16 + 20 + 24 + 28 + 32 + 36 + 40 + 44$

51. Find the sum of the first 40 terms of the sequence. {1, 6, 11, 16, …} (**See Example 7**)

52. Find the sum of the first 60 terms of the sequence. {2, 10, 18, 26, …}

53. Find the sum. $5 + 4.5 + 4 + 3.5 + \cdots + (-30.5)$

54. Find the sum. $8 + 7.2 + 6.4 + 5.6 + \cdots + (-45.6)$

For Exercises 55–64, find the sum. (See Example 8)

55. $\sum_{j=1}^{18}(j + 6)$

56. $\sum_{j=1}^{15}(j - 3)$

57. $\sum_{i=1}^{50}(2i + 6)$

58. $\sum_{i=1}^{40}(3i - 7)$

59. $\sum_{k=1}^{162}\left(3 - \frac{1}{2}k\right)$

60. $\sum_{k=1}^{141}\left(4 - \frac{1}{4}k\right)$

61. $-1 + 4 + 9 + \cdots + 49$

62. $12 + 16 + 20 + \cdots + 84$

63. $-7 + (-11) + (-15) + \cdots + (-39)$

64. $-18 + (-23) + (-28) + \cdots + (-183)$

Objective 3: Apply Arithmetic Sequences and Series

65. Suzanne must choose between two job offers. The first job offers $64,000 for the first year. Each year thereafter, she would receive a $3200 raise. The second job offers $60,000 in the first year. Each year thereafter, she would receive a $5000 raise. (**See Example 9**)

a. If she anticipates working for the company for 5 yr, find the total amount she would earn from each job.

b. If she anticipates working for the company for 10 yr, find the total amount she would earn from each job.

66. José must choose between two job offers. The first job pays $50,000 the first year. Each year thereafter, he would receive a raise of $2400. A second job offers $54,000 the first year with a raise of $2000 each year thereafter. However, with the second job, José would have to pay $100 per month out of his paycheck for health insurance.

a. If José anticipates working for the company for 6 yr, find the total amount he would earn from the first job and the total amount he would earn from the second job.

b. If he anticipates working for the company for 12 yr, find the total amount he would earn from the first job and the total amount he would earn from the second job.

67. An object in free fall is dropped from a tall cliff. It falls 16 ft in the first second, 48 ft in the second second, 80 ft in the third second, and so on.

a. Write a formula for the nth term of an arithmetic sequence that represents the distance d_n (in ft) that the object will fall in the nth second.

b. How far will the object fall in the 8th second?

c. What is the total distance that the object will fall in 8 sec?

68. A ball rolling down an inclined plane rolls 4 in. in the first second, 8 in. in the second second, 12 inches in the third second, and so on.

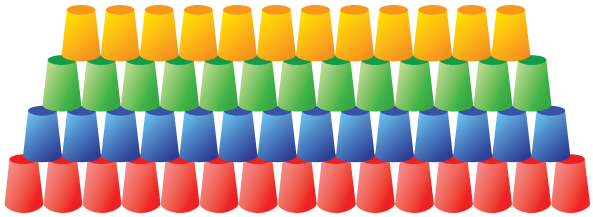
a. Write a formula for the nth term of an arithmetic sequence that represents the distance d_n (in inches) that the ball will roll in the nth second.

b. How far will the ball roll in the 10th second?

c. What is the total distance that the ball will travel in 10 sec?

ISTUDY

69. The students at Prairiewood Elementary plan to make a pyramid out of plastic cups. The bottom row has 15 cups. Moving up the pyramid, the number of cups in each row decreases by 1.



a. If the students build the pyramid so that there are 12 rows, how many cups will be at the top?

b. How many total cups will be required?

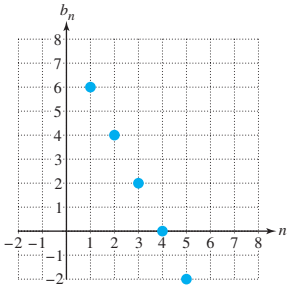
70. A theater has 32 rows. The first row has 18 seats, and each row that follows has three more seats than the row in front.

a. Determine the number of seats in row 32.

b. Determine the total number of seats in the theater.

Mixed Exercises

71. Refer to the graph of the sequence $\{b_n\}$.



a. Estimate the first four terms of the sequence.

b. Write a formula for the nth term of the sequence.

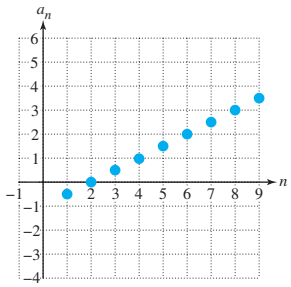
c. Find the 30th term.

d. Find the sum of the first 30 terms.

e. If $b_n = -180$, what is n?

f. Find the difference between b_{88} and b_{20}.

72. Refer to the graph of the sequence $\{a_n\}$.



a. Estimate the first four terms of the sequence.

b. Write a formula for the nth term of the sequence.

c. Find the 20th term.

d. Find the sum of the first 20 terms.

e. If $a_n = 256$, what is n?

f. Find the difference between a_{50} and a_{32}.

73. Find the sum of the integers from -20 to 256.

74. Find the sum of the integers from -102 to 57.

75. Compute the sum of the first 50 positive integers that are exactly divisible by 5.

76. Compute the sum of the first 60 positive integers that are exactly divisible by 4.

77. Compute the sum of all integers between 40 and 100 that are exactly divisible by 3.

78. Compute the sum of all integers between 60 and 150 that are exactly divisible by 8.

79. a. Use the formula $S_n = \frac{n}{2}(a_1 + a_n)$ to show that the sum of the first n positive integers is $S_n = \frac{n}{2}(1 + n)$.

b. Find the sum of the first 100 positive integers.

c. Find the sum of the first 1000 positive integers.

80. a. Use the formula $S_n = \frac{n}{2}(a_1 + a_n)$ to show that the sum $1, 3, 5, \ldots (2n - 1) = n^2$.

b. Find the sum of the first 100 positive odd integers.

For Exercises 81–86, a description of a sequence is given. Find

a. The 10th term **b.** The sum of the first eight terms

81. The first term is 8, and the common difference is 5.

82. The first term is 0.04, and the common difference is 9.

83. The second term is 8, and the 22nd term is 128.

84. The fourth term is 1.75, and the 30th term is 14.75.

85. The nth term is $3n - 1$.

86. The nth term is $\frac{2n}{15}$.

The arithmetic mean (average) of two numbers c and d is given by $\bar{x} = \frac{c + d}{2}$. The value $\bar{x}$ is equidistant between c and d, so the sequence $c, \bar{x}, d$ is an arithmetic sequence. Inserting k equally spaced values between c and d yields the arithmetic sequence $c, \bar{x}_1, \bar{x}_2, \bar{x}_3, \bar{x}_4, \ldots, \bar{x}_k, d$. Use this information for Exercises 87–88.

87. Insert three arithmetic means between 4 and 28. (*Hint*: There will be a total of five terms. Write the nth term of an arithmetic sequence with $a_1 = 4$ and $a_5 = 28$, and then find a_2, a_3, and a_4.)

88. Insert four arithmetic means between 19 and 64.

ISTUDY

Write About It

89. Suppose that $\{a_1, a_2, a_3, \ldots\}$ is an arithmetic sequence with common difference d. Explain why $\{a_1, a_3, a_5, \ldots\}$ is also an arithmetic sequence.

90. Suppose you are helping a friend with the homework for this section. Explain how to construct an arithmetic sequence.

Expanding Your Skills

91. Determine the nth term of the arithmetic sequence whose nth partial sum is $n^2 + 2n$. [*Hint*: The nth term of the sequence is the difference between the sum of the first n terms and the first $(n - 1)$ terms.]

92. Determine the nth term of the arithmetic sequence whose nth partial sum is $2n^2$.

SECTION 12.3 Geometric Sequences and Series

OBJECTIVES

1. Identify Specific and General Terms of a Geometric Sequence
2. Evaluate Finite Geometric Series
3. Evaluate Infinite Geometric Series
4. Find the Value of an Annuity

1. Identify Specific and General Terms of a Geometric Sequence

The sequence 2, 4, 8, 16, 32, … is not an arithmetic sequence because the difference between consecutive terms is not the same constant. However, a different pattern exists. Notice that each term after the first is 2 times the preceding term. This sequence is called a geometric sequence.

Geometric Sequence

A **geometric sequence** $\{a_n\}$ is a sequence of the form

$$a_1, a_1r, a_1r^2, a_1r^3, a_1r^4, \ldots$$

- The value a_1 is the first term, and r is called the **common ratio** of the sequence.
- The value of r is the quotient of any term after the first and its predecessor.

$$r = \frac{a_{n+1}}{a_n}$$

- The nth term of the sequence is given by $a_n = a_1r^{n-1}$.
- The sequence can be defined recursively as a_1, $a_n = a_{n-1}r$ for $n \geq 2$.

A geometric sequence is recognized by dividing any term after the first by its predecessor. In all cases the quotient is the same ratio r.

EXAMPLE 1 Identifying a Geometric Sequence and the Common Ratio

Determine whether the sequence is geometric. If so, identify the common ratio.

a. $18, 6, 2, \frac{2}{3}, \ldots$ **b.** $3, 12, 48, 240, \ldots$

Solution:

a. $18, 6, 2, \frac{2}{3}, \ldots$

$\frac{a_2}{a_1} = \frac{6}{18} = \frac{1}{3}$, $\frac{a_3}{a_2} = \frac{2}{6} = \frac{1}{3}$, $\frac{a_4}{a_3} = \frac{\frac{2}{3}}{2} = \frac{2}{3} \cdot \frac{1}{2} = \frac{1}{3}$

The seqence is geometric because the ratio between each term and its predecessor is the same constant.

The common ratio is $r = \frac{1}{3}$.

b. $3, 12, 48, 240, \ldots$

$\frac{a_2}{a_1} = \frac{12}{3} = 4$, $\frac{a_3}{a_2} = \frac{48}{12} = 4$, $\frac{a_4}{a_3} = \frac{240}{48} = 5$

The sequence is *not* geometric because the ratio between a_4 and a_3 is different than the ratio of other pairs of consecutive terms.

Skill Practice 1 Determine whether the sequence is geometric. If so, identify the common ratio.

a. 80, 20, 5, $\frac{5}{4}$, … **b.** 1, 8, 64, 640, …

Example 2 illustrates the fundamental characteristic of a geometric sequence; that is, each term of a geometric sequence is a constant multiple of the preceding term.

EXAMPLE 2 Writing Several Terms of a Geometric Sequence

Write the first five terms of a geometric sequence with $a_1 = 5$ and $r = -2$.

Solution:

By definition, a geometric sequence follows the pattern a_1, $a_1 r$, $a_1 r^2$, $a_1 r^3$, … . The first five terms are

$a_1 = 5$
$a_2 = 5(-2) = -10$
$a_3 = 5(-2)^2 = 20$
$a_4 = 5(-2)^3 = -40$
$a_5 = 5(-2)^4 = 80$

TIP Alternatively, we can use a recursive formula: $a_1 = 5$ and $a_n = a_{n-1} \cdot r$ for $n \geq 2$.

$a_2 = a_1 \cdot (-2) = 5(-2) = -10$
$a_3 = a_2 \cdot (-2) = -10(-2) = 20$
$a_4 = a_3 \cdot (-2) = 20(-2) = -40$
$a_5 = a_4 \cdot (-2) = -40(-2) = 80$

Skill Practice 2 Write the first five terms of the geometric sequence with $a_1 = 2$ and $r = -3$.

In Example 3, we write an expression for the nth term of a geometric sequence given the first four terms.

EXAMPLE 3 Writing the nth Term of a Geometric Sequence

Write a formula for the nth term of the geometric sequence. 2, 3, $\frac{9}{2}$, $\frac{27}{4}$, …

Solution:

$r = \frac{a_2}{a_1} = \frac{3}{2}$ Dividing any term by its predecessor, we have a common ratio of $\frac{3}{2}$.

$a_n = a_1 r^{n-1}$ Begin with the formula for the nth term of a geometric sequence.

$a_n = 2\left(\frac{3}{2}\right)^{n-1}$ Substitute $a_1 = 2$ and $r = \frac{3}{2}$.

Skill Practice 3 Write the nth term of the geometric sequence.

4, 5, $\frac{25}{4}$, $\frac{125}{16}$, …

A graph of several terms of the geometric sequence from Example 3 is shown in Figure 12-5. The points representing the sequence coincide with points on the graph of the exponential function $f(x) = 2\left(\frac{3}{2}\right)^{x-1}$ for positive integer values of x (Figure 12-6).

Answers

1. a. Geometric; $r = \frac{1}{4}$
b. Not geometric
2. 2, −6, 18, −54, 162
3. $a_n = 4\left(\frac{5}{4}\right)^{n-1}$

ISTUDY

In fact, a geometric sequence with $r > 0$ and $r \neq 1$ is an exponential function whose domain is restricted to the set of positive integers.

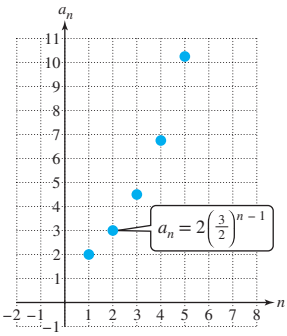


Figure 12-5

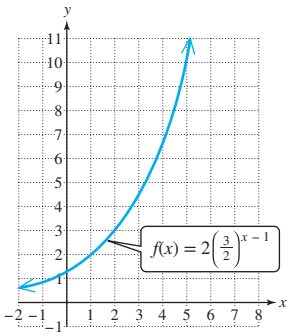

Figure 12-6

EXAMPLE 4 Finding a Specified Term of a Geometric Sequence

Find the fifth term of a geometric sequence $\{a_n\}$ given that $a_1 = 15$ and $a_2 = -9$.

Solution:

$$r = \frac{a_2}{a_1} = \frac{-9}{15} = -\frac{3}{5}$$ Divide a_2 by a_1 to obtain the common ratio $-\frac{3}{5}$.

$$a_n = a_1 r^{n-1}$$ Use the formula for the nth term of a geometric sequence.

$$a_n = 15\left(-\frac{3}{5}\right)^{n-1}$$ Substitute $a_1 = 15$ and $r = -\frac{3}{5}$ to get the nth term for this sequence.

$$a_5 = 15\left(-\frac{3}{5}\right)^{5-1}$$ To find a_5, substitute 5 for n.

$$a_5 = \frac{243}{125}$$

Skill Practice 4 Find the sixth term of a geometric sequence $\{a_n\}$ given that $a_1 = 64$ and $a_2 = -16$.

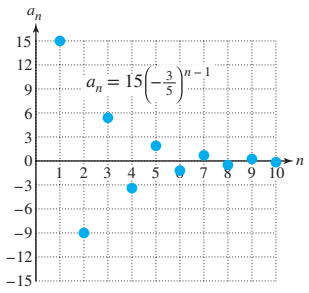

Figure 12-7

Example 4 illustrates that a geometric sequence with a negative common ratio is an alternating sequence. The graph of the first 10 terms of the sequence is shown in Figure 12-7.

EXAMPLE 5 Writing the *n*th Term of a Geometric Sequence

Given the terms $a_2 = 80$ and $a_5 = 40.96$ of a geometric sequence, find r, a_1, and a_n.

Solution:

In this example, we need to find two unknown quantities. One strategy is to begin with the formula for the nth term of the geometric sequence and substitute the known values for terms 2 and 5 of the sequence. Then solve the resulting system of nonlinear equations.

$$a_n = a_1 r^{n-1}$$

$$80 = a_1 r^{(2-1)} \longrightarrow 80 = a_1 r$$ Substitute $a_2 = 80$.

$$40.96 = a_1 r^{(5-1)} \longrightarrow 40.96 = a_1 r^4$$ Substitute $a_5 = 40.96$.

Answer

4. $a_6 = -\frac{1}{16}$

Substitute $a_1 = \frac{80}{r}$ from the first equation into the second equation: $40.96 = a_1 r^4$.

$$40.96 = \frac{80}{r} r^4$$
$$40.96 = 80r^3$$
$0.512 = r^3$ Divide by 80.

$r = 0.8$ Take the cube root of both sides.

$a_1 = \frac{80}{r} = \frac{80}{0.8} = 100$ To solve for a_1, substitute $r = 0.8$ into the equation $a_1 = \frac{80}{r}$.

The value of r is 0.8, the value of a_1 is 100, and the nth term is $a_n = 100(0.8)^{n-1}$.

Skill Practice 5 Given the terms $a_2 = 54$ and $a_5 = 182.25$ of a geometric sequence, find r, a_1, and a_n.

2. Evaluate Finite Geometric Series

The nth partial sum S_n of the first n terms of a geometric sequence is a **finite geometric series.** Consider the geometric series:

$$S_n = a_1 + a_1 r + a_1 r^2 + a_1 r^3 + \cdots + a_1 r^{n-1}$$

Suppose that we subtract rS_n from S_n.

$$\begin{array}{rllll} S_n = a_1 & + a_1 r & + a_1 r^2 & + \cdots + a_1 r^{n-1} \\ rS_n = a_1 r & + a_1 r^2 & + a_1 r^3 & + \cdots + a_1 r^n \\ \hline S_n - rS_n = (a_1 - a_1 r) & + (a_1 r - a_1 r^2) & + (a_1 r^2 - a_1 r^3) & + \cdots + (a_1 r^{n-1} - a_1 r^n) \end{array}$$

$S_n - rS_n = a_1 - a_1 r^n$ The terms in red form a sum of zero.

$S_n(1 - r) = a_1(1 - r^n)$ Factor each side of the equation.

$S_n = \frac{a_1(1 - r^n)}{1 - r}$ Divide by $(1 - r)$.

nth Partial Sum of a Geometric Sequence

The sum S_n of the first n terms of a geometric sequence is given by

$$S_n = \frac{a_1(1 - r^n)}{1 - r}$$

where a_1 is the first term of the sequence and r is the common ratio, $r \neq 1$.

EXAMPLE 6 Evaluating a Finite Geometric Series

Find the sum. $\sum_{i=1}^{6} 4\left(\frac{1}{2}\right)^{i-1}$

Solution:

$$\sum_{i=1}^{6} 4\left(\frac{1}{2}\right)^{i-1} = 4 + 2 + 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8}$$

The individual terms in the series form a geometric sequence with $a_1 = 4$ and $r = \frac{1}{2}$. The value of the series is the sixth partial sum of the sequence of terms.

$$S_n = \frac{a_1(1 - r^n)}{1 - r} = \frac{4\left[1 - \left(\frac{1}{2}\right)^6\right]}{1 - \frac{1}{2}} = \frac{4\left(1 - \frac{1}{64}\right)}{\frac{1}{2}} = \frac{63}{8}$$

Apply the formula for the nth partial sum with $n = 6$.

Skill Practice 6 Find the sum. $\sum_{i=1}^{7} 9\left(\frac{1}{3}\right)^{i-1}$

Answers

5. $r = 1.5$; $a_1 = 36$; $a_n = 36(1.5)^{n-1}$

6. $\frac{1093}{81}$

ISTUDY

EXAMPLE 7 Evaluating a Finite Geometric Series

Find the sum of the finite geometric series. $5 + 10 + 20 + \cdots + 5120$

Solution:

The common ratio is 2 and $a_1 = 5$. The nth term of the sequence of terms can be written as $a_n = 5(2)^{n-1}$. To find the number of terms n, substitute 5120 for a_n.

$$\begin{aligned} 5120 &= 5(2)^{n-1} \\ 1024 &= 2^{n-1} && \text{Divide both sides by 5.} \\ 2^{10} &= 2^{n-1} && \text{Apply the equivalence property of exponential expressions.} \\ 10 &= n - 1 \\ n &= 11 && \text{The sequence has 11 terms.} \end{aligned}$$

TIP The equivalence property of exponential expressions indicates that if $b^n = b^m$, then $n = m$. That is, if two exponential expressions with the same base are equal, then their exponents are equal.

With $a_1 = 5$, $r = 2$, and $n = 11$, we have

$$S_n = \frac{a_1(1 - r^n)}{1 - r} = \frac{5(1 - 2^{11})}{1 - 2} = 10{,}235$$

Skill Practice 7 Find the sum of the finite geometric series.

$3 + 6 + 12 + \cdots + 768$

3. Evaluate Infinite Geometric Series

For a positive integer n, the series $\sum_{i=1}^{n} a_i = a_1 + a_2 + a_3 + \cdots + a_n$ is called a **finite series** because there are a finite number of terms. The series $\sum_{i=1}^{\infty} a_i = a_1 + a_2 + a_3 + \cdots$ is called an **infinite series** because there are an infinite number of terms. Although it is impossible to add an infinite number of terms on a term-by-term basis, we might ask if the sum approaches a limiting value. If the nth partial sum S_n of an infinite series approaches a number L as $n \to \infty$, we say that the series **converges** and we call L the sum of the series. If a series does not converge, we say that the series **diverges** (the sum does not exist).

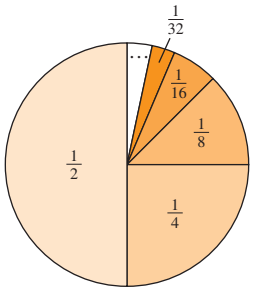

Figure 12-8

Consider the geometric sequence $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \ldots, \left(\frac{1}{2}\right)^n, \ldots$ and the corresponding infinite geometric series $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots + \left(\frac{1}{2}\right)^n + \cdots$. To visualize the infinite series, suppose that we add $\frac{1}{2}$ of a pie plus $\frac{1}{4}$ of a pie plus $\frac{1}{8}$ of a pie and so on. Will we approach some finite amount of pie? From Figure 12-8, it appears that the sum will be 1 whole unit.

For an infinite geometric sequence with $-1 < r < 1$ (equivalently $|r| < 1$), the value of r^n will become smaller as n gets larger. For example:

$$\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \ldots, \underbrace{\left(\frac{1}{2}\right)^{10}}_{\approx 0.0009766}, \ldots, \underbrace{\left(\frac{1}{2}\right)^{15}}_{\approx 0.0000305}, \ldots$$

In fact, for $|r| < 1$, as $n \to \infty$, $r^n \to 0$. Therefore, as n approaches infinity

$$S_n = \frac{a_1(1 - r^n)}{1 - r} \text{ approaches } \frac{a_1(1 - 0)}{1 - r} = \frac{a_1}{1 - r}.$$

Answer

7. 1533

ISTUDY

Sum of an Infinite Geometric Series

Given an infinite geometric series $a_1 + a_1r + a_1r^2 + a_1r^3 + \cdots$, with $|r| < 1$, the sum S of all terms in the series is given by

$$S = \frac{a_1}{1 - r}$$

Note: If $|r| \geq 1$, then the sum does not exist.

EXAMPLE 8 Evaluating an Infinite Geometric Series

Find the sum if possible. **a.** $\sum_{i=1}^{\infty} 5\left(-\frac{1}{3}\right)^{i-1}$ **b.** $2 + \frac{8}{3} + \frac{32}{9} + \frac{128}{27} + \cdots$

Solution:

a. $\sum_{i=1}^{\infty} 5\left(-\frac{1}{3}\right)^{i-1} = 5 - \frac{5}{3} + \frac{5}{9} - \frac{5}{27} + \frac{5}{81} + \cdots$

The sum is an infinite geometric series with $a_1 = 5$ and $r = -\frac{1}{3}$.

Because $|r| = \left|-\frac{1}{3}\right| < 1$, we have $S = \frac{a_1}{1 - r} = \frac{5}{1 - \left(-\frac{1}{3}\right)} = \frac{15}{4}$.

The sum is $\frac{15}{4}$.

b. $2 + \frac{8}{3} + \frac{32}{9} + \frac{128}{27} + \cdots$ is a geometric series with $a_1 = 2$ and $r = \frac{4}{3}$.

Because $|r| = \left|\frac{4}{3}\right| \geq 1$, the sum does not exist.

Skill Practice 8 Find the sum if possible.

a. $\sum_{i=1}^{\infty} 4\left(\frac{3}{4}\right)^{i-1}$ **b.** $2 + \frac{5}{2} + \frac{25}{8} + \frac{125}{32} + \cdots$

In Example 9, we use the formula for the sum of an infinite geometric series to write a repeating decimal as a fraction.

EXAMPLE 9 Writing a Repeating Decimal as a Fraction

a. Write $0.\overline{5}$ as a fraction. **b.** Write $1.9\overline{75}$ as a fraction.

Solution:

a. $0.\overline{5} = 0.5555\ldots$

$$= \underbrace{\frac{5}{10} + \frac{5}{100} + \frac{5}{1000} + \frac{5}{10{,}000}} + \cdots$$

Infinite geometric series with $a_1 = \frac{5}{10}$ and $r = \frac{1}{10}$ $\longrightarrow$ $S = \frac{a_1}{1 - r} = \frac{\frac{5}{10}}{1 - \frac{1}{10}} = \frac{\frac{5}{10}}{\frac{9}{10}} = \frac{5}{9}$

$$0.\overline{5} = \frac{5}{9}$$

Answers

8. a. 16

b. $r = \frac{5}{4} \geq 1$, so the sum does not exist.

ISTUDY

b. $1.9\overline{75} = 1.9757575\ldots$

$$= \frac{19}{10} + \underbrace{\left[\frac{75}{1000} + \frac{75}{100{,}000} + \cdots\right]}$$

Infinite geometric series with $a_1 = \frac{75}{1000}$ and $r = \frac{1}{100}$ $\longrightarrow$ $S = \frac{a_1}{1-r} = \frac{\frac{75}{1000}}{1-\frac{1}{100}} = \frac{\frac{75}{1000}}{\frac{99}{100}} = \frac{75}{990} = \frac{5}{66}$

$$1.9\overline{75} = \frac{19}{10} + \frac{5}{66} = \frac{326}{165}$$

Skill Practice 9 **a.** Write $0.\overline{7}$ as a fraction. **b.** Write $0.3\overline{4}$ as a fraction.

When money is infused into the economy, a percentage of the money received by individuals or businesses is often respent over and over again. Economists call this the **multiplier effect.**

EXAMPLE 10 **Investigating an Application of an Infinite Geometric Series—The Multiplier Effect**

Suppose that \$200 million is spent annually by tourists in a certain state. Further suppose that 75% of the money is respent in the state and then respent over and over again, each time at a rate of 75%. Determine the theoretical total amount spent from the initial \$200 million if the money can be respent an infinite number of times.

Solution:

The total amount spent can be represented by the infinite geometric series where all values are in \$ millions.

75% of 200 | 75% of 150

$$200 + 150 + 112.5 + \cdots$$

We have $a_1 = 200$ and $r = 0.75$. Because $|r| = |0.75| < 1$, we have

$$S = \frac{a_1}{1-r} = \frac{200}{1-0.75} = 800.$$

Theoretically, the total amount spent is \$800 million.

Skill Practice 10 Suppose that after a tax rebate an individual spends \$210. The money is then respent over and over again, each time at a rate of 70%. Determine the total amount spent. Assume that the money can be respent an infinite number of times.

4. Find the Value of an Annuity

In Section 4.2, we studied applications of exponential functions involving compound interest. We learned that if P dollars is invested in an account at interest rate r, compounded annually for t years, then the amount A in the account is given by

$$A = P(1+r)^t$$

However, rather than making a one-time lump sum payment of P dollars, many individuals will invest smaller amounts at regular and more frequent intervals. Such a sequence of fixed payments made (or received) by an individual over a fixed period of time is called an **annuity.**

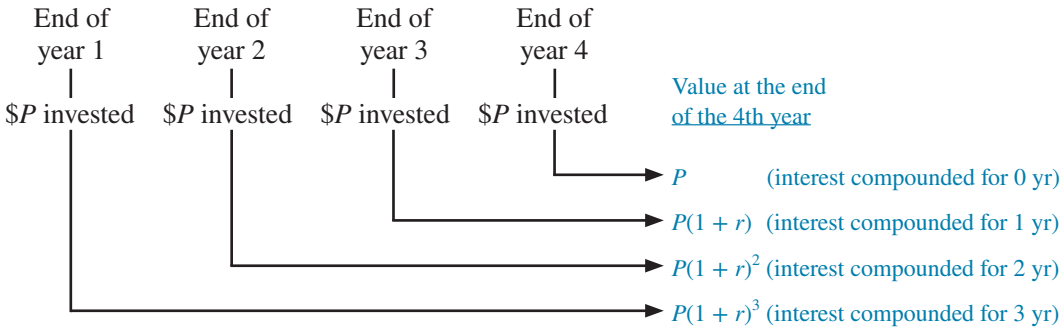
Answers

9. a. $\frac{7}{9}$ **b.** $\frac{31}{90}$

10. \$700

ISTUDY

Suppose that an individual invests P dollars at the *end* of each year for 4 yr at interest rate r. The money deposited at the end of the first year will have 3 yr in which to earn interest. The money invested at the end of the second year will earn interest for 2 yr, and the money invested at the end of the third year will earn interest for 1 yr. However, the money invested at the end of the fourth year will not earn any interest.



The total amount A, also called the **future value** of the annuity, is given by

$$A = P + P(1 + r) + P(1 + r)^2 + P(1 + r)^3$$

This is a finite geometric series with $a_1 = P$ and common ratio of $(1 + r)$. Using the relationship $S_n = \dfrac{a_1(1 - r^n)}{1 - r}$, the total amount invested for t years is given by

$$A = \frac{P[1 - (1 + r)^t]}{1 - (1 + r)} = \frac{P[1 - (1 + r)^t]}{-r} \text{ or simply } A = \frac{P[(1 + r)^t - 1]}{r}$$

If deposits are made n times per year, then the interest rate per compounding period is $\frac{r}{n}$, and the total number of times the money is compounded is nt.

TIP In this section we study **ordinary annuities.** These are annuities in which money is invested at the *end* of the compounding periods. If the money is invested at the beginning of the compounding periods, such an investment is called an **annuity due** and the future value is computed with a different formula.

Future Value of an Ordinary Annuity

Suppose that P dollars is invested at the end of each compounding period n times per year at interest rate r. Then the value A (in \$) of the annuity after t years is given by

$$A = \frac{P[(1 + \frac{r}{n})^{nt} - 1]}{\frac{r}{n}}$$

EXAMPLE 11 Finding the Value of an Annuity

Suppose that an employee working for a state college puts aside \$150 at the end of each month in a tax-sheltered annuity. The annuity pays 6% annual interest compounded monthly. Suppose that the employee begins contributing at age 28.

a. How much will the annuity be worth by the time the employee reaches age 62?

b. How much interest will have been earned?

ISTUDY

Point of Interest

The contributions made to the investment in Example 11 are **tax deferred.** This means that the principal invested each month has not yet been taxed. Because the principal is invested pretax, the individual potentially has more money available to invest. Furthermore, no taxes are paid on either the principal or interest until the money is withdrawn. This type of plan is meant as a long-term investment, and withdrawals are typically taken after age 59½ without penalty.

Solution:

a. $A = \dfrac{P\left[\left(1 + \frac{r}{n}\right)^{nt} - 1\right]}{\frac{r}{n}}$

$A = \dfrac{150\left[\left(1 + \frac{0.06}{12}\right)^{(12)(34)} - 1\right]}{\frac{0.06}{12}}$

$A = 199{,}548.50$

$P = \$150$
$r = 0.06$
$n = 12$ (the money is invested monthly)
$t = 62 - 28 = 34$ yr

The annuity will be worth \$199,548.50 when the employee reaches age 62.

b. \$150 is invested 12 times per year for 34 yr.
Principal invested: $(\$150)(12)(34) = \$61{,}200$
The amount of interest is $\$199{,}548.50 - \$61{,}200 = \$138{,}348.50$.

Skill Practice 11 Suppose that an employee contributes \$100 to an annuity at the end of each month for 25 yr. If the annuity earns 7%,

a. Determine the value of the annuity at the end of the 25-yr period.

b. How much interest will be earned?

Answers

11. a. \$81,007.17 **b.** \$51,007.17

R.1. Simplify. $-\frac{5}{6} \div \frac{2}{3}$

R.2. Solve for x. $3^x = 81$

R.3. For $g(x) = \left(\frac{1}{4}\right)^x$ find $g(0)$, $g(1)$, $g(2)$, $g(-1)$, and $g(-2)$.

R.4. For $h(x) = 16^x$ find $h(0)$, $h(1)$, and $h(-1)$.

R.5. Suppose that an investor deposits \$14,000 in a savings account for 10 yr at 2% interest. Use the model $A(t) = P\left(1 + \frac{r}{n}\right)^{nt}$ for P dollars in principal invested at an interest rate r compounded n times per year for t years for the following compounding options. Round to the nearest dollar.

a. Interest compounded annually

b. Interest compounded quarterly

c. Interest compounded monthly

Concept Connections

1. A _____ sequence is a sequence in which each term after the first is the product of the preceding term and a fixed nonzero real number, called the common _____, r.

2. The nth term of a geometric sequence with first term a_1 and common ratio r is given by $a_n =$ _____.

3. The nth partial sum S_n of the first n terms of a geometric sequence is a (finite/infinite) geometric series.

4. The sum S_n of the first n terms of a geometric sequence with first term a_1 and common ratio r is given by the formula $S_n =$ _____.

5. Given a geometric sequence with $|r| < 1$, the value of $r^n \to$ _____ as $n \to \infty$.

6. Given an infinite geometric series with first term a_1 and common ratio r, if $|r| < 1$, then the sum S is given by the formula $S =$ _____. If $|r| \geq 1$, then the sum (does/does not) exist.

7. A sequence of payments made at equal intervals over a fixed period of time is called an _____.

8. Suppose that an infinite series $a_1 + a_2 + a_3 + \cdots + a_n + \cdots$ approaches a value L as $n \to \infty$. Then the series _____. Otherwise, the series _____.

Objective 1: Identify Specific and General Terms of a Geometric Sequence

For Exercises 9–18, determine whether the sequence is geometric. If so, find the value of *r*. (See Example 1)

9. 6, 18, 54, 162, …

10. 4, 20, 100, 500, …

11. $-7, \frac{7}{2}, -\frac{7}{4}, \frac{7}{8}, \ldots$

12. $5, -\frac{5}{3}, \frac{5}{9}, -\frac{5}{27}, \ldots$

13. 3, 12, 60, 360, …

14. 7, 14, 42, 88, …

15. $\sqrt{5}, 5, 5\sqrt{5}, 25, \ldots$

16. $\sqrt[3]{7}, \sqrt[3]{49}, 7, 7\sqrt[3]{7}, \ldots$

17. $2, \frac{4}{t}, \frac{8}{t^2}, \frac{16}{t^3}, \ldots$

18. $\frac{5}{a^2}, \frac{15}{a^4}, \frac{45}{a^6}, \frac{135}{a^8}, \ldots$

For Exercises 19–24, write the first five terms of a geometric sequence $\{a_n\}$ based on the given information about the sequence. (See Example 2)

19. $a_1 = 7$ and $r = 2$

20. $a_1 = 2$ and $r = 3$

21. $a_1 = 24$ and $r = -\frac{2}{3}$

22. $a_1 = 80$ and $r = -\frac{4}{5}$

23. $a_1 = 36$ and $a_n = \frac{1}{2}a_{n-1}$ for $n \geq 2$

24. $a_1 = 27$, $a_n = \frac{1}{3}a_{n-1}$ for $n \geq 2$

For Exercises 25–30, write a formula for the *n*th term of the geometric sequence. (See Example 3)

25. 5, 10, 20, 40, …

26. 3, 6, 12, 24, …

27. $-2, -1, -\frac{1}{2}, -\frac{1}{4}, \ldots$

28. $-8, -2, -\frac{1}{2}, -\frac{1}{8}, \ldots$

29. $\frac{16}{3}, -4, 3, -\frac{9}{4}, \ldots$

30. $\frac{18}{5}, -\frac{6}{5}, \frac{2}{5}, -\frac{2}{15}, \ldots$

31. A farmer depreciates a $100,000 tractor. The resale value of the tractor n years after purchase is 85% of its value from the previous year.

a. Write a formula for the nth term of a sequence that represents the resale value of the tractor n years after purchase.

b. What will the resale value be 5 yr after purchase? Round to the nearest $1000.

32. A Coulter Counter is a device used to count the number of microscopic particles in a fluid, most notably, cells in blood. A hospital depreciates a $9000 Coulter Counter at a rate of 75% per year after purchase.

a. Write a formula for the nth term of a sequence that represents the resale value of the device n years after purchase.

b. What will the resale value be 4 yr after purchase? Round to the nearest $100.

33. Doctors in a certain city report 24 confirmed cases of the flu to the health department. At that time, the health department declares a flu epidemic. If the number of reported cases increases by roughly 30% each week thereafter, find the number of cases 10 weeks after the initial report. Round to the nearest whole unit.

34. A homeowner buys a house for $240,000 and finds that the value of the property increases by 3% per year thereafter. Assuming that the trend continues, find the value of the home 15 yr later. Round to the nearest $1000.

For Exercises 35–42, find the indicated term of a geometric sequence from the given information. (See Example 4)

35. $a_1 = 12$ and $a_2 = -8$. Find the sixth term.

36. $a_1 = 16$ and $a_2 = -12$. Find the fifth term.

37. $a_1 = 2$ and $a_4 = 16$. Find a_{12}.

38. $a_1 = 4$ and $a_4 = 108$. Find a_{10}.

39. $a_2 = -6$ and $r = \frac{1}{2}$. Find a_7.

40. $a_2 = -15$ and $r = \frac{1}{3}$. Find a_8.

41. $a_5 = -\frac{16}{9}$ and $r = -\frac{2}{3}$. Find a_1.

42. $a_6 = \frac{5}{16}$ and $r = -\frac{1}{2}$. Find a_1.

43. If the second and third terms of a geometric sequence are 15 and 75, what is the first term?

44. If the second and third terms of a geometric sequence are 4 and 1, what is the first term?

ISTUDY

For Exercises 45–48, find a_1 and r for a geometric sequence $\{a_n\}$ from the given information. (See Example 5)

45. $a_2 = 18$ and $a_5 = 144$

46. $a_2 = 21$ and $a_7 = 5103$

47. $a_3 = 72$ and $a_6 = -\frac{243}{8}$

48. $a_3 = 45$ and $a_6 = -\frac{243}{25}$

Objectives 2–3: Evaluate Finite and Infinite Geometric Series

For Exercises 49–72, find the sum of the geometric series, if possible. (See Examples 6–8)

49. $\sum_{n=1}^{10} 3(2)^{n-1}$

50. $\sum_{n=1}^{8} 4(3)^{n-1}$

51. $\sum_{k=1}^{7} 6\left(\frac{2}{3}\right)^{k-1}$

52. $\sum_{j=1}^{7} 2\left(\frac{3}{4}\right)^{j-1}$

53. $15 + 5 + \frac{5}{3} + \frac{5}{9} + \frac{5}{27} + \frac{5}{81}$

54. $50 + 10 + 2 + \frac{2}{5} + \frac{2}{25} + \frac{2}{125}$

55. $2 + 6 + 18 + \cdots + 13{,}122$

56. $4 + 12 + 36 + \cdots + 78{,}732$

57. $1 + \frac{2}{3} + \frac{4}{9} + \cdots + \frac{32}{243}$

58. $\frac{8}{3} + 2 + \frac{3}{2} + \cdots + \frac{243}{512}$

59. $1 + \frac{1}{5} + \frac{1}{25} + \frac{1}{125} + \cdots$

60. $1 + \frac{1}{6} + \frac{1}{36} + \frac{1}{216} + \cdots$

61. $-2 - \frac{1}{2} - \frac{1}{8} - \frac{1}{32} - \cdots$

62. $-5 - 1 - \frac{1}{5} - \frac{1}{25} - \cdots$

63. $2 + 8 + 32 + 128 + \cdots$

64. $1 + 6 + 36 + 216 + \cdots$

65. $\sum_{j=1}^{\infty} \left(\frac{2}{3}\right)^{j-1}$

66. $\sum_{i=1}^{\infty} \left(\frac{3}{4}\right)^{i-1}$

67. $\sum_{k=1}^{\infty} \left(\frac{3}{2}\right)^{k-1}$

68. $\sum_{n=1}^{\infty} \left(\frac{4}{3}\right)^{n-1}$

69. $\sum_{i=1}^{12} 4(2)^i$ [*Hint*: Rewrite the expression within the summation so that the base of 2 appears to the $(i-1)$ power.]

70. $\sum_{j=1}^{10} 5(2)^j$

71. $\sum_{n=3}^{\infty} 4\left(\frac{1}{2}\right)^{n-1}$ (*Hint*: Evaluate the infinite sum from $n = 1$ to infinity. Then subtract the terms corresponding to $n = 1$ and $n = 2$.)

72. $\sum_{n=4}^{\infty} 18\left(\frac{1}{3}\right)^{n-1}$

For Exercises 73–80, write the repeating decimal as a fraction. (See Example 9)

73. $0.\overline{8}$

74. $0.\overline{2}$

75. $0.6\overline{4}$

76. $0.7\overline{8}$

77. $0.\overline{81}$

78. $0.\overline{72}$

79. $3.4\overline{25}$

80. $4.1\overline{62}$

81. Bike Week in Daytona Beach brings an estimated 500,000 people to the town. Suppose that each person spends an average of $300.

a. How much money is infused into the local economy during Bike Week?

b. If the money is respent in the community over and over again at a rate of 68%, determine the total amount spent. Assume that the money is respent an infinite number of times. (**See Example 10**)

82. An individual with questionable integrity prints and spends $12,000 in counterfeit money. If the "money" is respent over and over again each time at a rate of 76%, determine the total amount spent. Assume that the "money" is respent an infinite number of times without being detected.

83. Rafael received an inheritance of $18,000. He saves $6480 and then spends $11,520 of the money on college tuition, books, and living expenses for school. If the money is respent over and over again in the community an infinite number of times, at a rate of 64%, determine the total amount spent.

84. A tax rebate returns $100 million to individuals in the community. Suppose that $25,000,000 is put into savings, and that $75,000,000 is spent. If the money is spent over and over again an infinite number of times, each time at a rate of 75%, determine the total amount spent.

Objective 4: Find the Value of an Annuity

For Exercises 85–86, find the value of an ordinary annuity in which regular payments of P dollars are made at the end of each compounding period, n times per year, at an interest rate r for t years. (See Example 11)

85. $P = \$200$, $n = 12$, $r = 5\%$, $t = 30$ yr

86. $P = \$100$, $n = 24$, $r = 5.5\%$, $t = 28$ yr

ISTUDY

87. a. An employee invests \$100 per month in an ordinary annuity. If the interest rate is 6%, find the value of the annuity after 20 yr. (**See Example 11**)

b. If the employee invests \$200 instead of \$100 at 6%, find the value of the annuity after 20 yr. Compare the result to part (a).

c. If the employee invests \$100 per month in the annuity at 6% interest, find the value after 40 yr. Compare the result to part (a).

88. a. An employee invests \$500 per month in an ordinary annuity. If the interest rate is 5%, find the value of the annuity after 18 yr.

b. If the employee invests \$1000 per month in the annuity instead of \$500 at 5% interest, find the value of the annuity after 18 yr. Compare the result to part (a).

c. If the employee invests \$500 per month in the annuity at 5% interest, find the value of the annuity after 36 yr. Compare the result to part (a).

Mixed Exercises

89. a. Given a geometric sequence whose nth term is $a_n = 6(0.4)^n$, are the terms of this sequence increasing or decreasing?

b. Given a geometric sequence whose nth term is $a_n = 3(1.4)^n$, are the terms of this sequence increasing or decreasing?

90. a. Given a geometric sequence whose nth term is $a_n = -8(0.2)^n$, are the terms of this sequence increasing or decreasing?

b. Given a geometric sequence whose nth term is $a_n = -5(1.6)^n$, are the terms of this sequence increasing or decreasing?

For Exercises 91–94, match the sequence with its graph.

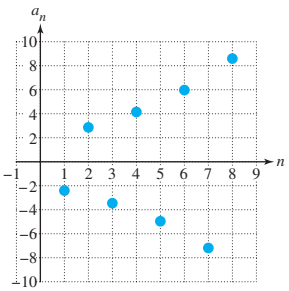
91. $a_n = 5(0.8)^n$

92. $a_n = 2(1.2)^n$

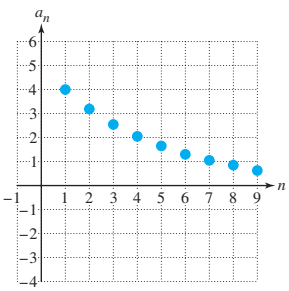
93. $a_n = 5(-0.8)^n$

94. $a_n = 2(-1.2)^n$

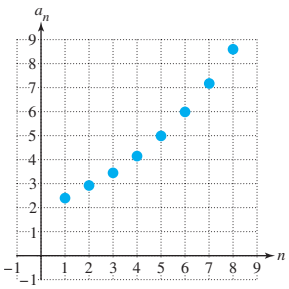
a.



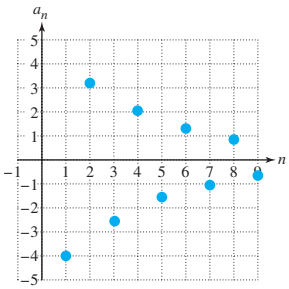
b.



c.



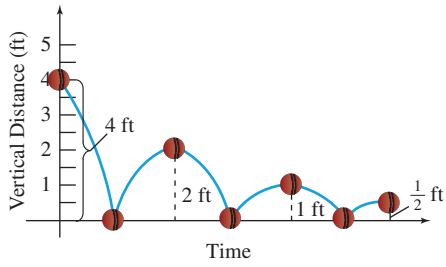
d.



95. The initial swing (one way) of a pendulum makes an arc of 24 in. Each swing (one way) thereafter makes an arc of 98% of the length of the previous swing. What is the total arc length that the pendulum travels?

96. The initial swing (one way) of a pendulum makes an arc of 4 ft. Each swing (one way) thereafter makes an arc of 90% of the length of the previous swing. What is the total arc length that the pendulum travels?

97. A child drops a ball from a height of 4 ft. With each bounce, the ball rebounds to 50% of its original height. After the ball falls from its initial height of 4 ft, the vertical distance traveled for every bounce thereafter is doubled (the ball travels up and down).



The total vertical distance traveled by the ball is given by

$$\underbrace{4 + \underbrace{2 \cdot (2) + 2(1) + 2\left(\tfrac{1}{2}\right) + 2\left(\tfrac{1}{4}\right)\cdots}_{\text{Vertical distance for each bounce is doubled}}}_{\text{Initial height}} = \underbrace{4 + 4 + 2 + 1 + \tfrac{1}{2} + \ldots}_{\text{Infinite geometric series}}$$

Determine the total vertical distance traveled by the ball.

98. A ball is dropped from a height of 12 ft. With each bounce, the ball rebounds to $\frac{3}{4}$ of its height. Determine the total vertical distance traveled by the ball.

ISTUDY

99. Suppose that an individual is paid \$0.01 on day 1 and every day thereafter, the payment is doubled.

a. Write a formula for the nth term of a sequence that gives the payment (in \$) on day n.

b. How much will the individual earn on day 10? day 20? and day 30?

c. What is the total amount earned in 30 days?

100. The vibration of sound is measured in cycles per second, also called hertz (Hz). The frequency for middle C on a piano is 256 Hz. The C above middle C (one octave above) is 512 Hz. The frequencies of musical notes follow a geometric progression.

a. Find the frequency for C two octaves above middle C.

b. Find the frequency for C one octave *below* middle C.

101. The yearly salary for job A is \$60,000 initially with an annual raise of \$3000 every year thereafter. The yearly salary for job B is \$56,000 for year 1 with an annual raise of 6%.

a. Consider a sequence representing the salary for job A for year n. Is this an arithmetic or geometric sequence? Find the total earnings for job A over 20 yr.

b. Consider a sequence representing the salary for job B for year n. Is this an arithmetic or geometric sequence? Find the total earnings for job B over 20 yr. Round to the nearest dollar.

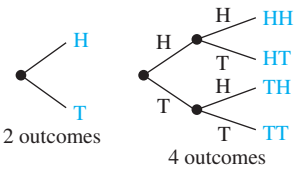
c. What is the difference in total salary between the two jobs over 20 yr?

102. a. Jacob has a job that pays \$48,000 the first year with a 4% raise each year thereafter. Find the sum of Jacob's yearly salaries over a 20-yr period. Round to the nearest dollar.

b. Cherise has a job that pays \$48,000 the first year with a 4.5% raise each year thereafter. Find the sum of Cherise's yearly salaries over a 20-yr period. Round to the nearest dollar.

c. How much more will Cherise earn than Jacob over the 20-yr period?

103. If a fair coin is flipped n times, the number of head/tail arrangements follows a geometric sequence. In the figure, if the coin is flipped 1 time, there are two possible outcomes, H or T. If the coin is flipped 2 times, then there are four possible outcomes: HH, HT, TH, and TT.



a. Write a formula for the nth term of a sequence representing the number of outcomes if a fair coin is flipped n times.

b. How many outcomes are there if a fair coin is flipped 10 times?

104. An ancestor is a person from whom an individual is descended (a parent, a grandparent, a great-grandparent, and so on). Every individual has two biological parents, a mother and a father. The mother and father in turn each have two biological parents, and so on.

1st Generation	2nd Generation	3rd Generation
2 parents	4 grandparents	8 great-grandparents

The terms of the sequence 2, 4, 8, 16, … give the additional number of ancestors for each generation back in time. Determine the total number of ancestors that an individual has going back 12 generations.

Write About It

105. Explain the difference between an arithmetic sequence and a geometric sequence.

106. Explain why two terms are not sufficient to determine whether an infinite sequence is arithmetic or geometric. For example, explain why 4, 16, … can be arithmetic, geometric, or neither.

107. A geometric sequence $a_1, a_2, a_3, \ldots$ has a common ratio r. Explain why the sequence $a_1, a_3, a_5, \ldots$ is also geometric and determine the common ratio.

Expanding Your Skills

108. Show that $x, x + 2, x + 4, x + 6, \ldots$ is *not* a geometric sequence.

109. If $a_1, a_2, a_3, a_4, \ldots$ is a geometric sequence with common ratio r, show that $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \frac{1}{a_4}\ldots$ is also a geometric sequence and determine the value of r.

ISTUDY

110. Suppose that $a_1, a_2, a_3, \ldots$ is an arithmetic sequence with common difference d. Show that $10^{a_1}, 10^{a_2}, 10^{a_3}, 10^{a_4}, \ldots$ is a geometric sequence and find the common ratio r.

111. Suppose that $a_1, a_2, a_3, \ldots$ is a geometric sequence with $r > 0$ and $a_1 > 0$. Show that the sequence $\log a_1, \log a_2, \log a_3, \ldots$ is arithmetic and find the common difference d.

112. Given the series $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots$,

a. Find the sum.

b. How many terms must be taken so that the nth partial sum is within $\frac{1}{100}$ of the actual sum?

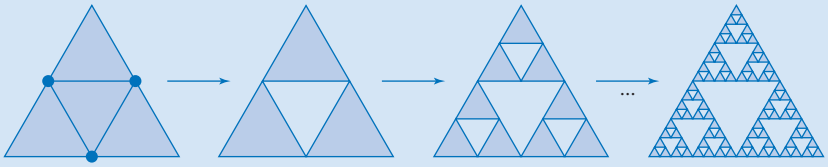
113. Determine whether the sequence $\ln 1, \ln 2, \ln 4, \ln 8, \ldots$ is arithmetic or geometric. If the sequence is arithmetic, find d. If the sequence is geometric, find r.

Point of Interest

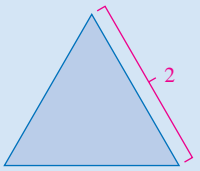
The mathematician Benoit Mandelbrot wrote (*New Scientist* magazine, 14 September, 1990) "I coined the word fractal in 1975 from the Latin 'fractus' which describes a broken stone—broken up and irregular. Fractals are geometrical shapes that, contrary to those of Euclid, are not regular at all. First, they are irregular all over. Second, they have the same degree of irregularity on all scales. A fractal object looks the same when examined from far away or nearby—it is self-similar."

The fractal Sierpinski triangle can be constructed by the following steps.

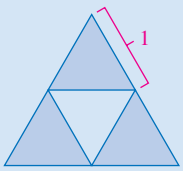
Begin with a solid, filled-in equilateral triangle and identify the midpoints of each side. Connect the midpoints to form a new smaller, inverted equilateral triangle which we remove. Repeat the same process in each of the 3 blue triangles. The Sierpinski triangle is what remains behind when this process continues forever.



114. Assume that each side of the original triangle measures 2 units. For an equilateral triangle of side s, the area is given by $A = \frac{\sqrt{3}}{4}s^2$. At each step, we can calculate the area of the portion of the triangle remaining. (Assume the answers are in square units.)

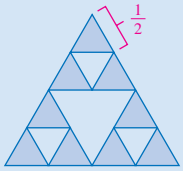


$A_0 = \frac{\sqrt{3}}{4}(2)^2 = \sqrt{3}$



One blue triangle: $A = \frac{\sqrt{3}}{4}(1)^2 = \frac{\sqrt{3}}{4}$

3 blue triangles: $A_1 = 3 \cdot \frac{\sqrt{3}}{4} = \frac{3}{4}\sqrt{3}$



One blue triangle: $A = \frac{\sqrt{3}}{4}\left(\frac{1}{2}\right)^2 = \frac{\sqrt{3}}{16}$

9 blue triangles: $A_2 = 9 \cdot \frac{\sqrt{3}}{16} = \frac{9}{16}\sqrt{3}$

a. The area of the blue triangles at each stage is given by the sequence $\sqrt{3}, \frac{3}{4}\sqrt{3}, \frac{9}{16}\sqrt{3}, \ldots$. Write the common ratio and a formula for the nth term of this geometric sequence. Is this sequence decreasing or increasing?

b. What is the area of this Sierpinski triangle at step 5?

c. If this process continues indefinitely, what will the area of the triangle become?

PROBLEM RECOGNITION EXERCISES

Comparing Arithmetic and Geometric Sequences and Series

For Exercises 1–10, determine if the *n*th term of the sequence defines an arithmetic sequence, a geometric sequence, or neither. If the sequence is arithmetic, find the common difference *d*. If the sequence is geometric, find the common ratio *r*.

1. $a_n = \frac{2n}{3} + \frac{1}{4}$

2. $a_n = -\frac{3}{5}n - \frac{1}{3}$

3. $a_n = (-1)^{n-1}$

4. $a_n = (-2)^n$

5. $a_n = \frac{n-1}{n+1}$

6. $a_n = \frac{3n-4}{2n+1}$

7. $a_n = 5(\sqrt{5})^{n-1}$

8. $a_n = 6(\sqrt{2})^{n+1}$

9. $a_n = 5 + \sqrt{2}n$

10. $a_n = \frac{\sqrt{3}}{2}n + 4$

For Exercises 11–28, evaluate the sum if possible.

11. $\sum_{i=1}^{1506} 5$

12. $\sum_{i=1}^{417} (-3)$

13. $\sum_{i=1}^{716} (-1)^{i+1}$

14. $\sum_{j=1}^{2651} (-1)^j$

15. $\sum_{n=1}^{3} \frac{n-2}{n+1}$

16. $\sum_{j=1}^{4} (j^4 - 2j^2)$

17. $\sum_{n=1}^{4} -3\left(\frac{1}{3}\right)^{n-1}$

18. $\sum_{n=1}^{5} -2\left(\frac{3}{4}\right)^{n-1}$

19. $\sum_{n=1}^{\infty} 6\left(\frac{5}{3}\right)^{n-1}$

20. $\sum_{i=1}^{\infty} 7\left(\frac{4}{3}\right)^{i-1}$

21. $\sum_{i=1}^{27} (-6i - 4)$

22. $\sum_{i=1}^{41} (-5i - 3)$

23. $\sum_{n=1}^{\infty} 8\left(\frac{1}{2}\right)^n$

24. $\sum_{n=1}^{\infty} 12\left(\frac{1}{3}\right)^n$

25. $36 + 30 + 25 + \frac{125}{6} + \cdots$

26. $54 + 36 + 24 + 16 + \cdots$

SECTION 12.4 Mathematical Induction

OBJECTIVES

1. Prove a Statement Using Mathematical Induction
2. Prove a Statement Using the Extended Principle of Mathematical Induction

1. Prove a Statement Using Mathematical Induction

In this section, we present a technique of mathematical proof that enables us to prove the validity of a statement that is true over the set of positive integers. This technique is called mathematical induction.

Consider the following sum:

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} + \cdots + \frac{1}{n(n+1)}$$

The sequence of terms that make up the sum is neither arithmetic nor geometric. Therefore, we have no formula readily available to evaluate the sum of the first n terms.

ISTUDY

We might consider evaluating the nth partial sum for several positive integers n to determine if a pattern exists. For each value of n, we have a corresponding statement P_n involving the value of the partial sum.

$n = 1$ $\quad \frac{1}{1 \cdot 2} = \frac{1}{2}$ Call this statement P_1.

$n = 2$ $\quad \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} = \frac{1}{2} + \frac{1}{6} = \frac{2}{3}$ Call this statement P_2.

$n = 3$ $\quad \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} = \frac{1}{2} + \frac{1}{6} + \frac{1}{12} = \frac{3}{4}$ Call this statement P_3.

$n = 4$ $\quad \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} = \frac{1}{2} + \frac{1}{6} + \frac{1}{12} + \frac{1}{20} = \frac{4}{5}$ Call this statement P_4.

TIP The proof of the statement

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \cdots + \frac{1}{n(n+1)} = \frac{n}{n+1}$$

is given in Example 2.

For the first four terms, the numerator is the same as the term number n and the denominator is one more than the term number. From this observation, we might make the following hypothesis, which we call P_n.

$$P_n: \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} + \cdots + \frac{1}{n(n+1)} = \frac{n}{n+1}$$

In words, the hypothesis P_n suggests that the sum of the first n terms of the sequence $\left\{\frac{1}{n(n+1)}\right\}$ is $\frac{n}{n+1}$. Equivalently, $\sum_{i=1}^{n} \frac{1}{i(i+1)} = \frac{n}{n+1}$.

We have shown that the statement P_n is true for $n = 1$, 2, 3, and 4, but what about values of n thereafter? Because there are infinitely many positive integers, there are actually infinitely many statements to prove, and we cannot approach them on a case-by-case basis. Instead we will use the principle of mathematical induction.

Principle of Mathematical Induction

Let P_n be a statement involving the positive integer n, and let k be an arbitrary positive integer. Then P_n is true for all positive integers n if

1. P_1 is true, and
2. The truth of P_k implies the truth of P_{k+1}.

P_n represents the statements, P_1, P_2, P_3, and so on. Mathematical induction is a two-part process to prove all the statements in the sequence. We first need to show that the statement is true for $n = 1$. That is, prove that P_1 is true. The second part involves proving that if any statement P_k in the sequence is true, then the statement that follows is also true (P_k implies P_{k+1}).

Intuitively, mathematical induction is similar to the sequential effect of falling dominos. Pushing the first domino down is analogous to proving P_1. Then showing that any falling domino in the sequence will cause the next domino to fall is the idea behind part 2 in mathematical induction. That is, if domino 1 falls, and any falling domino makes the next domino in line fall, then all the dominos will fall.

In Examples 1 and 2, we use mathematical induction to prove a statement involving a summation.

Cultura RM/Alamy Stock Photo

ISTUDY

EXAMPLE 1 Using Mathematical Induction

Use mathematical induction to prove that $1 + 3 + 5 + 7 + \cdots + (2n - 1) = n^2$.

Solution:

Let P_n denote the statement $1 + 3 + 5 + 7 + \cdots + (2n - 1) = n^2$.

1. Show that P_1 is true.
For $n = 1$, the sum is 1 which equals $(1)^2$.
Therefore, P_1 is true.

We need to show that P_1 is true. That is, we need to show that the left and right sides of the statement are equal for $n = 1$.

2. Next, assume that P_k is true and show that P_{k+1} is true.
Assume that P_k is true.
Assume that $1 + 3 + 5 + 7 + \cdots + (2k - 1) = k^2$.
We must show that P_{k+1} is true.

The statement that P_k is true is called the **inductive hypothesis.**

We must show that $1 + 3 + 5 + \cdots + (2k - 1) + [2(k + 1) - 1] = (k + 1)^2$. (1)

Avoiding Mistakes

It is important to use parentheses when substituting $(k + 1)$ into a statement for n.

The left side of statement P_{k+1} can be written as

$$\overbrace{[1 + 3 + 5 + 7 + \cdots + (2k - 1)]}^{\text{Sum of first } k \text{ terms}} + \overbrace{[2(k + 1) - 1]}^{(k+1)\text{th term}}$$

$$= k^2 + [2(k + 1) - 1]$$

By the inductive hypothesis, we can replace the sum of the first k terms by k^2.

$$= k^2 + (2k + 2 - 1)$$
$$= k^2 + 2k + 1$$
$$= (k + 1)^2 \text{ as desired. This matches equation (1).}$$

We have shown that P_1 is true, and that if P_k is true, then P_{k+1} is true. By mathematical induction, we conclude that the statement is true for all positive integers.

Skill Practice 1 Use mathematical induction to prove
P_n: $2 + 4 + 6 + 8 + \cdots + 2n = n(n + 1)$.

In Example 2, we prove the statement introduced at the beginning of this section.

EXAMPLE 2 Using Mathematical Induction

Use mathematical induction to prove that

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{n(n + 1)} = \frac{n}{n + 1}.$$

Solution:

Let P_n denote the statement $\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{n(n + 1)} = \frac{n}{n + 1}$.

1. Show that P_1 is true.

For $n = 1$, the sum equals $\frac{1}{1 \cdot 2} = \frac{1}{2}$ which is the same as $\frac{n}{n + 1} = \frac{1}{1 + 1} = \frac{1}{2}$.

left side of statement — right side of statement

Answer
1. See page SA-84.

2. Next, assume that P_k is true.

Assume that $\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \cdots + \frac{1}{k(k+1)} = \frac{k}{k+1}$.

Assume that P_k is true. This is the inductive hypothesis.

We must show that P_{k+1} is true.

We must show that

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \cdots + \frac{1}{k(k+1)} + \frac{1}{(k+1)[(k+1)+1]} = \frac{k+1}{(k+1)+1} = \frac{k+1}{k+2}. \quad (1)$$

The left side of statement P_{k+1} can be written as

$$\overbrace{\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \cdots + \frac{1}{k(k+1)}}^{\text{Sum of first } k \text{ terms}} + \overbrace{\frac{1}{(k+1)[(k+1)+1]}}^{(k+1)\text{th term}}$$

$$= \frac{k}{k+1} + \frac{1}{(k+1)[(k+1)+1]}$$

By the inductive hypothesis, replace the sum of the first k terms by $\frac{k}{k+1}$.

$$= \frac{k}{k+1} + \frac{1}{(k+1)(k+2)}$$

Simplify.

$$= \frac{k}{(k+1)} \cdot \frac{(k+2)}{(k+2)} + \frac{1}{(k+1)(k+2)}$$

Write terms with a common denominator.

$$= \frac{k^2 + 2k + 1}{(k+1)(k+2)}$$

Add the fractions.

$$= \frac{(k+1)^2}{(k+1)(k+2)}$$

Factor the numerator.

$= \frac{k+1}{k+2}$ as desired. This matches equation (1).

We have shown that P_1 is true, and that if P_k is true, then P_{k+1} is true. By mathematical induction, we conclude that the statement is true for all positive integers.

Skill Practice 2 Use mathematical induction to prove that

$$P_n\colon \frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 7} + \cdots + \frac{1}{(2n-1)(2n+1)} = \frac{n}{2n+1}.$$

Mathematical induction can be used to prove the following useful summation formulas involving powers of the first n positive integers (Table 12-3). The proofs of these formulas are addressed in Exercises 17–20.

Table 12-3 Sums of Powers

Let n represent a positive integer. Then,

1. $\sum_{i=1}^{n} 1 = n$
2. $\sum_{i=1}^{n} i = \frac{n(n+1)}{2}$
3. $\sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6}$
4. $\sum_{i=1}^{n} i^3 = \frac{n^2(n+1)^2}{4}$

Answer

2. See pages SA-84–85.

In Examples 3 and 4, we use mathematical induction to prove statements that do not involve a sum.

EXAMPLE 3 Using Mathematical Induction

Use mathematical induction to prove that 4 is a factor of $9^n - 1$.

Solution:

Let P_n be the statement: 4 is a factor of $9^n - 1$.

To show that 4 is a factor of any expression, we need to write the expression as the product of 4 and some positive integer that we call a.

1. Show that P_n is true for $n = 1$.

P_1 reads: 4 is a factor of $9^1 - 1 = 8$.

P_1 is true because $8 = 4 \cdot 2$, indicating that 4 is indeed a factor of 8.

2. Next, assume that P_k is true and show that P_{k+1} is true:

Assume that 4 is a factor of $9^k - 1$.

This implies that $9^k - 1 = 4a$ or equivalently $9^k = 4a + 1$. Inductive hypothesis

We must show that 4 is a factor of $9^{k+1} - 1$.

$$\begin{aligned} 9^{k+1} - 1 &= 9 \cdot 9^k - 1 \\ &= 9 \cdot (4a + 1) - 1 && \text{From the inductive hypothesis, replace } 9^k \text{ by } 4a + 1. \\ &= 36a + 9 - 1 && \text{Apply the distributive property.} \\ &= 36a + 8 \\ &= 4(9a + 2) && \text{Factor. The value 4 is a factor of the expression } 4(9a + 2). \text{ Therefore, 4 is a factor of } 9^{k+1} - 1. \end{aligned}$$

We have shown that P_1 is true, and that if P_k is true, then P_{k+1} is true. By mathematical induction, we conclude that the statement is true for all positive integers.

Skill Practice 3 Use mathematical induction to prove that 2 is a factor of $5^n + 1$.

2. Prove a Statement Using the Extended Principle of Mathematical Induction

Mathematical induction can be extended to prove statements that might hold true only for integers greater than or equal to some positive integer j. In such a case, we use the extended principle of mathematical induction.

Extended Principle of Mathematical Induction

Let P_n be a statement involving the positive integer n. Then P_n is true for all positive integers $n \geq j$ if

1. P_j is true, and

2. For an integer k, if $k \geq j$, the truth of P_k implies the truth of P_{k+1}.

Answer

3. See page SA-85.

ISTUDY

EXAMPLE 4 Using the Extended Principle of Mathematical Induction

Use mathematical induction to prove that $n! > 2^n$ for positive integers $n \geq 4$.

Solution:

Let P_n be the statement: $n! > 2^n$.

1. First show that P_n is true for $n = 4$.

To prove that P_4 is true, show that $4! > 2^4$.

$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$ and $2^4 = 16$. Therefore, $4! > 2^4$, indicating that P_4 is true.

2. Next, assume that P_k is true for $k \geq 4$, and show that P_{k+1} is true.

Assume that $k! > 2^k$ and show that $(k + 1)! > 2^{k+1}$ where $k \geq 4$.

$$(k + 1)! = (k + 1) \cdot k!$$

$> (k + 1)(2^k)$ By the inductive hypothesis, $k! > 2^k$. Therefore, we can replace $k!$ by 2^k and replace the $=$ sign with $>$.

$> 2 \cdot 2^k$ For $k \geq 4$, the expression $(k + 1) > 2$. Therefore, we can replace $(k + 1)$ by 2 and maintain the $>$ symbol.

$= 2^{k+1}$

From the string of inequalities we have shown that $(k + 1)! > 2^{k+1}$.

We have shown that P_4 is true, and that if P_k is true, then P_{k+1} is true. By mathematical induction, we conclude that $n! > 2^n$ is true for all integers, $n \geq 4$.

TIP In part 2 of Example 4, we manipulate the expression $(k + 1)!$ on the left side to show that it is greater than the expression on the right side for $k \geq 4$.

Skill Practice 4 Use mathematical induction to prove that $\left(\frac{3}{2}\right)^n > 2n$ for $n \geq 7$.

Point of Interest

Mathematical induction is one type of mathematical proof, but there are many other techniques, including proof by contradiction. This technique uses the premise that a statement's being false would imply a contradiction. This approach was used in the complex proof of Fermat's last theorem.

The equation $x^2 + y^2 = z^2$ has infinitely many positive integer solutions for a, b, and c. Such solutions are called Pythagorean triples, such as $a = 5$, $b = 12$, and $c = 13$. However, French mathematician Pierre de Fermat (1601–1665) posed the statement that the equation $x^n + y^n = z^n$ has *no* such solutions for positive integers $n > 2$. Fermat made this claim, now famously called Fermat's last theorem, while annotating a copy of Diophantus' *Arithmetika*. Fermat included a comment that he had "found a remarkable proof of this fact, but there is not enough space in the margin to write it."

Proof of this theorem eluded mathematicians for over 350 yr until Andrew Wiles of Princeton University announced in June of 1993 that he had solved the problem. Wiles's proof is extremely complex and was revised to correct a slight but critical flaw shortly after publication. The proof involves the use of mathematics that did not exist in Fermat's time, and for this reason mathematicians believe that Fermat did not have a simpler proof.

Answer

4. See page SA-85.

SECTION 12.4 Practice Exercises

Prerequisite Review

For Exercises R.1–R.4, factor completely.

R.1. $x^4 + x^2$

R.2. $-15r^4 - 60r^3$

R.3. $w^2 + 4w + 4$

R.4. $v^2 - 9v + 18$

For Exercises R.5–R.6, simplify.

R.5. $t - 4 + \dfrac{1}{t+4}$

R.6. $\dfrac{9}{a(a-3)} + \dfrac{3}{a}$

Concept Connections

1. Let P_n be a statement involving the positive integer n, and let k be an arbitrary positive integer. Proof by mathematical _____ indicates that P_n is true for all positive integers n if (1) _____ is true, and (2) the truth of P_k implies the truth of _____.

2. The statement that P_k is true is called the _____ hypothesis.

Objective 1: Prove a Statement Using Mathematical Induction

For Exercises 3–16, use mathematical induction to prove the given statement for all positive integers n. (See Examples 1–2)

3. $2 + 6 + 10 + \cdots + (4n - 2) = 2n^2$

4. $2 + 8 + 14 + \cdots + (6n - 4) = n(3n - 1)$

5. $5 + 8 + 11 + \cdots + (3n + 2) = \dfrac{n}{2}(3n + 7)$

6. $4 + 9 + 14 + \cdots + (5n - 1) = \dfrac{n}{2}(5n + 3)$

7. $8 + 4 + 0 + \cdots + (-4n + 12) = -2n(n - 5)$

8. $12 + 6 + 0 + \cdots + (-6n + 18) = -3n(n - 5)$

9. $1 + 2 + 2^2 + 2^3 + \cdots + 2^{n-1} = 2^n - 1$

10. $1 + 3 + 3^2 + 3^3 + \cdots + 3^{n-1} = \dfrac{1}{2}(3^n - 1)$

11. $\dfrac{3}{4} + \dfrac{3}{16} + \dfrac{3}{64} + \cdots + \dfrac{3}{4^n} = 1 - \left(\dfrac{1}{4}\right)^n$

12. $\dfrac{1}{2} + \dfrac{1}{4} + \dfrac{1}{8} + \cdots + \dfrac{1}{2^n} = 1 - \left(\dfrac{1}{2}\right)^n$

13. $1 \cdot 2 + 2 \cdot 3 + 3 \cdot 4 + \cdots + n(n+1) = \dfrac{n(n+1)(n+2)}{3}$

14. $1 \cdot 3 + 2 \cdot 5 + 3 \cdot 7 + \cdots + n(2n+1) = \dfrac{n(n+1)(4n+5)}{6}$

15. $\left(1 - \dfrac{1}{2}\right)\left(1 - \dfrac{1}{3}\right)\left(1 - \dfrac{1}{4}\right) \cdots \left(1 - \dfrac{1}{n+1}\right) = \dfrac{1}{n+1}$

16. $\left(1 - \dfrac{1}{2^2}\right)\left(1 - \dfrac{1}{3^2}\right)\left(1 - \dfrac{1}{4^2}\right) \cdots \left(1 - \dfrac{1}{(n+1)^2}\right) = \dfrac{n+2}{2(n+1)}$

For Exercises 17–24, use mathematical induction to prove the given statement for all positive integers n. (See Example 3)

17. $\displaystyle\sum_{i=1}^{n} 1 = n$

18. $\displaystyle\sum_{i=1}^{n} i = \dfrac{n(n+1)}{2}$

19. $\displaystyle\sum_{i=1}^{n} i^2 = \dfrac{n(n+1)(2n+1)}{6}$

20. $\displaystyle\sum_{i=1}^{n} i^3 = \dfrac{n^2(n+1)^2}{4}$

21. 2 is a factor of $5^n - 3$.

22. 2 is a factor of $7^n - 3$.

23. $4^n - 1$ is divisible by 3.

24. $5^n - 1$ is divisible by 4.

Objective 2: Prove a Statement Using the Extended Principle of Mathematical Induction

For Exercises 25–28, use trial-and-error to determine the smallest positive integer n for which the given statement is true.

25. $n! > 3^n$

26. $(n+1)! > 4^n$

27. $3n < 2^n$

28. $5n < 3^n$

For Exercises 29–32, use mathematical induction to prove the given statement. (See Example 4)

29. $n! > 3^n$ for positive integers $n \geq 7$.

30. $(n+1)! > 4^n$ for positive integers $n \geq 6$.

31. $3n < 2^n$ for positive integers $n \geq 4$.

32. $5n < 3^n$ for positive integers $n \geq 3$.

ISTUDY

Mixed Exercises

For Exercises 33–36, use mathematical induction to prove the given statement for all positive integers n and real numbers x and y.

33. $(xy)^n = x^n y^n$ **34.** $\left(\frac{x}{y}\right)^n = \frac{x^n}{y^n}$ provided that $y \neq 0$. **35.** If $x > 1$, then $x^n > x^{n-1}$. **36.** If $0 < x < 1$, then $x^n < x^{n-1}$.

We have used mathematical induction to prove that a statement is true for all positive integers n. To show that a statement is *not* true, all we need is one case in which the statement is false. This is called a counterexample. For Exercises 37–38, find a counterexample to show that the given statement is *not* true.

37. The expression $n^2 - n + 11$ is prime for all positive integers n.

38. The inequality $5^n > n!$ is true for all positive integers n.

Write About It

39. Explain the difference between the principle of mathematical induction and the extended principle of mathematical induction.

40. Suppose that a fellow student showed that the expression $n^2 + n + 1$ is prime for $n = 1$, 2, and 3. Explain why this is not a sufficient proof that the expression is prime for all positive integers n.

Expanding Your Skills

41. Show that $n^2 - n$ is even for all positive integers n.

42. Show that $n^2 - n + 1$ is odd for all positive integers n.

For Exercises 43–44, use the Fibonacci sequence $\{F_n\} = \{1, 1, 2, 3, 5, 8, 13, \ldots\}$. Recall that the Fibonacci sequence can be defined recursively as $F_1 = 1$, $F_2 = 1$, and $F_n = F_{n-1} + F_{n-2}$ for $n \geq 3$.

43. Prove that $F_1 + F_2 + F_3 + \cdots + F_n = F_{n+2} - 1$ for positive integers $n \geq 3$.

44. Prove that $F_1 + F_3 + F_5 + \cdots + F_{2n-1} = F_{2n}$ for all positive integers n.

SECTION 12.5 The Binomial Theorem

OBJECTIVES

1. Determine Binomial Coefficients
2. Apply the Binomial Theorem
3. Find a Specific Term in a Binomial Expansion

1. Determine Binomial Coefficients

In Section R.4 we learned how to square a binomial.

$$(a + b)^2 = a^2 + 2ab + b^2$$

The expression $a^2 + 2ab + b^2$ is called the **binomial expansion** of $(a + b)^2$. To expand $(a + b)^3$, we can find the product $(a + b)(a + b)^2$.

$$(a + b)(a + b)^2 = (a + b)(a^2 + 2ab + b^2)$$
$$= a^3 + 2a^2b + ab^2 + a^2b + 2ab^2 + b^3$$
$$= a^3 + 3a^2b + 3ab^2 + b^3$$

Similarly, to expand $(a + b)^4$, we can multiply $(a + b)$ by $(a + b)^3$. Using this method, we can expand several powers of $(a + b)$.

$(a + b)^0 = 1$

$(a + b)^1 = 1a + 1b$

$(a + b)^2 = 1a^2 + 2ab + 1b^2$

$(a + b)^3 = 1a^3 + 3a^2b + 3ab^2 + 1b^3$

$(a + b)^4 = 1a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + 1b^4$

$(a + b)^5 = 1a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + 1b^5$

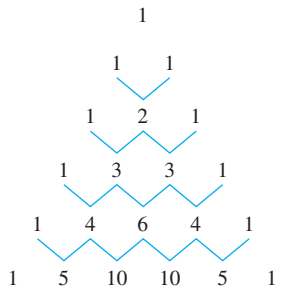

Figure 12-9

From the expansion of $(a + b)^n$, we note the following patterns.

- The exponent on a decreases from n to 0 on sequential terms from left to right.
- The exponent on b increases from 0 to n on sequential terms from left to right.
- The sum of the exponents on each term (that is, the degree of each term) is n.
- The number of terms in the expansion is $(n + 1)$. For example, the expansion of $(a + b)^4$ has five terms.

The coefficients for the expansion of $(a + b)^n$ follow a triangular array of numbers called **Pascal's triangle** (Figure 12-9), named after the French mathematician Blaise Pascal (1623–1662). Each row begins and ends with a 1, and each entry in between is the sum of the two diagonal entries from the row above. For example, in the last row of Figure 12-9, we have

$$1, \quad 1 + 4 = 5, \quad 4 + 6 = 10, \quad 6 + 4 = 10, \quad 4 + 1 = 5, \text{ and } 1$$

EXAMPLE 1 Expanding a Binomial

Expand. $(a + b)^6$

Solution:

The expansion of $(a + b)^6$ will have 7 terms (one more than the exponent of 6). Using the entries of the seventh row of Pascal's triangle as the coefficients, the expansion of $(a + b)^6$ is:

$$\begin{array}{c} 1 \\ 1 \quad 1 \\ 1 \quad 2 \quad 1 \\ 1 \quad 3 \quad 3 \quad 1 \\ 1 \quad 4 \quad 6 \quad 4 \quad 1 \\ 1 \quad 5 \quad 10 \quad 10 \quad 5 \quad 1 \\ 1 \quad 6 \quad 15 \quad 20 \quad 15 \quad 6 \quad 1 \end{array}$$

$$(a + b)^6 = 1a^6 + 6a^5b + 15a^4b^2 + 20a^3b^3 + 15a^2b^4 + 6ab^5 + 1b^6$$

Skill Practice 1 Expand. $(a + b)^7$

Determining the coefficients of a binomial expansion using Pascal's triangle would be cumbersome for expansions of higher degree. Instead we can compute the coefficients of a binomial expansion using the following formula.

TIP The expression $\binom{n}{r}$ will also be used in Section 12.6 when we study counting principles. $\binom{n}{r}$ represents the number of ways we can *choose* a group of r items in any order from a group of n items.

Coefficients of a Binomial Expansion

Let n and r be nonnegative integers with $n \geq r$. The expression $\binom{n}{r}$ (read as "n choose r") is called a **binomial coefficient** and is defined by

$$\binom{n}{r} = \frac{n!}{r!(n - r)!}$$

Note: The notation ${}_nC_r$ is often used in place of $\binom{n}{r}$.

EXAMPLE 2 Computing Binomial Coefficients

Evaluate.

a. $\binom{6}{0}$ **b.** $\binom{6}{1}$ **c.** $\binom{6}{2}$ **d.** $\binom{6}{6}$

Answer

1. $a^7 + 7a^6b + 21a^5b^2 + 35a^4b^3 + 35a^3b^4 + 21a^2b^5 + 7ab^6 + b^7$

ISTUDY

Solution:

For parts (a)–(d), apply $\binom{n}{r} = \dfrac{n!}{r!(n-r)!}$

a. $\binom{6}{0} = \dfrac{6!}{0! \cdot (6-0)!} = \dfrac{6!}{0! \cdot 6!} = \dfrac{6!}{1 \cdot 6!} = 1$ $n = 6$ and $r = 0$. Recall that $0! = 1$.

b. $\binom{6}{1} = \dfrac{6!}{1! \cdot (6-1)!} = \dfrac{6!}{1! \cdot 5!} = \dfrac{6 \cdot 5!}{1 \cdot 5!} = 6$ $n = 6$ and $r = 1$.

c. $\binom{6}{2} = \dfrac{6!}{2! \cdot (6-2)!} = \dfrac{6!}{2! \cdot 4!} = \dfrac{6 \cdot 5 \cdot 4!}{2 \cdot 1 \cdot 4!} = 15$ $n = 6$ and $r = 2$.

d. $\binom{6}{6} = \dfrac{6!}{6! \cdot (6-6)!} = \dfrac{6!}{6! \cdot 0!} = \dfrac{6!}{6! \cdot 1} = 1$ $n = 6$ and $r = 6$.

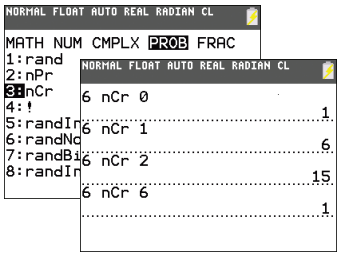
Skill Practice 2 Evaluate.

a. $\binom{5}{0}$ **b.** $\binom{5}{1}$ **c.** $\binom{5}{2}$ **d.** $\binom{5}{5}$

TECHNOLOGY CONNECTIONS

Evaluating Binomial Coefficients

To evaluate binomial coefficients on a graphing utility, use the ${}_nC_r$ function found in the MATH menu under PRB.



2. Apply the Binomial Theorem

From Example 2, notice that $\binom{6}{0} = 1$, $\binom{6}{1} = 6$, and $\binom{6}{2} = 15$ are the coefficients for the first three terms of the expansion of $(a + b)^6$. The value $\binom{6}{6} = 1$ is the coefficient of the last term of the expansion. Using the values of $\binom{n}{r}$ for the coefficients, we have a formula for the expansion of the binomial $(a + b)^n$. This is called the **binomial theorem.**

The Binomial Theorem

Let n be a positive integer. The expansion of $(a + b)^n$ is given by

$$(a+b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \cdots + \binom{n}{n-1}ab^{n-1} + \binom{n}{n}b^n$$

$$= \sum_{r=0}^{n}\binom{n}{r}a^{n-r}b^r$$

Answers

2. a. 1 **b.** 5 **c.** 10 **d.** 1

EXAMPLE 3 Applying the Binomial Theorem

Expand by using the binomial theorem. $(2x + 3)^4$

Solution:

The expression $(2x + 3)^4$ is in the form $(a + b)^4$ with $a = 2x$ and $b = 3$.

$$(a + b)^4 = \binom{4}{0}a^4 + \binom{4}{1}a^3b + \binom{4}{2}a^2b^2 + \binom{4}{3}ab^3 + \binom{4}{4}b^4$$

$$\begin{aligned}(2x + 3)^4 &= \binom{4}{0}(2x)^4 + \binom{4}{1}(2x)^3(3) + \binom{4}{2}(2x)^2(3)^2 + \binom{4}{3}(2x)(3)^3 + \binom{4}{4}(3)^4\\ &= 1(16x^4) + 4(8x^3)(3) + 6(4x^2)(9) + 4(2x)(27) + 1(81)\\ &= 16x^4 + 96x^3 + 216x^2 + 216x + 81\end{aligned}$$

Skill Practice 3 Expand by using the binomial theorem. $(4y + 5)^4$

In Example 4, we expand a difference of terms.

EXAMPLE 4 Applying the Binomial Theorem

Expand by using the binomial theorem. $(3x^2 - 5y)^3$

Solution:

The expression $(3x^2 - 5y)^3 = [3x^2 + (-5y)]^3$ is in the form $(a + b)^3$ with $a = 3x^2$ and $b = -5y$.

$$(a + b)^3 = \binom{3}{0}a^3 + \binom{3}{1}a^2b + \binom{3}{2}ab^2 + \binom{3}{3}b^3$$

$$\begin{aligned}[3x^2 + (-5y)]^3 &= \binom{3}{0}(3x^2)^3 + \binom{3}{1}(3x^2)^2(-5y) + \binom{3}{2}(3x^2)(-5y)^2 + \binom{3}{3}(-5y)^3\\ &= 1(27x^6) + 3(9x^4)(-5y) + 3(3x^2)(25y^2) + 1(-125y^3)\\ &= 27x^6 - 135x^4y + 225x^2y^2 - 125y^3\end{aligned}$$

Skill Practice 4 Expand by using the binomial theorem. $(2t^4 - 3v)^3$

3. Find a Specific Term in a Binomial Expansion

Consider the first four terms of the binomial expansion of $(a + b)^n$.

The exponent on b is one less than the term number.

$$\binom{n}{0}a^nb^0 + \binom{n}{1}a^{n-1}b^1 + \binom{n}{2}a^{n-2}b^2 + \binom{n}{3}a^{n-3}b^3$$

These values match the exponent on b.

From the observed pattern, the kth term has a factor of b raised to the $k - 1$ power. That is, the exponent on b is one less than the term number. Furthermore, the sum of the exponents must equal n. Therefore, the factor a is raised to the $n - (k - 1)$ power. That is, the exponent on a is n minus the exponent on b.

Answers

3. $256y^4 + 1280y^3 + 2400y^2 + 2000y + 625$

4. $8t^{12} - 36t^8v + 54t^4v^2 - 27v^3$

ISTUDY

*k*th Term of a Binomial Expansion

Let n and k be positive integers with $k \le n + 1$. The kth term of $(a + b)^n$ is

$$\binom{n}{k-1}a^{n-(k-1)}b^{k-1}$$

EXAMPLE 5 Finding a Specific Term of a Binomial Expansion

Find the eighth term of $(2x + y^4)^{10}$.

Solution:

To find the eighth term of $(a + b)^{10}$, we require the exponent on b to be 7 (one less than the term number). Therefore, the exponent on a must be 3 so that the sum of the exponents is 10.

Therefore, the eighth term of $(a + b)^{10}$ is $\binom{10}{7}a^3b^7$.

Sum of exponents must be 10.

1 less than the term number

same as exponent on b

The eighth term of $(2x + y^4)^{10}$ is $\binom{10}{7}(2x)^3(y^4)^7 = 120(8x^3)(y^{28}) = 960x^3y^{28}$.

Alternatively, we can apply the formula for the kth term of a binomial expansion with $n = 10$, $k = 8$, $a = 2x$, and $b = y^4$.

$$\binom{n}{k-1}a^{n-(k-1)}b^{k-1} = \binom{10}{8-1}(2x)^{10-(8-1)}(y^4)^{8-1} = \binom{10}{7}(2x)^3(y^4)^7 = 960x^3y^{28}$$

The eighth term of the expansion is $960x^3y^{28}$.

Skill Practice 5 Find the seventh term of $(3c + d^5)^9$.

Answer
5. $2268c^3d^{30}$

SECTION 12.5 Practice Exercises

Concept Connections

1. The expression $a^3 + 3a^2b + 3ab^2 + b^3$ is called the _____ expansion of $(a + b)^3$.

2. Consider $(a + b)^n$, where n is a whole number. How many terms are in the binomial expansion?

3. Consider $(a + b)^n$, where n is a whole number. What is the degree of each term in the expansion?

4. Consider $(a + b)^n$, where n is a whole number. The coefficients of the terms in the expansion can be found by using _____ triangle or by using $\binom{n}{r}$.

5. For positive integers n and k ($k \le n + 1$), the kth term of $(a + b)^n$ is given by $\binom{\square}{\square}a^{\square}b^{\square}$.

6. Given $(a + b)^{17}$, the 12th term is given by $\binom{\square}{\square}a^{\square}b^{\square}$.

Objective 1: Determine Binomial Coefficients

7. a. Write the first five rows of Pascal's triangle.

b. Write the expansion of $(x - y)^4$. **(See Example 1)**

8. a. Write the first four rows of Pascal's triangle.

b. Write the expansion of $(c - d)^3$.

For Exercises 9–10, evaluate the given expressions. Compare the results to the fifth and sixth rows of Pascal's triangle. (See Example 2)

9. a. $\binom{4}{0}$ **b.** $\binom{4}{1}$ **c.** $\binom{4}{2}$ **d.** $\binom{4}{3}$ **e.** $\binom{4}{4}$

10. a. $\binom{5}{0}$ **b.** $\binom{5}{1}$ **c.** $\binom{5}{2}$ **d.** $\binom{5}{3}$ **e.** $\binom{5}{4}$ **f.** $\binom{5}{5}$

For Exercises 11–14, evaluate the expression.

11. $\binom{13}{3}$ **12.** $\binom{17}{15}$ **13.** $\binom{11}{5}$ **14.** $\binom{9}{4}$

Objective 2: Apply the Binomial Theorem

For Exercises 15–28, expand the binomial by using the binomial theorem. (See Examples 3–4)

15. $(3x + 1)^5$ **16.** $(5x + 3)^5$ **17.** $(7x + 3)^3$ **18.** $(6x + 5)^3$

19. $(2x - 5)^4$ **20.** $(4x - 1)^4$ **21.** $(2x^3 - y)^5$ **22.** $(3y^2 - z)^5$

23. $(p^2 - w^4)^6$ **24.** $(t^3 - v^5)^6$ **25.** $(0.2 + 0.1k)^4$ **26.** $(0.1 + 0.3m)^4$

27. $\left(\frac{c}{2} - d\right)^3$ **28.** $\left(\frac{x}{3} - n\right)^3$

Objective 3: Find a Specific Term in a Binomial Expansion

For Exercises 29–40, find the indicated term of the binomial expansion. (See Example 5)

29. $(m + n)^{10}$; seventh term **30.** $(p + q)^{11}$; ninth term **31.** $(c - d)^8$; fourth term

32. $(x - y)^9$; sixth term **33.** $(u^2 + 2v^4)^{15}$; tenth term **34.** $(y^3 + 2z^2)^{14}$; tenth term

35. $(\sqrt{3}x^2 + y^3)^9$; fourth term **36.** $(\sqrt{2}u^3 + v^4)^8$; third term **37.** $(h^4 - 1)^{12}$; middle term

38. $(k^3 - 1)^{10}$; middle term **39.** $(p^4 + 3q)^8$; term containing p^{12} **40.** $(a^3 + 4b)^6$; term containing a^9

Mixed Exercises

41. Expand $(e^x - e^{-x})^4$.

42. Expand $(e^x + e^{-x})^3$.

43. Use the binomial theorem to expand $(x + y - z)^3$.

44. Use the binomial theorem to expand $(a + b - 2)^3$.

45. Use the binomial theorem to find $(1.01)^4$. [*Hint*: Write the expression as $(1 + 0.01)^4$.]

46. Use the binomial theorem to find $(1.1)^5$.

47. Simplify. $(x + y)^3 - (x - y)^3$

48. Simplify. $(x + 1)^3 - (x - 1)^3$

For Exercises 49–52, simplify the difference quotient: $\dfrac{f(x + h) - f(x)}{h}$

49. $f(x) = 2x^3 + 4$ **50.** $f(x) = 4x^3 + 3$ **51.** $f(x) = x^4 - 5x^2 + 1$ **52.** $f(x) = x^4 - 6x^2 - 4$

ISTUDY

For Exercises 53–56, use the binomial theorem to find the value of the complex number raised to the given power. Recall that $i = \sqrt{-1}$.

53. $(2 + i)^3$ **54.** $(3 + i)^3$ **55.** $(5 - 2i)^4$ **56.** $(6 - 5i)^4$

57. Show that $\binom{n}{r}$ and $\binom{n}{n-r}$ are equivalent. **58.** Show that $\binom{n}{0} = 1$ and $\binom{n}{n} = 1$.

Write About It

59. Explain why $\binom{-13}{3}$ is undefined. **60.** Explain why $\binom{3}{5}$ is undefined.

61. Explain why many graphing utilities give an error message for the expression $\frac{120!}{118!}$. How can this expression be evaluated by hand?

Expanding Your Skills

Stirling's formula (named after Scottish mathematician, James Stirling: 1692–1770) is used to approximate large values of $n!$. Stirling's formula is $n! \approx \sqrt{2\pi n}\left(\frac{n}{e}\right)^n$. For Exercises 62–63,

a. Use Stirling's formula to approximate the given expression. Round to the nearest whole unit.

b. Compute the actual value of the expression.

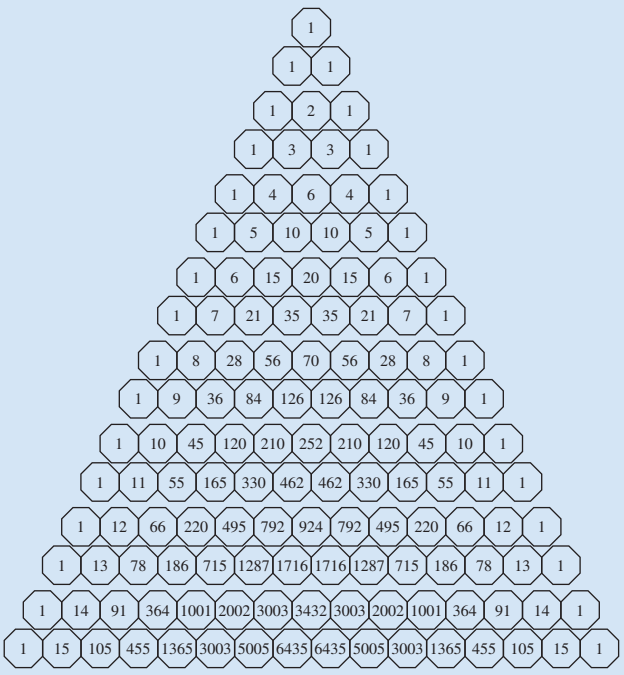
c. Determine the percent difference between the approximate value and the actual value. Round to the nearest tenth of a percent.

62. 8! **63.** 12!

Using techniques from calculus, we can show that $(1 + x)^n = 1 + nx + \frac{n(n-1)x^2}{2!} + \frac{n(n-1)(n-2)}{3!}x^3 + \cdots$, for $|x| < 1$. This formula can be used to evaluate binomial expressions raised to noninteger exponents. For Exercises 64–65, use the first four terms of this infinite series to approximate the given expression. Round to 3 decimal places if necessary.

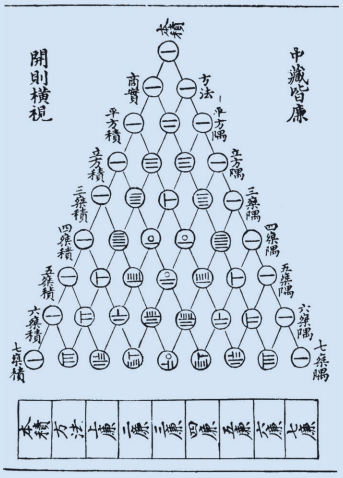
64. $(1.4)^{3/2}$ [*Hint*: $(1.4)^{3/2} = (1 + 0.4)^{3/2}$] **65.** $\sqrt[4]{(1.3)^3}$

Point of Interest



The array of numbers we call Pascal's triangle was also known in India, China, and Iran hundreds of years earlier. The 10th century Indian mathematician Halayudha gave a description of how to fit binomial coefficients into a triangular array. The Persian poet and mathematician Omar Kayyam also described a triangle of values. One of the earliest illustrations of the triangular array appears in 1261 in the mathematical text *Xiangjie Jiuzhang Suanfa*.

For Exercises 66–69, we examine some of the interesting patterns appearing in the rows, columns, and diagonals of Pascal's triangle.



History and Art Collection/Alamy Stock Photo

66. a. Write the sequence corresponding to the sum of the numbers in each row of Pascal's triangle for the first nine rows.

b. Let n represent the row number in Pascal's triangle, beginning with $n = 0$. Write a formula for the nth term of the sequence representing the sum of the numbers in row n.

c. Use the binomial theorem to prove the result in part (b). (*Hint*: For $(a + b)^n$, let $a = 1$ and $b = 1$.)

67. Examine the rows in Pascal's triangle that begin with a prime number after the leftmost entry of 1. What do you observe about the relationship between the first prime and the other entries in the row (not counting the last entry of 1)?

68. A triangular number represents objects stacked in the shape of an equilateral triangle. The first triangular number is $T_1 = 1$, followed by $T_2 = 3$, $T_3 = 6$, and so on.

a. What is the fifth triangular number?

b. Write the first six terms of the sequence of triangular numbers by starting at the beginning or end of the third row of Pascal's triangle and following the diagonal downward.

c. The triangular numbers may also be represented by $T_n = \binom{n+1}{2}$. What is the 20th triangular number?

d. Following the diagonal from either end of the fourth row of Pascal's triangle will give **tetrahedral numbers** (triangular pyramid numbers). The first tetrahedral number is 1. The second tetrahedral number is 4, (geometrically, we envision three round objects touching, then place a fourth on top.) The third tetrahedral number is 10. How would you arrange 10 round objects in a stack to form a tetrahedron? What is the fifth tetrahedral number?

e. The tetrahedral numbers may also be represented as follows:

$$n\text{th tetrahedral number} = \binom{n+2}{3}.$$

What is the eighth tetrahedral number?

69. If we darken out all the odd-numbered entries in Pascal's triangle and leave the even-numbered entries light, what pattern seems to appear? (*Hint*: Refer to Section 12.3, Exercise 114.)

SECTION 12.6 Principles of Counting

OBJECTIVES

1. Apply the Fundamental Principle of Counting
2. Count Permutations
3. Count Combinations

1. Apply the Fundamental Principle of Counting

Many states have lotteries as a means to raise income. The game "Florida Lotto" for example, pays a grand prize to players who choose six distinct numbers from 1 to 53 (in any order) that match the same group of six numbers in the drawing. The number of such six-number combinations is 22,957,480 (see Example 8). If a player chooses one group of six numbers, then the probability (likelihood) of winning the grand prize is $\frac{1}{22{,}957{,}480}$. This value (roughly 1 in 23 million) means that it is highly unlikely that anyone will win the grand prize. To put this in perspective, the following events are more likely to happen than winning the grand prize in "Florida Lotto."

- A pedestrian being killed by a motor vehicle: Probability $\approx \frac{1}{1{,}000{,}000}$
- Flipping a coin 24 times and getting all heads: Probability $= \frac{1}{16{,}777{,}216}$
- Dying from a venomous insect or animal bite: Probability $\approx \frac{1}{100{,}000}$

In this section and in Section 12.7, we present basic principles of counting and how these principles apply to probability. We begin in Example 1, by using a figure called a tree diagram to organize different outcomes of a sequence of events.

ISTUDY

EXAMPLE 1 Counting the Outcomes of a Sequence of Events

Suppose that a frozen custard shop offers 4 flavors of custard, 2 types of syrup, and 2 toppings. If a customer selects 1 item from each group for a sundae, how many different sundaes can be made?

Custard Flavors	Syrups	Toppings
Vanilla (V)	Hot fudge (H)	Nuts (N)
Chocolate (C)	Butterscotch (B)	Granola (G)
Mint chip (M)		
Peanut butter (P)		

Solution:

We can depict the 4 flavors of custard by the leftmost branches in Figure 12-10. Then for each branch of custard, there are 2 branches representing the type of syrup. Finally, for each custard-syrup arrangement, there are 2 toppings.

The tree diagram shows 16 different sundaes:

VHN, VHG, VBN, VBG, CHN, CHG, CBN, CBG, MHN, MHG, MBN, MBG, PHN, PHG, PBN, and PBG.

Notice that the number of outcomes is easily found by multiplying the number of choices from each group:

number of custards · number of syrups · number of toppings

Total outcomes: $(4)(2)(2) = 16$

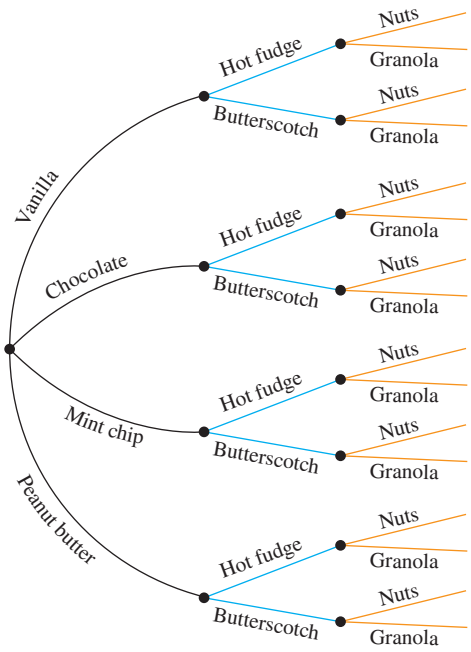


Figure 12-10

Skill Practice 1 A single-topping pizza can be made from either thick or thin crust, and a choice of 6 toppings. How many different types of single-topping pizzas can be made?

The result from Example 1 suggests that the number of outcomes for the sequence of events is the product of the number of outcomes for each individual event. This is generalized as the **fundamental principle of counting.**

Fundamental Principle of Counting

If one event can occur in m different ways and a second event can occur in n different ways, then the number of ways that the two events can occur in sequence is $m \cdot n$.

In Example 2, we demonstrate that the fundamental principle of counting can be applied for a sequence of many events.

Answer
1. 12

ISTUDY

EXAMPLE 2 Applying the Fundamental Principle of Counting

A computer password must have three letters (either upper- or lowercase), followed by two digits. How many passwords can be made if

a. There are no restrictions on the letters or digits?

b. No letter or digit may be used more than once?

Solution:

a. The computer password is a sequence of five characters. The number of arrangements of letters and digits is given by the product of the number of outcomes for each character. There are 26 letters of the alphabet from which to choose, but these may be either upper- or lowercase. Thus, there are 52 choices of letters. The digits in the password may be selected from 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. Therefore, the total number of passwords is given by

$$\overbrace{52 \cdot 52 \cdot 52}^{\text{There are 52 choices for each letter.}} \cdot \overbrace{10 \cdot 10}^{\text{There are 10 choices for each digit.}} = 14{,}060{,}800$$

b. If no letter may be repeated, then the number of letters from which to choose must be decreased by one when the second letter is selected. Likewise, the number of letters must be decreased by one again when the third letter is selected. The same logic is used when selecting the digits. Once the first digit is selected in the password, there are only nine remaining digits available for the second choice.

$$\overbrace{52 \cdot 51 \cdot 50}^{\text{The number of letters is decreased by one for each letter in the sequence.}} \cdot \overbrace{10 \cdot 9}^{\text{There are 10 choices for the first digit, but only 9 remaining for the second.}} = 11{,}934{,}000$$

Skill Practice 2 A code for an alarm system is made up of two uppercase letters, followed by four digits. How many codes can be made if

a. There are no restrictions on the letters or digits?

b. No letter or digit may be used more than once?

EXAMPLE 3 Applying the Fundamental Principle of Counting

A quiz has five true/false questions and five multiple-choice questions. The multiple-choice questions each have four possible answers, of which only one is correct. If a student forgets to study and must guess on each question, in how many ways can the student answer the questions on the test?

Solution:

The quiz questions form a 10-stage event. Each true/false question has two possible choices (true or false). Each multiple-choice question has four possible choices (for example: a, b, c, or d). Therefore, the number of ways that the questions can be answered on the test is given by

$$\overbrace{2 \cdot 2 \cdot 2 \cdot 2 \cdot 2}^{\text{Each true/false question has 2 choices}} \cdot \overbrace{4 \cdot 4 \cdot 4 \cdot 4 \cdot 4}^{\text{Each multiple-choice question has 4 choices}} = 32{,}768$$

Answers

2. a. $26 \cdot 26 \cdot 10 \cdot 10 \cdot 10 \cdot 10 = 6{,}760{,}000$
b. $26 \cdot 25 \cdot 10 \cdot 9 \cdot 8 \cdot 7 = 3{,}276{,}000$

ISTUDY

Skill Practice 3 A quiz has four true/false questions and six multiple-choice questions. The multiple-choice questions each have five possible answers, of which only one is correct. In how many ways can the questions on the test be answered?

2. Count Permutations

We now look at a situation in which n items are to be arranged in order. Such an arrangement is called a **permutation.** For example, consider the different arrangements of the letters in the word FIVE.

FIVE	FIEV	FVIE	FVEI	FEIV	FEVI
IFVE	IFEV	IVEF	IVFE	IEVF	IEFV
VFIE	VFEI	VEIF	VEFI	VIEF	VIFE
EFIV	EFVI	EIFV	EIVF	EVIF	EVFI

} 24 arrangements

There are 24 such arrangements. We can arrive at the same conclusion by applying the fundamental principle of counting. There are 4 letters available for the first choice in the arrangement. That leaves 3 letters remaining for the second choice, followed by 2 letters for the third choice, and only 1 letter for the last choice. Therefore, the number of permutations of 4 distinct letters is given by

$$4 \cdot 3 \cdot 2 \cdot 1 = 24$$

We generalize this as follows:

Number of Permutations of n Distinguishable Elements

The number of permutations of n distinct elements is $n!$.

Note: This means that there are $n!$ ways to arrange n distinguishable items in various orders.

Now suppose that we wanted to arrange the letters in the word NINE. Notice that if we were to switch the first and third letters (both "N's"), we would get the same arrangement. This is because the two N's are indistinguishable. This means that when counting the number of permutations we must "divide out" the number of ways that the two N's can be arranged. The two N's can be arranged in 2! different ways. This leads to the following result.

Number of Permutations of n Elements, Some Indistinguishable

Consider a set of n elements with r_1 duplicates of one kind, r_2 duplicates of a second kind, … , r_k duplicates of a kth kind. Then the number of distinguishable permutations of the n elements of the set is

$$\frac{n!}{r_1! \cdot r_2! \cdot \cdots \cdot r_k!}$$

Note: The factors of $r_1!$, $r_2!$, … , $r_k!$ in the denominator remove the repetition of arrangements that arise from the indistinguishable elements.

Answer
3. 250,000

ISTUDY

EXAMPLE 4 Counting Permutations

a. Determine the number of ways that 6 people can be arranged in line at a ticket counter.

b. Determine the number of ways that the letters in the word MICROSCOPIC can be arranged.

Solution:

a. No two people can be the same. Therefore, we are arranging 6 different (distinguishable) items in various orders. The number of such permutations is given by

$6! = 720$ There are 720 ways in which 6 people can be arranged in line.

b. The word MICROSCOPIC has 11 letters. However, the letter I appears twice, the letter O appears twice, and the letter C appears 3 times. The number of unique arrangements of these letters is

$$\frac{11!}{2! \cdot 2! \cdot 3!} = 1{,}663{,}200$$

Skill Practice 4

a. In how many ways can 7 different books be arranged on a bookshelf?

b. Determine the number of ways that the letters in the word RIFFRAFF can be arranged.

In Example 5, we determine the number of permutations from a group of n items in which fewer than n items are selected at one time.

EXAMPLE 5 Finding Permutations of n Items Taken r at a Time

Suppose that 5 students (Alberto, Beth, Carol, Dennis, and Erik) submit applications for scholarships. There are two scholarships available. The first is for \$1000 and the second is for \$500. In how many ways can 2 students from the 5 be selected to receive the scholarships?

Solution:

We begin by labeling the students as A, B, C, D, and E. We can construct a list of the possible outcomes.

AB	AC	AD	AE	BC	BD	BE	CD	CE	DE
BA	CA	DA	EA	CB	DB	EB	DC	EC	ED

Each outcome in the second row involves the same 2 people as the outcome directly above in the first row, but in the reverse order. The order of selection is important. For example:

- AB means that Alberto gets \$1000 and Beth gets \$500, whereas
- BA means that Beth gets \$1000 and Alberto gets \$500.

There are 20 possible ways to select 2 people from 5 people in which the order of selection is relevant. That is, there are 20 permutations of 5 people taken 2 at a time.

Skill Practice 5

Determine the number of ways that 2 students from a group of 4 students can be selected to hold the positions of president and vice president of student government.

Answers

4. a. $7! = 5040$ **b.** $\frac{8!}{2! \cdot 4!} = 840$

5. 12

ISTUDY

The number of permutations of 5 people taken 2 at a time can also be computed by using the fundamental principle of counting. There are 5 candidates for the $1000 scholarship, which leaves 4 students left over for the $500 scholarship. The product is $5 \cdot 4 = 20$.

This result can also be obtained by using factorial notation:

Number of people in the group (5).

$$\frac{5!}{(5-2)!} = \frac{5!}{3!} = \frac{5 \cdot 4 \cdot \cancel{(3 \cdot 2 \cdot 1)}^{1}}{\cancel{(3 \cdot 2 \cdot 1)}} = 20$$

Number of people to be selected (2).

Suppose that n represents the number of distinct elements in a group from which r elements will be chosen in a particular order. We call each arrangement a **permutation** of n elements taken r at a time and denote the number of such permutations as ${}_nP_r$.

Number of Permutations of n Elements Taken r at a Time

The number of permutations of n elements taken r at a time is given by

$${}_nP_r = \frac{n!}{(n-r)!}, \text{ or equivalently } {}_nP_r = \overbrace{n(n-1)(n-2)\cdots(n-r=1)}^{r \text{ factors}}$$

Note: ${}_nP_r$ counts the number of permutations of n items taken r at a time under the assumption that no item can be selected more than once, and that each of the n items is distinguishable.

EXAMPLE 6 Counting Permutations in an Application

If 8 horses enter a race, in how many ways can the horses finish first, second, and third?

Solution:

We must find the number of ways that 3 horses can be selected from 8 horses in a prescribed order (first, second, third). This is given by ${}_8P_3$.

$${}_8P_3 = \frac{8!}{(8-3)!} = \frac{8!}{5!} = \frac{8 \cdot 7 \cdot 6 \cdot \cancel{5!}^{1}}{\cancel{5!}} = 8 \cdot 7 \cdot 6 = 336$$

TIP The alternative formula for ${}_nP_r$ indicates that we multiply n times the consecutive integers less than n until a total of r factors is reached.

Alternatively: ${}_8P_3 = \underbrace{8 \cdot 7 \cdot 6}_{3 \text{ factors}} = 336$ ($n = 8$)

There are 336 possible first-, second-, and third-place arrangements.

Skill Practice 6 A judge at the County Fair must give blue, red, and white ribbons for first-, second-, and third-place entries in a poetry contest. If there are 12 contestants, in how many ways can the judge award the ribbons?

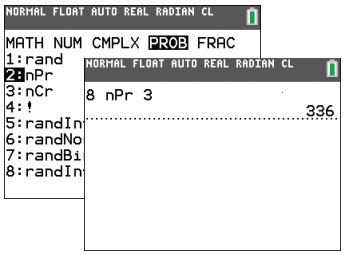
Answer
6. 1320

ISTUDY

TECHNOLOGY CONNECTIONS

Evaluating a Number of Permutations, ${}_nP_r$

Most graphing utilities can evaluate the number of permutations of n elements taken r at a time. For example, use the ${}_nP_r$ function found in the MATH menu under PRB.



3. Count Combinations

Consider the situation in Example 5 in which 5 students are selected for 2 scholarships. If the scholarships were for *equal* amounts (say for \$500 each), then the order in which the 2 students are selected does not matter. This is because the "prizes" are indistinguishable; that is, the outcomes AB and BA are the same because student A and student B would each receive \$500.

In this scenario, we want to select a set of 2 people from a set of 5 people without regard to order. In such a case, the outcomes are called *combinations* (rather than permutations). From the list of permutations given in Example 5, we can strike through the redundant cases that arise from the order of the two individuals in the group. As a result, there are 10 combinations of 5 people taken 2 at a time.

AB	AC	AD	AE	BC	BD	BE	CD	CE	DE
~~BA~~	~~CA~~	~~DA~~	~~EA~~	~~CB~~	~~DB~~	~~EB~~	~~DC~~	~~EC~~	~~ED~~

To find the number of combinations, we divide the number of permutations (in this case 20) by 2! because there are 2! ways in which two letters can be arranged in order.

$$\text{Number of combinations} = \frac{{}_5P_2}{2!} = \frac{20}{2} = 10$$

To generalize, suppose that n represents the number of distinct elements in a group from which r elements will be chosen in *no particular order*. We call each selection a **combination** of n elements taken r at a time and denote the number of such combinations as ${}_nC_r$.

TIP The number of combinations ${}_nC_r$ is equal to the number of permutations ${}_nP_r$ divided by $r!$. The value $r!$ in the denominator "divides out" the redundant cases involving different arrangements of r elements within the same group.

Number of Combinations of n Elements Taken r at a Time

The number of combinations of n elements taken r at a time is given by

$${}_nC_r = \frac{n!}{r! \cdot (n-r)!}, \text{ or equivalently, } {}_nC_r = \frac{{}_nP_r}{r!}$$

EXAMPLE 7 Comparing Combinations and Permutations

a. In how many ways can 3 students from a group of 15 students be selected to serve on a committee?

b. In how many ways can 3 students from a group of 15 students be selected to serve on a committee, if the students will hold the offices of president, vice president, and treasurer?

ISTUDY

Solution:

a. In this situation, the students will serve indistinguishable roles on the committee. Therefore, the order in which the 3 students are selected is not relevant. The number of such committees is the number of *combinations* of $n = 15$ students taken $r = 3$ at a time.

$$_{15}C_3 = \frac{15!}{3! \cdot (15-3)!} = \frac{15!}{3! \cdot 12!} = \frac{\overset{5}{\cancel{15}} \cdot \overset{7}{\cancel{14}} \cdot 13 \cdot \overset{1}{\cancel{12!}}}{\cancel{3} \cdot \cancel{2} \cdot 1 \cdot \cancel{12!}} = 455$$

b. Now the students will be selected to a committee and assigned different roles (president, vice president, and treasurer). In this case, the order in which the students are selected matters. We need to count the number of *permutations* of $n = 15$ students taken $r = 3$ at a time.

$$_{15}P_3 = \frac{15!}{(15-3)!} = \frac{15!}{12!} = \frac{15 \cdot 14 \cdot 13 \cdot \overset{1}{\cancel{12!}}}{\cancel{12!}} = 2730$$

Skill Practice 7 Suppose that 20 people enter a raffle.

a. In how many ways can four different people among the 20 be selected to receive prizes of \$50 each?

b. In how many ways can four different people among the 20 be selected to receive prizes of \$50, \$25, \$10, and \$5?

In Example 7, notice that there are $3! = 6$ times as many permutations as combinations. The reason is that for each combination of 3 items, such as A, B, and C, there are $3! = 6$ permutations: ABC, ACB, BAC, BCA, CAB, CBA.

EXAMPLE 8 Counting Combinations in an Application

In the game "Florida Lotto," a player must select a group of 6 numbers (without regard to order) from the numbers 1 to 53. If the 6 numbers match the numbers in the drawing, then the player wins the grand prize. How many groups of 6 numbers are possible?

Solution:

In this situation, the order in which the group of 6 numbers is selected does not matter. Therefore, we need to compute the number of combinations of $n = 53$ numbers taken $r = 6$ at a time.

$$_{53}C_6 = \frac{53!}{6! \cdot (53-6)!} = \frac{53!}{6! \cdot 47!} = 22{,}957{,}480$$

There are 22,957,480 different groups of 6 numbers taken from 53 numbers.

Skill Practice 8 The California lottery game "Fantasy 5" offers a grand prize to a player who selects the correct group of 5 numbers (in any order) from the numbers 1 to 39. How many groups of 5 numbers are possible?

Point of Interest

As mentioned in the section opener, the probability of winning the grand prize in "Florida Lotto" for a player who plays 1 combination of 6 numbers is $\frac{1}{22{,}957{,}480}$.

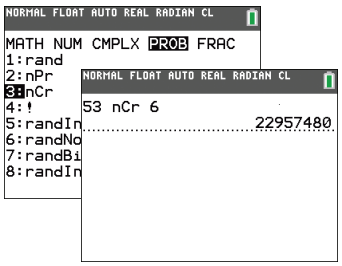
Evaluating a Number of Combinations, ${}_nC_r$

Most graphing utilities can evaluate the number of combinations of n elements taken r at a time. For example, use the ${}_nC_r$ function found in the MATH menu under PRB.



In Example 9 we encounter a situation in which more than one technique of counting must be used.

EXAMPLE 9 Applying Multiple Principles of Counting

Suppose that a group of 3 full-time employees and 2 part-time employees is to be selected for a special project from a group of 8 full-time employees and 7 part-time employees. In how many ways can such a group be formed?

Solution:

This situation can be thought of as a sequence of two events in which we apply the fundamental principle of counting.

$$\begin{pmatrix}\text{Total number}\\ \text{of groups}\end{pmatrix} = \begin{pmatrix}\text{Number of ways to select}\\ \text{3 full-time employees from}\\ \text{8 full-time employees}\\ \text{in any order}\end{pmatrix} \cdot \begin{pmatrix}\text{Number of ways to select}\\ \text{2 part-time employees from}\\ \text{7 part-time employees}\\ \text{in any order}\end{pmatrix}$$

$$= {}_8C_3 \cdot {}_7C_2$$
$$= 56 \cdot 21$$
$$= 1176$$

Avoiding Mistakes

The roles of the employees in the group are indistinguishable. Therefore, count the number of combinations rather than permutations.

Skill Practice 9 The coach of a co-ed softball team must select 4 women and 5 men from a group of 7 women and 10 men to play in a game. In how many ways can such a team be formed?

Answer
9. 8820

SECTION 12.6 Practice Exercises

Prerequisite Review

For Exercises R.1–R.4, evaluate the expression.

R.1. 9! **R.2.** 0! **R.3.** $\frac{7!}{5!}$ **R.4.** $\frac{10!}{4!\,6!}$

Concept Connections

1. The fundamental _____ of _____ indicates that if one event can occur in m different ways, and a second event can occur in n different ways, then the two events can occur in sequence in _____ different ways.

2. If n items are arranged in order, then each arrangement is called a _____ of n items.

3. The number of ways that n distinguishable items can be arranged in various orders is _____.

4. Consider a set of n elements of which one element is repeated r times. Then the number of permutations of the elements of the set is given by $\frac{\square}{\square}$.

ISTUDY

5. Suppose that n represents the number of distinct elements in a group from which r elements will be chosen in a particular order. Then each arrangement is called a _____ of n items taken _____ at a time.

6. Suppose that n represents the number of elements in a group from which r elements will be selected in no particular order. Then each group selected is called a _____ of n elements taken _____ at a time.

7. The number of permutations of n elements taken r at a time is denoted by ${}_nP_r$ and is computed by

$${}_nP_r = \frac{\square}{\square} \quad \text{or} \quad {}_nP_r = n(n-1)(n-2)\cdots(n-r+1).$$

8. The number of combinations of n elements taken r at a time is denoted by ${}_nC_r$ and is computed by _____.

Objective 1: Apply the Fundamental Principle of Counting

For Exercises 9–14, consider the set of integers from 1 to 20, inclusive. If one number is selected, in how many ways can we obtain

9. an even number?

10. an odd number?

11. a prime number?

12. a number that is a multiple of 5?

13. a number that is a multiple of 10?

14. a number that is divisible by 4?

15. At a hospital, the dinner menu consists of 4 choices of entrée, 3 choices of salad, 6 choices of beverage, and 4 choices of dessert. How many different meals can be formed if a patient chooses one item from each category? (**See Example 1**)

16. Casey travels several times a year for work, taking 2 pairs of slacks, 6 shirts, and 4 scarves, all of different colors. Assuming that the items all match together well, how many different outfits does Casey have if one item is selected from each category?

17. A license plate has 3 capital letters followed by 3 digits.

a. How many license plates can be made if there are no restrictions on the letters or digits? (**See Example 2**)

b. How many license plates can be made if no digit or letter may be repeated?

18. A security company requires its employees to have a 7-character computer password that must consist of 5 lowercase letters and 2 digits.

a. How many passwords can be made if there are no restrictions on the letters or digits?

b. How many passwords can be made if no digit or letter may be repeated?

19. The call letters for a radio station consist of four capital letters, starting with either K or W.

a. How many 4-letter arrangements are possible, assuming that letters may be repeated?

b. How many 4-letter arrangements are possible, assuming that the letters may not be repeated?

20. An employee identification code for a hospital consists of 2 letters from the set {A, B, C, D} followed by 4 digits.

a. How many identification codes are possible if both letters and digits may be repeated?

b. How many identification codes are possible if letters and digits may not be repeated?

21. An online survey is used to monitor customer service. The survey consists of 14 questions. Ten questions have 5 possible responses (strongly agree, agree, neutral, disagree, and strongly disagree). The remaining 4 questions are yes/no questions. In how many different ways can the survey be filled in? (**See Example 3**)

22. A test consists of 3 multiple-choice questions, each with four possible responses, and 7 true/false questions. In how many ways can a student answer the questions on the test?

23. On a computer, 1 *bit* is a single binary digit and has two possible outcomes: either 1 or 0. One *byte* is 8 bits. That is, a byte is a sequence of 8 binary digits. How many arrangements of 1's and 0's can be made with one byte?

24. Older models of garage door remote controls have a sequence of 10 switches that are individually placed in an up or down position. The remote control can "talk to" the overhead door unit if the 10 corresponding switches in the unit are in the same up/down sequence. How many up/down sequences are possible in an arrangement of 10 switches?

Objectives 2–3: Count Permutations and Combinations

25. **a.** In how many ways can the letters in the word FLORIDA be arranged? (**See Example 4**)

b. In how many ways can the letters in the word MISSISSIPPI be arranged?

26. **a.** In how many ways can the letters in the word XRAY be arranged?

b. In how many ways can the letters in the word MAMMOGRAM be arranged?

27. In how many ways can the letters in the word WRONG be arranged and misspelled?

28. In how many ways can the letters in the word EXACTLY be arranged and misspelled?

ISTUDY

29. A delivery truck must make 4 stops at locations A, B, C, and D. Over several weeks, management asks the driver to drive each possible route and record the time required to complete the route. This is to determine the most time-efficient route. How many possible routes are there?

30. In how many ways can 6 people in a family be lined up for a photograph?

For Exercises 31–36, evaluate ${}_nP_r$.

31. ${}_6P_4$ **32.** ${}_8P_5$ **33.** ${}_{12}P_2$

34. ${}_{11}P_3$ **35.** ${}_9P_9$ **36.** ${}_5P_5$

37. Evaluate ${}_{20}P_3$ and interpret its meaning.

38. Evaluate ${}_{15}P_6$ and interpret its meaning.

For Exercises 39–44, evaluate ${}_nC_r$.

39. ${}_6C_4$ **40.** ${}_8C_5$ **41.** ${}_{12}C_2$

42. ${}_{11}C_3$ **43.** ${}_9C_9$ **44.** ${}_5C_5$

45. Evaluate ${}_{20}C_3$ and interpret its meaning.

46. Evaluate ${}_{15}C_6$ and interpret its meaning.

47. Given {A, B, C},

a. List all the permutations of two elements from the set. (**See Example 5**)

b. List all the combinations of two elements from the set.

48. Given {W, X, Y, Z},

a. List all the permutations of three elements from the set.

b. List all the combinations of three elements from the set.

49. Suppose that 9 horses run a race. How many first-, second-, and third-place finishes are possible? (**See Example 6**)

Digital Stock/Corbis

50. In how many ways can a judge award blue, red, and yellow ribbons to 3 films at a film festival if there are 10 films entered?

51. **a.** In a drama class, 5 students are to be selected from 24 students to perform a synchronized dance. In how many ways can 5 students be selected from the 24? (**See Example 7**)

b. Determine the number of ways that 5 students can be selected from the class of 24 to play 5 different roles in a short play.

52. **a.** There are 100 members of the U.S. Senate. Suppose that 4 senators currently serve on a committee. In how many ways can 4 more senators be selected to serve on the committee?

b. In how many ways can a group of 3 U.S. senators be selected from a group of 7 senators to fill the positions of chair, vice-chair, and secretary for the Ethics Committee?

53. A chess tournament has 16 players. Every player plays every other player exactly once. How many chess matches will be played?

54. Suppose that a tennis tournament has 64 players. In how many ways can a pairing for a first-round match be made between 2 players among the 64 players? Assume that each player can play any other player without regard to seeding.

55. In the Minnesota Lotto game "Gopher 5," a player wins the grand prize by choosing the same group of 5 numbers from 1 through 47 as is chosen by the computer. How many 5-number groups are possible? (**See Example 8**)

56. In the New York state lottery game "Lotto," a player wins the grand prize by choosing the same group of 6 numbers from 1 through 59 as is chosen by the computer. How many 6-number groups are possible?

57. In ballroom dancing, one partner is designated as the "lead" and the other is designated as the "follow." A ballroom dance instructor wants to choose 3 leads and 3 follows from a group of 7 leads and 9 follows to demonstrate a new dance pattern. How many different groups of 3 leads and 3 follows can be formed? (**See Example 9**)

58. A committee of 4 juniors and 4 seniors is to be made up from a group of students containing 12 juniors and 9 seniors. In how many ways can such a committee be formed?

ISTUDY

Mixed Exercises

59. In a "Pick-4" game, a player wins a prize for matching a 4-digit number from 0000 to 9999 with the number randomly selected during the drawing. How many 4-digit numbers can a player choose? Assume that a number can start with a zero or zeros such as 0001.

60. In a "Numbers" game, a player wins a prize for matching a 3-digit number from 000 to 999 with the number randomly selected during the drawing. How many 3-digit numbers can a player choose? Assume that a number can start with a zero or zeros such as 001.

61. Liza is a basketball coach and must select 5 players out of 12 players to start a game. In how many ways can the 5 players be selected if each player is equally qualified to play each position?

62. Neeja has a list of 8 books that must be read for an upcoming class. To get a head start, Neeja wants to do some of the reading over the summer but only has time to read 5 of the 8 books. In how many ways can 5 books be selected from 8 books?

63. In how many ways can a manager assign 5 employees at a coffee shop to 5 different tasks? Assume that each employee is assigned to exactly one task.

64. In how many ways can a class of 12 kindergarten children line up at the cafeteria?

65. Twenty batteries have been sitting in a drawer for 2 yr. There are 4 dead batteries among the 20. If three batteries are selected at random, determine the number of ways in which

a. 3 dead batteries can be selected.

b. 3 good batteries can be selected.

c. 2 good batteries and 1 dead battery can be selected.

66. There are 30 seeds in a package. Five seeds are defective (will not germinate). If four seeds are selected at random, determine the number of ways in which

a. 4 defective seeds can be selected.

b. 4 good seeds can be selected.

c. 2 good seeds and 2 defective seeds can be selected.

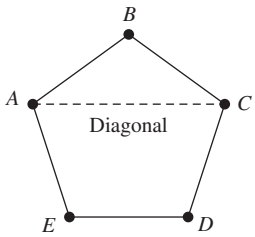
67. A "combination" lock is opened by correctly "dialing" 3 numbers from 0 to 39, inclusive. The user who knows the code turns the dial to the right to the first number in the code, then to the left to find the second number in the code, and then back to the right for the third number in the code. If someone does not know the code and tries to guess, how many guesses are possible?

68. A palindrome is an arrangement of letters that reads the same way forward and backward. For example, one five-letter palindrome is: ABCBA.

a. How many 5-letter palindromes are possible from a 26-letter alphabet?

b. How many 4-letter palindromes are possible from a 26-letter alphabet?

A line segment connecting any two nonadjacent vertices of a polygon is called a *diagonal* of the polygon. For Exercises 69–72, determine the number of diagonals for the given polygon.



69. quadrilateral (4 sides)

70. pentagon (5 sides)

71. hexagon (6 sides)

72. octagon (8 sides)

For Exercises 73–78, consider the set of numbers {0, 1, 2, 3, 4, 5}. How many 3-digit codes can be formed with the given restrictions?

73. The code has no restrictions.

74. The code may not contain repeated digits.

75. The code must represent a 3-digit number. (*Hint*: This means that the first digit cannot be zero.)

76. The code must represent a 3-digit number that is a multiple of 5.

77. The code must represent an even 3-digit number.

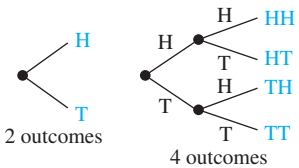
78. All three digits in the code must be the same.

79. In Exercise 103 from Section 12.3, we learned that if a fair coin is flipped n times, the number of head/tail arrangements follows a geometric sequence.

a. Determine the number of head/tail arrangements if a fair coin is flipped 3 times, 4 times, and 5 times.

b. If a cat has three kittens, how many male/female sequences are possible for the three births? List the outcomes using "M" for male and "F" for female.

c. If a cat has 6 kittens, how many male/female sequences are possible for the six births?



80. Social Security numbers assigned in the United States are comprised of 9 digits of the form _ _ _-_ _-_ _ _ _. Would there be enough Social Security numbers for the population of China if the Chinese used the same system? (*Hint*: The population of China is approximately 1.5 billion.)

81. Airlines often oversell seats on an airplane. This is done so that the seats for the few passengers that are no-shows will still have been sold. Sometimes, however, all passengers show up and there are more ticketed passengers than seats. Suppose that one flight has 160 passengers and only 156 seats. Determine the number of ways that the airline can select 4 people at random to place on a different flight.

ISTUDY

82. In how many ways can a platoon leader select 4 soldiers from among 15 soldiers to secure a building?

83. A car can comfortably hold a family of five. If two people among the five can drive, how many different seating arrangements are possible?

84. A television station must play twelve 30-sec commercials during a half-hour show. In how many ways can the commercials be aired?

Write About It

85. Consider a horse race with 8 horses. Explain how the fundamental principle of counting or the permutation rule can be used to determine the number of first-, second-, and third-place arrangements.

86. Explain why the number of combinations of n items taken r at a time can be computed by $\frac{{}_nP_r}{r!}$.

Expanding Your Skills

87. Three biology books, 4 math books, and 2 physics books are to be placed on a bookshelf where the books in each discipline are grouped together. In how many ways can the books be arranged on the bookshelf?

88. A softball team has 9 players consisting of 3 adults and 6 children. In how many ways can the coach arrange the batting order if the adults must bat consecutively and the children must bat consecutively?

89. Given that ${}_nC_{n-2} = 15$, solve for n.

90. Given that ${}_nP_{n-2} = 60$, solve for n.

91. a. Show that ${}_nC_r = {}_nC_{n-r}$.

b. Given that ${}_nC_8 = {}_nC_3$, solve for n.

92. Given that ${}_nP_r = 336$ and ${}_nC_r = 56$, find r.

93. Suppose that six different symbols are to be used to make a password. The password can be of any length (e.g., a one-symbol password, a two-symbol password, a three-symbol password, and so on). If no symbol can be used more than once, how many passwords are possible?

94. Two parents have 10 different photos of their new baby and 3 different photos of their wedding. They want to arrange 4 photos of the baby and 2 wedding photos on the shelf in such a way that the wedding photos are side-by-side. How many arrangements of photographs can they make?

95. Suppose that a four-digit number is to be formed using the digits 2, 4, 6, and 8, and that each digit is to be used exactly once in the number. Find the *sum* of all such four-digit numbers.

96. a. In how many ways can 6 people be seated at a round table?

b. In how many ways can 7 people be seated at a round table if a married couple must sit together?

97. In how many ways can 8 different cookies be distributed among 4 children so that each child receives 2 cookies?

98. In how many ways can a student choose one or more books to read from a group of 5 books?

SECTION 12.7 Introduction to Probability

OBJECTIVES

1. Determine Theoretical Probabilities
2. Determine Empirical Probabilities
3. Find the Probability of the Union of Two Events
4. Find the Probability of Sequential Independent Events

1. Determine Theoretical Probabilities

The Centers for Disease Control publishes National Vital Statistics Reports every year that provide data for birth rates and mortality rates based on gender, race, age, and other factors. The data in Table 12-4 give the 1-yr survival rates for people in the United States for selected ages.

Table 12-4

Age (yr)	Probability of 1-yr Survival
10	0.9999
20	0.9991
30	0.9990
40	0.9981
50	0.9959
60	0.9907
70	0.9791
80	0.9434
90	0.8543

From the table, the probability that a 20-yr-old will live to age 21 is 0.9991. Put another way, this means that approximately 99.91% of 20-yr-olds will live to age 21 (see Example 5).

A **probability** is a value assigned to an event that quantifies the likelihood of the event to occur. To compute the probability of an event, we first need to define several key terms. An **experiment** is a test

TIP The word "die" is the singular of the word "dice." That is, we roll one die but we roll two dice.

Ron Chapple Stock/FotoSearch/ Glow Images

with an uncertain outcome. The set of all possible outcomes of an experiment is called the **sample space** of the experiment. For example:

Experiment:	**Sample Space:**
Flip a coin	{head, tail}
Roll a single 6-sided die	{1, 2, 3, 4, 5, 6}

An **event** is a subset of the sample space and is often denoted by E or some other capital letter.

Description of Event:	**Set Representing the Event:**
Flip a coin and the outcome is "head"	{head}
Roll a six-sided die and an even number comes up	{2, 4, 6}

The number of elements in an event E is often denoted by $n(E)$. For example, given the event $E = \{2, 4, 6\}$, $n(E) = 3$.

If we assume that all elements in a sample space are equally likely to occur, then we define the theoretical probability of an event as follows:

Theoretical Probability of Event E

Let S represent a sample space with equally likely outcomes, and let E be a subset of S. Then the probability of event E, denoted by $P(E)$, is given by

$$P(E) = \frac{n(E)}{n(S)}$$

$n(E)$ ← Number of elements in the event

$n(S)$ ← Number of elements in the sample space

Avoiding Mistakes

The probability $\frac{1}{2}$ does not mean that exactly 1 out of every 2 rolls of a die will result in an even number. Instead, it is a ratio that we expect experimental observations to approach after the experiment is performed a large number of times.

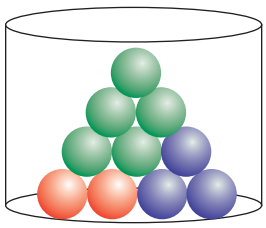
The probability of an event is the relative frequency of the event compared to the sample space. For example, if E is the event of rolling an even number on a die, then $E = \{2, 4, 6\}$ and $S = \{1, 2, 3, 4, 5, 6\}$. Then,

$$P(E) = \frac{n(E)}{n(S)} = \frac{3}{6} = \frac{1}{2}$$

The value of a probability can be written as a fraction, as a decimal, or as a percent. Therefore, $P(E) = \frac{1}{2}$, or 0.5, or 50%.

EXAMPLE 1 Finding the Probability of an Event

Suppose that a box contains two red, three blue, and five green marbles. If one marble is selected at random, find the probability of the event.



a. E_1: A red marble is selected.

b. E_2: A blue marble is selected.

c. E_3: A white marble is selected.

Solution:

Each of the 10 marbles in the box is equally likely to be selected. Denote the sample space as $S = \{R_1, R_2, B_1, B_2, B_3, G_1, G_2, G_3, G_4, G_5\}$.

a. $E_1 = \{R_1, R_2\}$ — The number of red marbles is 2.

Therefore, $P(E_1) = \dfrac{n(E_1)}{n(S)} = \dfrac{2}{10} = \dfrac{1}{5}$. — The probability of selecting a red marble is $\frac{1}{5}$.

b. $E_2 = \{B_1, B_2, B_3\}$ — The number of blue marbles is 3.

Therefore, $P(E_2) = \dfrac{n(E_2)}{n(S)} = \dfrac{3}{10}$. — The probability of selecting a blue marble is $\frac{3}{10}$.

c. $E_3 = \{\ \}$ — The number of white marbles is 0.

Therefore, $P(E_3) = \dfrac{n(E_3)}{n(S)} = \dfrac{0}{10} = 0$. — It is intuitively obvious that a white marble cannot be selected. Mathematically, a probability of 0 means that the event is impossible.

Skill Practice 1 A sock drawer has 6 blue socks, 2 white socks, and 12 black socks. If one sock is selected at random, find the probability of the event.

a. E_1: A blue sock is selected. **b.** E_2: A black sock is selected.
c. E_3: A brown sock is selected.

TIP If the probability of an event is close to 0, the event is unlikely to happen. If the probability is close to 1, the event is very likely to happen. If the probability is close to 0.5, the event is roughly as likely to happen as not to happen.

The number of outcomes in an event is a nonnegative number less than or equal to the number of outcomes in the sample space. Therefore, the value of a probability is a number between 0 and 1, inclusive. That is, $0 \le P(E) \le 1$. Furthermore,

- If $P(E) = 0$, then the event E is called an **impossible event.**
- If $P(E) = 1$, then the event E is called a **certain event.**

In Example 1(c), it is impossible to draw a white marble from the box. However, we would be 100% certain of drawing a red, blue, or green marble from the box and the probability would be 1.

EXAMPLE 2 Finding the Probability of an Event

An American roulette wheel has 38 slots, numbered 1 through 36, 0, and 00. Eighteen slots are red, 18 are black, and 2 are green. The dealer spins the wheel in one direction and rolls a small ball in the opposite direction until both come to rest. The ball is equally likely to fall in any one of the 38 slots. On a given spin of an American roulette wheel, find the probability of the event.

a. E_1: The ball lands on an odd number.
b. E_2: The ball lands on a green slot.
c. E_3: The ball does not land on a green slot.

All kind of people/Shutterstock

TIP We say that the ball is "*equally likely*" to fall on any one of the 38 slots. This means that the probability of the ball falling on the "1" slot is the same as falling on the "2" slot, and the same as falling on the "3" slot, etc.

Answers

1. **a.** $\frac{3}{10}$ **b.** $\frac{3}{5}$ **c.** 0

ISTUDY

Solution:

The sample space has 38 outcomes. That is $n(S) = 38$.

a. There are 18 odd numbers. Therefore, $n(E_1) = 18$ and

$$P(E_1) = \frac{n(E_1)}{n(S)} = \frac{18}{38} = \frac{9}{19} \approx 0.4737.$$

b. There are 2 green slots on the wheel. Therefore, $n(E_2) = 2$ and

$$P(E_2) = \frac{n(E_2)}{n(S)} = \frac{2}{38} = \frac{1}{19} \approx 0.0526.$$

c. There are 36 slots that are not green. Therefore, $n(E_3) = 36$ and

$$P(E_3) = \frac{n(E_3)}{n(S)} = \frac{36}{38} = \frac{18}{19} \approx 0.9474.$$

Skill Practice 2 On a given spin of an American roulette wheel, find the probability of the event.

a. E_1: The ball lands on the number 7.
b. E_2: The ball lands on a red slot.
c. E_3: The ball does not land on a red slot.

From Example 2(b) and 2(c), notice that event E_3 consists of all elements in the sample space not in event E_2. Therefore, the union of the two events makes up the entire sample space, and $P(E_2) + P(E_3) = \frac{1}{19} + \frac{18}{19} = 1$. In this case, we say that events E_2 and E_3 are *complementary events*.

Definition of Complementary Events

Let E be an event relative to sample space S. The **complement of E,** denoted by $\overline{E}$ (or sometimes by $\sim E$ or E') is the set of outcomes in the sample space but not in event E. It follows that

$$P(E) + P(\overline{E}) = 1.$$

EXAMPLE 3 Finding the Probabilities of Complementary Events

Suppose that 2 dice are rolled. Determine the probability that

a. The sum of the numbers showing on the dice is 7.
b. The sum of the numbers showing on the dice is *not* 7.

Solution:

Each individual die has 6 equally likely outcomes. Therefore, by the fundamental principle of counting, the number of ways the pair of dice can fall is $6 \cdot 6 = 36$ (Figure 12-11).

Second Die

First Die	1	2	3	4	5	6
1	(1, 1)	(1, 2)	(1, 3)	(1, 4)	(1, 5)	(1, 6)
2	(2, 1)	(2, 2)	(2, 3)	(2, 4)	(2, 5)	(2, 6)
3	(3, 1)	(3, 2)	(3, 3)	(3, 4)	(3, 5)	(3, 6)
4	(4, 1)	(4, 2)	(4, 3)	(4, 4)	(4, 5)	(4, 6)
5	(5, 1)	(5, 2)	(5, 3)	(5, 4)	(5, 5)	(5, 6)
6	(6, 1)	(6, 2)	(6, 3)	(6, 4)	(6, 5)	(6, 6)

Figure 12-11

Answers

2. a. $\frac{1}{38}$ **b.** $\frac{9}{19}$ **c.** $\frac{10}{19}$

ISTUDY

a. Let E represent the event that the numbers showing on the dice have a sum of 7. A sum of 7 will occur if the dice land on one of the following 6 outcomes.

$E = \{(1, 6), (2, 5), (3, 4), (4, 3), (5, 2), (6, 1)\}$. Therefore, $n(E) = 6$ and

$P(E) = \dfrac{n(E)}{n(S)} = \dfrac{6}{36} = \dfrac{1}{6}$. The probability of rolling a sum of 7 is $\frac{1}{6}$.

b. The event that the numbers on the dice do not present a sum of 7 is the complement of event E. Therefore, we have the option of using the formula $P(E) + P(\overline{E}) = 1$.

$P(\overline{E}) = 1 - P(E) = 1 - \dfrac{1}{6} = \dfrac{5}{6}$ The probability of rolling a sum other than 7 is $\frac{5}{6}$.

Skill Practice 3 Suppose that two dice are rolled. Determine the probability that

a. The sum of the numbers showing on the dice is 8.

b. The sum of the numbers showing on the dice is *not* 8.

In Example 4, we use the techniques of counting learned in Section 12.6 to determine the probability of an event.

EXAMPLE 4 **Finding the Probability of an Event by Using Counting Techniques**

Suppose that 5 good batteries and 3 bad batteries are mixed in a drawer and are indistinguishable from one another. If a homeowner selects two batteries at random, find the probability that both batteries are good.

Solution:

Let G represent the event that two good batteries are chosen. The number of elements in G is the number of possible ways to select 2 good batteries from a group of 5 good batteries without regard to order.

$$n(G) = {}_5C_2 = 10$$

The sample space S consists of all possible ways in which 2 batteries (good or bad) can be selected from 8 batteries without regard to order. That is,

$$n(S) = {}_8C_2 = 28$$

The probability that both batteries will be good is

$$P(G) = \frac{n(G)}{n(S)} = \frac{{}_5C_2}{{}_8C_2} = \frac{10}{28} = \frac{5}{14} \approx 0.3571$$

Skill Practice 4 Suppose that a group of three songs is to be selected from a list of 8 country songs and 6 rock songs. Find the probability that the group of three songs will consist of all country songs.

2. Determine Empirical Probabilities

Suppose that the Centers for Disease Control wants to measure the 1-yr survival rates for Americans for specific ages. There is no way that this can be derived theoretically. Instead, the probability can be approximated through observations. A probability computed in this way is called an **empirical probability.**

Answers

3. a. $\frac{5}{36}$ **b.** $\frac{31}{36}$

Computing Empirical Probability

The empirical probability of an event E is given by

$$P(E) = \frac{\text{Number of times the event } E \text{ occurs}}{\text{Number of times the experiment is performed}}$$

EXAMPLE 5 Computing an Empirical Probability

Data from the Centers for Disease Control for a recent year indicate that there were approximately 4,295,000 individuals of age 20 in the United States. One year later 3887 of these individuals had died and 4,291,113 had lived. Determine the probability that a 20-yr-old will survive to age 21. (*Source*: www.cdc.gov)

Solution:

Let E represent the event that a 20-yr-old lives to age 21.

The experiment involves 4,295,000 individuals of age 20. The number of observed outcomes where an individual lives to the age of 21 is 4,291,113. Therefore, the empirical probability is given by

$$P(E) = \frac{4{,}291{,}113}{4{,}295{,}000} \approx 0.9991$$

Skill Practice 5 Suppose that of approximately 4,224,100 individuals of age 40 in the United States, 8038 die before the age of 41 and 4,216,062 survive. Determine the probability that a 40-yr-old will live to age 41.

3. Find the Probability of the Union of Two Events

We now study the probability of the union of two events. Suppose that one card is drawn from a standard deck of cards. The sample space has the following properties (Figure 12-12).

- The deck consists of 52 cards.
- The cards are divided into four suits (or categories) called spades (♠), clubs (♣), hearts (♥), and diamonds (♦).
- Each suit consists of 13 cards labeled: Ace (A), 2, 3, 4, 5, 6, 7, 8, 9, 10, Jack (J), Queen (Q), and King (K).
- There are 26 black cards (spades and clubs) and 26 red cards (hearts and diamonds).

Figure 12-12

Answer
5. 0.9981

Let A be the event that an ace is drawn: {A♠, A♣, A♥, A♦}.

Let K be the event that a king is drawn: {K♠, K♣, K♥, K♦}.

Events A and K have no elements in common (a single card cannot be both an ace and a king). Therefore, the intersection of A and K is the empty set, $A \cap K = \{\}$, and we say that events A and K are **mutually exclusive** (do not overlap).

Now let event A be the event that an ace is drawn, and let S be the event that a spade is drawn (Figure 12-13).

Figure 12-13

Notice that events A and S share the comment element of the ace of spades, A♠. Therefore, events A and S are *not* mutually exclusive, meaning that they overlap.

We are now ready to generalize. To find the probability of the event (A or B), denoted $P(A \text{ or } B)$, find the probability of the *union* of A and B.

Probability of *A* or *B*

Given events A and B in the same sample space, $P(A \text{ or } B)$ is given by

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

Note: If A and B are mutually exclusive, then $P(A \cap B) = 0$ and we have $P(A \cup B) = P(A) + P(B)$.

EXAMPLE 6 Computing the Probability of *A* or *B*

Suppose that one card is selected at random from a standard deck of cards. Find the probability that

a. The card is an ace or a king.

b. The card is an ace or a spade.

Solution:

Let A be the event that an ace is drawn: {A♠, A♣, A♥, A♦}.

Let K be the event that a king is drawn: {K♠, K♣, K♥, K♦}.

Let S be the event that a spade is drawn:

S = {A♠, 2♠, 3♠, 4♠, 5♠, 6♠, 7♠, 8♠, 9♠, 10♠, J♠, Q♠, K♠}.

a. Events A and K are mutually exclusive. Therefore, to find $P(A \text{ or } K)$, we have

$$P(A \cup K) = P(A) + P(K)$$

$$= \frac{4}{52} + \frac{4}{52}$$

There are 4 aces in the deck out of 52 cards. $P(A) = \frac{4}{52}$.
There are 4 kings in the deck out of 52 cards. $P(K) = \frac{4}{52}$.

$$= \frac{8}{52} \text{ or } \frac{2}{13}$$

TIP In Example 6(a), since A and K are mutually exclusive, then $P(A \cap K) = 0$.

ISTUDY

TIP As an alternative to computing $P(A) + P(S) - P(A \cap S)$, count the number of elements in the event $(A \cup S)$, being careful not to count the events common to A and S twice. That is, count 13 spades plus the 3 aces that are not spades. This gives a total of 16 elements in event $(A \cup S)$. Thus,

$$P(A \cup S) = \frac{16}{52} = \frac{4}{13}$$

b. From Figure 12-13, events A and S are *not* mutually exclusive. Therefore, to find $P(A \text{ or } S)$, we have:

$$P(A \cup S) = P(A) + P(S) - P(A \cap S)$$

$$= \frac{4}{52} + \frac{13}{52} - \frac{1}{52} \quad \text{(ace of spades)}$$

$$= \frac{16}{52} \text{ or } \frac{4}{13}$$

There are 4 aces in the deck out of 52 cards. $P(A) = \frac{4}{52}$.

There are 13 spades in the deck out of 52 cards. $P(S) = \frac{13}{52}$.

There is 1 spade that is an ace in the deck. Therefore, $P(A \cap S) = \frac{1}{52}$.

Skill Practice 6 Suppose that one card is drawn at random from a standard deck. Find the probability that

a. The card is a 2 or a 10.

b. The card is a 2 or a red card.

EXAMPLE 7 Computing an Empirical Probability of *A* or *B*

The safety and security department at a college asked a sample of 265 students to respond to the following question.

"Do you think that the college has adequate lighting on campus at night?"

The table gives the results of the survey based on whether the student lives off campus or on campus.

	Yes	No	No Opinion	Total
Off campus	92	7	4	103
On campus	36	102	24	162
Total	128	109	28	265

If one student is selected at random from the group, find the probability that

a. The student answered "Yes" or had "No Opinion."

b. The student answered "No" or lived on campus.

Solution:

a. Let Y be the event that the student answered "Yes."
Let O be the event that the student had "No Opinion."

Y and O are mutually exclusive events (do not overlap).

$$P(Y \text{ or } O) = P(Y) + P(O)$$

$$= \frac{128}{265} + \frac{28}{265}$$

$$= \frac{156}{265}$$

$P(Y) = \frac{128}{265}$ and $P(O) = \frac{28}{265}$.

	Yes	No	No Opinion	Total
Off campus	92	7	4	103
On campus	36	102	24	162
Total	128	109	28	265

Answers

6. a. $\frac{2}{13}$ **b.** $\frac{7}{13}$

TIP As an alternative to computing $P(N) + P(C) - P(N \cap C)$, count the number of elements in the event $(N \cup C)$, being careful not to count the elements common to N and C twice; that is, count the 162 students who live on campus plus the 7 students who live off campus and answered "No" for a total of 169 elements in event $(N \cup C)$. Thus, $P(N \cup C) = \frac{169}{265}$.

b. Let N be the event that the student answered "No."
Let C be the event that the student lives on campus.

N and C are *not* mutually exclusive (the events overlap).

	Yes	No	No Opinion	Total
Off campus	92	7	4	103
On campus	36	102	24	162
Total	128	109	28	265

$$P(N \text{ or } C) = P(N) + P(C) - P(N \cap C)$$

$$= \frac{109}{265} + \frac{162}{265} - \frac{102}{265}$$

$P(N) = \frac{109}{265}$, $P(C) = \frac{162}{265}$, and $P(N \cap C) = \frac{102}{265}$

$$= \frac{169}{265}$$

The 102 students who live on campus and answered "No" are the elements in the intersection of N and C.

Skill Practice 7 Refer to the data given in Example 7. If one student is selected at random from the group, find the probability that

a. The student answered "Yes" or "No."

b. The student lives off campus or had no opinion.

4. Find the Probability of Sequential Independent Events

When a coin is tossed, the probability that it lands heads up is $\frac{1}{2}$. Now suppose that the coin is flipped two times in succession. What is the probability that it lands heads up twice in a row? Our intuition tells us that the probability should be less than $\frac{1}{2}$ because it is more unlikely that the desired outcome will happen twice in a row than one time. We also know that the outcome of the first event (heads up) does not affect the outcome of the second event (also heads up). For this reason, the two events are called **independent events.**

Probability of a Sequence of Independent Events

If events A and B are independent events, then the probability that both A and B will occur is

$$P(A \text{ and } B) = P(A) \cdot P(B)$$

For example,

Let A represent the event that a coin lands heads up on the first toss.
Let B represent the event that a coin lands heads up on the second toss.

Then the probability that the coin will land heads up on both tosses is

$$P(A \text{ and } B) = P(A) \cdot P(B) = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$$

TIP In Example 8 there are 8 elements in the sample space:

RRR, RRB, RBR, RBB
BRR, BRB, BBR, BBB

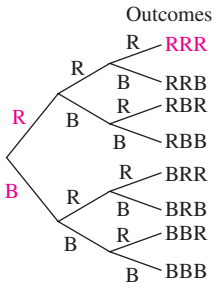
The event RRR occurs 1 time. Thus, the probability of all red cards is $\frac{1}{8}$.

EXAMPLE 8 Finding the Probability of Independent Events

A carnival game is played in which a player selects a card at random from a standard 52-card deck. After each pick, the player returns the card to the deck, the deck is shuffled, and the player selects again. If the player selects three red cards in a row, the player wins a prize. What is the probability that the player will win?

Solution:

First note, that each selection of a card is independent of the previous selection. This is because the cards from previous selections are returned to the deck. In a sense, the player is "starting over" with a fresh deck of 52 cards each time. Furthermore, because the number of black cards equals the number of red cards (26 each), the probability of selecting a red card (R) is:



$$P(R) = \frac{26}{52} = \frac{1}{2}$$

$$P(\text{all red}) = P(\text{red on 1st}) \cdot P(\text{red on 2nd}) \cdot P(\text{red on 3rd})$$

$$= \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{8}$$

Skill Practice 8 Suppose that the game from Example 8 is extended so that the player wins a better prize if five black cards are selected in a row. What is the probability that the player will win?

EXAMPLE 9 Finding the Probability of Independent Events

In baseball, a player's batting "average" is the quotient of the number of hits to the number of "at bats." It can also be interpreted as the probability that the player will get a hit on a given time at bat. If a player had a batting average of 0.279 for a recent season, determine the probability of getting a hit on four consecutive times at bat.

Solution:

Let H represent the event that the player gets a hit on a given time at bat. Furthermore, each time at bat is independent of the time before.

We have that $P(H) = 0.279$. Therefore,

$$P(\text{4 consecutive hits}) = (0.279)(0.279)(0.279)(0.279)$$
$$\approx 0.006$$

If the player has four times at bat, there is less than a 1% chance of getting a hit all four times.

Skill Practice 9 Suppose the probability that a person will catch a winter "cold" is 0.16. What is the probability that four unrelated people will all catch winter "colds"?

SECTION 12.7 Practice Exercises

Prerequisite Review

R.1. Given: $P = \{a, b, c, d, e, f, g, h, i\}$ and $Q = \{c, f, h, o, u\}$
List the elements of the following sets.

a. $P \cap Q$ **b.** $P \cup Q$

R.2. Given: $M = \{-4, -2, 1, 3, 5\}$ and $N = \{-5, -4, -3, -2, -1\}$
List the elements of the following sets.

a. $M \cap N$ **b.** $M \cup N$

Concept Connections

1. The _____ _____of an experiment is the set of all possible outcomes.

2. An _____ is a subset of the sample space of an experiment.

3. If $P(E) = 0$, then E is called an _____ event. If $P(E) = 1$, then E is called a _____ event.

4. The notation $\overline{E}$ represents the _____ of event E. Furthermore, $P(E) + P(\overline{E}) =$ _____.

5. Two events in a sample space are _____ _____ if they do not share any common elements. That is, the two events do not overlap.

6. If two events A and B are not mutually exclusive, then $P(A \cup B)$ can be computed by the formula $P(A \cup B) =$ _____.

7. If two events A and B are mutually exclusive, then $P(A \cap B) =$ _____. As a result, $P(A \cup B)$ can be computed from the formula $P(A \cup B) =$ _____.

8. For two independent events A and B, $P(A \text{ and } B) =$ _____.

Objective 1: Determine Theoretical Probabilities

9. Which of the values can represent the probability of an event?

a. 1.84 **b.** $-\frac{3}{7}$ **c.** 0.00 **d.** 1.00
e. 250% **f.** 6.1 **g.** 0.61 **h.** 6.1%

10. Which of the values can represent the probability of an event?

a. 2.32 **b.** 0.231 **c.** 2.31% **d.** -1
e. $\frac{3}{8}$ **f.** $-\frac{1}{4}$ **g.** $\sqrt{2}$ **h.** 125%

For Exercises 11–16, match the probability with a statement a, b, c, d, e, or f.

a. Event E is certain to happen.
b. Event E cannot happen.
c. Event E is very likely to happen.
d. Event E is very unlikely to happen.
e. Event E is somewhat likely to happen.
f. Event E is as likely to happen as not to happen.

11. $P(E) = 0.994$ **12.** $P(E) = 1$ **13.** $P(E) = 0.75$
14. $P(E) = 0.003$ **15.** $P(E) = 0.5$ **16.** $P(E) = 0$

For Exercises 17–24, consider an experiment where a single 10-sided die is rolled with the outcomes 1, 2, 3, 4, 5, 6, 7, 8, 9, 10. Determine the probability of each event.

17. A number less than 5 is rolled.

18. A number less than 3 is rolled.

19. A number between 4 and 10, inclusive, is rolled.

20. A number between 2 and 7, inclusive, is rolled.

21. A number greater than 10 is rolled.

22. A number less than 1 is rolled.

23. A number greater than or equal to 1 is rolled.

24. A number less than or equal to 10 is rolled.

25. A course in early civilization has 6 freshmen, 8 sophomores, and 16 juniors. If one student is selected at random, find the probability of the following events. (**See Example 1**)

a. A junior is selected.
b. A freshman is selected.
c. A senior is selected.

26. Suppose that a box contains 4 chocolate chip cookies, 8 molasses cookies, and 12 raisin cookies. If one cookie is selected at random, find the probability for each of the following events.

a. A chocolate chip cookie is selected.
b. A molasses cookie is selected.
c. A ginger cookie is selected.

For Exercises 27–28, consider an American roulette wheel. For a given spin of the wheel, find the probability for each of the following events. (See Example 2)

27. a. The ball lands on an even number (do not include 0 and 00).

b. The ball lands on a number that is a multiple of 5 (do not include 0 and 00).

c. The ball does not land on the number 8.

28. a. The ball lands on a black slot.

b. The ball lands on a number that is a multiple of 6 (do not include 0 and 00).

c. The ball does not land on the number 12.

29. If $P(E) = 0.842$, what is the value of $P(\overline{E})$?

30. If $P(A) = 0.431$, what is the value of $P(\overline{A})$?

31. According to the Centers for Disease Control, the probability that a live birth will be of twins in the United States is 0.016. What is the probability that a live birth will *not* be of twins?

32. A baseball player with a batting average of 0.291 has a probability of 0.291 of getting a hit for a given time at bat. What is the probability that the player will *not* get a hit for a given time at bat?

For Exercises 33–36, consider the sample space when two fair dice are rolled. Determine the probabilities for the following events. (See Example 3)

33. a. The sum of the numbers on the dice is 4.

b. The sum of the numbers on the dice is *not* 4.

34. a. The sum of the numbers on the dice is 12.

b. The sum of the numbers on the dice is *not* 12.

35. a. The sum of the numbers on the dice is greater than 9.

b. The sum of the numbers on the dice is less than 4.

36. a. The sum of the numbers on the dice is greater than or equal to 8.

b. The sum of the numbers on the dice is less than or equal to 5.

37. After a nationally televised trial, a poll of viewers indicated that 68% thought the defendant was guilty, 22% thought the defendant was not guilty, and the rest were undecided. What is the probability that a person selected from the viewing audience was undecided?

38. A student flips a coin five times, and the probability that "tails" comes up all five times is 0.03125. What is the probability of getting at least one "head?"

39. Suppose that a drug study has a group of participants consisting of 18 people in the placebo group and 16 people in the experimental group. The individuals in the placebo group are administered pills that look like a real drug but have no medicinal value. The individuals in the experimental group are administered the drug that is under study. Suppose that a doctor selects a group of 9 patients at random from all of those in the study.

a. What is the probability that the 9 patients are all in the placebo group?

b. What is the probability that the 9 patients are all in the experimental group?

c. Why do the probabilities from parts (a) and (b) not add up to 1?

40. Suppose that 20 good batteries and 6 defective batteries are in a drawer.

a. If 4 batteries are drawn at random, what is the probability that all four will be defective?

b. What is the probability that all four will be good?

c. Why do the probabilities from parts (a) and (b) not add up to 1?

41. In the Illinois state lottery game "Little Lotto," a player wins the grand prize by choosing the same group of five numbers from 1 through 39 as is chosen by the computer. What is the probability that a player will win the grand prize by playing 1 ticket?

42. In the New York state lottery game "Lotto," a player wins the grand prize by choosing the same group of 6 numbers from 1 through 59 as is chosen by the computer. What is the probability that a player will win the grand prize by playing 5 different tickets?

ISTUDY

Scientist Gregor Mendel (1822–1884) is often called the "father of modern genetics" and is famous for his work involving the inheritance of certain traits in pea plants. Suppose that the genes controlling the color of peas are Y for yellow and y for green. Each plant has two genes, one from the female (seed) and one from the male (pollen). The Y gene is dominant, and therefore a plant with genes YY will have yellow peas, a plant with genes Yy or yY will have yellow peas, and a plant with genes yy will have green peas.

If a plant with two yellow genes (YY) is crossed with a plant with two green genes (yy), the result is four hybrid offspring with genotypes Yy. The offspring will be yellow, but will carry the recessive green gene.

		Parent 2	
		y	**y**
Parent 1	**Y**	Yy	Yy
	Y	Yy	Yy

43. Suppose that both parent pea plants are hybrids with genotype Yy.

a. Make a chart showing the possible genotypes of the offspring.

		Parent 2	
		Y	**y**
Parent 1	**Y**		
	y		

b. What is the probability that a given offspring will have green peas?

c. What is the probability that a given offspring will have yellow peas?

44. Suppose that one parent pea plant has genotype YY and the other has genotype Yy.

a. Make a chart showing the possible genotypes of the offspring.

		Parent 2	
		Y	**y**
Parent 1	**Y**		
	Y		

b. What is the probability that a given offspring will have green peas?

c. What is the probability that a given offspring will have yellow peas?

Objective 2: Determine Empirical Probabilities

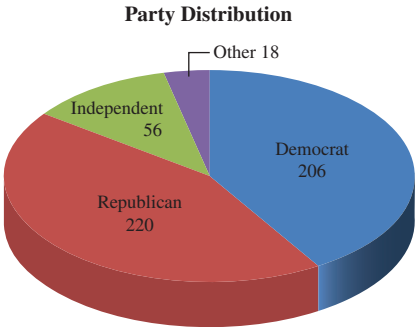
45. At a hospital specializing in treating heart disease, it was found that 222 out of 4624 patients undergoing open heart mitral valve surgery died during surgery or within 30 days after surgery. Determine the probability that a patient will not survive the surgery or 30 days after the surgery. This is called the mortality rate. Round to 3 decimal places. (**See Example 5**)

46. China has the largest population of any country with approximately 1.5 billion people. In a recent year, census results indicated that 199,500,000 Chinese were over the age of 60. If a person is selected at random from the population of China, what is the probability that the person is over 60 years old? Round to 3 decimal places.

47. For a certain district, a random sample of registered voters results in the distribution by political party given in the graph. Based on these results, what is the probability of selecting a voter at random from the district and getting

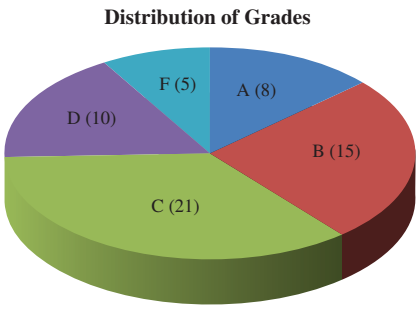
a. A Democrat?

b. A voter who is neither Democrat, Republican, nor Independent?



48. The final exam grades for a sample of students in a Freshmen English class at a large university result in the following grade distribution. Based on these results, what is the probability of selecting a student at random taking Freshmen English and getting a student who received

a. An "A." **b.** A "C."



Objective 3: Find the Probability of the Union of Two Events

For Exercises 49–58, consider the sample space for a single card drawn from a standard deck. (See Example 6 and Figure 12-12) Find the probability that the card drawn is

49. A jack or a queen.

50. An ace or a 2.

51. A jack or a diamond.

52. A 5 or a heart.

53. A face card (jack, queen, or king).

54. A card numbered between 5 and 10, inclusive.

ISTUDY

55. A face card or a red card.

56. A card numbered between 5 and 10, inclusive, or a black card.

57. A heart, club, or spade.

58. An ace, 2, or 3.

For Exercises 59–66, use the data in the table categorizing cholesterol levels by the ages of the individuals in a study. If one person from the study is chosen at random, find the probability of the given event. (See Example 7)

	Normal Cholesterol	Elevated Cholesterol	Total
30 and under	14	4	18
31–60	52	28	80
61 or older	22	80	102
Total	88	112	200

59. The person has elevated cholesterol.

60. The person is 61 or older.

61. The person is 60 or under.

62. The person is 31 or older.

63. The person has normal cholesterol or is 61 or older.

64. The person has elevated cholesterol or is 30 or under.

65. The person is between 31 and 60, inclusive, or has elevated cholesterol.

66. The person is 61 or older or has elevated cholesterol.

Objective 4: Find the Probability of Sequential Independent Events

67. Suppose that a die is rolled followed by the flip of a coin. Find the probability that the outcome is a 5 on the die followed by the coin turning up heads. (**See Example 8**)

68. If a code for an alarm is a 4-digit sequence, determine the probability that someone guesses each digit correctly.

69. The 5-yr survival rate for stage I breast cancer is 88%. (*Source*: American Cancer Society, www.cancer.org) If two women with stage I breast cancer are selected at random, what is the probability that they both survive 5 yr? (**See Example 9**)

70. Basketball player Steph Curry makes approximately 91% of free throws. If he plays in a game in which he shoots 6 free throws, what is the probability that he will make all 6?

71. In the 2010 Wimbledon Championships, John Isner from the United States and Nicolas Mahut from France played a first-round tennis match that became the longest match in tennis history. (The match stretched over a 3-day period with Isner winning 70-68 in the fifth set.) In 2011, after a random draw, the two men met again in the first round of Wimbledon. This is highly improbable. If there are 128 players in the draw, estimate the probability that

a. Isner and Mahut would meet in the first round at Wimbledon in any given year. Assume that any player can play any other player in the first round (that is, disregard the fact that seeded players do not play one another in the first round).

b. Isner and Mahut would meet in the first round 2 yr in a row.

72. A traffic light at an intersection has a 120-sec cycle. The light is green for 80 sec, yellow for 5 sec, and red for 35 sec.

a. When a motorist approaches the intersection, find the probability that the light will be red. (Assume that the color of the light is defined as the color when the car is 100 ft from the intersection. This is the approximate distance at which the driver makes a decision to stop or go.)

b. If a motorist approaches the intersection twice during the day, find the probability that the light will be red both times.

73. A test has 10 questions. Five questions are true/false and five questions are multiple-choice. Each multiple-choice question has 4 possible responses of which exactly one is correct. Find the probability that a student guesses on each question and gets a perfect score.

74. A quiz has 6 multiple-choice questions and each question has 5 possible responses, of which exactly one is correct. Find the probability that a student answers each question *incorrectly*.

ISTUDY

Mixed Exercises

The blood type of an individual is classified according to the presence of certain antigens, substances that cause the immune system to produce antibodies. These antigens are denoted by A, B, and Rh. If an individual's blood contains either the A or B antigen, these letters are listed in the blood type. If neither A nor B is present, then the letter O is used. If the Rh antigen is present, the blood is said to be Rh positive (Rh^+); otherwise, the blood is Rh negative (Rh^-). Under this system, a person with AB^+ blood has all three antigens, and group O^- is absent all three antigens.

The distribution of blood types for people living in the United States is given in the table. (*Source*: Stanford School of Medicine, http://bloodcenter.stanford.edu) Refer to the table for Exercises 75–82. Round to 3 decimal places when necessary.

Type	Probability
O^+	0.374
O^-	0.066
A^+	0.357
A^-	0.063
B^+	0.085
B^-	0.015
AB^+	0.034
AB^-	0.006

75. a. If an individual is randomly selected from the population, find the probability that the individual will have the Rh factor.

b. If three people are selected at random, find the probability that they all have the Rh factor.

76. a. If a person is selected at random from the population, find the probability that the individual has the A antigen.

b. If four people are randomly selected, find the probability that all four have the A antigen.

77. a. Which blood type is most common?

b. Which blood type is most rare?

78. Across all blood types, is a person more likely to have the Rh factor or less likely to have the Rh factor?

Doctors know that certain restrictions apply when considering the administration of blood to a patient. The antigens of the blood donor and recipient must be compatible. If an antigen is absent from the recipient's blood, then the recipient cannot receive blood from a person who has that antigen. For example, a person with B^+ blood cannot receive AB^+ blood because of the presence of the A antigen from the donor. Use this information and the table with Exercises 75–78 for Exercises 79–82.

79. Suppose that a person is randomly selected from the population. What is the probability that this individual's blood can be used for a transfusion for a person with type B^+ blood?

80. Suppose that a person is randomly selected from the population. What is the probability that this individual's blood can be used for a transfusion for a person with type A^+ blood?

81. a. What is the probability that an individual from the population can donate blood to a person with type O^- blood?

b. Explain why a person with type O^- blood is called a universal donor.

82. a. What is the probability that an individual from the population can donate blood to a person with AB^+ blood?

b. Explain why a person with AB^+ blood can receive blood from anyone.

83. A slot machine in a casino has three wheels that all spin independently. Each wheel has 11 stops, denoted by 0 through 9, and bar. What is the probability that a given outcome is bar-bar-bar?

84. Airlines often overbook flights because a small percentage of passengers do not show up (perhaps due to missed connections). Past history indicates that for a certain route, the probability that an individual passenger will not show up is 0.04. Suppose that 61 people bought tickets for a flight that has 60 seats. Determine the probability that there will not be enough seats. Round to 3 decimal places.

85. South Florida humorist Dave Barry often wrote about his dog, Zippy. Suppose that the Barry home has 3200 ft^2 of living area with tile floor. Further suppose that an expensive 8 ft by 10 ft oriental rug is placed on the floor. If Zippy had an "accident" in the house, what is the probability that it would happen on the expensive rug?

For Exercises 86–88,

a. Shade the area bounded by the given inequalities on a coordinate grid showing $-5 \le x \le 5$ and $-5 \le y \le 5$.

b. Suppose that an enthusiastic mathematics student makes a square dart board out of the portion of the rectangular coordinate system defined by $-5 \le x \le 5$ and $-5 \le y \le 5$. Find the probability that a dart thrown at the target will land in the shaded region.

86. $y \ge |x|$ and $y \le 4$

87. $|y| \le 3$ and $|x| \le 2$

88. $x^2 + y^2 \le 9$

ISTUDY

Write About It

89. In a carnival game, players win a prize if they can toss a ring around the neck of a bowling pin. How would you go about estimating the probability of winning the game?

90. Give an example of two events that are mutually exclusive.

91. Give an example of two events that are not mutually exclusive.

92. Explain why a probability of $\frac{5}{4}$ is impossible.

Expanding Your Skills

93. Suppose that a box of DVDs contains 10 action movies and 5 comedies.

a. If two DVDs are selected from the box with replacement, determine the probability that both are comedies.

b. It probably seems more reasonable that someone would select two *different* DVDs from the box. That is, the first DVD would not be replaced before the second DVD is selected. In such a case, are the events of selecting comedies on the first and second picks independent events?

c. If two DVDs are selected from the box *without* replacement, determine the probability that both are comedies.

94. Suppose that 12 students (5 freshmen and 7 sophomores) are being considered for two different scholarships. One scholarship is for \$500 and the other is for \$250.

a. Two students are selected at random from the group of 12 to receive the scholarships. If a student may receive both scholarships, determine the probability that both students are freshmen.

b. Now suppose that an individual student may not receive both scholarships. Determine the probability that both students chosen are freshmen.

95. If five cards are dealt from a standard deck of 52 cards, find the probability that

a. The cards are all hearts.

b. The cards are all of the same suit.

96. If five cards are dealt from a standard deck of 52 cards, find the probability that

a. The cards consist of four aces.

b. The cards are four of a kind (four cards with the same face value).

97. Three different mathematics books, 5 different science books, and 2 different history books are placed on a shelf. What is the probability that the books of each subject are shelved together? Round to four decimal places.

98. Suppose that a box has 4 white balls and 6 red balls. Three players, A, B, and C will play a game where they each select one ball at random from the box, without replacement. Person A goes first, person B goes second, and person C goes third. The first person to pick a white ball wins the game. Find the probability of a win for each person.

99. Suppose that 5 dice are thrown. Find the probability that a "4" appears on exactly 2 of the 5 dice. Round to four decimal places.

100. Suppose that 6 dice are thrown. Find the probability that an even number appears on 4 of the 6 dice. Round to four decimal places.

101. Suppose a basketball player typically makes 45% of shots taken.

a. On a given shot, what is the probability that the player will not make the basket?

b. Now suppose that the player takes four shots in a game. What is the probability that the player makes none of the shots? Round to four decimal places.

c. What is the probability that the player makes exactly 1 shot? Round to four decimal places.

d. What is the probability that the player makes exactly 2 shots? Round to four decimal places.

e. What is the probability that the player makes exactly 3 shots? Round to four decimal places.

f. What is the probability that the player makes all 4 shots? Round to four decimal places.

g. What is the sum of the probabilities from parts (b)–(f)?

h. What is the probability that the player makes at least 2 shots?

102. A study found that for a particular strain of the influenza virus, a person who had received the flu vaccine had a 0.025 chance of contracting the virus after being exposed to an infectious person. The probability that an unvaccinated person would contract the virus after exposure was 0.4. If two people, one vaccinated and one unvaccinated, are exposed to the flu virus, what is the probability that at least one will contract the flu?

103. A box contains 4 quarters, 5 dimes, and 8 nickels. Find the probability that if three coins are selected, the value will be \$0.40. Round to four decimal places.

ISTUDY

104. A box contains 5 white ping pong balls and 1 yellow ping pong ball. A second box has 6 white ping pong balls. Suppose that 4 balls are drawn at random from the first box and placed in the second box. Then, 2 balls are drawn from the second box and placed in the first.

a. Determine the probability that after both moves, the yellow ball is in the second box.

b. Determine the probability that after both moves, the yellow ball is in the first box.

Probability is an important tool used to compute mathematical expectation or expected value. The term *expected value* refers to the return expected for some kind of action. For example, suppose that you take a 24-question multiple choice test in which the possible responses are a, b, c, and d and for which there is exactly one correct answer. The probability of guessing correctly on a given question is $\frac{1}{4}$. Thus, if you guessed on every question, you would expect to get $\frac{1}{4} \cdot 24 = 6$ questions correct.

Expected value is often used to determine the expected winnings (or loss) in a game of chance. If p is the probability that an individual will win (or lose) m dollars, then the expected value, E, is given by $E = pm$. If an experiment has two possible outcomes, the expected value is the average, long-run payoff (or loss) weighted by the probabilities of each outcome. That is,

$$\text{Expected value} = \begin{pmatrix}\text{Probability of}\\ \text{outcome 1}\end{pmatrix}\begin{pmatrix}\text{Payoff (or loss)}\\ \text{of outcome 1}\end{pmatrix} + \begin{pmatrix}\text{Probability of}\\ \text{outcome 2}\end{pmatrix}\begin{pmatrix}\text{Payoff (or loss)}\\ \text{of outcome 2}\end{pmatrix}$$

Use this formula for Exercises 105–108.

105. At a carnival, a game is constructed so that a player will win a $2 prize approximately 5% of the time. If the cost to play the game is $0.50, find the player's expected value by following these steps. Note that there are two possible outcomes: the player can win the game, or the player can lose.

a. What is the probability that the player wins? What is the net payoff if the player wins?

b. What is the probability that the player loses? What is the net loss if the player loses? (Write the net loss as a negative dollar value.)

c. Compute the player's expected value.

d. Interpret the meaning of the expected value both for the player and for the carnival.

e. If the carnival game is played 10,000 times during a two-week carnival, how much will the carnival make in profit from this game?

106. At a fund-raiser for a charity, a game is set up with a box of 9 red balls and 1 yellow ball. A player pays $1 to play the game, then reaches into the box and takes out a ball, sight-unseen. If the yellow ball is selected, the player wins a $5 bill. However, if a red ball is selected, the player wins nothing.

a. What is the probability that the player will win? What is the net payoff if the player wins?

b. What is the probability that the player will lose? What is the net loss if the player loses? (Write the net loss as a negative dollar value.)

c. Compute the player's expected value.

d. Interpret the meaning of the expected value both for the player and for the charity.

e. If the game is played 500 times, how much will the charity make from this game?

107. An insurance company charges a premium of $850 per year to insure a certain car for a certain driver. Given the driver's age and driving history, the company estimates the probability of an accident within the year to be 0.008. If the driver has an accident, the company estimates an average payout of $20,000 (this includes payment for car repair for all vehicles involved and medical expenses).

a. What is the probability that the insurance company *will not* have to pay out money for a claim during the course of the year (that is, the driver does not have an accident)? If there is no accident, what is the revenue collected by the insurance company for this policy?

b. What is the probability that the insurance company *will* have to pay out money for a claim (that is, the driver has an accident during the year)? In the event of an accident, what is the net loss that the insurance company incurs? (*Hint*: The net loss is the yearly premium minus the average payout.)

c. Compute the insurance company's expected value.

d. Interpret the meaning of the result of part (c).

108. A person buys a car in Florida, and the car dealership offers a warranty on the air-conditioning system. The consumer's cost for the warranty is $150. The dealership knows from long-term data that the probability of an air-conditioner failing during the warranty period is 1.5%. But if the AC unit does fail, the dealership will pay out an average of $1600 to fix it.

a. What is the probability that the dealership *will not* have to pay out money to fix the AC unit (that is, the AC unit does not fail within the warranty period)? If the AC unit does not fail during the warranty period, what is the revenue collected by the dealership?

b. What is the probability that the dealership *will* have to pay out money to fix the AC unit? In the event that the AC unit fails, what is the net loss that the dealership incurs? (*Hint*: The net loss is the $150 in revenue for the warranty minus the average cost to fix the AC unit.)

c. Compute the dealership's expected value.

d. Interpret the meaning of the result of part (c).

ISTUDY

CHAPTER 12 KEY CONCEPTS

SECTION 12.1 Sequences and Series	Reference
An **infinite sequence** is a function whose domain is the set of positive integers. A **finite sequence** is a function whose domain is the set of the first n positive integers.	p. 1092
A sequence in which consecutive terms alternate in sign is an **alternating sequence.**	p. 1093
A **recursive formula** defines the nth term of a sequence as a function of one or more terms preceding it.	p. 1094
For a positive integer n, the quantity $\boldsymbol{n!}$ ("n factorial") is defined as $n! = (n)(n-1)(n-2)\cdots(2)(1)$ By definition, $0! = 1$.	p. 1095
The $\boldsymbol{n}$**th partial sum** of a sequence $\{a_n\}$ is a finite series and is given by $S_n = \sum_{i=1}^{n} a_i = a_1 + a_2 + a_3 + \cdots + a_n$	p. 1097
The sum of *all* terms in an infinite sequence is an **infinite series:** $\sum_{i=1}^{\infty} a_i = a_1 + a_2 + a_3 + \cdots$	p. 1097
Properties of summation: If $\{a_n\}$ and $\{b_n\}$ are sequences, and c is a real number, then 1. $\sum_{i=1}^{n} c = cn$ 2. $\sum_{i=1}^{n} ca_i = c\sum_{i=1}^{n} a_i$ 3. $\sum_{i=1}^{n}(a_i \pm b_i) = \sum_{i=1}^{n} a_i \pm \sum_{i=1}^{n} b_i$	p. 1099

SECTION 12.2 Arithmetic Sequences and Series	Reference
An **arithmetic sequence** is a sequence in which each term after the first differs from its predecessor by a common difference d.	p. 1104
The nth term of an arithmetic sequence: $a_n = a_1 + (n-1)d$ where a_1 is the first term of the sequence and d is the common difference.	p. 1104
Sum of the first n terms of an arithmetic sequence (nth partial sum): $S_n = \frac{n}{2}(a_1 + a_n)$ where a_1 is the first term of the sequence and a_n is the nth term of the sequence.	p. 1109

SECTION 12.3 Geometric Sequences and Series	Reference
A **geometric sequence** is a sequence in which each term after the first is the product of the preceding term and a fixed nonzero real number, called the **common ratio.** If the first term of a geometric sequence is a_1, and the common ratio is r, then the nth term of a geometric sequence is given by $a_n = a_1 r^{n-1}$.	p. 1115
nth partial sum of a geometric sequence: The sum S_n of the first n terms of a geometric sequence is given by $S_n = \frac{a_1(1-r^n)}{1-r}$ where a_1 is the first term of the sequence and r is the common ratio, $r \neq 1$.	p. 1118
Sum of an infinite geometric series: Given an infinite geometric series $a_1 + a_1 r + a_1 r^2 + a_1 r^3 + \cdots$ with $\lvert r\rvert < 1$, the sum S of all terms in the series is given by $S = \frac{a_1}{1-r}$ *Note*: If $\lvert r\rvert \geq 1$, then the sum does not exist.	p. 1120

ISTUDY

Future value of an ordinary annuity: p. 1122

Suppose that P dollars is invested at the end of each compounding period n times per year at interest rate r. Then the value A (in \$) of the annuity after t years is given by

$$A = \frac{P\left[\left(1 + \frac{r}{n}\right)^{nt} - 1\right]}{\frac{r}{n}}$$

SECTION 12.4 Mathematical Induction

Reference

Mathematical induction is a technique of mathematical proof that is often used to prove that a statement is true for all positive integers. p. 1129

The principle of mathematical induction: p. 1130

Let P_n be a statement involving the positive integer n, and let k be an arbitrary positive integer. Then P_n is true for all positive integers n if

1. P_1 is true, and
2. The truth of P_k implies the truth of P_{k+1}.

The assumption that P_k is true is called the **inductive hypothesis.** p. 1131

Extended principle of induction: p. 1133

Mathematical induction can be extended to prove statements that might hold true only for integers greater than or equal to some positive integer j. In such a case,

- First prove the statement for $n = j$.
- Then show that the truth of the statement for an integer greater than or equal to j implies the truth of the statement for the integer that follows.

SECTION 12.5 The Binomial Theorem

Reference

Binomial theorem: pp. 1137–1138

Let n be a positive integer. The expansion of $(a + b)^n$ is given by

$$(a+b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \cdots + \binom{n}{n-1}ab^{n-1} + \binom{n}{n}b^n$$

$$= \sum_{r=0}^{n}\binom{n}{r}a^{n-r}b^r$$

The values $\binom{n}{0}, \binom{n}{1}, \binom{n}{2}, \ldots, \binom{n}{n}$ are called the **binomial coefficients** of the expansion of $(a + b)^n$.

The binomial coefficients can also be found by using **Pascal's triangle.**

$$\begin{array}{ccccccc} & & & 1 & & & \\ & & 1 & & 1 & & \\ & 1 & & 2 & & 1 & \\ 1 & & 3 & & 3 & & 1 \\ 1 & 4 & & 6 & & 4 & 1 \\ 1 & \ldots & & & & & \end{array}$$

Finding the *k*th term of a binomial expansion: p. 1140

Let n and k be positive integers with $k \le n + 1$. The kth term of $(a + b)^n$ is $\binom{n}{k-1}a^{n-(k-1)}b^{k-1}$

SECTION 12.6 Principles of Counting

Reference

Fundamental principle of counting: p. 1144

If one event can occur in m different ways and a second event can occur in n different ways, then the number of ways that the two events can occur in sequence is $m \cdot n$.

ISTUDY

A **permutation** is an ordered arrangement of distinct items. • The number of permutations of n distinct elements is $n!$.	p. 1146
• Consider a set of n elements with r_1 duplicates of one kind, r_2 duplicates of a second kind, … , r_k duplicates of a kth kind. Then the number of distinguishable permutations of the n elements of the set is: $\frac{n!}{r_1! \cdot r_2! \cdot \cdots \cdot r_k!}$	p. 1146
• The number of permutations of n elements taken r at a time is given by $_nP_r = \frac{n!}{(n-r)!}$ or equivalently, $_nP_r = n(n-1)(n-2)\cdots(n-r+1)$	p. 1148
A **combination** is a collection of distinct items taken without regard to order. The number of combinations of n elements taken r at a time is given by $_nC_r = \frac{n!}{r! \cdot (n-r)!}$.	p. 1149

SECTION 12.7 Introduction to Probability	**Reference**
Theoretical probability of an event: Let S represent a sample space with equally likely outcomes, and let E be a subset of S. Then the probability of event E, denoted by $P(E)$, is given by $P(E) = \frac{n(E)}{n(S)}$	p. 1156
Let E be an event relative to sample space S. The **complement of E,** denoted by $\overline{E}$, is the set of outcomes in the sample space but not in event E. It follows that $P(E) + P(\overline{E}) = 1$.	p. 1158
Empirical probability is computed based on observed outcomes of the relative frequency of an event to the number of times an experiment is performed.	p. 1159
Two events are **mutually exclusive** if they share no common elements. **The probability of *A* or *B*:** Given events A and B in a same sample space, $P(A \text{ or } B)$ is given by $P(A \cup B) = P(A) + P(B) - P(A \cap B)$. If A and B are mutually exclusive, then $P(A \cup B) = P(A) + P(B)$.	p. 1161
Probability of a sequence of independent events: Two events are **independent** if the probability of one event does not affect the probability of the second event. If events A and B are independent events, then the probability that both A and B will occur is $P(A \text{ and } B) = P(A) \cdot P(B)$.	p. 1163

Detailed Chapter Summaries are available with the online resources.

CHAPTER 12 Review Exercises

SECTION 12.1

For Exercises 1–2, simplify the expression.

1. $\frac{8!}{3! \cdot 5!}$

2. $\frac{(2n+1)!}{(2n-3)!}$

For Exercises 3–4, write the first five terms of the sequence.

3. $a_n = \frac{(n+1)!}{n!}$

4. $c_1 = 5;\ c_n = -2c_{n-1} + 1$

5. Given the sequence defined by $b_n = (-1)^{n-1} \cdot n$, which terms are positive and which are negative?

6. Given $b_n = \frac{n+4}{3n}$, find b_{45}.

7. a. Write the first five terms of the sequence defined by $a_n = 2n + 3$.

b. Evaluate $\sum_{i=1}^{5}(2i+3)$.

c. Use the formula $S_n = \frac{n}{2}(a_1 + a_n)$ to verify the fifth partial sum of the arithmetic sequence from part (a).

ISTUDY

8. Write the sum $4 - \frac{4}{3} + \frac{4}{5} - \frac{4}{7} + \cdots$ using summation notation with n as the index of summation. (Using techniques from calculus, we can show that this sum converges to π.)

For Exercises 9–11, find the sum.

9. $\sum_{i=3}^{8} 2i$ **10.** $\sum_{i=1}^{34} 10$ **11.** $\sum_{i=1}^{60} (-1)^{i+1}$

12. Write an expression for the nth term a_n for the sequence. $10, -30, 90, -270, \ldots$

For Exercises 13–14, write the sum using summation notation. Use i as the index of summation.

13. $\frac{3}{2} + \frac{4}{4} + \frac{5}{8} + \frac{6}{16} + \frac{7}{32}$

14. $x^2 + x^2y + x^2y^2 + x^2y^3$

15. Rewrite the series as an equivalent series with the new index of summation.

$$\sum_{i=1}^{10} i^3 = \sum_{j=0}^{\square} \square = \sum_{k=2}^{\square} \square$$

16. Determine if the statement is true or false.

$$\sum_{i=1}^{100} (4i - 2) = -200 + 4\sum_{i=1}^{100} i$$

17. Suppose that a single cell of bacteria divides every 20 min for 4 hr. Write a formula for the sequence $\{a_n\}$ representing the number of cells after the nth cell division.

SECTION 12.2

For Exercises 18–20, determine whether the sequence is arithmetic. If so, identify the common difference d.

18. $11, 10.2, 9.4, 8.6, 7.8, \ldots$

19. $4, \frac{21}{4}, \frac{13}{2}, \frac{31}{4}, \ldots$

20. $9, 12, 16, 21, 27, \ldots$

21. Determine the first five terms of the arithmetic sequence $\{a_n\}$ with $a_1 = 4$, and $d = 8$.

22. a. Write an expression for the nth term of the arithmetic sequence $\{a_n\}$ with $a_1 = -19$, and $d = 5$.

b. Find a_{36}.

23. Find the 23rd term of an arithmetic sequence with $a_1 = 15$ and $a_{57} = 239$.

24. Given an arithmetic sequence with $a_{15} = 86$ and $a_{37} = 240$, find the 104th term.

25. Find the number of terms of the arithmetic sequence. $11, 14, 17, 20, 23, \ldots, 122$

26. A salesperson working for a heating and air-conditioning company earns an annual base salary of \$30,000 plus \$500 on every new system sold. Suppose that $\{a_n\}$ is a sequence representing the salesperson's total yearly income based on the number of units sold n.

a. Write a formula for the nth term of a sequence that represents the salesperson's total income for n units sold. In this case, define $\{a_n\}$ with domain $n \geq 0$ to allow for the possibility of 0 units sold.

b. How much will the salesperson earn in a year for selling 42 new units?

27. Find the sum of the first 35 terms of the arithmetic sequence $-1, -9, -17, -25, \ldots$.

For Exercises 28–30, find the sum.

28. $3 + 10 + 17 + 24 + \cdots + 437$

29. $\sum_{n=1}^{36} (2 - 5n)$ **30.** $\sum_{i=1}^{68} \left(5 + \frac{1}{2}i\right)$

31. How long will it take to pay off a debt of \$3960 if \$50 is paid off the first month, \$60 is paid off the second month, \$70 is paid off the third month, and so on?

SECTION 12.3

For Exercises 32–34, determine whether the sequence is geometric. If so, find the value of r.

32. $\frac{3}{10}, \frac{3}{1000}, \frac{3}{100{,}000}, \cdots$ **33.** $3, 9, 36, 180, \ldots$

34. $5p^3, -5p^5, 5p^7, -5p^9, \ldots$

35. Write the first five terms of a geometric sequence with $a_1 = 120$, and $r = \frac{2}{3}$.

36. Write a formula for the nth term of the geometric sequence.

$$-40, 20, -10, 5, \ldots$$

For Exercises 37–39, find the indicated term of a geometric sequence from the given information.

37. $a_1 = 4$ and $a_2 = 12$. Find a_6.

38. $a_1 = -15$ and $a_4 = -\frac{5}{9}$. Find a_7.

39. $a_7 = \frac{1}{64}$ and $r = -\frac{1}{4}$. Find a_1.

40. Find a_1 and r for a geometric sequence given that $a_3 = 18$ and $a_6 = 486$.

For Exercises 41–46, find the sum of the geometric series, if possible.

41. $\sum_{n=1}^{7} 5(3)^{n-1}$ **42.** $\sum_{i=1}^{6} 12\left(-\frac{2}{3}\right)^{i-1}$

43. $\sum_{k=1}^{\infty} 5\left(\frac{5}{6}\right)^{k-1}$ **44.** $\sum_{i=1}^{\infty} \frac{2}{3}(4)^{i-1}$

45. $\sum_{n=3}^{\infty} 6\left(\frac{1}{2}\right)^{n-1}$ **46.** $36 - 12 + 4 - \frac{4}{3} + \cdots$

ISTUDY

47. Write $0.8\overline{7}$ as a fraction.

48. An estimated 150,000 people attend the Coconut Grove art festival over a 3-day period. Admission to the event is \$10 per person. In addition, suppose that each person spends an average of \$100 on art, drinks, and food.

a. How much money is initially infused into the local economy during the festival for admission, art, drinks, and food?

b. If the money is later respent in the community over and over again at a rate of 70%, determine the total amount spent. Assume that the money is respent an infinite number of times.

For Exercises 49–50, find the value of an ordinary annuity in which regular payments of P dollars are made at the end of each compounding period, n times per year, at an interest rate r for t years.

49. $P = \$150$, $n = 12$, $r = 4\%$, $t = 16$ yr

50. $P = \$300$, $n = 12$, $r = 4\%$, $t = 32$ yr

51. a. At age 28, an employee begins investing \$100 each pay period (twice per month) in an ordinary annuity. If the interest rate is 5.5%, find the value of the annuity when the employee retires at age 62.

b. Determine the value of the annuity if the employee waits to retire until age 65.

52. The initial swing (one way) of a pendulum makes an arc of 2 ft. Each swing (one way) thereafter makes an arc of 85% of the length of the previous swing. What is the total arc length that the pendulum travels?

SECTION 12.4

For Exercises 53–56, use mathematical induction to prove the given statement for all positive integers n.

53. $3 + 7 + 11 + \cdots + (4n - 1) = n(2n + 1)$

54. $-5 + 2 + 9 + \cdots + (7n - 12) = \dfrac{n}{2}(7n - 17)$

55. $1 + 4 + 16 + \cdots + 4^{n-1} = \dfrac{1}{3}(4^n - 1)$

56. $10^n - 1$ is divisible by 3.

57. Use mathematical induction to show that $4^n < (n + 2)!$ for integers $n \geq 2$.

SECTION 12.5

58. a. Write the first four rows of Pascal's triangle.

b. Expand $(a + b)^3$.

59. Evaluate the given expression. Compare the results to the result of Exercise 58.

a. $\binom{3}{0}$ **b.** $\binom{3}{1}$ **c.** $\binom{3}{2}$ **d.** $\binom{3}{3}$

For Exercises 60–64, expand the binomial by using the binomial theorem.

60. $(4y + 3)^4$ **61.** $(2x - 3)^5$ **62.** $(5c^3 - d^2)^4$

63. $(t^5 + u^3)^6$ **64.** $\left(\dfrac{x}{2} + 2y\right)^3$

For Exercises 65–67, find the indicated term of the binomial expansion.

65. $(5x + 4y)^6$; fifth term

66. $(3x^4 - 2)^8$; middle term

67. $(2c^2 - d^5)^9$; Term containing d^{25}.

68. Given $f(x) = 4x^3 + 2x$, find the difference quotient.

69. Use the binomial theorem to find the value of $(3 + 2i)^4$ where i is the imaginary unit.

SECTION 12.6

70. Gaynelle can travel one of 3 roads from home to school. From school to work there are 4 different routes. How many different routes are available for Gaynelle to travel from home to school to work?

71. A disc jockey has 7 songs that must be played in a half-hour period. In how many different ways can the 7 songs be arranged?

72. In how many ways can the letters in the word SHUFFLE be arranged?

73. In how many ways can the letters in the word SPACE be arranged and misspelled?

74. A quiz consists of 6 true/false questions and 4 multiple-choice questions. The multiple-choice questions each have 5 possible responses (a, b, c, d, e) of which only one is correct. In how many different ways can a student fill out the answers to the quiz?

75. A 3-digit code is to be made from the set of digits $\{4, 5, 6, 7, 8\}$.

a. How many codes can be formed if there are no restrictions?

b. How many codes can be formed if the corresponding 3-digit number is to be an even number?

c. How many codes can be formed if the corresponding 3-digit number is to be a multiple of 5 and there can be no repetition of digits?

76. Evaluate ${}_{21}P_4$ and interpret its meaning.

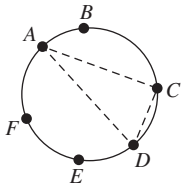
77. Evaluate ${}_{21}C_4$ and interpret its meaning.

78. Evaluate ${}_{10}P_3$ and ${}_{10}C_3$ and compare the results.

79. In how many ways can a statistician select a sample of 15 people from a population of 90 people?

ISTUDY

80. How many triangles can be made if the vertices are from three of the six points on the circle? One such triangle is shown in the figure.



81. The Daytona 500 auto race has 40 cars that initially start the race. How many first-, second-, and third-place finishes can occur?

U.S. Air Force photo by
Master Sgt Michael A. Kaplan

82. Suppose that a drama class has 22 students.

a. In how many ways can 4 students be selected to take part in a survey?

b. In how many ways can 4 students be selected to act out a scene from a play involving 4 different parts?

83. To meet the graduation requirements, a student must take 2 English classes out of 10 available, 3 math classes out of 6 available, and 2 history classes out of 7 available. Assuming that the student has met the prerequisites of each course and that there are no scheduling conflicts, determine the number of ways in which the student can select these courses.

SECTION 12.7

84. Which of the following can represent the probability of an event?

a. 0 **b.** 1 **c.** 1.2 **d.** 0.12

e. 1.2% **f.** 120% **g.** −0.12 **h.** $\frac{4}{5}$

85. If the probability of an event is 0.0042, is the event likely to occur or not likely to occur?

86. If the probability of an event is $\frac{87}{90}$, is the event likely to occur or not likely to occur?

87. If $P(E) = 0.73$, what is the probability of $P(\overline{E})$?

88. Suppose that a box containing music CDs has 4 with country music, 6 with rock music, 3 with jazz music, and 7 with rap music. If one CD is selected at random from the box, determine the probability that

a. The CD has rap music.

b. The CD has jazz music.

c. The CD does not have jazz music.

d. The CD has classical music.

89. Suppose that two fair dice are rolled. Determine the probability that

a. The sum of the numbers on the dice is 6.

b. The sum of the numbers on the dice is greater than 9.

c. The numbers on the dice form a sum that is a multiple of 5.

90. For a recent season, the batting average for a baseball player was 0.306. (This means that the probability of getting a hit on a given time at bat is 0.306.)

a. Determine the probability that the player will not get a hit on a given time at bat.

b. If the player is at bat three times in a game, what is the probability of getting a hit all three times?

c. If the player is at bat three times in a game, what is the probability of not getting a hit on any of the three times at bat?

91. Suppose that 15 lightbulbs are in a cabinet and that 4 are defective. If 3 bulbs are chosen at random,

a. What is the probability that all 3 will be defective?

b. What is the probability that all 3 will be good?

c. Why do the probabilities from parts (a) and (b) not add up to 1?

92. Suppose that a lottery game has the player select 5 distinct numbers from 1 to 30, inclusive. The player wins by choosing numbers that match those randomly selected in a drawing.

a. What is the probability that a player will win if the numbers do not have to be selected in any particular order?

b. If the player has to pick the correct 5 numbers in a specific order, what is the probability that the player will win?

93. For a recent year, the Centers for Disease Control reported that the probability that a 50-yr-old will live to age 51 is 0.9959. In a group of ten 50-yr-olds, what is the probability that all ten survive to the age of 51?

For Exercises 94–99, use the data in the table categorizing smokers and nonsmokers according to their blood pressure (BP) levels. If one person is chosen at random, find the probability of the given event.

	Normal BP	Elevated BP	Total
Smokers	42	28	70
Nonsmokers	80	10	90
Total	122	38	160

94. The person has elevated blood pressure.

95. The person is a nonsmoker.

96. The person has elevated blood pressure or is a nonsmoker.

ISTUDY

97. The person has normal blood pressure or is a smoker.

98. The person is a smoker or has elevated blood pressure.

99. The person is a nonsmoker or has normal blood pressure.

For Exercises 100–103, refer to the sample space for a card drawn from a standard deck. See page 1160.

100. If one card is drawn at random from a standard deck, what is the probability that it is an 8 or a club?

101. If one card is drawn at random from a standard deck, what is the probability that it is a red card or a 5?

102. If *two* cards are drawn at random with replacement from a standard deck, what is the probability that both are hearts?

103. If *two* cards are drawn at random with replacement from a standard deck, what is the probability that both are kings?

CHAPTER 12 Test

1. Write the first six terms of the sequence defined by $a_1 = -2$, $a_2 = 3$, $a_n = a_{n-2} + a_{n-1}$ for $n \geq 3$.

2. Simplify. $\dfrac{(3n+1)!}{(3n-1)!}$

For Exercises 3–5,

a. Determine whether the sequence is arithmetic, geometric, or neither.

b. If the sequence is arithmetic, determine d. If the sequence is geometric, determine r.

c. Write an expression a_n for the nth term of the sequence.

3. 0.139, 0.00139, 0.0000139, …

4. 0.52, 0.68, 0.84, 1.00, …

5. $\dfrac{3}{5}, \dfrac{6}{25}, \dfrac{9}{125}, \dfrac{12}{625}, \cdots$

6. Write the first four terms of the geometric sequence with $a_1 = 4$ and $r = \frac{3}{2}$.

7. Write the first five terms of the arithmetic sequence with $a_1 = 10$ and $a_{20} = 67$.

8. Find the 78th term of an arithmetic sequence with $a_1 = 64$ and $d = -11$.

9. Find the 6th term of a geometric sequence with $a_1 = -3$ and $r = 2$.

10. Find the number of terms in the arithmetic sequence.

$$-15, -19, -23, -27, \ldots, -679$$

11. Find the number of terms in the geometric sequence.

$$16, 8, 4, 2, \ldots, \frac{1}{16}$$

12. Given an arithmetic sequence with $a_{12} = -21$ and $a_{50} = -97$, find a_1 and d.

13. Given a geometric sequence with $a_3 = 20$ and $a_8 = 640$, find a_1 and r.

For Exercises 14–18, evaluate the sum if possible.

14. $\dfrac{3}{2} + \dfrac{3}{4} + \dfrac{3}{8} + \dfrac{3}{16} + \cdots$

15. $\displaystyle\sum_{k=1}^{54} (3k+7)$

16. $\displaystyle\sum_{i=1}^{6} 4\left(\frac{3}{2}\right)^{i-1}$

17. $\displaystyle\sum_{k=1}^{4} k!$

18. $\displaystyle\sum_{i=1}^{\infty} \frac{1}{2}\left(\frac{6}{5}\right)^{i-1}$

19. Suppose that a county fair has an estimated 50,000 people attend over a 2-week period. Admission to the fair is \$5.00. In addition, suppose that each person spends an average of \$10 on food, drinks, and rides.

a. How much money is initially infused into the local community for admission, food, drinks, and rides?

b. If the money is respent in the local community over and over again at a rate of 65%, determine the total amount spent. Assume that the money is respent an infinite number of times. Round to the nearest dollar.

20. An employee invests \$400 per month in an ordinary annuity. If the interest rate is 5.2%, find the value of the annuity after 25 yr.

21. Lakeisha wants to install new tile. The tile costs \$3.50/ft^2 and labor is \$4.00/ft^2. Write the nth term of a sequence representing the cost to tile an n by n square foot area where n is an integer and $n \geq 1$ ft.

22. How many days will it take Johan to read a 920-page book if Johan reads 20 pages the first day, 25 pages the second day, 30 pages the third day, and so on?

For Exercises 23–25, use mathematical induction to prove the given statement for all positive integers n.

23. $6 + 10 + 14 + \cdots + (4n+2) = n(2n+4)$

24. $1 + 5 + 25 + \cdots + 5^{n-1} = \frac{1}{4}(5^n - 1)$

25. 2 is a factor of $7^n - 5$.

ISTUDY

For Exercises 26–27, expand the binomial by using the binomial theorem.

26. $\left(\frac{x}{2}+3\right)^4$

27. $(4c^2 - t^4)^5$

For Exercises 28–29, find the indicated term of the binomial expansion.

28. $(-2t + v^2)^{10}$; eighth term

29. $(3x + y^2)^7$; Term containing y^6.

30. Evaluate ${}_{13}P_5$ and ${}_{13}C_5$.

31. Explain the difference between a permutation and a combination of n items taken r at a time.

32. A musician plans to perform 9 selections. In how many ways can the selections be arranged?

33. How many outfits can be made from 4 pairs of slacks, 5 shirts, and 3 ties, if one selection from each category is made? Assume that all items fashionably match.

34. In how many ways can the letters in the word HIPPOPOTAMUS be arranged and misspelled?

35. Suppose that a jury pool consists of 30 senior citizens and 26 non-seniors.

a. In how many ways can a jury of 12 people be selected?

b. In how many ways can a jury of 6 seniors and 6 non-seniors be selected?

c. What is the probability of randomly selecting a jury of 6 seniors and 6 non-seniors?

d. What is the probability of randomly selecting a jury of all non-seniors?

36. A review sheet for a history test has 10 essay questions. Suppose that the professor picks 3 questions from the review sheet to put on the test. In how many ways can the professor choose 3 questions from 10 questions?

37. After a service call by a plumber, the company follows up with a survey to rate the service and professionalism of the technician. The survey has 6 yes/no questions and 4 multiple-choice questions each with 3 possible responses. In how many different ways can a customer fill out the survey?

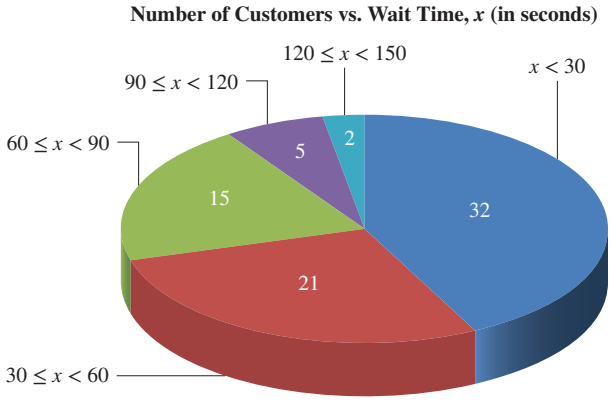
38. Suppose that 50 people buy raffle tickets.

a. In how many ways can 4 people who bought tickets be selected if each is to receive a $20 gift certificate to a restaurant?

b. In how many ways can 4 people who bought tickets be selected if the first person wins a $10 gift certificate, the second person wins a $25 gift certificate, the third person wins a $50 gift certificate, and the fourth person wins a $200 camera?

39. For a recent year, approximately 36,000 people were killed in the United States in motor vehicle accidents. If the population had 300,000,000 people at that time, estimate the probability of being killed in a motor vehicle crash.

40. A cable company advertises short wait times for customer service calls. The graph shows the wait times (in seconds) for a sample of customers. Based on the data given, if a customer is selected at random, find the probability that



a. The customer will wait less than 30 sec.

b. The customer will wait at least 30 sec.

c. The customer will wait at least 90 sec but less than 120 sec.

d. The customer will wait more than 150 sec.

41. If two fair dice are thrown, find the probability that the sum is between 6 and 8, inclusive.

42. Suppose that two cards are drawn from a standard deck with replacement. What is the probability that an ace is selected, followed by a heart?

43. For a recent year, 31.9% of Americans living below the poverty level were not covered by health insurance. (*Source*: U.S. Census Bureau, www.census.gov) If three people were selected at random from this population, what is the probability that all three would not have coverage?

For Exercises 44–47, use the data in the table categorizing the type of payment used at a grocery store according to the gender of the customer. If one person is chosen at random, find the probability of the given event.

	Cash	Credit Card	Check	Total
Male	19	24	13	56
Female	14	30	20	64
Total	33	54	33	120

44. The customer is female.

45. The customer is male or paid by check.

46. The customer paid by credit card or by cash.

47. The customer paid cash or was female.

ISTUDY

CHAPTER 12 Cumulative Review Exercises

For Exercises 1–4, consider sets A and B and determine if the statement is true or false.

$$A = \{x \mid 4 > x\}, B = \{x \mid x \le 1\}$$

1. $4 \in A$

2. $1 \in B$

3. $A \cap B = B$

4. $A \cup B = B$

5. a. Write an expression for the distance between t and 5 on the number line.

b. Simplify the expression from part (a) for $t < 5$.

6. Simplify without using a calculator.

$$\frac{(6.0 \times 10^{13})(9.0 \times 10^{8})}{2.0 \times 10^{-6}}$$

For Exercises 7–10, simplify the expression.

7. $-27^{-4/3}$

8. $(\sqrt{x} + 5\sqrt{2})(3\sqrt{x} - \sqrt{2})$

9. $\dfrac{4 - x^{-2}}{6 - 3x^{-1}}$

10. i^{127}

For Exercises 11–18, solve the equation or inequality. Write the solution set to the inequalities in interval notation.

11. $\sqrt{2x^2 - x - 14} + 4 = x$

12. $(x^2 + x)^2 - 14(x^2 + x) + 24 = 0$

13. $|3x - 5| = |2x + 1|$

14. $-5x \le 20$ and $3 - [2 - (x - 4)] < 2x + 5$

15. $0 \le |x + 7| - 6$

16. $\dfrac{2x + 1}{x + 4} \ge 1$

17. $\log_4(2x + 7) = 2 + \log_4 x$

18. $5e^{x+1} - 100 = 0$

19. Given $f(x) = 2x^3 - 5x^2 - 28x + 15$,

a. Find all the zeros of $f(x)$.

b. Identify the x-intercepts of the graph of f.

c. Determine the y-intercept of the graph of f.

d. Graph $y = f(x)$.

e. Solve the inequality $2x^3 - 5x^2 - 28x + 15 < 0$.

20. An object is launched straight upward with an initial speed of 400 ft/sec from a height of 4 ft. The height of the object t seconds after launch can be modeled by $s(t) = -16t^2 + 400t + 4$, where $s(t)$ is the height measured in feet.

a. Determine the time required for the object to reach its maximum height.

b. Determine the maximum height of the object.

c. Determine the time required for the object to hit the ground. Round to 1 decimal place.

21. Given $x^2 + y^2 - 8x - 2y + 1 = 0$,

a. Write the equation of the circle in standard form.

b. Identify the center and radius of the circle.

c. Graph the circle.

For Exercises 22–25, graph the equation.

22. $\dfrac{y^2}{9} - \dfrac{x^2}{16} = 1$

23. $\dfrac{(x + 1)^2}{4} + \dfrac{(y - 2)^2}{9} = 1$

24. $y = \log_2(x + 3)$

25. $y = \begin{cases} |x| + 1 & \text{for } x \le 1 \\ -x + 1 & \text{for } x > 1 \end{cases}$

26. Explain how the graph of $f(x) = 2\sqrt{x - 1} + 3$ is related to the graph of $y = \sqrt{x}$.

27. Given $f(x) = 4x^3 - 3x$,

a. Find the difference quotient.

b. Find the average rate of change on the interval $[1, 3]$.

c. Determine if the function is even, odd, or neither.

28. Given $g(x) = 5x - 1$,

a. Is g a one-to-one function?

b. Write an equation for $g^{-1}(x)$.

29. Given $f(x) = x^3 - x^2 - 7x + 15$,

a. Is $2 + i$ a zero of $f(x)$?

b. Is $(x + 3)$ a factor of $f(x)$?

30. Given $r(x) = \dfrac{3x^2 + 2}{x^2 - 5x - 14}$,

a. Determine the vertical asymptote(s).

b. Determine the horizontal or slant asymptote if either exists.

31. The population of a city was 320,000 in the year 2000. By 2012, the population had reached 360,800.

a. Write a model of the form $P(t) = P_0e^{kt}$ to represent the population $P(t)$ for a time t years since 2000.

b. Approximate the population in the year 2015 assuming that this trend continued. Round to the nearest 100 people.

c. Determine the amount of time for the population to reach 400,000 if this trend continues. Round to the nearest tenth of a year.

32. Write the expression in terms of $\log x$, $\log y$, and $\log z$.

$$\log\left(\frac{x^3}{y^5\sqrt{z}}\right)$$

ISTUDY

33. Simplify. $\log_2 \frac{1}{16}$

34. Approximate the value of $\log_5 417$ to 4 decimal places.

For Exercises 35–37, solve the system of equations.

35.
$$\begin{aligned} 2x - 5y &= 13 \\ -3x + 2y &= -3 \end{aligned}$$

36.
$$\begin{aligned} 4x \quad - 2z &= -4 \\ 6y + 5z &= 8 \\ 7x - 3y \quad &= 13 \end{aligned}$$

37.
$$\begin{aligned} 2x - y &= 6 \\ x^2 + y &= 9 \end{aligned}$$

38. Use Gaussian elimination or Gauss-Jordan elimination to solve the system of equations.
$$\begin{aligned} -2x - 9y + 16z &= -15 \\ x + y - z &= 4 \\ x - 2y + 5z &= 1 \end{aligned}$$

39. Use Cramer's rule to solve the system.
$$\begin{aligned} 13x - 2y &= 11 \\ 5x + 3y &= 6 \end{aligned}$$

40. Graph the solution set.
$$\begin{aligned} x^2 + y^2 &\le 16 \\ y &> -x^2 + 4 \end{aligned}$$

For Exercises 41–46, refer to the matrices given and perform the indicated operations, if possible.

$$A = \begin{bmatrix} 4 & -3 \\ 5 & 9 \end{bmatrix} \qquad B = \begin{bmatrix} -1 & 6 \\ 3 & 7 \end{bmatrix}$$

$$C = \begin{bmatrix} -1 & 4 & 0 \\ 3 & 6 & 1 \\ 2 & -5 & 7 \end{bmatrix} \qquad D = \begin{bmatrix} -5 & 1 & 0 \\ 8 & 4 & 6 \end{bmatrix}$$

41. $-5A + 2B$

42. $3C - A$

43. $|A|$

44. $|C|$

45. CD

46. AD

47. Given $A = \begin{bmatrix} 1 & 2 & -1 \\ 0 & 1 & 3 \\ 1 & 0 & 2 \end{bmatrix}$, find A^{-1}.

48. Use the inverse matrix from Exercise 47 to solve the system of equations.
$$\begin{aligned} x + 2y - z &= -5 \\ y + 3z &= 13 \\ x + 2z &= 5 \end{aligned}$$

49. Given $(y + 2)^2 = -8(x - 1)$,

a. Determine the vertex of the graph of the parabola.

b. Identify the focus.

c. Write an equation for the directrix.

50. Determine whether the sequence is arithmetic or geometric, and find the value of the common difference or the common ratio.
$$-a^2, a^5, -a^8, a^{11}, \ldots$$

51. Find the 500th term of an arithmetic sequence with $a_1 = 6.9$ and $d = 0.3$.

For Exercises 52–53, find the sum.

52. $\sum_{k=1}^{74} (5k + 3)$

53. $\sum_{i=1}^{8} 6(2)^{i-1}$

54. Find the sum if possible. $6 + 2 + \frac{2}{3} + \frac{2}{9} + \ldots$

55. Evaluate the expressions.

a. $8!$ **b.** $\binom{12}{11}$ **c.** ${}_{15}P_3$

56. Expand the binomial. $(3x - y^2)^5$

57. Simplify. $\frac{(3n - 1)!}{2!(3n + 1)!}$

58. In how many ways can 5 children be arranged in a line for a photograph?

59. Suppose that four students are to be randomly selected from a group of 8 freshmen and 5 sophomores. What is the probability of selecting 2 freshmen and 2 sophomores?

60. If one card is selected from a standard deck of cards, what is the probability that the card selected is a diamond or an ace? (*Hint*: Refer to Figure 12-12 from page 1160.)

ISTUDY

Student Answer Appendix

CHAPTER R

Section R.1 Practice Exercises, pp. 13–19

1. set
3. real; numbers
5. $|a-b|$ or $|b-a|$
7. $(a+b)+c$; $(ab)c$
9. **a.** 3 is an element of the set of natural numbers.
b. -3.1 is not an element of the set of whole numbers.
11. **a.** False **b.** False **c.** True **d.** True
13. **a.** 6 **b.** 6 **c.** $-12, 6$ **d.** $0.\overline{3}, 0.33, -0.9, -12, \frac{11}{4}, 6$
e. $\sqrt{5}, \frac{\pi}{6}$ **f.** $\sqrt{5}, 0.\overline{3}, 0.33, -0.9, -12, \frac{11}{4}, 6, \frac{\pi}{6}$
15. $a \geq 5$ **17.** $3c \leq 9$ **19.** $m+4>70$
21. True **23.** True **25.** False **27.** False
29. $(-7, \infty)$; $\{x \mid x > -7\}$ **31.** $(-\infty, 4.1]$; $\{x \mid x \leq 4.1\}$
33. $[-6, 0)$; $\{x \mid -6 \leq x < 0\}$
35.  ; $(-\infty, 6]$
37.  ; $\left(-\frac{7}{6}, \frac{1}{3}\right]$
39.  ; $(4, \infty)$
41.  ; $\{x \mid -3 < x \leq 7\}$
43.  ; $\{x \mid x \leq 6.7\}$
45.  ; $\left\{x \mid x \geq -\frac{3}{5}\right\}$
47. **a.** $\{0, 3, 4, 6, 8, 9, 12\}$ **b.** $\{0, 12\}$ **c.** $\{-2, 0, 4, 8, 12\}$
d. $\{4, 8\}$ **e.** $\{-2, 0, 3, 4, 6, 8, 9, 12\}$ **f.** $\{\ \}$
49. **a.** $\{0, 1, 2, 3, 4, 5, 8, 12\}$ **b.** $\{8\}$ **c.** $\{\ \}$ **d.** $\{3\}$
e. $\{-2, 4, 6, 7, 8\}$ **f.** $\{0, 4, 6, 7, 8, 12\}$
51. **a.** $\mathbb{R}$ **b.** $\{x \mid -1 \leq x < 9\}$ **c.** $\{x \mid x < 9\}$ **d.** $\{x \mid x < -8\}$
e. $\{x \mid x < -8 \text{ or } x \geq -1\}$ **f.** $\{\ \}$

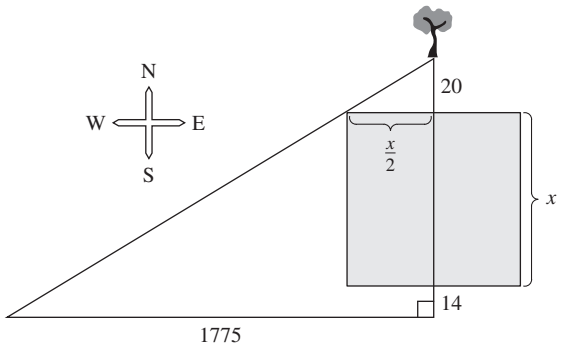
145. a.



b. Each side is 250 paces.

Problem Recognition Exercises, p. 131

1. a. Expression; $6x^2 - 13x - 5$ **b.** Equation; $\left\{\frac{5}{2}, -\frac{1}{3}\right\}$

2. a. Expression; $\dfrac{4x + 36}{(x - 3)(x + 7)}$ **b.** Equation; $\{-9\}$

3. a. Equation; $\left\{\dfrac{3 \pm 2\sqrt{2}}{2}\right\}$ **b.** Expression; $4x^2 - 12x + 1$

4. a. Equation; $\{3\}$ **b.** Expression; $15y - 38$

5. a. Equation; $\{7, 4\}$ **b.** Equation; $\left\{\dfrac{11 \pm \sqrt{233}}{2}\right\}$

6. a. Equation; $\left\{\frac{2}{3}, -10\right\}$ **b.** Equation; $\left\{-\frac{7}{4}\right\}$

7. a. Equation; $\{-7, -5\}$ **b.** Expression; $\dfrac{35 + 12x + x^2}{x}$

8. a. Equation; $\{\ \}$; The value 2 does not check.

b. Expression; $\frac{5}{3}$; for $x \neq 2$

Section 1.5 Practice Exercises, pp. 135–138

R.1. 260 ft^2 **R.2.** 56 ft^3 **R.3.** $\sqrt{55}$ m **R.4.** 121.5 km^2

1. $A = \frac{1}{2}bh$ **3.** $V = lwh$

5. a. $x(2x + 3) = 629$ **b.** The width is 17 yd and the length is 37 yd.

7. a. $\frac{1}{2}x(x - 2) = 40$ **b.** The base is 10 ft and the height is 8 ft.

9. a. $\frac{8}{5}x^2 = 640$ **b.** The length is 20 in., the width is 8 in., and the height is 4 in.

11. a. $x^2 + (x + 2)^2 = (2x - 2)^2$ **b.** The legs are 6 ft and 8 ft, and the hypotenuse is 10 ft.

13. The width is approximately 5.4 yd and the length is approximately 7.4 yd.

15. The base is approximately 17.7 ft and the height is approximately 9.7 ft.

17. a. $x(x + 2) = 120$ **b.** The integers are 10 and 12 or -10 and -12.

19. a. $x^2 + (x + 1)^2 = 113$ **b.** The integers are 7 and 8 or -7 and -8.

21. The dimensions of the cargo space are 6 ft by 7 ft by 12 ft.

23. The base is 9 ft and the height is 12 ft.

25. a. The lengths of the sides of the lower triangle are 6 ft, 8 ft, and 10 ft.
b. The total area is 44 ft^2.

27. a. The length is approximately 2.91 in. and the width is approximately 1.94 in. **b.** Using the rounded values from part (a), the screen is approximately 949 pixels by 632 pixels.

29. There were 8 players.

31. There were 600,000 organisms approximately 9 hr and 39 hr after the culture was started.

33. a. $s = -16t^2 + 16t$ **b.** It would take Michael Jordan 0.5 sec to reach his maximum height of 4 ft.

35. a. $s = -16t^2 + 75t + 4$ **b.** The ball will be at an 80-ft height 1.5 sec and 3.2 sec after being kicked.

37. The radius is approximately 25 yd.

39. The distance is $90\sqrt{2}$ ft or approximately 127.3 ft.

41. a. 235 ft **b.** 62 mph

43. a. $L = \dfrac{1 + \sqrt{5}}{2} \approx 1.62$ **b.** 14.6 ft

45. a. $y = \dfrac{160 - 4x}{6}$ or $y = \dfrac{80 - 2x}{3}$ **b.** $A = x\left(\dfrac{80 - 2x}{3}\right)$

c. Each pen can be 25 yd by 10 yd, or it can be 15 yd by $\frac{50}{3}$ yd.

47. a. $a = \dfrac{3\sqrt{10}}{\pi}, b = \dfrac{6\sqrt{10}}{\pi}$

b. The pond is approximately 12 ft long and 6 ft wide.

Section 1.6 Practice Exercises, pp. 146–150

R.1. $(x - 3)(3x + 4)(3x - 4)$ **R.2.** $a \neq -3$

R.3. There are no restricted values on the variable.

R.4. $5y(2y + 3)^2$ **R.5.** $\frac{1}{343}$ **R.6.** $\sqrt[7]{c^2}$ or $(\sqrt[7]{c})^2$

1. absolute; $\{k, -k\}$ **3.** quadratic; $m^{1/3}$ **5.** $\left\{0, \frac{1}{2}, -6\right\}$

7. $\{\pm\sqrt{7}, \pm 2i\}$ **9.** $\left\{\pm\frac{1}{5}, -\frac{4}{3}\right\}$ **11.** $\{-7, -2, 2\}$

13. $\{\pm 2i, \pm 2\}$ **15.** $\{0, -4, 2 \pm 2i\sqrt{3}\}$

17. $\left\{\pm\dfrac{2\sqrt{3}}{3}, \pm i\sqrt{5}\right\}$ **19.** $\{2, -1 \pm i\sqrt{2}\}$

21. $\{5\}$; The value –2 does not check. **23.** $\left\{\dfrac{6 \pm \sqrt{51}}{3}\right\}$

25. $\left\{\frac{5}{2}, -1\right\}$ **27.** $\{\ \}$; The value 3 does not check.

29. Jesse travels 6 km/hr in still water.

31. Jean runs 8 mph and rides 16 mph.

33. a. $\{6, -6\}$ **b.** $\{0\}$ **c.** $\{\ \}$

35. a. $\{7, -1\}$ **b.** $\{3\}$ **c.** $\{\ \}$ **37.** $\left\{\frac{5}{3}, 1\right\}$ **39.** $\{11, 3\}$

47. x-intercept: $(-2, 0)$; y-intercept: None

49. x-intercept: $(0, 0)$; y-intercept $(0, 0)$

51. x-intercept: $(-6, 0)$; y-intercept: $(0, 3)$

53. x-intercepts: $(-3, 0)$, $(3, 0)$; y-intercept: $(0, 9)$

55. x-intercepts: $(3, 0)$, $(7, 0)$; y-intercept: $(0, 3)$

57. x-intercept: $(-1, 0)$; y-intercepts: $(0, -1)$, $(0, 1)$

59. x-intercept: $(0, 0)$; y-intercept: $(0, 0)$

61. x-intercept: None; y-intercept: None

63. $d(A, C) = 2\sqrt{26}$ mi and $d(B, C) = 2\sqrt{17}$ mi

65. a. 457 pixels **b.** $(223, 184)$ **c.** $(317, 119)$

67. From the distance formula, $d(A, B) = |x|$, $d(A, C) = |x|$, and $d(B, C) = |x|$.

69. a. Length: $3\sqrt{2}$ ft; Width: $2\sqrt{2}$ ft
b. Perimeter: $10\sqrt{2}$ ft; Area: 12 ft^2

71. Center: (1, 2); Radius: $\sqrt{10}$ **73.** Area: 25 m^2

75. Collinear **77.** Not collinear

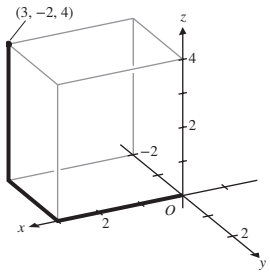
79. a. iii; x-intercept none; y-intercept $(0, 2)$ **b.** i; x-intercept $(-2, 0)$; y-intercept $(0, 2)$ **c.** ii; x-intercepts $(-2, 0)$, $(2, 0)$; y-intercept $(0, 2)$

81. The points (x_1, y_1) and (x_2, y_2) define the endpoints of the hypotenuse d of a right triangle. The lengths of the legs of the triangle are $|x_2 - x_1|$ and $|y_2 - y_1|$. Applying the Pythagorean theorem produces $d^2 = |x_2 - x_1|^2 + |y_2 - y_1|^2$, or equivalently $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ for $d \geq 0$.

83. To find the x-intercept(s), substitute 0 for y and solve for x. To find the y-intercept(s), substitute 0 for x and solve for y.

85. (3, 7); (3, −1); (−3, 1) **87.** (−3, −4) and (−5, 6)

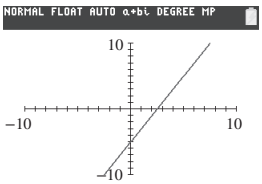
89.



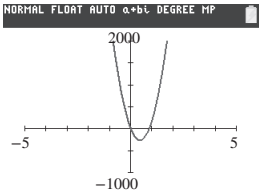
91. $\sqrt{91}$ **93.** $9\sqrt{2}$

95. The viewing window is part of the Cartesian plane shown in the display screen of a calculator. The boundaries of the window are often denoted by [Xmin, Xmax, Xscl] by [Ymin, Ymax, Yscl].

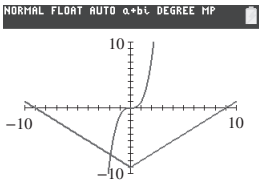
97.



99.



101.



103. a. The 7-day average is found by averaging the number of COVID-19 cases over seven consecutive days. To find the *moving* average, researchers compute the 7-day average for days 1 through 7, then for days 2 through 8, then for days 3 through 9, and so on. By grouping the data into 7-day increments and taking the average, unusually high or low values are averaged out. Plotting the 7-day averages results in a smoother curve and gives a better representation of the overall trend. **b.** The "peaks" represent high average daily values of new COVID-19 cases over a small increment of time. The "valleys" represent low average daily values. **c.** The peaks that occurred in December 2020 and January 2021 were probably the result of social gatherings during the holidays. **d.** Answers will vary.

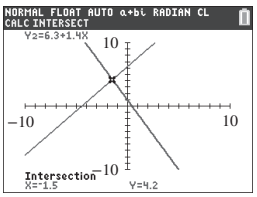
105. –3400 cases per day; The number of COVID-19 cases reported to the CDC decreased on average by 3400 cases per day during this period.

107. The line will be slanted if both A and B are nonzero. If A is zero and B is not zero, then the equation can be written in the form $y = k$ and the graph is a horizontal line. If B is zero and A is not zero, then the equation can be written in the form $x = k$, and the graph is a vertical line. **109.** The slope and y-intercept are easily determined by inspection of the equation.

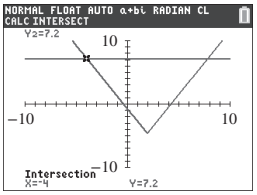
111. 4 units^2 **113.** 10 units^2

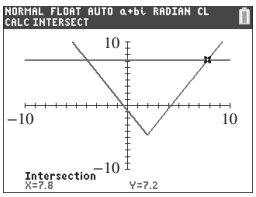
115. a. $y = -\frac{A}{B}x + \frac{C}{B}$ **b.** $m = -\frac{A}{B}$ **c.** $\left(0, \frac{C}{B}\right)$

117. a. $\{-1.5\}$ **b.** $(-\infty, -1.5)$ **c.** $(-1.5, \infty)$



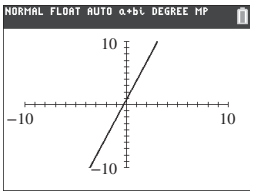
119. a. $\{-4, 7.8\}$





b. $(-\infty, -4] \cup [7.8, \infty)$ **c.** $[-4, 7.8]$

121. The lines are not exactly the same. The slopes are different.



Section 2.5 Practice Exercises, pp. 233–240

R.1. $y = -5x + 8$ **R.2.** $y = \frac{3}{5}x + 3$; Slope $= \frac{3}{5}$, y-intercept is $(0, 3)$

R.3. Undefined **R.4.** 0 **R.5.** $C = 450 + 950m + 250n$

1. $y - y_1 = m(x - x_1)$ **3.** -1 **5.** $y = -2x - 1$

7. $y = \frac{2}{3}x + \frac{2}{3}$ **9.** $y = 1.2x - 1.48$ **11.** $y = \frac{1}{9}x + \frac{4}{3}$

13. $y = -\frac{8}{5}x + 8$ **15.** $y = 3.5x - 2.95$ **17.** $y = -4$

19. $x = \frac{2}{3}$ **21.** Undefined **23. a.** $m = \frac{3}{11}$ **b.** $m = -\frac{11}{3}$

25. a. $m = -6$ **b.** $m = \frac{1}{6}$ **27. a.** $m = 1$ **b.** $m = -1$

29. Perpendicular **31.** Parallel **33.** Perpendicular

35. Neither **37.** $y = -2x + 9$; $2x + y = 9$ **39.** $y = -5x + 26$; $5x + y = 26$

41. $y = \frac{3}{7}x + \frac{38}{7}$; $3x - 7y = -38$

43. $y = 0.5x + 5.3$; $5x - 10y = -53$ **45.** $y = 6$

47. $y = -\frac{3}{4}$ **49.** $x = -61.5$

51. a. $S(x) = 0.12x + 400$ for $x \geq 0$
b. $S(8000) = 1360$ means that the sales person will make \$1360 if \$8000 in merchandise is sold for the week.

53. a. $T(x) = 0.019x + 172$ for $x > 0$
b. $T(180{,}000) = 3592$ means that the property tax is \$3592 for a home with a taxable value of \$180,000.

55. a. $C(x) = 34.5x + 2275$ **b.** $R(x) = 80x$
c. $P(x) = 45.5x - 2275$ **d.** 50 items

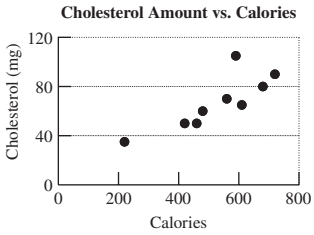
57. a. $\{730\}$ **b.** $[0, 730)$ **c.** $(730, \infty)$

59. a. $C(x) = 2.88x + 790$ **b.** $R(x) = 6x$ **c.** $P(x) = 3.12x - 790$
d. The business will make a profit if it produces and sells 254 dozen or more cookies. **e.** The business will lose \$322.

61. a. $y = -1.2x + 1250$ **b.** $m = -1.2$ mph/mb means that for an increase of 1 mb in pressure, the wind speed decreases by 1.2 mph.
c. 170 mph **d.** No. There is no guarantee that the linear trend continues outside the interval of the observed data points.

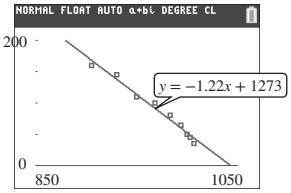
63. a. $y = 2.75x + 29.5$
b. $m = 2.75$ means that the average height of girls increased by 2.75 in. per year during this time period.
c. 59.75 in. **d.** 66.4 in.

65. a.



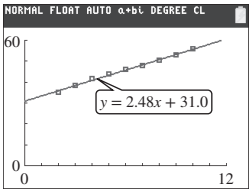
b. $c(x) = 0.125x$ **c.** $m = 0.125$ means that the amount of cholesterol increases at an average rate of 0.125 mg per calorie of hamburger. **d.** 81.25 mg **67.** Yes **69.** No

71. a. $y = -1.22x + 1273$ **b.**



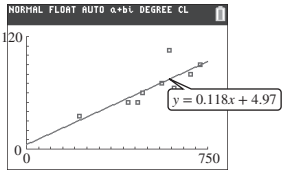
c. 175 mph
d. 5 mph

73. a. $y = 2.48x + 31.0$ **b.**



c. 58.28 in.
d. 64.8 in.
e. 1.6 in.

75. a. $y = 0.118x + 4.97$ **b.**



c. Approximately 82 mg

77. a. $y = \frac{1}{3}x + 1$ **b.** $y = \frac{3}{2}x - 6$ **c.** $y = -\frac{1}{2}x + 6$

79. $\left(\frac{8}{5}, 0\right)$ **81.** $f(x) = \frac{7}{3}x + 4$ **83.** $h(x) = x + 5$

85. If the slopes of the two lines are the same and the y-intercepts are different, then the lines are parallel. If the slope of one line is the opposite of the reciprocal of the slope of the other line, then the lines are perpendicular. **87.** Profit is equal to revenue minus cost.

89. $y = \frac{2}{3}x + \frac{2}{3}$, $-4 \leq x \leq 2$ **91. a.** $y = \frac{1}{8}x + \frac{1}{2}$, $-20 < x \leq 12$

b. $y = \frac{1}{5}x + 1$, $-25 \leq x < 15$ **93.** $y = -x + 4$

95. $y = 12x + 17$ **97.** $y = -\frac{5}{2}x + \frac{21}{2}$ for $1 \leq x \leq 5$

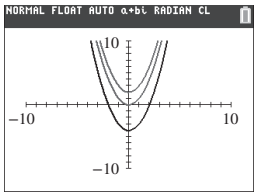
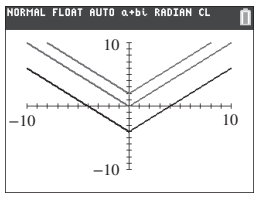
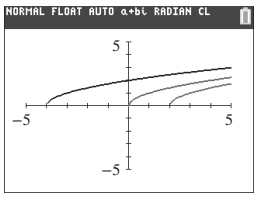
9. The graphs have the shape of $y = x^2$ with a vertical shift.



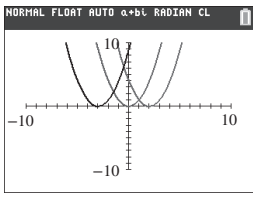
10. The graphs have the shape of $y = |x|$ with a vertical shift.



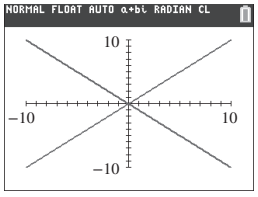
11. The graphs have the shape of $y = \sqrt{x}$ with a horizontal shift.



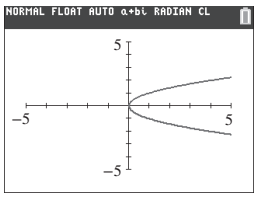
12. The graphs have the shape of $y = x^2$ with a horizontal shift.



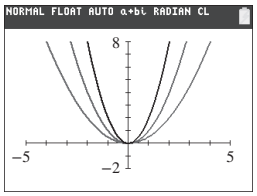
13. The graph of $g(x) = -|x|$ has the shape of the graph of $y = |x|$ but is reflected across the x-axis.



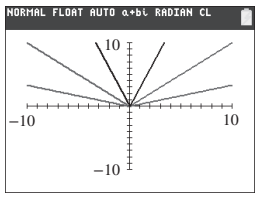
14. The graph of $g(x) = -\sqrt{x}$ has the shape of the graph of $y = \sqrt{x}$ but is reflected across the x-axis.



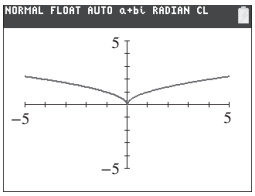
15. The graphs have the shape of $y = x^2$ but show a vertical shrink or stretch.



16. The graphs have the shape of $y = |x|$ but show a vertical shrink or stretch.



17. The graph of $g(x) = \sqrt{-x}$ has the shape of the graph of $y = \sqrt{x}$ but is reflected across the y-axis.



18. The graph of $g(x) = \sqrt[3]{-x}$ has the shape of the graph of $y = \sqrt[3]{x}$ but is reflected across the y-axis.

89. $y = (-x + 4.5)^3 + 2.1$ **91.** $y = -\frac{2}{x} - 3$

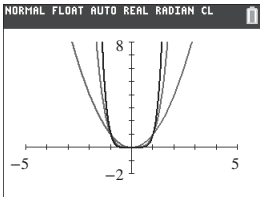
93. As written, $g(x) = |2x|$ is in the form $g(x) = f(ax)$ with $a > 1$. This indicates a horizontal shrink. However, $g(x)$ can also be written as $g(x) = |2| \cdot |x| = 2|x|$. This is written in the form $g(x) = af(x)$ with $a > 1$. This represents a vertical stretch.

95. The graph of f is the same as the graph of $y = |x|$ with a horizontal shift to the right 2 units and a vertical shift downward 3 units. By contrast, the graph of g is the graph of $y = |x|$ with a horizontal shift to the right 3 units and a vertical shift downward 2 units.

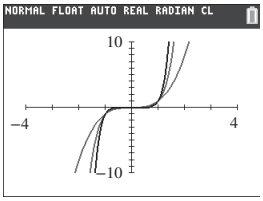
97. $f(x) = (x - 2)^2 - 3$ **99.** $f(x) = \frac{1}{x + 3}$

101. $f(x) = -x^3 + 1$ **103.** $y = 2t^2 + 1$

105. **a.**



b.



c. The general shape of $y = x^n$ is similar to the graph of $y = x^2$ for even values of n greater than 1.

d. The general shape of $y = x^n$ is similar to the graph of $y = x^3$ for odd values of n greater than 1.

115. If replacing y by $-y$ in the equation results in an equivalent equation, then the graph is symmetric to the x-axis. If replacing x by $-x$ in the equation results in an equivalent equation, then the graph is symmetric to the y-axis. If replacing both x by $-x$ and y by $-y$ results in an equivalent equation, then the graph is symmetric to the origin.

117. At $x = 1$, there are two different y values. The relation contains the ordered pairs (1, 2) and (1, 3).

119. A relative maximum of a function is the greatest function value relative to other points on the function nearby.

121. Relative minimum **123.** **a.** Concave down **b.** Decreasing

125. **a.** Concave up **b.** Decreasing

127. **a.** $(-\infty, 2), (4, \infty)$ **b.** $(2, 4)$ **c.** $(1, \infty)$ **d.** $(-\infty, 1)$

e. The function increases without bound. As such, there is no highest point on the function. The lowest point on the function occurs when $x = 1$, and the lowest value is -20.

129. **a.** Domain of f: $\left[-\frac{3\pi}{2}, 2\pi\right]$; domain of g: $(-\infty, 2\pi]$;
domain of h: $[-\pi, \infty)$

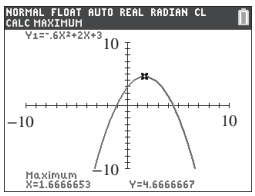
b. Functions f and h each have an absolute maximum. The absolute maximum of f is 2 $\left(\text{it occurs when } x = -\frac{3\pi}{2}\right)$. The absolute maximum of h is 1 $\left(\text{it occurs when } x = \frac{\pi}{2}\right)$.

c. Functions f and g each have an absolute minimum. The absolute minimum of f is -2 $\left(\text{it occurs when } x = -\frac{\pi}{2}\right)$. The absolute minimum of g is -2 $\left(\text{it occurs when } x = -\frac{\pi}{2}\right)$.

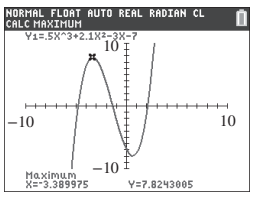
d. The graphs are composed of line segments and rays; therefore, there is no concavity either upward or downward.

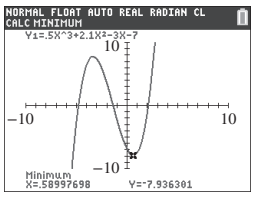
131. 
133. 
135. **a.** Relative minimum of 4.667 at $x = 1.667$

b. Increasing on $(-\infty, 1.667)$;
Decreasing on $(1.667, \infty)$



137. **a.** Relative maximum of 7.824 at $x = -3.390$;
Relative minimum of -7.936 at $x = 0.590$





b. Increasing on $(-\infty, -3.390)$, $(0.590, \infty)$
Decreasing on $(-3.390, 0.590)$

61. False. If a relation has two y-intercepts, then it would fail the vertical line test and the relation would not define y as a function of x.
63. True **65.** Discriminant is 0; one x-intercept
67. Discriminant is 57; two x-intercepts **69.** Discriminant is -96; no x-intercepts **71.** Graph g **73.** Graph h **75.** Graph f
77. Graph c **79.** For a parabola opening upward, such as the graph of $f(x) = x^2$, the minimum value is the y-coordinate of the vertex. There is no maximum value because the y values of the function become arbitrarily large for large values of $|x|$.
81. No function defined by $y = f(x)$ can have two y-intercepts because the graph would fail the vertical line test.
83. Because a parabola is symmetric with respect to the vertical line through the vertex, the x-coordinate of the vertex must be equidistant from the x-intercepts. Therefore, given $y = f(x)$, the x-coordinate of the vertex is 4 because 4 is midway between 2 and 6. The y-coordinate of the vertex is $f(4)$.
85. $f(x) = 2(x - 2)^2 - 3$ **87.** $f(x) = -\frac{1}{3}(x - 4)^2 + 6$
89. $c = 9$ **91.** $b = 4$ or $b = -4$ **93.** $\left(\frac{1}{5}, \frac{3}{5}\right)$
95. **a.** $R(x) = (12 + x)(10 - 0.5x)$ or $R(x) = -0.5x^2 + 4x + 120$; $0 \le x \le 8$
b. Selling 16 ornaments produces the maximum revenue of \$128.
97. Answers will vary.

43. $f(x) = 18x^3 + 39x^2 + 8x - 16$ **45.** $f(x) = x^6 - 14x^5 + 65x^4$

47. $f(x) = x^4 - 12x^3 + 62x^2 - 300x + 925$

49. Positive: 3 or 1; Negative: 3 or 1 **51.** Positive: 6, 4, 2, or 0; Negative: 1 **53.** Positive: 0; Negative: 4, 2, or 0

55. Positive: 0; Negative: 0 **57.** 4 real zeros; $f(x)$ has 1 positive real zero, no negative real zeros, and the number 0 is a zero of multiplicity 3.

59. a. Yes **b.** No

61. a. Yes **b.** Yes **63. a.** Yes **b.** Yes

65. True **67.** False. Only numbers less than -3 are also guaranteed to be lower bounds.

69. $\frac{7}{4}, -\frac{1}{2}$, and 4 (each with multiplicity 1)

71. $\pm\sqrt{5}, \frac{1}{2}, -2$, and -4 (each with multiplicity 1)

73. -3 (multiplicity 2) and $\frac{1}{2}$ (multiplicity 2)

75. $\frac{1}{2}, 3, 1 \pm 2i$ (each with multiplicity 1)

77. $\frac{5}{2}$ (multiplicity 2), $1 \pm i$ (each multiplicity 1)

79. 0 (multiplicity 2), -1 (multiplicity 2), and $\pm i\sqrt{10}$ (each multiplicity 1)

81. 0 (multiplicity 3) and $5 \pm 3i$ (each multiplicity 1)

83. -1 and $2 \pm 3i$ (each multiplicity 1)

85. False. For example, the graph of $f(x) = x^4 + 1$ has no x-intercepts. Thus, $x^4 + 1$ has no real zeros.

87. False. For example, the graph of $f(x) = x^{10} + 1$ has no x-intercepts.

89. True **91.** All statements are true.

93. a. $f(2) = -2$ and $f(3) = 1$. Since $f(2)$ and $f(3)$ have opposite signs, the intermediate value theorem guarantees that f has at least one real zero between 2 and 3.
b. $\frac{7 \pm \sqrt{17}}{4}$; Furthermore, $\frac{7 + \sqrt{17}}{4} \approx 2.78$ is on the interval $[2, 3]$.

95. $f(x) = \frac{1}{5}(x-1)(x+3)(x+5)$ **97.** $f(x) = \frac{1}{20}(x-3)^2(x+4)^2$

99. If a polynomial has real coefficients, then all nonreal zeros must come in conjugate pairs. This means that if the polynomial has nonreal zeros, there would be an even number of them. A third-degree polynomial has 3 zeros (including multiplicities). Therefore, it would have either 2 or 0 nonreal zeros, leaving room for either 1 or 3 real zeros.

101. $f(x)$ has no variation in sign, nor does $f(-x)$. By Descartes' rule of signs, there are no positive or negative real zeros. Furthermore, 0 itself is not a zero of $f(x)$ because x is not a factor of $f(x)$. Therefore, there are no real zeros of $f(x)$.

103. a. $f(x) = (x-3)(x+3)(x-3i)$ **b.** $x = 3, x = -3$, and $x = 3i$
c. $g(x) = (x-3)(x-3i)(x+3i)$ **d.** $x = 3, x = 3i$, and $x = -3i$
e. The conjugate zeros theorem applies only for polynomials with *real* coefficients

105. $n - 2$ possible nonreal zeros **107.** The triangular front has a base of 6 ft and a height of 4 ft. The length is 9 ft.

109. Each dimension was decreased by 1 in.

111. The dimensions are either 2 cm by 3 cm or $-1 + \sqrt{13}$ cm by $\frac{1 + \sqrt{13}}{2}$ cm.

113. a. $(x+3)(x-1)(x^2+4)$ **b.** $(x+3)(x-1)(x+2i)(x-2i)$

115. a. $(x - \sqrt{5})(x + \sqrt{5})(x^2 + 7)$
b. $(x - \sqrt{5})(x + \sqrt{5})(x + \sqrt{7}i)(x - \sqrt{7}i)$

117. The fourth roots of 1 are 1, -1, i, and $-i$.

119. The number $\sqrt{5}$ is a real solution to the equation $x^2 - 5 = 0$ and a zero of the polynomial $f(x) = x^2 - 5$. However, by the rational zeros theorem, the only possible rational zeros of $f(x)$ are ±1 and ±5. This means that $\sqrt{5}$ is irrational. **121.** -2

77. $(-2, \infty)$ **79.** $(-3, -1) \cup (0, \infty)$ **81.** $(-\infty, 1) \cup (4, 7]$

83. $\left\{-\frac{1}{2}\right\} \cup [2, 4) \cup (4, \infty)$

85. a. $s(t) = -16t^2 + 216t$ **b.** The shell will explode 6.75 sec after launch. **c.** The spectators can see the shell between 1 sec and 6.75 sec after launch.

87. The car will stop within 250 ft if the car is traveling less than 50 mph.

89. a. The horizontal asymptote is $y = 0$ and means that the temperature will approach 0°C as time increases without bound.
b. More than 6 hr is required for the temperature to fall below 5°C.

91. The smoker would need another cigarette 51 min after the previous cigarette.

93. The width should be between $2\sqrt{15}$ ft and $4\sqrt{5}$ ft. This is between approximately 7.7 ft and 8.9 ft.

95. a. $(-\infty, -1] \cup [6, \infty)$ **b.** $(-\infty, -1] \cup (6, \infty)$ **c.** $(-1, 6]$

97. a. $(-\infty, 1]$ **b.** $(-\infty, -2] \cup [1, 2]$ **c.** $[-2, 1) \cup [2, \infty)$

99. $[-3, 3]$ **101.** $(-\infty, -\sqrt{5}] \cup [\sqrt{5}, \infty)$

103. $(-\infty, -6] \cup \left[\frac{3}{2}, \infty\right)$ **105.** $(-\infty, -6) \cup \left(\frac{3}{2}, \infty\right)$

107. $(-\infty, -2) \cup [0, \infty)$

109. a.

Sign of $(x-a)^2$:	+	+	+	+
Sign of $(b-x)$:	+	+	−	−
Sign of $(x-c)^3$:	−	−	−	+
Sign of $(x-a)^2(b-x)(x-c)^3$:	−	−	+	−
		a	b	c

b. (b, c) **c.** $(-\infty, a) \cup (a, b) \cup (c, \infty)$

111. The solution set to the inequality $f(x) < 0$ corresponds to the values of x for which the graph of $y = f(x)$ is below the x-axis.

113. Both the numerator and denominator of the rational expression are positive for all real numbers x. Therefore, the expression cannot be negative for any real number.

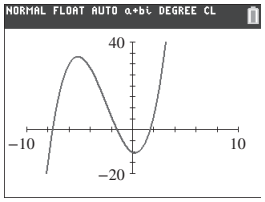
115. $[-\sqrt{2}, \sqrt{2}]$ **117.** [3, 5) **119.** $(-\infty, -32]$

121. [2, 18) **123.** $[0, 2) \cup (4, 6]$ **125.** $(-3, 3)$

127. $(-\infty, -2\sqrt{5}) \cup (-4, 4) \cup (2\sqrt{5}, \infty)$

129. a. $0.552x^3 + 4.13x^2 - 1.84x - 10.2 < 0$

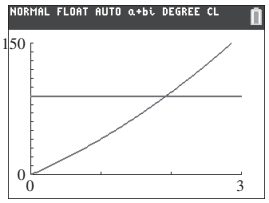
b.



c. The real zeros are approximately -7.6, -1.5, and 1.6.

d. $(-\infty, -7.6) \cup (-1.5, 1.6)$

131. a.



b. (1.9, 90)

c. The radius should be no more than 1.9 in. to keep the amount of aluminum to at most 90 in.^{2}.

Problem Recognition Exercises, p. 408

1. $(-28, -18]$ **2.** $\left\{\frac{3 \pm \sqrt{19}}{2}\right\}$ **3.** $\left\{\pm\frac{1}{5}, \frac{1}{2}\right\}$

4. $(-\infty, -2) \cup [0, \infty)$ **5.** $\{77\}$ **6.** $(-5, -1]$

7. $\left\{-\frac{1}{5}, \frac{9}{5}\right\}$ **8.** $\left\{\frac{133}{66}\right\}$ **9.** $\left\{\frac{10}{7}\right\}$

10. {5}; The value −2 does not check. **11.** [4, 10] **12.** (4, 10)

R.1. $(-\infty, -1) \cup (-1, \infty)$ **R.2.** $(-\infty, \infty)$ **R.3.** $\left(-\infty, \frac{1}{4}\right]$

R.4. $(n \circ p)(x) = x^2 - 3x + 1$ **R.5.** $(p \circ n)(x) = x^2 - x - 2$

R.6. $(p \circ p)(x) = x^4 - 6x^3 + 6x^2 + 9x$

1. $\{(2, 1), (3, 2), (4, 3)\}$ **3.** one; to; one **5.** x; x

7. Yes **9.** No **11.** No **13.** No **15.** Yes **17.** No

19. No **21.** No

23. Yes; If $f(a) = f(b)$, then $4a - 7 = 4b - 7$, which implies that $a = b$.

25. Yes; If $g(a) = g(b)$, then $a^3 + 8 = b^3 + 8$, which implies that $a = b$.

27. No; For example the points $(1, -3)$ and $(-1, -3)$ have the same y values but different x values. That is, $m(a) = m(b) = -3$, but $a \neq b$.

29. No; For example, the points $(2, 3)$ and $(-4, 3)$ have the same y values but different x values. That is, $p(a) = p(b) = 3$, but $a \neq b$.

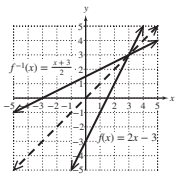
31. Yes **33.** No **35.** Yes

37. a. Yes **b.** The value $g(x)$ represents the number of years since the year 2010 based on the number of applicants to the freshman class, x.

39. a. If $f(a) = f(b)$, then $2a - 3 = 2b - 3$, which implies that $a = b$. The function is one-to-one.

b. $f^{-1}(x) = \dfrac{x + 3}{2}$

c.

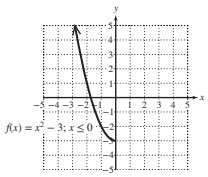


41. $f^{-1}(x) = 4 - 9x$ **43.** $h^{-1}(x) = x^3 + 5$

45. $m^{-1}(x) = \sqrt[3]{\dfrac{x - 2}{4}}$ **47.** $c^{-1}(x) = \dfrac{5 - 2x}{x}$

49. $t^{-1}(x) = -\dfrac{2x + 4}{x - 1}$ **51.** $f^{-1}(x) = \sqrt[3]{b(x + c)} + a$

53. a.

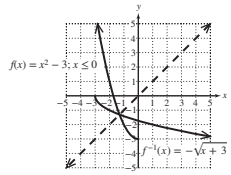


b. Yes **c.** $(-\infty, 0]$

d. $[-3, \infty)$

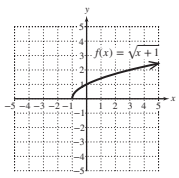
e. $f^{-1}(x) = -\sqrt{x + 3}$

f.



g. $[-3, \infty)$ **h.** $(-\infty, 0]$

55. a.



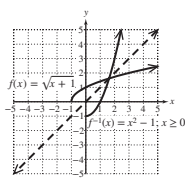
b. Yes **c.** $[-1, \infty)$

d. $[0, \infty)$

e. $f^{-1}(x) = x^2 - 1; x \geq 0$

f. The range of f is $[0, \infty)$. Therefore, the domain of f^{-1} must be $[0, \infty)$.

g.



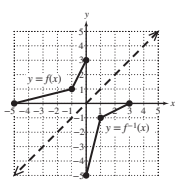
h. $[0, \infty)$ **i.** $[-1, \infty)$

57. Domain: $[0, 4)$; Range: $[0, \infty)$ **59.** $f^{-1}(x) = 3 - x; x \geq 3$

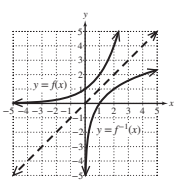
61. subtracts; $x - 6$ **63.** $f^{-1}(x) = \dfrac{x + 4}{7}$ **65.** $f^{-1}(x) = \sqrt[3]{x - 20}$

67. $f^{-1}(x) = \dfrac{x - 1}{8}$ **69.** $q^{-1}(x) = (x - 1)^5 + 4$

71.



73.



75. a. 12 **b.** 0.5 **c.** 10 **77.** True

79. False. The range of a one-to-one function is the same as the domain of its inverse.

81. a. 50 mph **b.** $w^{-1}(x) = \dfrac{x - 1220}{-1.17}$; The inverse gives the barometric pressure $w^{-1}(x)$ for a given wind speed x. **c.** 957 mb

83. a. $T(x) = 6.33x$ **b.** $T^{-1}(x) = \dfrac{x}{6.33}$ **c.** $T^{-1}(x)$ represents the mass of a mammal based on the amount of air inhaled per breath, x. **d.** $T^{-1}(170) = 27$ means that a mammal that inhales 170 mL of air per breath during normal respiration is approximately 27 kg (this is approximately 60 lb—the size of a Labrador retriever).

85. a. $T(x) = 24x + 108$ **b.** $T^{-1}(x) = \dfrac{x - 108}{24}$

c. $T^{-1}(x)$ represents the taxable value of a home (in \$1000) based on x dollars of property tax paid on the home. **d.** $T^{-1}(2988) = 120$ means that if a homeowner is charged \$2998 in property taxes, then the taxable value of the home is \$120,000.

87. The domain and range of a function and its inverse are reversed.

89. If a horizontal line intersects the graph of a function in more than one point, then the function has at least two ordered pairs with the same y-coordinate but different x-coordinates. This conflicts with the definition of a one-to-one function.

91. a. $f(8) = 3$ **b.** $f(32) = 5$ **c.** $f(2) = 1$ **d.** $f\left(\frac{1}{8}\right) = -3$

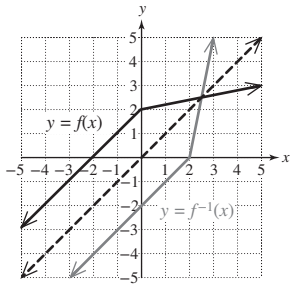
93. Let f be an increasing function. Then for every value a and b in the domain of f such that $a < b$ we have $f(a) < f(b)$. Now if $u \neq v$, then either $u < v$ or $v < u$. Then either $f(u) < f(v)$ or $f(v) < f(u)$. In either case, $f(u) \neq f(v)$, and f is one-to-one.

95. $(f \circ g)^{-1} = g^{-1} \circ f^{-1} = x + 6$

97. a. $y = x + 2; -3 \leq y < 2$ and $y = \sqrt{x + 4}; 2 \leq y \leq 3$

b. $f^{-1}(x) = \begin{cases} x - 2 & -3 \leq x < 2 \\ x^2 - 4 & 2 \leq x \leq 3 \end{cases}$

c.



Section 4.2 Practice Exercises, pp. 449–454

R.1. Domain $(-\infty, 3)$, Range $(-\infty, 0]$

R.2. a. -2 **b.** $-\infty$

c. -2 **d.** ∞

105. Let the real number t correspond to the point $P(x, y)$ on the unit circle. Then $t + \pi$ corresponds to the point $P(-x, -y)$ on the unit circle. By definition, $\tan t = \frac{y}{x}$ and $\tan(t + \pi) = \frac{-y}{-x} = \frac{y}{x}$. So we have shown that $\tan(t + \pi) = \tan t$.

107. Let the real number t correspond to the point $P(x, y)$ on the unit circle. Since the circumference of the unit circle is 2π, adding 2π to t results in the same terminal point (x, y). Consequently, $\sin(t + 2\pi) = \sin t$ for all t.

To show that 2π is the *smallest* positive value p for which $\sin(t + p) = \sin t$, we will do a proof by contradiction. Assume the contrary; that is, assume that there exists a value p on the interval $0 < p < 2\pi$ such that $\sin(t + p) = \sin t$. Substituting $t = 0$ results in $\sin(0 + p) = \sin 0$, or equivalently $\sin p = 0$. The only solution on the interval $0 < p < 2\pi$ is $p = \pi$. Now substitute $t = \frac{\pi}{2}$ into the equation $\sin(t + p) = \sin t$. We have $\sin(\frac{\pi}{2} + \pi) = \sin\frac{\pi}{2}$. This is a contradiction because $\sin\frac{3\pi}{2} = -1$ but $\sin\frac{\pi}{2} = 1$. Therefore, our original assumption that there exists a value p on the interval $0 < p < 2\pi$ such that $\sin(t + p) = \sin t$ is incorrect. The smallest possible value of p is 2π.

109. $\sin t = -\frac{a}{\sqrt{a^2 + 1}}, \cos t = -\frac{1}{\sqrt{a^2 + 1}}$

111. $\sin t = \pm\frac{\tan t}{\sqrt{1 + \tan^2 t}}, \cos t = \pm\frac{1}{\sqrt{1 + \tan^2 t}}$

83. $y = 2\cos\left(\frac{\pi}{8}x + \frac{\pi}{2}\right) + 5$ or $y = -2\cos\left(\frac{\pi}{8}x + \frac{\pi}{2}\right) + 5$

85. a. Vertical shift; $y = \cos x + 2$

b. Change in amplitude; $y = 2\cos x$

c. Change in period; $y = \cos 2x$

d. Phase shift; $y = \cos\left(x + \frac{\pi}{4}\right)$

87. $y = \frac{\pi}{2}\sin\left(\frac{\pi}{3}x\right)$

89. a. $y = 2\cos\left(x - \frac{\pi}{4}\right) + 3$ **b.** $y = 2\sin\left(x + \frac{\pi}{4}\right) + 3$

91. a. The graph of $y = \sin x$ is compressed horizontally by a factor of 2.

b. The graph of $y = \sin x$ is vertically stretched by a factor of 2.

93. a. The graph of $y = \sin x$ is shifted 2 units to the left.

b. The graph of $y = \sin x$ is shifted vertically upward 2 units.

95. No. If f were one-to-one, then $f(a) = f(b)$ would imply that $a = b$.

However, as a counterexample, $f\left(\frac{\pi}{4}\right) = f\left(\frac{3\pi}{4}\right) = \frac{\sqrt{2}}{2}$ but $\frac{\pi}{4} \neq \frac{3\pi}{4}$.

97. Yes. $(f + g)(x) = f(x) + g(x) = f(x + P) + g(x + P) = (f + g)(x + P)$ for all x in the domain of f and g.

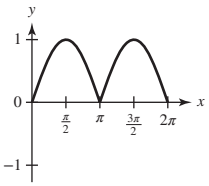
99. a. $\frac{3}{\pi} \approx 0.9549$ **b.** $\frac{3(\sqrt{3} - 1)}{\pi} \approx 0.6991$

c. $\frac{3(2 - \sqrt{3})}{\pi} \approx 0.2559$

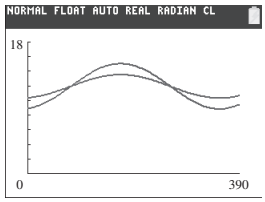
The average rate of change is positive and decreasing for the intervals given here. Likewise, the slopes of the lines are positive and decreasing.

101. One solution **103.** No solution

105.



107. a. The functions have different amplitudes.



b. The constant term of 12 is the vertical shift of the parent sine function. It represents the "equilibrium" value for duration of sunlight from which the amplitude is measured.

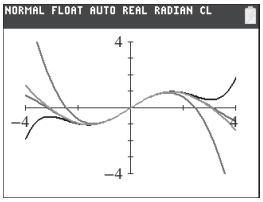
c. The factors 3.1 and 1.6 represent the amplitude of the functions a and m, respectively. The amplitude represents the greatest amount of deviation above and below the line $y = 12$.

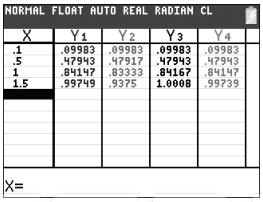
d. The period of each function is 365 days.

e. The horizontal shift represents the number of days from January 1 to the point where the duration of light and darkness is the same (12 hr each). This is the approximate number of days to the March equinox (first day of spring). **f.** (80, 12) and (262.5, 12)

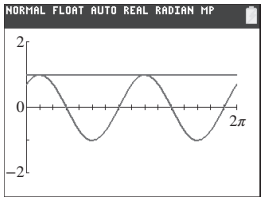
g. The points of intersection represent the points where the duration of light and darkness is the same. They represent the March and September equinoxes where the durations of light and darkness are each 12 hr.

109. Each polynomial function gives a better approximation for values of x close to zero than for values farther from zero. Furthermore, the greater the degree of the polynomial, the better the approximation of $\sin x$ for each value of x.

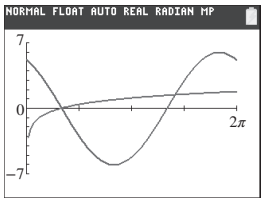




111. $x = \frac{\pi}{8}, x = \frac{9\pi}{8}$



113. $x \approx 1.04, x \approx 4.44$



115. $y = \cos x, y = -\cos x$

69. Solve the inequality $-\frac{\pi}{2} < Bx - C < \frac{\pi}{2}$. The endpoints of the resulting interval give the location of two consecutive vertical asymptotes: $x = \frac{1}{B}\left(C - \frac{\pi}{2}\right)$ and $x = \frac{1}{B}\left(C + \frac{\pi}{2}\right)$.

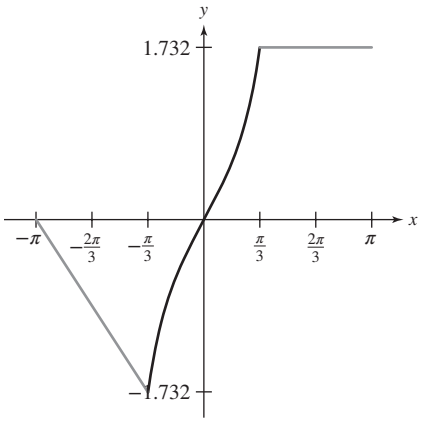
71. First graph the related reciprocal function, $y = A\cos(Bx - C)$, without the vertical shift. Then graph $y = A\sec(Bx - C)$ by first graphing the vertical asymptotes. The vertical asymptotes occur where $y = A\cos(Bx - C) = 0$.

Then plot the relative maximum and minimum points for $y = A\sec(Bx - C)$. These correspond to the relative minimum and maximum points of $y = A\cos(Bx - C)$. Sketch the general shape of the "parent" function $y = \sec x$ between the asymptotes.

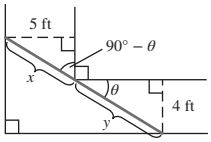
Then shift the graph of $y = A\sec(Bx - C)$ vertically D units.

73. $\left\{\frac{\pi}{4}, \frac{5\pi}{4}\right\}$ **75.** $\left\{\frac{\pi}{2}\right\}$

77.



79. Let x and y represent the hypotenuse of the upper and lower right triangles, respectively.



$\sin(90° - \theta) = \dfrac{5}{x} = \cos\theta$ and $\sin\theta = \dfrac{4}{y}$.

Therefore, $x = \dfrac{5}{\cos\theta} = 5\sec\theta$ and $y = \dfrac{4}{\sin\theta} = 4\csc\theta$.

$L = x + y = 5\sec\theta + 4\csc\theta$

81. The function values are close for x taken near 0.

83. a. $(r \circ t)(x) = -\csc^2 x$

b.

79. The short cable makes an angle of 60° with the ground, and the long cable makes an angle of 25.7° with the ground. **81.** 7.8° **83.** 34°

85. Let $\theta = \sec^{-1} x$ for $x \geq 1$. Then, $\sec\theta = x$

$\dfrac{1}{\cos\theta} = x$

$\cos\theta = \dfrac{1}{x}$

$\theta = \cos^{-1}\dfrac{1}{x}$

Hence, $\sec^{-1} x = \cos^{-1}\dfrac{1}{x}$.

87. Let $\alpha = \sec^{-1} x$ for $x \geq 1$, which implies that $\sec\alpha = x$ and

$\csc\left(\dfrac{\pi}{2} - \alpha\right) = x$

$\dfrac{\pi}{2} - \alpha = \csc^{-1} x$

Substituting $\alpha = \sec^{-1} x$ yields

$\dfrac{\pi}{2} - \sec^{-1} x = \csc^{-1} x$

$\dfrac{\pi}{2} = \sec^{-1} x + \csc^{-1} x$

CHAPTER 6

Section 6.1 Skill Practice

Answer 5

$$\frac{1}{1-\sin x} - \frac{1}{1+\sin x} = \frac{(1+\sin x)}{(1+\sin x)} \cdot \frac{1}{1-\sin x} - \frac{1}{1+\sin x} \cdot \frac{(1-\sin x)}{(1-\sin x)}$$
$$= \frac{1+\sin x - 1 + \sin x}{(1+\sin x)(1-\sin x)} = \frac{2\sin x}{1-\sin^2 x} = \frac{2\sin x}{\cos^2 x}$$
$$= 2 \cdot \frac{\sin x}{\cos x} \cdot \frac{1}{\cos x} = 2\tan x \sec x$$

Answer 6

$$1 - \frac{\sin^2 t}{1+\cos t} = 1 - \frac{\sin^2 t}{(1+\cos t)} \cdot \frac{(1-\cos t)}{(1-\cos t)} = 1 - \frac{\sin^2 t(1-\cos t)}{1-\cos^2 t}$$
$$= 1 - \frac{\sin^2 t(1-\cos t)}{\sin^2 t} = 1 - (1-\cos t) = \cos t$$

Answer 7

$$\ln|\cot x| + \ln|\sin x| = \ln\left|\frac{\cos x}{\sin x}\right| + \ln|\sin x|$$
$$= \ln\left(\left|\frac{\cos x}{\sin x}\right| \cdot |\sin x|\right) = \ln|\cos x|$$

77. $\dfrac{\sec x\sin x}{\csc x\cos x}=\dfrac{\frac{1}{\cos x}\cdot\sin x}{\frac{1}{\sin x}\cdot\cos x}=\dfrac{\frac{\sin x}{\cos x}}{\frac{\cos x}{\sin x}}=\dfrac{\sin x}{\cos x}\cdot\dfrac{\sin x}{\cos x}=\dfrac{\sin^2 x}{\cos^2 x}=\tan^2 x$

79. $\dfrac{2+\sin^2 t-3\sin^4 t}{\cos^2 t}=\dfrac{(1-\sin^2 t)(2+3\sin^2 t)}{\cos^2 t}$

$=\dfrac{\cos^2 t(2+3\sin^2 t)}{\cos^2 t}=2+3\sin^2 t$

81. $\dfrac{\tan x\sin x}{\tan x-\sin x}=\dfrac{\left(\frac{\sin x}{\cos x}\cdot\sin x\right)}{\left(\frac{\sin x}{\cos x}-\sin x\right)}\cdot\dfrac{\cos x}{\cos x}=\dfrac{\sin^2 x}{\sin x-\sin x\cos x}$

$=\dfrac{\sin^2 x}{\sin x(1-\cos x)}=\dfrac{\sin x}{1-\cos x}$

83. $(\sec\theta+\tan\theta)^2=\sec^2\theta+2\sec\theta\tan\theta+\tan^2\theta$

$=\dfrac{1}{\cos^2\theta}+2\cdot\dfrac{1}{\cos\theta}\cdot\dfrac{\sin\theta}{\cos\theta}+\dfrac{\sin^2\theta}{\cos^2\theta}=\dfrac{1+2\sin\theta+\sin^2\theta}{\cos^2\theta}$

$=\dfrac{(1+\sin\theta)^2}{1-\sin^2\theta}=\dfrac{(1+\sin\theta)^2}{(1+\sin\theta)(1-\sin\theta)}=\dfrac{1+\sin\theta}{1-\sin\theta}$

85. $(1+\sin x)[1+\sin(-x)]=(1+\sin x)(1-\sin x)$

$=1-\sin^2 x=\cos^2 x$

87. $\dfrac{\sin x}{\cos x+1}=\dfrac{\sin x}{\cos x+1}\cdot\dfrac{\cos x-1}{\cos x-1}=\dfrac{\sin x(\cos x-1)}{\cos^2 x-1}$

$=\dfrac{\sin x(\cos x-1)}{-\sin^2 x}=\dfrac{\cos x-1}{-\sin x}=\dfrac{1-\cos x}{\sin x}$

89. $\dfrac{1+\sin\theta}{\tan\theta}=\dfrac{\frac{1}{\sin\theta}\cdot(1+\sin\theta)}{\frac{1}{\sin\theta}\cdot\left(\frac{\sin\theta}{\cos\theta}\right)}=\dfrac{\frac{1}{\sin\theta}+1}{\frac{1}{\cos\theta}}=\dfrac{\csc\theta+1}{\sec\theta}$

91. $\dfrac{\sin^3 t-\cos^3 t}{\cos t\sin t-\cos^2 t}=\dfrac{(\sin t-\cos t)(\sin^2 t+\sin t\cos t+\cos^2 t)}{\cos t(\sin t-\cos t)}$

$=\dfrac{1+\sin t\cos t}{\cos t}=\dfrac{1}{\cos t}+\dfrac{\sin t\cos t}{\cos t}=\sec t+\sin t$

93. $\dfrac{\tan^4\theta-4}{\sec^2\theta+1}=\dfrac{(\tan^2\theta+2)(\tan^2\theta-2)}{\sec^2\theta+1}=\dfrac{(\sec^2\theta-1+2)(\sec^2\theta-1-2)}{\sec^2\theta+1}$

$=\dfrac{(\sec^2\theta+1)(\sec^2\theta-3)}{\sec^2\theta+1}=\sec^2\theta-3$

95. $\dfrac{\cot^3 z-1}{\cot z-1}-\cot z=\dfrac{(\cot z-1)(\cot^2 z+\cot z+1)}{\cot z-1}-\cot z$

$=\cot^2 z+\cot z+1-\cot z=\cot^2 z+1=\csc^2 z$

97. $\cos x\tan x-\sec x\cot x=\cos x\cdot\dfrac{\sin x}{\cos x}-\dfrac{1}{\cos x}\cdot\dfrac{\cos x}{\sin x}$

$=\sin x-\dfrac{1}{\sin x}=\dfrac{\sin^2 x-1}{\sin x}=-\dfrac{\cos^2 x}{\sin x}=-\dfrac{\cos x}{\sin x}\cdot\cos x$

$=-\cot x\cos x$

99. $\log|\cos x|-\log|\sin x|+\log|\sec x|=\log\left|\dfrac{\cos x\sec x}{\sin x}\right|$

$=\log\left|\dfrac{1}{\sin x}\right|=\log|\csc x|$

101. $e^{\ln(\sin^2 x+\cos^2 x)}=\sin^2 x+\cos^2 x=1$

103. $\dfrac{1}{\sin x+\cos x}+\dfrac{1}{\sin x-\cos x}=\dfrac{\sin x-\cos x+\sin x+\cos x}{\sin^2 x-\cos^2 x}$

$=\dfrac{2\sin x}{1-\cos^2 x-\cos^2 x}=\dfrac{2\sin x}{1-2\cos^2 x}$

105. $(f\circ g)(x)=\sqrt{1-\cos^2 x}=\sqrt{\sin^2 x}=|\sin x|$

107. The logic is incorrect because it shows that $\sin x\sec x=1$ only for one value of x. For this statement to be true, it must be true for *all* values of x for which $\sin x$ and $\sec x$ are defined. The counterexample $\sin\frac{\pi}{6}\sec\frac{\pi}{6}=\frac{1}{2}\cdot\frac{2\sqrt{3}}{3}=\frac{\sqrt{3}}{3}\neq 1$ shows that $\sin x\sec x=1$ is not true in general.

109. One method is to use the tools of algebra and the fundamental trigonometric identities to manipulate one side of the equation until we get the expression on the other side of the equation.

Alternatively, we can manipulate each side separately until we reach a common, equivalent expression.

15. LHS: $\frac{1}{2}(\cos[(x+y)-(x-y)]-\cos[(x+y)+(x-y)])$

$=\frac{1}{2}(\cos 2y-\cos 2x)=\frac{1}{2}[1-2\sin^2y-(1-2\sin^2x)]$

$=\frac{1}{2}(-2\sin^2y+2\sin^2x)=\sin^2x-\sin^2y$

17. LHS $=2\cdot\frac{1}{2}\left(\sin\left[\left(\frac{\pi}{4}+\frac{x-y}{2}\right)+\left(\frac{\pi}{4}-\frac{x+y}{2}\right)\right]\right.$

$\left.+\sin\left[\left(\frac{\pi}{4}+\frac{x-y}{2}\right)-\left(\frac{\pi}{4}-\frac{x+y}{2}\right)\right]\right)$

$=\sin\left(\frac{\pi}{4}+\frac{\pi}{4}+\frac{x-y}{2}-\frac{x+y}{2}\right)$

$+\sin\left(\frac{\pi}{4}-\frac{\pi}{4}+\frac{x-y}{2}+\frac{x+y}{2}\right)$

$=\sin\left(\frac{\pi}{2}-y\right)+\sin x=\cos y+\sin x$

19. $-2\cos 8x\sin x$ **21.** $2\cos\frac{11\beta}{2}\cos\frac{\beta}{2}$ **23.** $\frac{\sqrt{6}}{2}$ **25.** $-\frac{\sqrt{2}}{2}$

27. $\frac{\cos 3x-\cos x}{\cos 3x+\cos x}=\frac{-2\sin 2x\sin x}{2\cos 2x\cos x}=-\tan 2x\tan x$

29. $\sin 2x+\sin 4x+\sin 6x$

$=2\sin 3x\cos(-x)+\sin[2(3x)]$

$=2\sin 3x\cos x+2\sin 3x\cos 3x$

$=2\sin 3x(\cos x+\cos 3x)$

$=2\sin 3x[2\cos 2x\cos(-x)]$

$=4\cos x\cos 2x\sin 3x$

31. $\sin 5x-\sin 3x+2\sin x\cos 2x$

$=2\cos 4x\sin x+2\sin x\cos 2x$

$=2\sin x(\cos 4x+\cos 2x)$

$=2\sin x[2\cos 3x\cos x]$

$=2\sin x\cos x\cdot 2\cos 3x$

$=\sin 2x\cdot 2\cos 3x$

$=2\sin 2x\cos 3x$

33. $\frac{\cos 3x-\cos 2x+\cos x}{\sin 3x-\sin 2x+\sin x}$

$=\frac{\cos 3x+\cos x-\cos 2x}{\sin 3x+\sin x-\sin 2x}=\frac{2\cos 2x\cos x-\cos 2x}{2\sin 2x\cos x-\sin 2x}$

$=\frac{\cos 2x(2\cos x-1)}{\sin 2x(2\cos x-1)}=\cot 2x$

35. $2\cos\left(\frac{2x+h}{2}\right)\sin\frac{h}{2}$

ISTUDY

37. $\frac{1}{2}[\cos(u-v)+\cos(u+v)]$

$=\frac{1}{2}(\cos u\cos v+\sin u\sin v+\cos u\cos v-\sin u\sin v)$

$=\frac{1}{2}(2\cos u\cos v)=\cos u\cos v$

39. In the product-to-sum formula

$\cos u\cos v=\frac{1}{2}[\cos(u-v)+\cos(u+v)]$,

let $u=\frac{x+y}{2}$ and $v=\frac{x-y}{2}$.

Then, $\cos\frac{x+y}{2}\cos\frac{x-y}{2}$

$=\frac{1}{2}\left[\cos\left(\frac{x+y}{2}-\frac{x-y}{2}\right)+\cos\left(\frac{x+y}{2}+\frac{x-y}{2}\right)\right]$

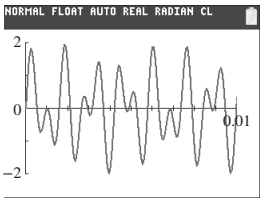
$=\frac{1}{2}(\cos y+\cos x)$

Therefore, $\cos x+\cos y=2\cos\frac{x+y}{2}\cos\frac{x-y}{2}$.

41. a. $y=\sin 1394\pi t+\sin 2418\pi t$

b. $y=2\sin 1906\pi t\cos 512\pi t$

c.



43. Formula (2) converts a product of cosines to a sum of cosines, whereas formula (6) converts a sum of cosines to a product of cosines. The two formulas work in reverse.

45. LHS: $\frac{\sin[A+(B-C)]}{2}-\frac{\sin[A-(B-C)]}{2}$

$+\frac{\sin[B+(C-A)]}{2}-\frac{\sin[B-(C-A)]}{2}$

$+\frac{\sin[C+(A-B)]}{2}-\sin\frac{[C-(A-B)]}{2}$

$=\frac{\sin(A+B-C)}{2}-\frac{\sin(A-B+C)}{2}+\frac{\sin(B+C-A)}{2}$

$-\frac{\sin(B-C+A)}{2}+\frac{\sin(C+A-B)}{2}-\frac{\sin(C-A+B)}{2}=0$

47. $\sin A+\sin B=2\sin\frac{A+B}{2}\cos\frac{A-B}{2}$ and $\sin C=2\sin\frac{C}{2}\cos\frac{C}{2}$.

Therefore, $\sin A+\sin B+\sin C$

$=2\sin\frac{A+B}{2}\cos\frac{A-B}{2}+2\sin\frac{C}{2}\cos\frac{C}{2}$

$=2\sin\frac{\pi-C}{2}\cos\frac{A-B}{2}+2\sin\frac{C}{2}\cos\frac{C}{2}$

$=2\sin\left(\frac{\pi}{2}-\frac{C}{2}\right)\cos\frac{A-B}{2}+2\sin\frac{C}{2}\cos\frac{C}{2}$

$=2\cos\frac{C}{2}\cos\frac{A-B}{2}+2\sin\frac{C}{2}\cos\frac{C}{2}$

$=2\cos\frac{C}{2}\left(\cos\frac{A-B}{2}+\sin\frac{C}{2}\right)$

$=2\cos\frac{C}{2}\left[\cos\frac{A-B}{2}+\cos\left(\frac{\pi}{2}-\frac{C}{2}\right)\right]$

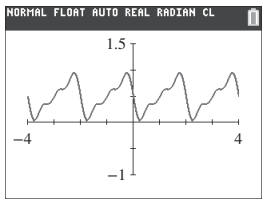
$=2\cos\frac{C}{2}\left(\cos\frac{A-B}{2}+\cos\frac{\pi-C}{2}\right)$

$=2\cos\frac{C}{2}\left(\cos\frac{A-B}{2}+\cos\frac{A+B}{2}\right)$

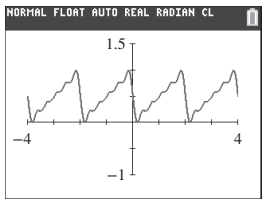
$=2\cos\frac{C}{2}\left[2\cos\frac{(A-B)+(A+B)}{4}\cos\frac{(A-B)-(A+B)}{4}\right]$

$=4\cos\frac{C}{2}\cos\frac{A}{2}\cos\left(-\frac{B}{2}\right)=4\cos\frac{A}{2}\cos\frac{B}{2}\cos\frac{C}{2}$

49. a.

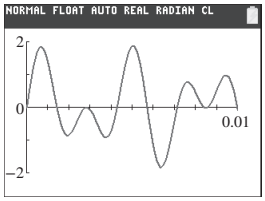


b.



51. a. $y=2\sin 702\pi t\cos 178\pi t$

b.



Problem Recognition Exercises, p. 681

1. $\frac{\cot x\cos x}{\cot x+\cos x}=\frac{\frac{\cos x}{\sin x}\cdot\cos x}{\frac{\cos x}{\sin x}+\cos x}\cdot\frac{\sin x}{\sin x}=\frac{\cos^2 x}{\cos x+\sin x\cos x}$

$=\frac{1-\sin^2 x}{\cos x(1+\sin x)}=\frac{(1-\sin x)(1+\sin x)}{\cos x(1+\sin x)}=\frac{1-\sin x}{\cos x}$

2. $\frac{1}{2}\cot\frac{\theta}{2}-\frac{1}{2}\tan\frac{\theta}{2}=\frac{1}{2}\cdot\frac{1+\cos\theta}{\sin\theta}-\frac{1}{2}\cdot\frac{\sin\theta}{1+\cos\theta}$

$=\frac{(1+\cos\theta)^2-\sin^2\theta}{2\sin\theta(1+\cos\theta)}=\frac{1+2\cos\theta+\cos^2\theta-\sin^2\theta}{2\sin\theta(1+\cos\theta)}$

$=\frac{2\cos\theta+\cos^2\theta+\cos^2\theta}{2\sin\theta(1+\cos\theta)}=\frac{2\cos\theta+2\cos^2\theta}{2\sin\theta(1+\cos\theta)}$

$=\frac{2\cos\theta(1+\cos\theta)}{2\sin\theta(1+\cos\theta)}=\frac{\cos\theta}{\sin\theta}=\cot\theta$

3. $\frac{\sin(A-B)}{\sin A\sin B}=\frac{\sin A\cos B-\cos A\sin B}{\sin A\sin B}$

$=\frac{\sin A\cos B}{\sin A\sin B}-\frac{\cos A\sin B}{\sin A\sin B}=\frac{\cos B}{\sin B}-\frac{\cos A}{\sin A}$

$=\cot B-\cot A$

4. $\frac{\sin 7x-\sin 5x}{\cos 7x+\cos 5x}=\frac{2\cos\frac{12x}{2}\sin\frac{2x}{2}}{2\cos\frac{12x}{2}\cos\frac{2x}{2}}=\frac{2\cos 6x\sin x}{2\cos 6x\cos x}$

$=\frac{\sin x}{\cos x}=\tan x$

5. $\frac{\cos\theta}{1-\sin\theta}-\frac{1-\sin\theta}{\cos\theta}=\frac{\cos^2\theta-(1-\sin\theta)^2}{\cos\theta(1-\sin\theta)}$

$=\frac{\cos^2\theta-(1-2\sin\theta+\sin^2\theta)}{\cos\theta(1-\sin\theta)}=\frac{\cos^2\theta-1+2\sin\theta-\sin^2\theta}{\cos\theta(1-\sin\theta)}$

$=\frac{1-\sin^2\theta-1+2\sin\theta-\sin^2\theta}{\cos\theta(1-\sin\theta)}=\frac{2\sin\theta-2\sin^2\theta}{\cos\theta(1-\sin\theta)}$

$=\frac{2\sin\theta(1-\sin\theta)}{\cos\theta(1-\sin\theta)}=2\frac{\sin\theta}{\cos\theta}=2\tan\theta$

6. $1+\tan x\tan\frac{x}{2}=1+\frac{\sin x}{\cos x}\cdot\frac{1-\cos x}{\sin x}$

$=1+\frac{1-\cos x}{\cos x}=\frac{\cos x+1-\cos x}{\cos x}$

$=\frac{1}{\cos x}=\sec x$

7. $\sin\left(\frac{\pi}{3}+\beta\right)-\sin\left(\frac{\pi}{3}-\beta\right)$

$=\sin\frac{\pi}{3}\cos\beta+\cos\frac{\pi}{3}\sin\beta-\left(\sin\frac{\pi}{3}\cos\beta-\cos\frac{\pi}{3}\sin\beta\right)$

$=\sin\frac{\pi}{3}\cos\beta+\cos\frac{\pi}{3}\sin\beta-\sin\frac{\pi}{3}\cos\beta+\cos\frac{\pi}{3}\sin\beta$

$=2\cos\frac{\pi}{3}\sin\beta=2\cdot\frac{1}{2}\cdot\sin\beta=\sin\beta$

8. $\sin\theta\cot\theta+\cos^2\theta\sec\theta=\sin\theta\cdot\frac{\cos\theta}{\sin\theta}+\cos^2\theta\cdot\frac{1}{\cos\theta}$

$=\cos\theta+\cos\theta=2\cos\theta$

$= \dfrac{\sin x(1 + \sin x)}{\cos^2 x(\sin x + 1)} = \dfrac{\sin x}{\cos x \cdot \cos x}$

$= \dfrac{1}{\cos x} \cdot \dfrac{\sin x}{\cos x} = \sec x \tan x$

5. a. $\dfrac{2\cot x}{1 + \cot^2 x} = \dfrac{2 \cdot \dfrac{\cos x}{\sin x}}{1 + \left(\dfrac{\cos x}{\sin x}\right)^2} = \dfrac{\dfrac{2\cos x}{\sin x}}{\dfrac{\sin^2 x + \cos^2 x}{\sin^2 x}}$

$= \dfrac{\dfrac{2\cos x}{\sin x}}{\dfrac{1}{\sin^2 x}} = \dfrac{2\cos x}{\sin x} \cdot \sin^2 x$

$= 2\cos x \sin x = \sin 2x$

b. $\left\{0, \dfrac{\pi}{2}, \pi, \dfrac{3\pi}{2}\right\}$

6. a. $\cos 2x - \cos 4x = -2\sin 3x \sin(-x)$

$= -2\sin 3x(-\sin x) = 2\sin 3x \sin x$

b. $\left\{0, \dfrac{\pi}{3}, \dfrac{2\pi}{3}, \pi, \dfrac{4\pi}{3}, \dfrac{5\pi}{3}\right\}$

7. a. $\dfrac{\sqrt{2} + \sqrt{6}}{4}$ **b.** $\sqrt{\dfrac{1 + \dfrac{\sqrt{3}}{2}}{2}}$

c. $\sqrt{\dfrac{1 + \dfrac{\sqrt{3}}{2}}{2}} = \sqrt{\dfrac{2 + \sqrt{3}}{4}} = \sqrt{\dfrac{2 + \sqrt{3}}{4} \cdot \dfrac{2}{2}}$

$= \sqrt{\dfrac{4 + 2\sqrt{3}}{8}} = \sqrt{\dfrac{1 + 2\sqrt{3} + (\sqrt{3})^2}{8}}$

$= \sqrt{\dfrac{(1 + \sqrt{3})^2}{8}} = \dfrac{1 + \sqrt{3}}{2\sqrt{2}} = \dfrac{1 + \sqrt{3}}{2\sqrt{2}} \cdot \dfrac{\sqrt{2}}{\sqrt{2}}$

$= \dfrac{\sqrt{2} + \sqrt{6}}{4}$

8. a. $\dfrac{\sqrt{6} + \sqrt{2}}{4}$

b. $\sin\dfrac{\pi}{24} = \dfrac{\sqrt{8 - 2\sqrt{6} - 2\sqrt{2}}}{4}$; $\cos\dfrac{\pi}{24} = \dfrac{\sqrt{8 + 2\sqrt{6} + 2\sqrt{2}}}{4}$

Chapter 6 Review Exercises, pp. 699–701

1. $\sin^2 x(\sin x - \cos x)(\sin x + \cos x)$

3. $(\tan x - 1)(\tan x + 1)$ or $\tan^2 x - 1$ **5.** $\cos x$

7. $\dfrac{\sin x \tan^2 x - \sin x}{\cos x \tan x + \cos x} = \dfrac{\sin x(\tan^2 x - 1)}{\cos x(\tan x + 1)}$

$= \tan x \dfrac{(\tan x + 1)(\tan x - 1)}{\tan x + 1} = \tan x(\tan x - 1)$

9. $\dfrac{1}{\csc x - 1} + \dfrac{1}{\csc x + 1} = \dfrac{(\csc x + 1) + (\csc x - 1)}{(\csc x - 1)(\csc x + 1)} = \dfrac{2\csc x}{\csc^2 x - 1}$

$= \dfrac{2\csc x}{\cot^2 x} = 2 \cdot \dfrac{1}{\sin x} \cdot \dfrac{\sin^2 x}{\cos^2 x} = \dfrac{2\sin x}{\cos^2 x}$

$= 2 \cdot \dfrac{\sin x}{\cos x} \cdot \dfrac{1}{\cos x} = 2\tan x \sec x$

11. $\ln|\csc x| + \ln|\tan x| = \ln|\csc x \cdot \tan x| = \ln\left|\dfrac{1}{\sin x} \cdot \dfrac{\sin x}{\cos x}\right|$

$= \ln\left|\dfrac{1}{\cos x}\right| = \ln|\sec x|$

13. LHS $= \cos x + (-\sin x)(-\tan x) = \cos x + \sin x \tan x$

$= \cos x + \sin x \cdot \dfrac{\sin x}{\cos x} = \dfrac{\cos^2 x + \sin^2 x}{\cos x} = \dfrac{1}{\cos x} = \sec x$

15. $\sqrt{16 - x^2} = 4\sin\theta$ **17.** $\dfrac{\sqrt{2} + \sqrt{6}}{4}$ **19.** $\sqrt{3} - 2$

21. $-\dfrac{\sqrt{2} + \sqrt{6}}{4}$ **23.** $-\dfrac{1}{2}$ **25.** $-\dfrac{400}{561}$ **27.** $\dfrac{48 - 15\sqrt{13}}{119}$

29. $\dfrac{\cos(x - y)}{\cos x \sin y} = \dfrac{\cos x \cos y + \sin x \sin y}{\cos x \sin y} = \dfrac{\cos x \cos y}{\cos x \sin y} + \dfrac{\sin x \sin y}{\cos x \sin y}$

$= \cot y + \tan x$

31. $\dfrac{\tan\left(x - \dfrac{3\pi}{4}\right)}{\tan\left(x + \dfrac{\pi}{4}\right)} = \tan\left(x - \dfrac{3\pi}{4}\right) \cdot \dfrac{1}{\tan\left(x + \dfrac{\pi}{4}\right)}$

$= \dfrac{\tan x - \tan\dfrac{3\pi}{4}}{1 + \tan x \tan\dfrac{3\pi}{4}} \cdot \dfrac{1 - \tan x \tan\dfrac{\pi}{4}}{\tan x + \tan\dfrac{\pi}{4}}$

$= \dfrac{\tan x - (-1)}{1 + \tan x(-1)} \cdot \dfrac{1 - \tan x(1)}{\tan x + (1)} = \dfrac{(\tan x + 1)(1 - \tan x)}{(1 - \tan x)(\tan x + 1)} = 1$

33. $2\sin\left(x + \dfrac{11\pi}{6}\right)$

35. $\dfrac{2\tan x}{1 + \tan^2 x} = \dfrac{2\tan x}{\sec^2 x} = 2 \cdot \dfrac{\sin x}{\cos x} \cdot \cos^2 x$

$= 2\sin x \cos x = \sin 2x$

37. $\sin^2\dfrac{x}{2} - \cos^2\dfrac{x}{2} = \dfrac{1 - \cos x}{2} - \dfrac{1 + \cos x}{2} = \dfrac{-2\cos x}{2} = -\cos x$

39. $8\cos 2x + 2\cos 4x + 6$

41. a. $-\dfrac{120}{169}$ **b.** $\dfrac{119}{169}$ **c.** $\dfrac{5\sqrt{26}}{26}$ **d.** $\dfrac{\sqrt{26}}{26}$

43. a. $-\dfrac{4}{5}$ **b.** $-\dfrac{3}{5}$ **c.** $\sqrt{\dfrac{5 + \sqrt{5}}{10}}$ **d.** $\sqrt{\dfrac{5 - \sqrt{5}}{10}}$

45. a. $\dfrac{24}{7}$ **b.** $-\dfrac{1}{2}$ **47.** $\dfrac{1}{2}\cos 2x - \dfrac{1}{2}\cos 10x$

49. $\dfrac{1}{2}\sin 3x - \dfrac{1}{2}\sin 9x$ **51.** $2\cos 5x \cos 3x$ **53.** $2\cos 4x \sin 2x$

55. $\dfrac{1 + \sqrt{2}}{4}$ **57.** $\dfrac{\sqrt{6}}{2}$

59. $\cos\left(\dfrac{\pi}{4} + t\right) - \cos\left(\dfrac{\pi}{4} - t\right)$

$= -2\sin\dfrac{\left(\frac{\pi}{4} + t\right) + \left(\frac{\pi}{4} - t\right)}{2}\sin\dfrac{\left(\frac{\pi}{4} + t\right) - \left(\frac{\pi}{4} - t\right)}{2}$

$= -2\sin\dfrac{\pi}{4}\sin t = -2 \cdot \dfrac{\sqrt{2}}{2}\sin t = -\sqrt{2}\sin t$

61. $\dfrac{\sin 4x - \sin 2x}{\cos 4x - \cos 2x} = \dfrac{2\cos 3x \sin x}{-2\sin 3x \sin x} = -\cot 3x$

63. a. $\left\{x \,\middle|\, x = \dfrac{4\pi}{3} + 2n\pi, x = \dfrac{5\pi}{3} + 2n\pi\right\}$ **b.** $\left\{\dfrac{4\pi}{3}, \dfrac{5\pi}{3}\right\}$

65. a. $\left\{x \,\middle|\, x = \dfrac{\pi}{6} + n\pi, x = \dfrac{5\pi}{6} + n\pi\right\}$ **b.** $\left\{\dfrac{\pi}{6}, \dfrac{5\pi}{6}, \dfrac{7\pi}{6}, \dfrac{11\pi}{6}\right\}$

R.1. 49.5° **R.2.** 131.4°

1. opposite

3. $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$ or $\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$ **5.** one

7. $C = 35°$,

$a = \frac{42\sin 43°}{\sin 102°} \approx 29.3$,

$c = \frac{42\sin 35°}{\sin 102°} \approx 24.6$

9. $B = 66°$,

$a = \frac{73\sin 17.8°}{\sin 66°} \approx 24.4$,

$c = \frac{73\sin 96.2°}{\sin 66°} \approx 79.4$

11. $Q = 113°$,

$q = \frac{18.9\sin 113°}{\sin 19°} \approx 53.4$, $r = \frac{18.9\sin 48°}{\sin 19°} \approx 43.1$

13. $C = 19°$, $b \approx 29.4$, $c \approx 17.1$ **15.** $C = 33.6°$, $a \approx 156.1$, $b \approx 75.8$

17. $B = 77.2°$, $a \approx 26.9$, $b \approx 46.1$ **19.** $A = 106.9°$, $b \approx 0.3$, $c \approx 0.5$

21. One triangle; $A \approx 114.2°$, $C \approx 27.8°$, $a \approx 48.9$ **23.** No triangle

25. Two triangles; $B \approx 78.3°$, $C \approx 56.7°$, $c < 15.4$; $B \approx 101.7°$, $C \approx 33.3°$, $c \approx 10.1$ **27.** Two triangles; $A \approx 16.1°$, $C \approx 150.8°$, $c \approx 232.9$, $A \approx 163.9°$, $C \approx 3.0°$, $c \approx 25.1$ **29.** 24.4 ft^2

31. 5.5 in.^{2} **33.** 0.1 mm^2 **35.** 483,556 mi^2

37. $AC \approx 6.9$ mi, $BC \approx 7.0$ mi **39.** **a.** 1787 ft **b.** 2264 ft

41. 425 ft **43.** 10.7 ft **45.** 20 **47.** **a.** 200 ft **b.** 106 ft

49. Perimeter: 1065 ft; Area: 49,300 ft^2 **51.** 7.8 in. or 4.3 in.

53. $C = 31°$, $a \approx 13.8$, $c \approx 8.0$ **55.** $A \approx 123.2°$, $C \approx 32.8°$, $a \approx 12.3$; $A \approx 8.8°$, $C \approx 147.2°$, $a \approx 2.3$ **57.** $A = 98.3°$, $a \approx 12.8$, $b \approx 3.0$

59. $A \approx 26.0°$, $B \approx 129.4°$, $b \approx 207.9$; $A \approx 154.0°$, $B \approx 1.4°$, $b \approx 6.6$

61. $B \approx 60.3°$, $C \approx 6.7°$, $c \approx 2.0$ **63.** $B = 174.2°$, $b \approx 29.0$, $c \approx 6.0$

65. No triangle **67.** Yes, it is leaning by 4.7° from the vertical.

69. **a.** 16.69 cm^2 **b.** 18.50 cm^2

71. **a.** $a = \frac{20\sin 40°}{\sin 95°}$; $b = \frac{10\sqrt{3}\sin 40°}{\sin 95°\sin 35°}$; $c = \frac{10\sqrt{3}\sin 40°}{\sin 35°\sin 50°}$

b. $a \approx 12.9$ in.; $b \approx 19.5$ in.; $c \approx 25.3$ in.

73. Distance from A: 6.8 mi; distance from B: 7.9 mi

75. $c^2 = a^2 + b^2 - 2ab\cos 90°$
$\Rightarrow c^2 = a^2 + b^2 - 2ab(0)$
$\Rightarrow c^2 = a^2 + b^2$

77. Compare the side opposite the given angle to the altitude of the triangle.

1. If the length of the side opposite the given angle is shorter than the altitude, then no triangle is possible.

2. If the length of the side opposite the given angle equals the altitude, then one right triangle is formed.

3. If the length of the side opposite the given angle is greater than the length of the known side adjacent to the given angle, then one triangle is possible.

4. If the length of the side opposite the given angle is greater than the altitude but less than the length of the known side adjacent to the given angle, then two triangles are possible.

79. The area of a triangle is one-half the product of the lengths of two known sides and the sine of the angle between them.

81. From the law of sines,

$$\frac{\sin A}{\sin B} = \frac{a}{b} \quad (1)$$

Subtract 1 from both sides of equation (1).

$$\frac{\sin A}{\sin B} - 1 = \frac{a}{b} - 1$$

$$\frac{\sin A - \sin B}{\sin B} = \frac{a - b}{b} \quad (2)$$

Add 1 to both sides of equation (1).

$$\frac{\sin A}{\sin B} + 1 = \frac{a}{b} + 1$$

$$\frac{\sin A + \sin B}{\sin B} = \frac{a + b}{b} \quad (3)$$

Divide (2) by (3).

$$\frac{\frac{\sin A - \sin B}{\sin B}}{\frac{\sin A + \sin B}{\sin B}} = \frac{\frac{a - b}{b}}{\frac{a + b}{b}}$$ which is equivalent to

$$\frac{a - b}{a + b} = \frac{\sin A - \sin B}{\sin A + \sin B}$$

Apply sum-to-product formulas.

$$\frac{a - b}{a + b} = \frac{\sin A - \sin B}{\sin A + \sin B} = \frac{2\cos\left(\frac{A+B}{2}\right)\sin\left(\frac{A-B}{2}\right)}{2\sin\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right)}$$

$$= \cot\left(\tfrac{A+B}{2}\right)\tan\left(\tfrac{A-B}{2}\right) = \frac{\tan\left(\frac{A-B}{2}\right)}{\tan\left(\frac{A+B}{2}\right)}$$

Thus, $\frac{a - b}{a + b} = \frac{\tan\left(\frac{A-B}{2}\right)}{\tan\left(\frac{A+B}{2}\right)}$.

55. The angle opposite the longest side of a triangle may potentially be greater than 90°. However, the angles opposite the two shorter sides of a triangle are guaranteed to be acute angles. Using the law of sines to find the measure of an angle involves evaluating the inverse sine function with a positive argument. In such a case, the inverse sine function will return an acute angle. Therefore, we should only use the law of sines to find the measures of the angles opposite the two shorter sides.

57. When applying the law of sines or cosines, do no intermediate rounding. Round the final answers only after all calculations have been performed. If possible, use the lengths of the given sides or measures of the given angles rather than rounded values from a prior calculation.

59. No. There are infinitely many triangles that can be constructed with the same three angles, so the lengths of the sides cannot be uniquely determined. The corresponding sides of two triangles with the same angles are proportional. You have already encountered such a situation when you studied similar triangles.

61. $2\sqrt{95}$ ft

63. From the law of cosines:

(1) $\cos B = \dfrac{a^2 + c^2 - b^2}{2ac}$ (2) $\cos C = \dfrac{a^2 + b^2 - c^2}{2ab}$

Therefore, $2ac\cos B = a^2 + c^2 - b^2$ and $2ab\cos C = a^2 + b^2 - c^2$
and $2ac\cos B + 2ab\cos C = a^2 + c^2 - b^2 + a^2 + b^2 - c^2$
$2ac\cos B + 2ab\cos C = 2a^2$.
Dividing both sides by $2a$, we obtain $a = b\cos C + c\cos B$.

Problem Recognition Exercises, p. 742

1. $c = 21$, $A \approx 43.60°$, $C \approx 46.40°$ **2.** $a \approx 23.63$, $B \approx 39.13°$, $C \approx 27.87°$ **3.** $A \approx 31.96°$, $B \approx 37.19°$, $C \approx 110.84°$

4. No triangle is possible. **5.** $a \approx 26.25$, $B \approx 40.36°$, $C \approx 49.64°$

6. $b \approx 28.22$, $c \approx 20.10$, $C = 42°$

7. Two possible triangles:
$c \approx 2.62$, $B \approx 126.09°$, $C \approx 13.91°$ or $c \approx 10.86$, $B \approx 53.91°$, $C \approx 86.09°$

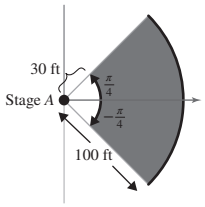
85. The graph is the set of points on and between the circles centered at the pole with radii 2 and 4.

87. The graph is the set of points between the line $\theta = 0$ (x-axis) and the line $\theta = \frac{\pi}{4}$ (line $y = x$).

89. **a.**



b. 2275π ft$^2 \approx 7148$ ft^2

91. (177, 151.7°) **93.** If $r < 0$, the point (r, θ) is $|r|$ units from the pole in the *opposite* direction of θ. That is, a negative value of r tells us to plot a point $|r|$ units in the direction $\theta + \pi$.

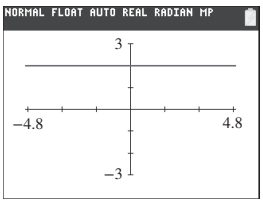
95. **a.** $P(r_1\cos\theta_1, r_1\sin\theta_1)$ and $Q(r_2\cos\theta_2, r_2\sin\theta_2)$

b.
$$\begin{aligned} d^2 &= (r_2\cos\theta_2 - r_1\cos\theta_1)^2 + (r_2\sin\theta_2 - r_1\sin\theta_1)^2 \\ &= {r_2}^2\cos^2\theta_2 - 2r_1r_2\cos\theta_2\cos\theta_1 + {r_1}^2\cos^2\theta_1 \\ &\quad + {r_2}^2\sin^2\theta_2 - 2r_1r_2\sin\theta_2\sin\theta_1 + {r_1}^2\sin^2\theta_1 \\ &= {r_2}^2(\cos^2\theta_2 + \sin^2\theta_2) + {r_1}^2(\cos^2\theta_1 + \sin^2\theta_1) \\ &\quad -2r_1r_2\cos\theta_2\cos\theta_1 - 2r_1r_2\sin\theta_2\sin\theta_1 \\ &= {r_1}^2 + {r_2}^2 - 2r_1r_2(\cos\theta_2\cos\theta_1 + \sin\theta_2\sin\theta_1) \\ &= {r_1}^2 + {r_2}^2 - 2r_1r_2\cos(\theta_2 - \theta_1) \end{aligned}$$

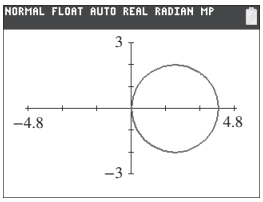
Therefore, $d = \sqrt{{r_1}^2 + {r_2}^2 - 2r_1r_2\cos(\theta_2 - \theta_1)}$.

97. Since $\theta_1 \neq \theta_2$ points P, Q, and the pole O are not collinear and thus form the vertices of a triangle, ΔPOQ.
Side $OP = r_1$ and side $OQ = r_2$, and the angle between them is $\angle POQ = |\theta_2 - \theta_1|$.
From the law of cosines, we have $PQ^2 = {r_1}^2 + {r_2}^2 - 2r_1r_2cos|\theta_2 - \theta_1|$.
Noting that the cosine function is even, we have $\cos(\theta_2 - \theta_1) = \cos[-(\theta_2 - \theta_1)] = \cos(\theta_1 - \theta_2)$, so we can drop the absolute value bars.
Therefore, the distance between P and Q is $PQ = \sqrt{{r_1}^2 + {r_2}^2 - 2r_1r_2cos(\theta_2 - \theta_1)}$.

99.



101.



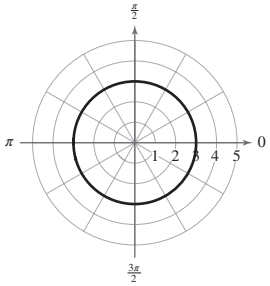
Section 8.2 Practice Exercises, pp. 783–788

R.1. y-axis **R.2.** x-axis **R.3.** x-axis, y-axis, and origin

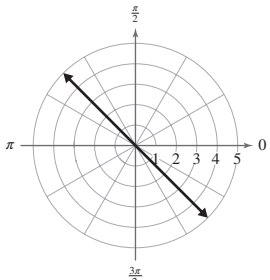
R.4. None of these **R.5.** $\left\{\frac{\pi}{12}, \frac{5\pi}{12}\right\}$ **R.6.** $\left\{0, \frac{2\pi}{3}, \frac{4\pi}{3}\right\}$

1. polar axis **3.** pole **5.** It gives us the values of θ for which the graph passes through the pole.

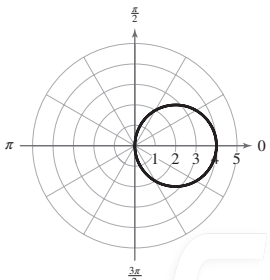
7.



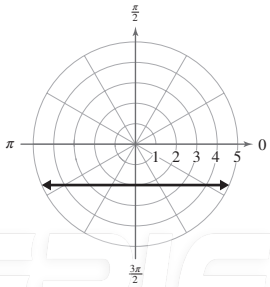
9.



11.



13.

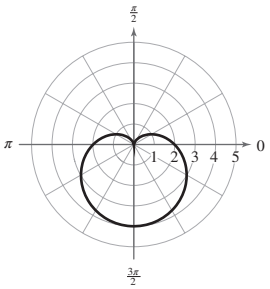


ISTUDY

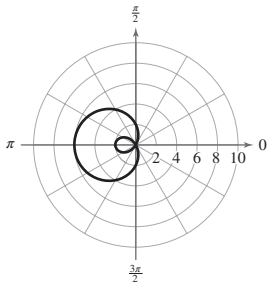
15. **a.** Yes **b.** Yes **c.** Yes **17.** **a.** Yes **b.** Inconclusive **c.** Inconclusive **19.** **a.** Inconclusive **b.** Yes **c.** Inconclusive

21. **a.** Inconclusive **b.** Inconclusive **c.** Inconclusive

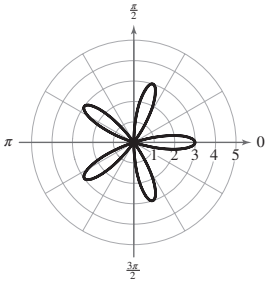
23. Cardioid



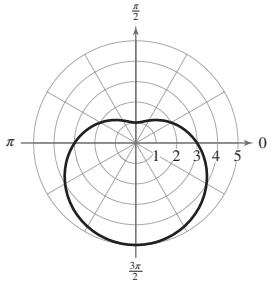
25. Limaçon with a loop



27. Rose (5 petals)



29. Dimpled limaçon

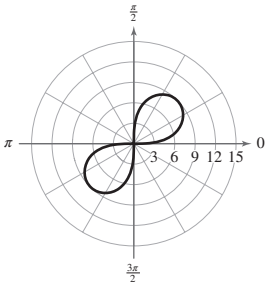


31. **a.** Rose (4 petals) **b.** $r = 5\cos 2\theta$

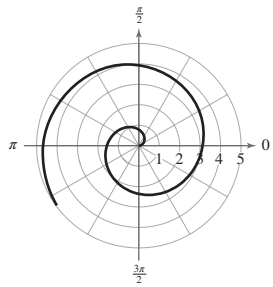
33. **a.** Circle (center on line $\theta = \frac{\pi}{2}$) **b.** $r = -4\sin\theta$

35. **a.** Lemniscate **b.** $r^2 = 4\sin 2\theta$ **37.** **a.** Limaçon (cardioid) **b.** $r = 2 - 2\cos\theta$ **39.** **a.** Horizontal line **b.** $r = \dfrac{2}{\sin\theta}$ or $r = 2\csc\theta$ **41.** $\dfrac{\pi}{2} < \theta < \dfrac{3\pi}{2}$

43.



45.

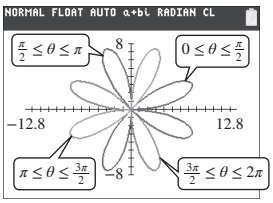


47. **a.** 6 **b.** $[0, \pi)$ **49.** **a.** 4 **b.** $[0, 2\pi)$ **51.** **a.** 3 **b.** $[0, 4\pi)$

53. d **55.** a **57.** $r = 3.5\cos 4\theta$

59. **a.** $\left\{0, \dfrac{\pi}{4}, \dfrac{\pi}{2}, \dfrac{3\pi}{4}, \pi, \dfrac{5\pi}{4}, \dfrac{3\pi}{2}, \dfrac{7\pi}{4}\right\}$

b.

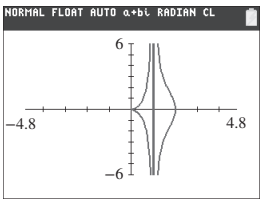


61. Since $\sin\theta = \sin(\pi - \theta)$, replacing θ by $\pi - \theta$ in a polar equation results in an equivalent equation. Therefore, the graph is symmetric with respect to the line $\theta = \dfrac{\pi}{2}$.

63. Symmetric with respect to the line $\theta = \dfrac{\pi}{2}$

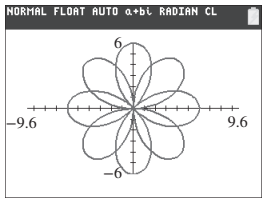
65. Symmetric with respect to the polar axis

67. **a.** $\theta = \dfrac{\pi}{2}$ and $\theta = \dfrac{3\pi}{2}$ **b.**



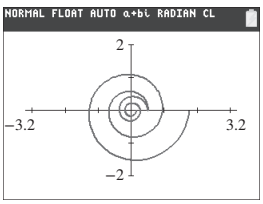
c. The graph appears to have a vertical asymptote. For example, when θ approaches $\dfrac{\pi}{2}$, the value of $|\sec\theta|$ (and subsequently $|r|$) becomes infinitely large. This means that the constant term on the right side of the equation does not contribute much to the value of r. Thus, for values of θ close to $\dfrac{\pi}{2}$, $r \approx \sec\theta$. Converting to rectangular coordinates, $r \approx \dfrac{1}{\cos\theta} \Rightarrow r\cos\theta = 1$ or equivalently, $x = 1$.

69. **a.–b.**



c. The graph of $r = 6\sin\left[2\left(\theta + \dfrac{\pi}{4}\right)\right]$ is the same as the graph of $r = 6\sin 2\theta$, but rotated $-\dfrac{\pi}{4}$ radians.

71. **a.**

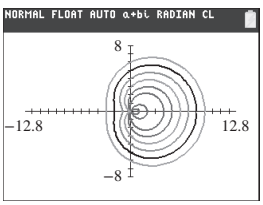


b. For $b > 0$, the spiral gets larger for increasing values of θ. For $b < 0$, the spiral gets smaller for increasing values of θ.

73. Cardioid; $r = 3 + 3\sin\theta$ **75.** Limaçon with a loop; $r = 2 + 6\cos\theta$

77. Limaçon with a dimple; $r = 3 - 2\cos\theta$

79.



When $\dfrac{a}{b} < 1$, the graph has an inner loop and the inner loop shrinks as $\dfrac{a}{b}$ approaches 1.

When $\dfrac{a}{b} = 1$, the inner loop converges to a sharp point.

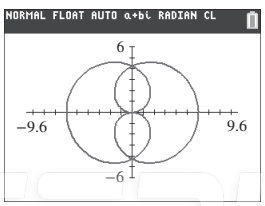
For $1 < \dfrac{a}{b} < 2$, the sharp point becomes a smooth dimple and the degree of curvature of the dimple decreases as $\dfrac{a}{b}$ approaches 2.

When $\dfrac{a}{b} = 2$, the dimple disappears and the "left" side of the curve is rounded outwards. **81.** $\theta = 0$ and $\theta = \pi$

83. **a.** No **b.** Yes

c. The graph is also symmetric with respect to the polar axis and to the pole.

d.

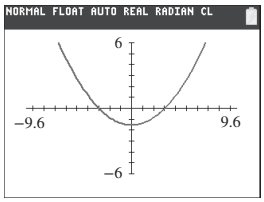


85. a. No **b.** Any point in a plane has an infinite number of representations in polar coordinates. While the curve physically passes through the point defined by $\left(4, \frac{\pi}{2}\right)$, it is a different representation of this point that satisfies the equation. For example, $\left(-4, \frac{3\pi}{2}\right)$ is a solution to $r = 4\cos 2\theta$ and represents the same physical location as $\left(4, \frac{\pi}{2}\right)$.

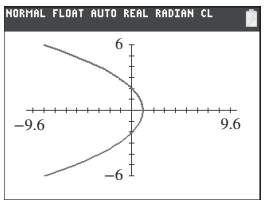
Problem Recognition Exercises, pp. 788–789

1. a. Equation C **b.** Circle centered at the origin (pole), radius 12 **c.** Origin, x-axis, and y-axis **2. a.** Equation F **b.** Vertical line through the x-axis at -3 **c.** x-axis **3. a.** Equation A **b.** Line with slope -2 and y-intercept $(0, 4)$ **c.** None of these
4. a. Equation H **b.** Circle centered at $(-3, 0)$ with radius 3 **c.** x-axis
5. a. Equation D **b.** Line through the origin with slope $-\sqrt{3}$ **c.** Origin **6. a.** Equation B **b.** Circle centered at $(0, -5)$ with radius 5 **c.** y-axis **7. a.** Equation E **b.** Horizontal line through the y-axis at 5 **c.** y-axis **8. a.** Equation G **b.** Circle centered at $(1, 1)$, with radius $\sqrt{2}$ **c.** None of these

9. The graph is a parabola opening upward with vertex at $\left(0, -\frac{3}{2}\right)$.



10. The graph is a parabola opening to the left with vertex at $(1, 0)$.



11. a. $(x, -y)$ **b.** $(r, -\theta)$ **12. a.** $(-x, y)$ **b.** $(r, \pi - \theta)$
13. a. $(-x, -y)$ **b.** $(-r, \theta)$

Section 8.3 Practice Exercises, pp. 799–803

R.1. $\frac{1}{6} + \frac{1}{12}i$ **R.2.** $15 + 24i$ **R.3.** $21 - 27i$

37. a. $\frac{1}{16}\left(\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right)$ **b.** $9\left(\cos\frac{5\pi}{3} + i\sin\frac{5\pi}{3}\right)$

39. a. $12(\cos 0 + i\sin 0)$ **b.** $\frac{2}{3}\left(\cos\frac{3\pi}{2} + i\sin\frac{3\pi}{2}\right)$

41. a. $288\left(\cos\frac{11\pi}{6} + i\sin\frac{11\pi}{6}\right)$ **b.** $2\left(\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right)$

43. $23{,}328\sqrt{3} + 23{,}328i$ **45.** 8 **47.** $\frac{81\sqrt{6}}{2} - \frac{81\sqrt{6}}{2}i$

49. $-128\sqrt{3} - 128i$ **51.** $-512\sqrt{3} - 512i$ **53.** $90°; \frac{360°}{n}$

55. $-3, 3, -\frac{3}{2} - \frac{3\sqrt{3}}{2}i, \frac{3}{2} - \frac{3\sqrt{3}}{2}i, -\frac{3}{2} + \frac{3\sqrt{3}}{2}i, \frac{3}{2} + \frac{3\sqrt{3}}{2}i$

57. $-3i, -\frac{3\sqrt{3}}{2} + \frac{3}{2}i, \frac{3\sqrt{3}}{2} + \frac{3}{2}i$ **59.** $2 + 2\sqrt{3}i, -2 - 2\sqrt{3}i$

61. $4\left(\cos\frac{3\pi}{8} + i\sin\frac{3\pi}{8}\right), 4\left(\cos\frac{11\pi}{8} + i\sin\frac{11\pi}{8}\right)$

63. $2\left(\cos\frac{\pi}{30} + i\sin\frac{\pi}{30}\right), 2\left(\cos\frac{13\pi}{30} + i\sin\frac{13\pi}{30}\right),$
$2\left(\cos\frac{5\pi}{6} + i\sin\frac{5\pi}{6}\right), 2\left(\cos\frac{37\pi}{30} + i\sin\frac{37\pi}{30}\right),$
$2\left(\cos\frac{49\pi}{30} + i\sin\frac{49\pi}{30}\right)$

65. $3(\cos 38° + i\sin 38°), 3(\cos 158° + i\sin 158°),$
$3(\cos 278° + i\sin 278°)$

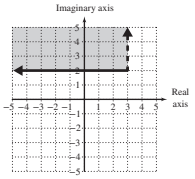
67. $9(\cos 157.5° + i\sin 157.5°), 9(\cos 337.5° + i\sin 337.5°)$

69. $\sqrt[6]{4}(\cos 40° + i\sin 40°), \sqrt[6]{4}(\cos 100° + i\sin 100°),$
$\sqrt[6]{4}(\cos 160° + i\sin 160°), \sqrt[6]{4}(\cos 220° + i\sin 220°),$
$\sqrt[6]{4}(\cos 280° + i\sin 280°), \sqrt[6]{4}(\cos 340° + i\sin 340°)$

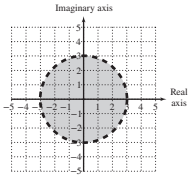
71. The value 1 is an nth root of 1 and can be represented as $1(\cos 0° + i\sin 0°)$ or $1(\cos 0 + i\sin 0)$. The moduli of the remaining roots are also 1, and the arguments differ by $\frac{360}{n}$ degrees, or $\frac{2\pi}{n}$ radians.

73. $\left[2\left(\cos\frac{2\pi}{9} + i\sin\frac{2\pi}{9}\right)\right]^3 = 2^3\left[\cos\left(3\cdot\frac{2\pi}{9}\right) + i\sin\left(3\cdot\frac{2\pi}{9}\right)\right]$
$= 8\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)$

75.



77.



79. $-\sqrt{6} - \sqrt{2} + (-\sqrt{6} + \sqrt{2})i$ **81.** $\frac{\sqrt{6} + \sqrt{2}}{4} + \left(\frac{\sqrt{6} - \sqrt{2}}{4}\right)i$

ISTUDY

83. $z_1 = -2 - 2\sqrt{3}i$ and $z_2 = 2i$

$z_1 z_2 = (-2 - 2\sqrt{3}i)(2i) = -4i - 4\sqrt{3}i^2$

$= 4\sqrt{3} - 4i = 8\left(\cos\frac{11\pi}{6} + i\sin\frac{11\pi}{6}\right)$

85. $\frac{z_1}{z_2} = \frac{r_1(\cos\theta_1 + i\sin\theta_1)}{r_2(\cos\theta_2 + i\sin\theta_2)}$

$= \frac{r_1(\cos\theta_1 + i\sin\theta_1)\cdot(\cos\theta_2 - i\sin\theta_2)}{r_2(\cos\theta_2 + i\sin\theta_2)\cdot(\cos\theta_2 - i\sin\theta_2)}$

$= \frac{r_1}{r_2}\cdot\frac{\cos\theta_1\cos\theta_2 - i\cos\theta_1\sin\theta_2 + i\sin\theta_1\cos\theta_2 - i^2\sin\theta_1\sin\theta_2}{\cos^2\theta_2 - i^2\sin^2\theta_2}$

$= \frac{r_1}{r_2}\cdot\frac{\cos\theta_1\cos\theta_2 + \sin\theta_1\sin\theta_2 + \mathrm{i}(\sin\theta_1\cos\theta_2 - \cos\theta_1\sin\theta_2)}{\cos^2\theta_2 + \sin^2\theta_2}$

$= \frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i\sin(\theta_1 - \theta_2)]$

87. a. $z^{-1} = \frac{1}{z} = \frac{1}{r(\cos\theta + i\sin\theta)}\cdot\frac{(\cos\theta - i\sin\theta)}{(\cos\theta - i\sin\theta)}$

$= \frac{1}{r}\cdot\frac{\cos\theta - i\sin\theta}{\cos^2\theta + \sin^2\theta} = r^{-1}[\cos(-\theta) + i\sin(-\theta)]$

b. $z^{-2} = \frac{1}{z^2} = \frac{1}{r^2(\cos 2\theta + i\sin 2\theta)}\cdot\frac{(\cos 2\theta - i\sin 2\theta)}{(\cos 2\theta - i\sin 2\theta)}$

$= \frac{1}{r^2}\cdot\frac{\cos 2\theta - i\sin 2\theta}{\cos^2 2\theta + \sin^2 2\theta} = r^{-2}[\cos(-2\theta) + i\sin(-2\theta)]$

89. $8 - 8i$ **91.** $-108 + 36\sqrt{3}i$

93. Setting one side equal to zero and factoring yields $(x + 2)(x^2 - 2x + 4)(x - 2)(x^2 + 2x + 4) = 0$. Solving for x gives $2, 1 + \sqrt{3}i, -1 + \sqrt{3}i, -2, -1 - \sqrt{3}i, 1 - \sqrt{3}i$ as expected.

95. $2\left(\cos\frac{5\pi}{16} + i\sin\frac{5\pi}{16}\right), 2\left(\cos\frac{13\pi}{16} + i\sin\frac{13\pi}{16}\right),$

$2\left(\cos\frac{21\pi}{16} + i\sin\frac{21\pi}{16}\right), 2\left(\cos\frac{29\pi}{16} + i\sin\frac{29\pi}{16}\right)$

97. $\cos\frac{5\pi}{18} + i\sin\frac{5\pi}{18}, \cos\frac{17\pi}{18} + i\sin\frac{17}{18}, \cos\frac{29\pi}{18} + i\sin\frac{29\pi}{18}$

99. The absolute value of z is the distance between (a, b) and the origin (0, 0) in the complex plane. The absolute value of a real number x is the distance between x and 0 on the number line.

101. a. $\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}$ or $\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i$

b. $e^{\pi i} + 1 = (\cos\pi + i\sin\pi) + 1$

$= (-1 + 0) + 1 = 0$

103.

$(3e^{\pi i/12})^8 - 81(3e^{\pi i/12})^4 + 6561 \stackrel{?}{=} 0$

$3^8 e^{8\pi i/12} - 3^4\cdot 3^4 e^{4\pi i/12} + 3^8 \stackrel{?}{=} 0$

$3^8(e^{2\pi i/3} - e^{\pi i/3} + 1) \stackrel{?}{=} 0$

$3^8\left[\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3} - \left(\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}\right) + 1\right] \stackrel{?}{=} 0$

$3^8\left(-\frac{1}{2} + \frac{\sqrt{3}}{2}i - \frac{1}{2} - \frac{\sqrt{3}}{2}i + 1\right) \stackrel{?}{=} 0$

$3^8(0) = 0$ ✓

105. $z_1 = (0)^2 + (0.3 + i) = 0.30 + 1.00i$; $|z_1| = 1.0$

$z_2 = (0.3 + i)^2 + (0.3 + i) = -0.61 + 1.60i$; $|z_2| = 1.7$

$z_3 = (-0.61 + 1.6i)^2 + (0.3 + i) = -1.89 - 0.95i$; $|z_3| = 2.1 > 2$

75. 508,829 N·m **77.** $120\sqrt{3}$ ft·lb

79. a. 180° **b.** Yes; $c = -5.5$

81. a. 75 **b.** −75 **c.** The vectors are parallel.

83. **v** and **w** are parallel.

85. a. For example: $\mathbf{u} = 2\mathbf{i} - 5\mathbf{j}$ and $\mathbf{w} = -4\mathbf{i} + 10\mathbf{j}$

b. For example: $\mathbf{u} = 5\mathbf{i} + 2\mathbf{j}$ and $\mathbf{w} = -10\mathbf{i} - 4\mathbf{j}$

87. \$10,470; The dot product represents the total revenue if the entire inventory were sold. **89.** 966 ft·lb

91. a. 191.3 lb **b.** 58.5 lb

93. The dot product of two nonzero vectors **v** and **w** is given by $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$. Since the magnitudes of **v** and **w** are positive, the sign of the dot product is determined by the factor $\cos\theta$. If $\mathbf{v} \cdot \mathbf{w} > 0$, then $\cos\theta > 0$ and $0° < \theta < 90°$. If $\mathbf{v} \cdot \mathbf{w} < 0$, then $\cos\theta < 0$ and $90° < \theta < 180°$.

95. $\|\mathbf{v} - \mathbf{w}\|^2 = (\mathbf{v} - \mathbf{w}) \cdot (\mathbf{v} - \mathbf{w})$
$= \mathbf{v} \cdot (\mathbf{v} - \mathbf{w}) - \mathbf{w} \cdot (\mathbf{v} - \mathbf{w}) = \mathbf{v} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{w} - \mathbf{w} \cdot \mathbf{v} + \mathbf{w} \cdot \mathbf{w}$
$= \|\mathbf{v}\|^2 - 2(\mathbf{v} \cdot \mathbf{w}) + \|\mathbf{w}\|^2 = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\mathbf{v} \cdot \mathbf{w}$

97. $\|\mathbf{v} + \mathbf{w}\|^2 + \|\mathbf{v} - \mathbf{w}\|^2$
$= (\mathbf{v} + \mathbf{w}) \cdot (\mathbf{v} + \mathbf{w}) + (\mathbf{v} - \mathbf{w}) \cdot (\mathbf{v} - \mathbf{w})$
$= \mathbf{v} \cdot \mathbf{v} + 2(\mathbf{v} \cdot \mathbf{w}) + \mathbf{w} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{v} - 2(\mathbf{v} \cdot \mathbf{w}) + \mathbf{w} \cdot \mathbf{w}$
$= 2\|\mathbf{v}\|^2 + 2\|\mathbf{w}\|^2 = 2(\|\mathbf{v}\|^2 + \|\mathbf{w}\|^2)$

99. a. 13 **b.** 36

31. $x - 3 + \dfrac{4}{x} + \dfrac{2x - 7}{x^2 + 7}$ **33.** $\dfrac{2x - 1}{x^2 + 5} + \dfrac{3x}{(x^2 + 5)^2}$

35. $\dfrac{3}{x - 4} + \dfrac{2x + 1}{x^2 + x + 4}$ **37.** $\dfrac{3x + 1}{x^2 + 2} + \dfrac{x - 5}{x^2 + 3}$

39. $2x - 5 + \dfrac{4}{x + 2} + \dfrac{-3}{x - 5}$ **41.** $3x - 4 + \dfrac{4}{x + 1} + \dfrac{-5}{(x + 1)^2}$

43. a. $(x - 3)^2(x + 5)$ **b.** $\dfrac{2}{x - 3} + \dfrac{1}{(x - 3)^2} + \dfrac{-5}{x + 5}$

45. a. $(x + 2)^3$ **b.** $\dfrac{3}{x + 2} + \dfrac{-4}{(x + 2)^2} + \dfrac{1}{(x + 2)^3}$

47. Partial fraction decomposition is a procedure in which a rational expression is written as a sum of two or more simpler rational expressions.

49. A proper rational expression is a rational expression in which the degree of the numerator is less than the degree of the denominator.

51. a. $\dfrac{1}{n} - \dfrac{1}{n + 2}$

b. $\left(\frac{1}{1} - \frac{1}{3}\right) + \left(\frac{1}{2} - \frac{1}{4}\right) + \left(\frac{1}{3} - \frac{1}{5}\right) + \left(\frac{1}{4} - \frac{1}{6}\right) + \left(\frac{1}{5} - \frac{1}{7}\right) + \cdots$

c. 0 **d.** $\dfrac{3}{2}$

53. $\dfrac{1}{ax} - \dfrac{b}{a(a + bx)}$ **55.** $\dfrac{2}{e^x + 1} + \dfrac{3}{e^x + 2}$

Section 9.6 Practice Exercises, pp. 906–910

R.1. a. $S(x) = 0.11x + 500$, for $x \ge 0$ **b.** $S(8000) = 1380$; The salesperson will make \$1380 if \$8000 in merchandise is sold for the week.

R.2. a. $y = 123x + 75$ **b.** (0, 75); The base cost to rent the car is \$75.

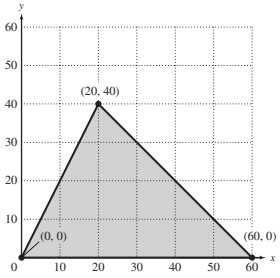
1. linear **3.** feasible

5. $z = 0.80x + 1.10y$ **7.** $z = 0.62x + 0.50y$

9. a. $x = 7, y = 5$ **b.** Maximum value: 31

11. a. $x = 10, y = 30$ **b.** Minimum value: 37,000

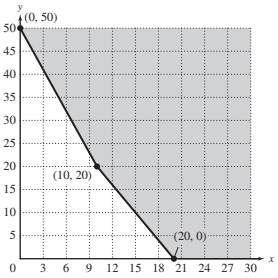
13. a. Vertices:
(0, 0), (20, 40), (60, 0)



b. $x = 60, y = 0$

c. Maximum: 15,000

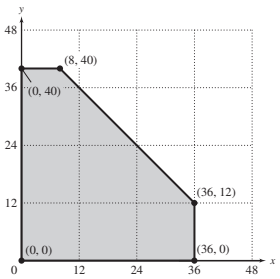
15. a. Vertices:
(0, 50), (10, 20), (20, 0)



b. $x = 20, y = 0$

c. Minimum: 60

17. a. Vertices:
(0, 0), (0, 40), (8, 40),
(36, 12), (36, 0)



b. $x = 36, y = 12$

c. Maximum: 6480

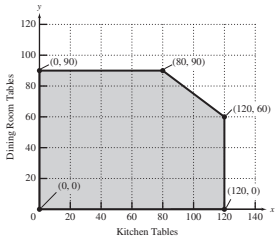
19. a. 1520 at (8, 6) **b.** 1660 at (4, 9)

21. $y \ge -\frac{3}{4}x + 3$
$y \le 3x$
$y \le 6$
$x \le 8$
$y \ge 0$

23. a. Profit: $z = 160x + 240y$

b. $x \ge 0 \quad y \ge 0 \quad x \le 120 \quad y \le 90 \quad 240x + 320y \le 48{,}000$

c.



d. (0, 0), (0, 90), (80, 90), (120, 60), (120, 0)

e. Profit at (0, 0): $z = 0$
Profit at (0, 90): $z = 21{,}600$
Profit at (80, 90): $z = 34{,}400$
Profit at (120, 60): $z = 33{,}600$
Profit at (120, 0): $z = 19{,}200$

f. The greatest profit is realized when 80 kitchen tables and 90 dining room tables are produced.

g. The maximum profit is \$34,400.

25. a. 280 large trees and 120 small trees would maximize profit.

b. The maximum profit is \$13,400.

c. In this case, the nursery should have 360 large trees and no small trees.

27. a. The company should make 8 trips with the small truck and 6 trips with the large truck. **b.** The minimum cost is \$1860.

29. a. The manufacturer should produce 600 grill A units and 500 grill B units to maximize profit. **b.** The maximum profit is \$114,000. **c.** In this case, the manufacturer should produce 1200 grill A units and 0 grill B units.

31. a. The farmer should plant 900 acres of corn and 300 acres of soybeans. **b.** The maximum profit is \$138,000. **c.** In this case, 500 acres of corn and 700 acres of soybeans should be planted.

33. Linear programming is a technique that enables us to maximize or minimize a function under specific constraints.

35. The feasible region for a linear programming application is found by first identifying the constraints on the relevant variables. Then the regions defined by the individual constraints are graphed. The intersection of the constraints defines the feasible region.

Chapter 9 Review Exercises, pp. 912–914

1. a. Yes **b.** No **3.** One solution **5.** $\{(2, -3)\}$

7. $\{\ \}$; The system is inconsistent.

9. Milk has 300 mg per cup and spinach has 240 mg per cup.

11. The speed of the plane in still air is 420 mph and the speed of the wind is 60 mph. **13.** $\{(-1, 2, -3)\}$

15. Infinitely many solutions; The equations are dependent.

17. $\left\{\left(x, -\frac{1}{5}x, -\frac{23}{5}x\right) \middle| x \text{ is any real number}\right\}$ or

$\{(-5y, y, 23y) \mid y \text{ is any real number}\}$ or

$\left\{\left(-\frac{5}{23}z, \frac{1}{23}z, z\right) \middle| z \text{ is any real number}\right\}$

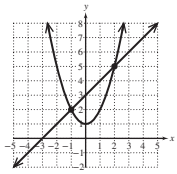
19. Esra put \$2000 in savings, and invested \$12,000 in the bond fund and \$6000 in the stock fund. **21.** $y = 3x^2 - 6x + 1$

23. $\frac{A}{x+2} + \frac{B}{x-1}$ **25.** $\frac{A}{x} + \frac{B}{x^2} + \frac{C}{2x+3}$

27. $\frac{Ax+B}{x^2+1} + \frac{Cx+D}{x^2+4}$ **29.** $\frac{5}{x+4} + \frac{2}{(x+4)^2}$

31. $\frac{-2}{x} + \frac{4x+1}{x^2+5}$

33. a.



b. $\{(-1, 2), (2, 5)\}$

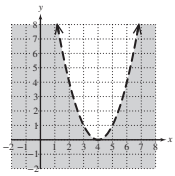
35. $\{(2, 4), (2, -4), (-2, 4), (-2, -4)\}$

37. $\{(4, 2)\}$

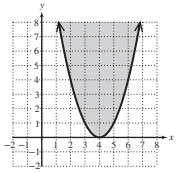
39. The numbers are 8 and 6 or -8 and -6.

41. The billboard is 12 ft by 24 ft.

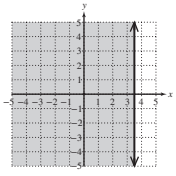
43. a.



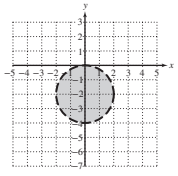
b.



45.

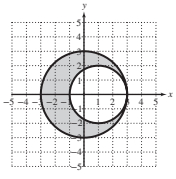


47.



49. a. No **b.** Yes

51.



53. $\{\ \}$ **55.** $z = 24x + 20y$

57. a.

f. $x_1 = 250$ vehicles per hour; $x_2 = 150$ vehicles per hour

g. $220 \le x_1 \le 270$ vehicles per hour; $130 \le x_2 \le 180$ vehicles per hour

47. a. $x_1 = 60$ vehicles per hour; $x_2 = 210$ vehicles per hour; $x_3 = 170$ vehicles per hour

b. $40 \le x_1 \le 90$ vehicles per hour; $190 \le x_2 \le 240$ vehicles per hour; $150 \le x_3 \le 200$ vehicles per hour

49. a.
$$\begin{aligned} 80x + 400y + 480z &= 9280 \\ 50x + 350y + 400z &= 7800 \\ 75x + 525y + 600z &= 10{,}500 \end{aligned}$$

b. $\{\ \}$ **c.** The system of equations reduces to a contradiction. There are no values for x, y, and z that can simultaneously meet the conditions of this problem.

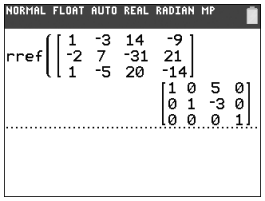
51. $5(-2z + 16) + 7(3z - 5) - 11z = 45$ ✓
$3(-2z + 16) + 5(3z - 5) - 9z = 23$ ✓
$(-2z + 16) + (3z - 5) - z = 11$

53. (0, 0, 0) is the only solution.

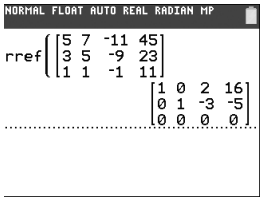
55. Infinitely many solutions; $\{(2z, 3z, z) \mid z \text{ is any real number}\}$

57. If a row of the reduced row-echelon form results in a contradiction (that is, zeros to the left of the vertical bar and a nonzero element to the right), then the system is inconsistent. **59.** The equations are equivalent, meaning that they all have the same solution set. The points in the solution set represent a common plane in space.

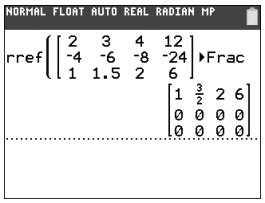
61. $\{\ \}$



63. $\{(-2z + 16, 3z - 5, z) \mid z$ is any real number$\}$



65. $\left\{\left(\dfrac{12 - 3y - 4z}{2}, y, z\right) \middle| y \text{ and } z \text{ are any real numbers}\right\}$ or $\{(x, y, z) \mid 2x + 3y + 4z = 12\}$



Section 10.3 Practice Exercises, pp. 950–955

R.1. -9 **R.2.** $x + (-9)$ **R.3.** $\{-4\}$

1. order; rows; columns. **3.** The order of the matrices must be the same, and the corresponding elements must be equal.

5. columns; rows **7.** False **9.** A row matrix is a matrix with only one row. **11. a.** 2×3 **b.** None of these

13. a. 3×1 **b.** Column matrix

15. a. 2×2 **b.** Square matrix

17. $\sqrt{5}$ **19.** $\frac{1}{3}$ **21.** 2

23. $x = 4, y = 2, z = 10$ **25.** $\begin{bmatrix} 4 & -6 & -9 \\ -\frac{3}{5} & -1 & -7 \end{bmatrix}$

27. $\begin{bmatrix} -3 & 1 \\ 13.2 & \frac{5}{2} \\ \frac{7}{3} & 3\sqrt{2} \end{bmatrix}$ **29.** $\begin{bmatrix} -4 & 7 \\ 0.2 & \frac{7}{6} \\ -\frac{2}{3} & 6 + \sqrt{2} \end{bmatrix}$ **31.** Not possible

33. Multiply each element in the matrix by the scalar.

35. $\begin{bmatrix} 6 & 12 & -27 \\ 3 & 3\sqrt{3} & \frac{3}{2} \end{bmatrix}$ **37.** $\begin{bmatrix} 3 & -8 & -10 \\ -16 & -2\sqrt{3} - 63 & -\frac{17}{3} \end{bmatrix}$

39. $\begin{bmatrix} -4 & -16 & 20 \\ -12 & -4\sqrt{3} - 36 & -\frac{14}{3} \end{bmatrix}$ **41.** $\begin{bmatrix} 9 & 8 & -38 \\ -8 & 2\sqrt{3} - 45 & -\frac{7}{3} \end{bmatrix}$

43. $X = \begin{bmatrix} \frac{3}{2} & 1 \\ 5 & \frac{7}{2} \end{bmatrix}$ **45.** $X = \begin{bmatrix} \frac{1}{5} & -2 \\ \frac{2}{5} & \frac{11}{5} \end{bmatrix}$ **47.** $X = \begin{bmatrix} 0 & \frac{8}{5} \\ \frac{1}{5} & -\frac{13}{10} \end{bmatrix}$

49. a. Yes; 4×1 **b.** No **51. a.** Yes; 5×5 **b.** Yes; 1×1

53. a. $\begin{bmatrix} -1 & 17 \\ -2 & 41 \end{bmatrix}$ **b.** $\begin{bmatrix} 22 & 31 \\ 13 & 18 \end{bmatrix}$ **c.** $\begin{bmatrix} 19 & 27 \\ 45 & 64 \end{bmatrix}$

55. a. $\begin{bmatrix} -6 & 8 & 38 \\ -12 & -24 & 36 \\ -13 & 4 & 69 \end{bmatrix}$ **b.** $\begin{bmatrix} -23 & 9 \\ 6 & 62 \end{bmatrix}$ **c.** Not possible

57. a. $\begin{bmatrix} 19 \\ 26 \\ 5 \end{bmatrix}$ **b.** Not possible **c.** $\begin{bmatrix} 79 & -5 & 2 \\ 4 & 27 & 45 \\ -1 & 12 & 53 \end{bmatrix}$

59. a. $\begin{bmatrix} \frac{2}{3} \end{bmatrix}$ **b.** $\begin{bmatrix} -\frac{1}{3} & -\frac{1}{6} \\ 2 & 1 \end{bmatrix}$ **c.** Not possible

61. a. $\begin{bmatrix} 4 & 8 & 20 & 24 \\ -6 & -12 & -30 & -36 \end{bmatrix}$ **b.** Not possible

c. Not possible

63. a. $[-25]$ **b.** $[-25]$ **c.** $[25]$

65. $\begin{bmatrix} 3.1 & -2.3 \\ 1.1 & 6.5 \end{bmatrix}$ **67.** $\begin{bmatrix} \frac{9}{5} & -3 & \sqrt{6} \\ 5 & \frac{1}{2} & 2 \\ 3 & 0 & 1 \end{bmatrix}$

69. a. $M - D = \begin{bmatrix} \$3600 & \$2400 \\ \$3400 & \$2000 \end{bmatrix}$;
This represents the profit that the dealer clears for each model.

b. $F = 1.06D = \begin{bmatrix} \$30{,}740 & \$29{,}150 \\ \$30{,}210 & \$28{,}514 \end{bmatrix}$

71. [\$1820]; The value \$1820 represents the total revenue from the sale of these four items.

73. a. $\begin{bmatrix} \$103{,}974 & \$42{,}560 \\ \$69{,}754 & \$28{,}400 \\ \$66{,}438 & \$26{,}960 \end{bmatrix}$; The first column gives the total revenue for Friday, Saturday, and Sunday, respectively. The second column gives the profit for Friday, Saturday, and Sunday, respectively.

b. \$66,438 **c.** \$97,920

75. a. TL (The product LT is not possible.)

b. $TL = \begin{bmatrix} \$2088 \\ \$2688 \\ \$1657 \end{bmatrix}$

77. a. $CN_1 = \begin{bmatrix} \$46 \\ \$40 \\ \$2.40 \end{bmatrix}$; The matrix CN_1 represents the additional cost for 24 text messages and 100 extra minutes for each of the cell phone plans.

b. $CN_3 = \begin{bmatrix} \$46 & \$23.60 & \$7.50 \\ \$40 & \$9.60 & \$0 \\ \$2.40 & \$5.60 & \$3 \end{bmatrix}$; The matrix CN_3 represents the additional cost per month for each plan. For example, row 1 represents the cost for plan A for months 1, 2, and 3, respectively.

ISTUDY

79. a. $A = \begin{bmatrix} -1 & 0 & 4 \\ 1 & 3 & 2 \end{bmatrix}$ **b.** $\begin{bmatrix} -1 & 0 & 4 \\ 1 & 3 & 2 \end{bmatrix} + \begin{bmatrix} 2 & 2 & 2 \\ -4 & -4 & -4 \end{bmatrix} = \begin{bmatrix} 1 & 2 & 6 \\ -3 & -1 & -2 \end{bmatrix}$

c. $\begin{bmatrix} 1 & 0 & -4 \\ 1 & 3 & 2 \end{bmatrix}$; This matrix represents the reflection of the triangle across the y-axis. **d.** $\begin{bmatrix} -1 & 0 & 4 \\ -1 & -3 & -2 \end{bmatrix}$; This matrix represents the reflection of the triangle across the x-axis.

e. $\begin{bmatrix} -2 & -1 & 3 \\ 1 & -1 & 0 \end{bmatrix}$; This matrix represents the reflection of the triangle across the x-axis, followed by a shift to the left 1 unit and a shift upward 2 units.

81. a. $A = \begin{bmatrix} -2 & 3 & 3 & 0 \\ 1 & 3 & 0 & -1 \end{bmatrix}$ **b.** $A + \begin{bmatrix} 0 & 0 & 0 & 0 \\ -3 & -3 & -3 & -3 \end{bmatrix}$

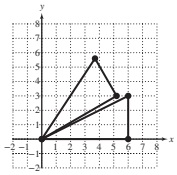
c. $A + \begin{bmatrix} -4 & -4 & -4 & -4 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

d. $\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} A = \begin{bmatrix} -2 & 3 & 3 & 0 \\ -1 & -3 & 0 & 1 \end{bmatrix}$

e. $\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} A = \begin{bmatrix} 2 & -3 & -3 & 0 \\ 1 & 3 & 0 & -1 \end{bmatrix}$

83. a. $\begin{bmatrix} 0 & 6 & 6 \\ 0 & 3 & 0 \end{bmatrix}$ **b.** $\begin{bmatrix} 0 & 3.7 & 5.2 \\ 0 & 5.6 & 3 \end{bmatrix}$

c. It appears that the triangle was rotated approximately 30° counterclockwise.



85. a. $\begin{bmatrix} 6 & 6 & 6 \\ 6 & 0 & 0 \\ 6 & 6 & 6 \\ 6 & 0 & 0 \\ 6 & 6 & 6 \end{bmatrix}$

b. $\begin{bmatrix} 6 & 6 & 6 \\ 6 & 0 & 0 \\ 6 & 6 & 6 \\ 6 & 0 & 0 \\ 6 & 6 & 6 \end{bmatrix} + \begin{bmatrix} -1 & -1 & -1 \\ -1 & 1 & 1 \\ -1 & -1 & -1 \\ -1 & 1 & 1 \\ -1 & -1 & -1 \end{bmatrix} = \begin{bmatrix} 5 & 5 & 5 \\ 5 & 1 & 1 \\ 5 & 5 & 5 \\ 5 & 1 & 1 \\ 5 & 5 & 5 \end{bmatrix}$

87. $A + B = \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix} + \begin{bmatrix} b_1 & b_2 \\ b_3 & b_4 \end{bmatrix}$

$= \begin{bmatrix} a_1 + b_1 & a_2 + b_2 \\ a_3 + b_3 & a_4 + b_4 \end{bmatrix} = \begin{bmatrix} b_1 + a_1 & b_2 + a_2 \\ b_3 + a_3 & b_4 + a_4 \end{bmatrix}$

$= B + A$

89. $A + (-A) = \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix} + \begin{bmatrix} -a_1 & -a_2 \\ -a_3 & -a_4 \end{bmatrix}$

$= \begin{bmatrix} a_1 + (-a_1) & a_2 + (-a_2) \\ a_3 + (-a_3) & a_4 + (-a_4) \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = 0$

91. $s(tA) = s \cdot \left(t \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix} \right) = s \cdot \begin{bmatrix} ta_1 & ta_2 \\ ta_3 & ta_4 \end{bmatrix}$

$= \begin{bmatrix} sta_1 & sta_2 \\ sta_3 & sta_4 \end{bmatrix} = (st) \begin{bmatrix} a_1 & a_2 \\ a_3 & a_4 \end{bmatrix} = (st)A$

93. $A^2 = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$, $A^3 = \begin{bmatrix} -i & 0 \\ 0 & -i \end{bmatrix}$, $A^4 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$; The entries along the main diagonal in matrix A^n are the same as the value of i^n.

95. a. $\begin{bmatrix} ac & 0 \\ 0 & bd \end{bmatrix}$ **b.** $\begin{bmatrix} 3 & 0 \\ 0 & 14 \end{bmatrix}$

97. The number of columns in the first matrix is not equal to the number of rows in the second matrix.

99. To find $-A$, take the additive inverse of each individual element of A. That is, $-A = [-a_{ij}]$.

ISTUDY

51. False. If a matrix has an inverse, it must be a square matrix.

53. False. For example, a square matrix with a row or column of all zeros does not have an inverse. **55.** True **57.** False. If one row (or column) of a matrix is a multiple of another row (or column), then the matrix does not have an inverse.

59. For example: $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$ **61. a.** $A^{-1} = \begin{bmatrix} \frac{3}{4} & -\frac{1}{4} \\ -\frac{5}{8} & \frac{3}{8} \end{bmatrix}$

b. $(A^{-1})^{-1} = A = \begin{bmatrix} 3 & 2 \\ 5 & 6 \end{bmatrix}$ **63.** $A^{-1} = \begin{bmatrix} \frac{1}{a} & 0 \\ 0 & \frac{1}{b} \end{bmatrix}$

65. a. $\{(-11, -10)\}$ **b.** $\left\{\left(\frac{1}{2}, \frac{2}{3}\right)\right\}$

67. If $AB = I_n$ and $BA = I_n$, then the matrices are inverses.

69. $\left[\begin{array}{cc|cc} a & b & 1 & 0 \\ c & d & 0 & 1 \end{array}\right] \overset{\frac{1}{a}R_1 \to R_2}{=} \left[\begin{array}{cc|cc} 1 & \frac{b}{a} & \frac{1}{a} & 0 \\ c & d & 0 & 1 \end{array}\right]$

$\overset{-c \cdot R_1 + R_2 \to R_2}{=} \left[\begin{array}{cc|cc} 1 & \frac{b}{a} & \frac{1}{a} & 0 \\ 0 & d - \frac{cb}{a} & -\frac{c}{a} & 1 \end{array}\right] = \left[\begin{array}{cc|cc} 1 & \frac{b}{a} & \frac{1}{a} & 0 \\ 0 & \frac{ad-bc}{a} & -\frac{c}{a} & 1 \end{array}\right]$

$\overset{\frac{a}{ad-bc} \cdot R_2 \to R_2}{=} \left[\begin{array}{cc|cc} 1 & \frac{b}{a} & \frac{1}{a} & 0 \\ 0 & 1 & -\frac{c}{ad-bc} & \frac{a}{ad-bc} \end{array}\right]$

$\overset{-\frac{b}{a} \cdot R_2 + R_1 \to R_1}{=} \left[\begin{array}{cc|cc} 1 & 0 & \frac{d}{ad-bc} & -\frac{b}{ad-bc} \\ 0 & 1 & -\frac{c}{ad-bc} & \frac{a}{ad-bc} \end{array}\right]$

Therefore, $A^{-1} = \dfrac{1}{ad - bc}\begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$, provided $ad - bc \neq 0$.

71. $x_1 = 36.5°\text{F}$, $x_2 = 37.5°\text{F}$, $x_3 = 40.5°\text{F}$, $x_4 = 41.5°\text{F}$

73. $A^{-1} = \begin{bmatrix} 0.29 & -0.10 & 0.08 & -0.27 \\ -0.09 & 0.12 & 0.00 & 0.27 \\ -0.12 & 0.00 & -0.07 & 0.25 \\ 0.15 & 0.03 & -0.06 & -0.01 \end{bmatrix}$

75. $\{(5.35, 41.71, 4.45)\}$

77. a. $A^{-1} = \begin{bmatrix} 5 & 4 & -6 \\ -4 & -4 & 5 \\ 1 & 1 & -1 \end{bmatrix}$ **b.** STAY SAFE

c. $\{(z + 3, 2z + 5, z) \mid z \text{ is any real number}\}$

Chapter 10 Review Exercises, pp. 983–986

1. $x - 2y + 3z = -1$
$y + 4z = -11$
$z = -2$;
Solution set: $\{(-1, -3, -2)\}$

3. $\left[\begin{array}{cc|c} 1 & -\frac{3}{2} & \frac{1}{2} \\ 5 & 6 & -4 \end{array}\right]$

5. $\{(5, -6)\}$ **7.** $\{(0, 2, 3)\}$ **9.** Chloe borrowed \$1000 from her friend, \$7000 from the credit union, and \$2000 from the bank.

11. $\{\ \}$ **13.** $\{(3z, -2z + 1, z) \mid z \text{ is any real number}\}$ **15.** $\{\ \}$

17. $\{(3z + 5, -4z + 3, z) \mid z \text{ is any real number}\}$

19. $\{(5y - 2z - 1, y, z) \mid y \text{ and } z \text{ are any real numbers}\}$ or $\{(x, y, z) \mid x - 5y + 2z = -1\}$

21. a. $x_1 = 76$ vehicles per hour; $x_2 = 97$ vehicles per hour
b. $46 \le x_1 \le 96$ vehicles per hour; $67 \le x_2 \le 117$ vehicles per hour

23. a. 3×2 **b.** None of these

25. a. 2×1 **b.** Column matrix **27.** 4 **29.** $x = 6$, $y = 3$, $z = 8$

31. $3A = \begin{bmatrix} -12 & 3 \\ 18 & -6 \\ 3 & 9 \end{bmatrix}$ **33.** Not possible

35. $2A - C = \begin{bmatrix} -8 - \pi & -2 \\ 15 & -5 \\ 2 & 1 \end{bmatrix}$ **37.** $AB = \begin{bmatrix} -7 & -7 & 22 \\ 10 & 8 & -30 \\ 5 & 18 & -25 \end{bmatrix}$

39. Not possible **41.** $A^2 = \begin{bmatrix} -2 & 36 \\ -6 & 10 \end{bmatrix}$ **43.** $BC = \begin{bmatrix} 2 & 7 \\ -6 & -21 \end{bmatrix}$

45. $QP = \begin{bmatrix} \$7922 \\ \$9843 \end{bmatrix}$; QP is the matrix representing the total revenue from these four items for each theater.

47. a. $A = \begin{bmatrix} 1 & 3 & 5 \\ 1 & 4 & 2 \end{bmatrix}$ **b.** $\begin{bmatrix} 1 & 3 & 5 \\ 1 & 4 & 2 \end{bmatrix} + \begin{bmatrix} -3 & -3 & -3 \\ -1 & -1 & -1 \end{bmatrix}$
$= \begin{bmatrix} -2 & 0 & 2 \\ 0 & 3 & 1 \end{bmatrix}$

ISTUDY

c. $\begin{bmatrix} -1 & -3 & -5 \\ 1 & 4 & 2 \end{bmatrix}$; This matrix represents the reflection of the triangle across the y-axis. **d.** $\begin{bmatrix} 1 & 3 & 5 \\ -1 & -4 & -2 \end{bmatrix}$; This matrix represents the reflection of the triangle across the x-axis. **49.** No

51. $A^{-1} = \begin{bmatrix} \frac{1}{6} & \frac{1}{6} \\ -\frac{1}{12} & \frac{5}{12} \end{bmatrix}$ **53.** Singular matrix

55. $A^{-1} = \begin{bmatrix} 0 & -1 & 4 \\ 1 & -1 & 5 \\ -3 & -1 & 0 \end{bmatrix}$ **57.** $\begin{bmatrix} -3 & 7 & 0 \\ 4 & 0 & 2 \\ 2 & -1 & 5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ -3 \\ -13 \end{bmatrix}$

59. $\{(4, -3)\}$ **61.** $\{(1, 2, 3)\}$

63. a. 24 **b.** 24 **65. a.** 13 **b.** -13

67. $81 - x^2$ **69.** 156 **71.** -270

73. $\left\{\left(\frac{3}{10}, -\frac{23}{30}\right)\right\}$ **75.** $\left\{\left(-\frac{7}{25}, -\frac{222}{125}, \frac{161}{125}\right)\right\}$

77. $y = -\frac{94}{67}$

Chapter 10 Test, pp. 986–987

1. $\left[\begin{array}{ccc|c} 1 & 5 & -3 & 1 \\ 3 & 1 & 4 & -2 \\ 0 & 4 & 2 & 6 \end{array}\right]$ **2.** $\left[\begin{array}{cccc|c} 0 & -14 & 13 & -5 \\ 1 & 5 & -3 & 1 \\ 0 & 4 & 2 & 6 \end{array}\right]$

3. $\left[\begin{array}{ccc|c} 3 & 1 & 4 & -2 \\ 1 & 5 & -3 & 1 \\ 0 & 1 & \frac{1}{2} & \frac{3}{2} \end{array}\right]$

4. The elements above the leading 1 in the third column are not all zero. Specifically, the element in row 1, column 3 should be 0.

5. $\{(-10, 3)\}$ **6.** $\{\ \}$ **7.** $\{(3z, -2z + 5, z) \mid z \text{ is any real number}\}$

8. a. 8 **b.** -8 **9. a.** -12 **b.** -12 **10.** -31

11. 236 **12.** $|A| = 0$. Therefore, A is singular (does not have an inverse).

13. $\{(-2, 3)\}$ **14.** $\{\ \}$ **15.** $\{(-2, -8, 2)\}$

16. $\{(-3z - 2, -4z + 1, z) \mid z \text{ is any real number}\}$

17. $\left\{\left(\frac{54}{61}, -\frac{53}{61}\right)\right\}$ **18.** $x = \frac{7}{31}$ **19.** $X = \begin{bmatrix} -1 & 2 \\ -4 & -2 \end{bmatrix}$

20. $2A - 3C = \begin{bmatrix} 8 & -1 & 6 \\ -2 & 11 & -12 \end{bmatrix}$ **21.** Not possible

22. $AB = \begin{bmatrix} -5 & 20 \\ 20 & 44 \end{bmatrix}$ **23.** $BA = \begin{bmatrix} 22 & 37 & 51 \\ -2 & -4 & -6 \\ 22 & 23 & 21 \end{bmatrix}$

24. Yes **25.** $A^{-1} = \begin{bmatrix} 2 & -1 \\ -\frac{5}{2} & \frac{3}{2} \end{bmatrix}$ **26.** Singular matrix

27. $A^{-1} = \begin{bmatrix} 3 & 1 & 2 \\ 7 & 2 & 5 \\ 1 & 1 & 1 \end{bmatrix}$ **28.** $\{(1, 5)\}$ **29.** $\{(2, 1, -3)\}$

30. a. $x_1 = 128$ vehicles per hour; $x_2 = 173$ vehicles per hour
b. $118 \le x_1 \le 168$ vehicles per hour; $163 \le x_2 \le 213$ vehicles per hour

31. $CN = \begin{bmatrix} 5500 \\ 8040 \end{bmatrix}$; This represents the total number of calories burned by two individuals with different weights after biking 6 hr, running 3 hr, and walking 5 hr. For example, the element 5500 in the first row tells us that 5500 cal would be burned by a 120-lb individual who biked 6 hr, ran 3 hr, and walked 5 hr in a given week. **32.** Yes

Chapter 10 Cumulative Review Exercises, pp. 987–988

1. $3x^2 + 3xh + h^2$ **2. a.** $(4, -5)$ **b.** $(-\infty, 4)$ **c.** $(4, \infty)$
d. $(-\infty, \infty)$ **e.** $(-\infty, -5]$ **3.** $\frac{2}{3}$ **4. a.** i **b.** -1

59. a. Major axis: 12 ft; Minor axis: 10 ft **b.** $\dfrac{x^2}{36} + \dfrac{y^2}{25} = 1$
c. Place the tacks at $(\sqrt{11}, 0)$ and $(-\sqrt{11}, 0)$. These are approximately 3.3 ft to the left and right of the center.

61. The foci should be located $\pm 30\sqrt{2}$ in. (approximately 42.4 in.) from the center along the major axis. **63.** b **65.** a

67. $e = \dfrac{12}{13}$ **69.** $e = \dfrac{3}{5}$ **71.** $e = \dfrac{\sqrt{2}}{2}$ **73.** The Earth's orbit is more circular, and the orbit for Halley's Comet is very elongated.

75. 405,500 km **77. a.** $\dfrac{x^2}{90^2} + \dfrac{y^2}{143.5^2} = 1$ **b.** $e \approx 0.78$
c. $\dfrac{x^2}{255^2} + \dfrac{y^2}{307.5^2} = 1$ **d.** $e \approx 0.56$ **e.** The outer ellipse is more circular than the inner ellipse because the eccentricity is closer to zero.

79. $\dfrac{x^2}{64} + \dfrac{y^2}{289} = 1$ **81.** $\dfrac{(x-4)^2}{25} + \dfrac{(y+1)^2}{9} = 1$

83. a. $\dfrac{x^2}{4} + y^2 = 1$; $e = \dfrac{\sqrt{3}}{2}$ (≈ 0.87); Foci: $(\pm\sqrt{3}, 0)$
b. $\dfrac{x^2}{4} + \dfrac{y^2}{9} = 1$; $e = \dfrac{\sqrt{5}}{3}$ (≈ 0.75); Foci: $(0, \pm\sqrt{5})$
c. $\dfrac{x^2}{4} + \dfrac{y^2}{16} = 1$; $e = \dfrac{\sqrt{3}}{2}$ (≈ 0.87); Foci: $(0, \pm 2\sqrt{3})$

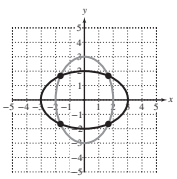
85. $\dfrac{(x-1)^2}{9} + \dfrac{(y+1)^2}{16} = 1$; $e = \dfrac{\sqrt{7}}{4}$ (≈ 0.66); Foci: $(1, -1 \pm \sqrt{7})$

87. a. $x^2 + y^2 = 4$ **b.** Elliptical **c.** Major axis: $\dfrac{4\sqrt{34}}{5}$ in. $\approx$ 4.7 in.; Minor axis: 4 in.

89. a. Top semiellipse **b.** Bottom semiellipse **c.** Right semiellipse **d.** Left semiellipse **91.** {(0, 3), (5, 0)}

93. {(0, 4), (−2, 0), (2, 0)}

95. $\left(\dfrac{6}{\sqrt{13}}, \dfrac{6}{\sqrt{13}}\right), \left(-\dfrac{6}{\sqrt{13}}, \dfrac{6}{\sqrt{13}}\right), \left(\dfrac{6}{\sqrt{13}}, -\dfrac{6}{\sqrt{13}}\right), \left(-\dfrac{6}{\sqrt{13}}, -\dfrac{6}{\sqrt{13}}\right)$



97. a. $A = 4\pi\sqrt{2}$ square units **b.** $P \approx 2\pi\sqrt{6}$ units

99. By the reflective property of an ellipse, any shot passing through one focus is reflected through the other focus.

101. The first equation represents an ellipse centered at the origin, whereas the second equation represents a line with slope $-\frac{4}{9}$ and y-intercept (0, 4).

ISTUDY

103. $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1 \qquad \frac{c^2}{a^2}+\frac{y^2}{b^2}=1 \qquad y=b\sqrt{1-\frac{c^2}{a^2}}$

$y=b\sqrt{\frac{a^2-c^2}{a^2}} \qquad y=\frac{b}{a}\sqrt{a^2-c^2}$

Recall that $c^2=a^2-b^2$, or equivalently $b^2=a^2-c^2$ and $b>0$.

Therefore, $y=\frac{b}{a}\sqrt{b^2}$ or $y=\frac{b^2}{a}$. The length of a latus rectum is $2y=\frac{2b^2}{a}$.

105. a. $y-y_1=-\frac{b^2x_1}{a^2y_1}(x-x_1)$

b. $a^2y_1y-a^2y_1^2=-b^2x_1x+b^2x_1^2$

c. $\frac{y_1y}{b^2}-\frac{y_1^2}{b^2}=-\frac{x_1x}{a^2}+\frac{x_1^2}{a^2}$

d. Rewriting the equation $\frac{y_1y}{b^2}-\frac{y_1^2}{b^2}=-\frac{x_1x}{a^2}+\frac{x_1^2}{a^2}$ with the x and y terms on the left, this becomes $\frac{x_1x}{a^2}+\frac{y_1y}{b^2}=\frac{x_1^2}{a^2}+\frac{y_1^2}{b^2}$. Because the right side is 1, the equation of the tangent line is $\frac{x_1x}{a^2}+\frac{y_1y}{b^2}=1$ or equivalently $\left(\frac{x_1}{a^2}\right)x+\left(\frac{y_1}{b^2}\right)y=1$.

107. a. $y=-x+5$ **b.** $y=-\sqrt{15}$

109. a. $(a+c)+(a-c)=2a$

b. $\sqrt{(x+c)^2+y^2}+\sqrt{(x-c)^2+y^2}=2a$

c. $\sqrt{(x+c)^2+y^2}=2a-\sqrt{(x-c)^2+y^2}$

$(x+c)^2+y^2=4a^2-4a\sqrt{(x-c)^2+y^2}+(x-c)^2+y^2$

$4a\sqrt{(x-c)^2+y^2}=4a^2+(x-c)^2-(x+c)^2$

$4a\sqrt{(x-c)^2+y^2}=4a^2-4xc$

$a\sqrt{(x-c)^2+y^2}=a^2-xc$

d. $\left(a\sqrt{(x-c)^2+y^2}\right)^2=(a^2-xc)^2$

$a^2\left[(x-c)^2+y^2\right]=a^4-2a^2xc+c^2x^2$

$a^2\left[x^2-2xc+c^2+y^2\right]=a^4-2a^2xc+c^2x^2$

$a^2x^2-2a^2xc+a^2c^2+a^2y^2=a^4-2a^2xc+c^2x^2$

$a^2x^2-c^2x^2+a^2y^2=a^4-a^2c^2$

$(a^2-c^2)x^2+a^2y^2=a^2(a^2-c^2)$

e. $b^2x^2+a^2y^2=a^2b^2$

$\frac{b^2x^2}{a^2b^2}+\frac{a^2y^2}{a^2b^2}=\frac{a^2b^2}{a^2b^2}$

$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$

111. a. Both equations have a sum of terms with a variable squared in the numerator and a real number squared in the denominator, all equal to 1.

b. $\frac{x^2}{9}+\frac{y^2}{36}=1$; This represents the graph of an ellipse in the xy-plane.

c. $\frac{y^2}{36}+\frac{z^2}{4}=1$; This represents the graph of an ellipse in the yz-plane.

d. $\frac{x^2}{9}+\frac{z^2}{4}=1$; This represents the graph of an ellipse in the xz-plane.

89. $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ $\frac{c^2}{a^2} - \frac{y^2}{b^2} = 1$ $y = b\sqrt{\frac{c^2}{a^2} - 1}$
$y = b\sqrt{\frac{c^2 - a^2}{a^2}}$ $y = \frac{b}{a}\sqrt{c^2 - a^2}$
Recall that $c^2 = a^2 + b^2$ or equivalently $b^2 = c^2 - a^2$ and $b > 0$.
Therefore, $y = \frac{b}{a}\sqrt{b^2}$ or $y = \frac{b^2}{a}$.
The length of a latus rectum is $2y = \frac{2b^2}{a}$.

91. **a.** $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$; This is an equation of an ellipse in the xy-plane.
b. $\frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$; This is an equation of a hyperbola in the yz-plane with transverse axis on the y-axis. **c.** $\frac{x^2}{a^2} - \frac{z^2}{c^2} = 1$; This is an equation of a hyperbola in the xz-plane with transverse axis on the x-axis.

Problem Recognition Exercises, pp. 1040–1041

1. Hyperbola; Center: $(2, -2)$; Vertices: $(6, -2), (-2, -2)$; Foci: $(7, -2), (-3, -2)$; Asymptotes: $y = \frac{3}{4}x - \frac{7}{2}$ and $y = -\frac{3}{4}x - \frac{1}{2}$; Eccentricity: $\frac{5}{4}$ **2.** Ellipse: Center: $(0, 2)$; Vertices: $(5, 2), (-5, 2)$; Endpoints of minor axis: $(0, 5), (0, -1)$; Foci: $(4, 2), (-4, 2)$; Eccentricity: $\frac{4}{5}$ **3.** Parabola; Vertex: $(-2, 5)$; Focus: $\left(-\frac{9}{4}, 5\right)$; Directrix: $x = -\frac{7}{4}$; Axis of symmetry: $y = 5$

4. Circle; Center: $(3, -7)$; Radius: 5 **5.** Ellipse; Center: $(-1, 0)$; Vertices: $(-1, 4), (-1, -4)$; Endpoints of minor axis: $(-2, 0), (0, 0)$; Foci: $\left(-1, \sqrt{15}\right), \left(-1, -\sqrt{15}\right)$; Eccentricity: $\frac{\sqrt{15}}{4}$

6. Parabola; Vertex: $(1, -3)$; Focus: $\left(1, -\frac{1}{2}\right)$; Directrix: $y = -\frac{11}{2}$; Axis of symmetry: $x = 1$

7. Circle; Center: $(-1, -6)$; Radius: 4

8. Hyperbola; Center: $(-4, 1)$; Vertices: $(-4, 13), (-4, -11)$; Foci: $(-4, 14), (-4, -12)$; Asymptotes: $y = \frac{12}{5}x + \frac{53}{5}$ and $y = -\frac{12}{5}x - \frac{43}{5}$; Eccentricity: $\frac{13}{12}$

9. Hyperbola; $\frac{(x - 2)^2}{16} - \frac{(y + 2)^2}{9} = 1$ **10.** Ellipse; $\frac{x^2}{25} + \frac{(y - 2)^2}{9} = 1$ **11.** Parabola; $(y - 5)^2 = -(x + 2)$

12. Circle; $(x - 3)^2 + (y + 7)^2 = 25$ **13.** Ellipse; $(x + 1)^2 + \frac{y^2}{16} = 1$

14. Parabola; $(x - 1)^2 = 10(y + 3)$ **15.** Circle; $(x + 1)^2 + (y + 6)^2 = 16$

16. Hyperbola; $\frac{(y - 1)^2}{144} - \frac{(x + 4)^2}{25} = 1$

17. $(x - 2)^2 + (y + 1)^2 = 0$; The graph is a single point: $(2, -1)$.

18. $\frac{x^2}{4} + \frac{(y - 3)^2}{9} = 0$; The graph is a single point: $(0, 3)$.

19. $(x - 4)^2 - \frac{(y + 2)^2}{4} = 0$; The graph is a pair of intersecting lines: $y = -2x + 6$ and $y = 2x - 10$.

20. $\frac{(x - 5)^2}{4} - \frac{(y + 1)^2}{9} = 0$; The graph is a pair of intersecting lines: $y = \frac{3}{2}x - \frac{17}{2}$ and $y = -\frac{3}{2}x + \frac{13}{2}$.

21. $\frac{x^2}{4} + \frac{(y - 2)^2}{9} = -1$; No solution. There are no real numbers x and y that would make the sum of two squares equal to -1.

22. $(x + 6)^2 + y^2 = -1$; No solution. There are no real numbers x and y that would make the sum of two squares equal to -1.

23. With $C = A$ and completing the square, the equation $Ax^2 + Cy^2 + Dx + Ey + F = 0$ becomes

$$Ax^2 + Ay^2 + Dx + Ey + F = 0$$

$$x^2 + y^2 + \frac{D}{A}x + \frac{E}{A}y + \frac{F}{A} = 0$$

$$\left(x + \frac{D}{2A}\right)^2 + \left(y + \frac{E}{2A}\right)^2 = \frac{D^2}{4A^2} + \frac{E^2}{4A^2} - \frac{F}{A}$$

$$\left(x + \frac{D}{2A}\right)^2 + \left(y + \frac{E}{2A}\right)^2 = \frac{D^2 + E^2 - 4AF}{4A^2}$$

This is the standard form of an equation of circle with center $\left(-\frac{D}{2A}, -\frac{E}{2A}\right)$ and radius $\frac{\sqrt{D^2 + E^2 - 4AF}}{2A}$ provided $D^2 + E^2 - 4AF > 0$.

24. Let $k = \frac{D^2}{4A} + \frac{E^2}{4C} - F$ and assume that $k \neq 0$. Then, by completing the square,

$Ax^2 + Cy^2 + Dx + Ey + F = 0$ becomes

$$A\left(x + \frac{D}{2A}\right)^2 + C\left(y + \frac{E}{2C}\right)^2 = \frac{D^2}{4A} + \frac{E^2}{4C} - F$$

$$A\left(x + \frac{D}{2A}\right)^2 + C\left(y + \frac{E}{2C}\right)^2 = k$$

$$\frac{\left(x + \frac{D}{2A}\right)^2}{\frac{k}{A}} + \frac{\left(y + \frac{E}{2C}\right)^2}{\frac{k}{C}} = 1$$

ISTUDY

a. The numerator of each term on the left side of the equation is nonnegative. Therefore, the sign of each term is dictated by the denominator. For A and C of the same sign, if k has the same sign as A, it also has the same sign as C and is nonzero. Thus, the denominators $\frac{k}{A}$ and $\frac{k}{C}$ are both positive. Therefore, the equation is in the standard form of an ellipse with center $\left(-\frac{D}{2A}, -\frac{E}{2C}\right)$.

b. For A and C of opposite signs and $k \neq 0$, the denominators $\frac{k}{A}$ and $\frac{k}{C}$ have opposite signs, indicating that the terms on the left side of the equation have opposite signs. Therefore, the equation is a hyperbola with center $\left(-\frac{D}{2A}, -\frac{E}{2C}\right)$.

25. If $A = 0$, then $Ax^2 + Cy^2 + Dx + Ey + F = 0$ becomes $Cy^2 + Dx + Ey + F = 0$. Completing the square gives

$$C\left(y^2 + \frac{E}{C}y + \frac{E^2}{4C^2}\right) = -Dx - F + \frac{E^2}{4C}$$

$$C\left(y + \frac{E}{2C}\right)^2 = -D\left(x + \frac{F}{D} - \frac{E^2}{4CD}\right)$$

$$\left(y + \frac{E}{2C}\right)^2 = -\frac{D}{C}\left[x - \left(\frac{E^2}{4CD} - \frac{F}{D}\right)\right]$$

Assuming that $C \neq 0$ and $D \neq 0$, this is the standard form of an equation of a parabola opening to the left or right with vertex $\left(\frac{E^2}{4CD} - \frac{F}{D}, -\frac{E}{2C}\right)$.

53. The equation can be written as $(x - y)^2 = 1$, which means that $x - y = \pm 1$. The graph is the pair of parallel lines $y = x - 1$ and $y = x + 1$. **55.** The Bxy term introduces a rotation.

57. Since $\tan^{-1}\frac{1}{2} \approx 26.6° < 30°$, point P will be below the positive x'-axis. Therefore, P is in Quadrant IV in the $x'y'$-plane.

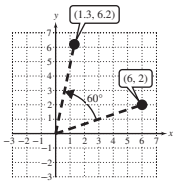
59.
$$\begin{aligned} A' + C' &= (A\cos^2\theta + B\sin\theta\cos\theta + C\sin^2\theta) \\ &\quad + (A\sin^2\theta - B\sin\theta\cos\theta + C\cos^2\theta) \\ &= A(\cos^2\theta + \sin^2\theta) + C(\sin^2\theta + \cos^2\theta) \\ &= A + C \end{aligned}$$

61. The graph of $x^2 + y^2 = r^2$ is a circle centered at the origin. Rotating the graph about the origin will result in the same graph. Therefore, the equation $x^2 + y^2 = r^2$ is invariant under rotation.

63. a. $\begin{bmatrix} \cos 60° & -\sin 60° \\ \sin 60° & \cos 60° \end{bmatrix}\begin{bmatrix} 6 \\ 2 \end{bmatrix}$ or $\begin{bmatrix} \frac{1}{2} & -\frac{\sqrt{3}}{2} \\ \frac{\sqrt{3}}{2} & \frac{1}{2} \end{bmatrix}\begin{bmatrix} 6 \\ 2 \end{bmatrix}$

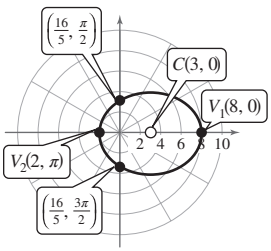
b. $\begin{bmatrix} 3 - \sqrt{3} \\ 3\sqrt{3} + 1 \end{bmatrix}$

c.



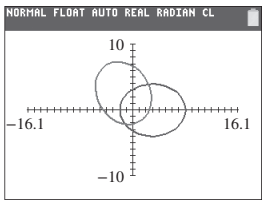
Section 11.5 Skill Practice

Answer 3

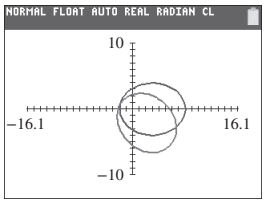


Answer 4

4. a.



b.



Section 11.5 Practice Exercises, pp. 1062–1064

R.1. a. $\frac{(x+4)^2}{11} + \frac{(y-6)^2}{5} = 1$

b. Center: $(-4, 6)$; Vertices: $(-4 \pm \sqrt{11}, 6)$; Endpoints of minor axis: $(-4, 6 \pm \sqrt{5})$; Foci: $(-4 \pm \sqrt{6}, 6)$

R.2. a. $\frac{(x+1)^2}{5} - \frac{(y-2)^2}{11} = 1$

b. Center: $(-1, 2)$; Vertices: $(-1 \pm \sqrt{5}, 2)$; Foci: $(3, 2)$ and $(-5, 2)$

R.3. a. $(y-1)^2 = -4(x-4)$

b. Vertex: (4, 1); Focus (3,1); Directrix: $x = 5$

R.4. $(x+3)^2 + y^2 = 9$; A circle centered at $(-3, 0)$ with radius 3.

R.5. $y = 4$; A horizontal line passing through the y-axis at 4.

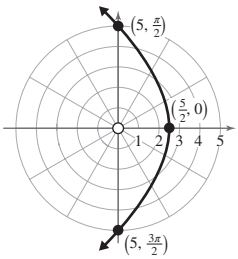
1. $e = 1$; $0 < e < 1$; $e > 1$ **3.** horizontal; $y = d$

5. a. $e = 1$, $d = 2$ **b.** Parabola **c.** $y = 2$ **d.** Graph C

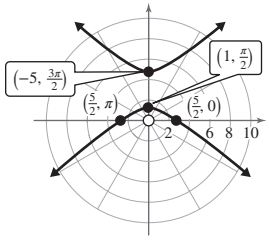
7. a. $e = \frac{2}{5}$, $d = 5$ **b.** Ellipse **c.** $x = -5$ **d.** Graph B

9. a. $e = 2$, $d = \frac{5}{4}$ **b.** Hyperbola **c.** $x = \frac{5}{4}$ **d.** Graph E

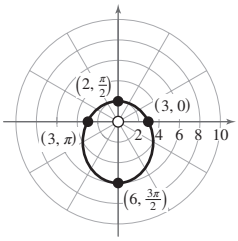
11.



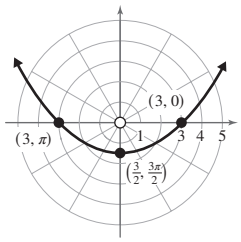
13.



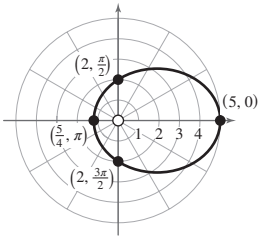
15.



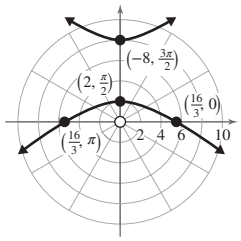
17.



19.



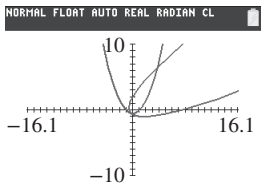
21.



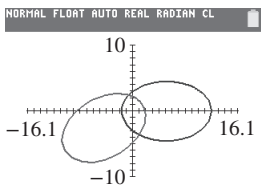
23. a. $(0, 3)$ **b.** $y = \pm\frac{2\sqrt{5}}{5}x + 3$

25. a. $\left(\frac{15}{8}, 0\right)$ **b.** $\frac{25}{4}$ units **c.** 5 units

27. $r = \frac{1}{1 - \sin\left(\theta + \frac{\pi}{3}\right)}$



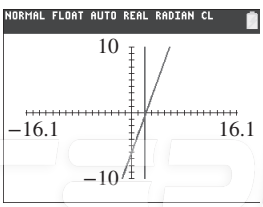
29. $r = \frac{12}{4 - 3\cos\left(\theta - \frac{7\pi}{6}\right)}$



31. a. $r = 2\sec\theta$

b. $r = 2\sec\left(\theta + \frac{\pi}{9}\right)$

c.



33. $\frac{x^2}{9} + \frac{(y+4)^2}{25} = 1$; This is the graph of the same ellipse given in Example 3. The ellipse is centered at (0, −4) with vertices (0, 1) and (0, −9) and minor axis of 6 units.

35. $y^2 = -10\left(x - \frac{5}{2}\right)$; This is the graph of the same parabola given in Exercise 11: The parabola opens to the left with vertex $\left(\frac{5}{2}, 0\right)$, and focal length $\frac{5}{2}$ units.

37. $r = \frac{2}{1+\sin\theta}$ **39.** $r = \frac{\frac{5}{2}}{1-\frac{5}{4}\cos\theta}$

41. The eccentricity of r_1 is $\frac{3}{2}$, indicating that the graph is a hyperbola. The eccentricity of r_2 is $\frac{2}{3}$, indicating that the graph is an ellipse.

43. a. $e = \frac{c}{a} \Rightarrow c = ae$

b. $x = 2c - r\cos\theta$ or equivalently, $x = 2ea - r\cos\theta$ and $y = r\sin\theta$. From the Pythagorean theorem,

$r_1^2 = x^2 + y^2 = (2ea - r\cos\theta)^2 + (r\sin\theta)^2$
$= 4e^2a^2 - 4ear\cos\theta + r^2\cos^2\theta + r^2\sin^2\theta$
$= 4e^2a^2 - 4ear\cos\theta + r^2(\cos^2\theta + \sin^2\theta)$
$= 4e^2a^2 - 4ear\cos\theta + r^2$. Thus,
$r_1 = \sqrt{4e^2a^2 - 4ear\cos\theta + r^2}$.

c. $r + r_1 = 2a$. Thus,

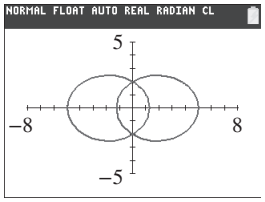
$r + \sqrt{4e^2a^2 - 4ear\cos\theta + r^2} = 2a$
$\sqrt{4e^2a^2 - 4ear\cos\theta + r^2} = 2a - r$
$\left(\sqrt{4e^2a^2 - 4ear\cos\theta + r^2}\right)^2 = (2a - r)^2$
$4e^2a^2 - 4ear\cos\theta + r^2 = 4a^2 - 4ar + r^2$
$4e^2a^2 - 4ear\cos\theta = 4a^2 - 4ar$.

Solving for r, we have
$4ar - 4ear\cos\theta = 4a^2 - 4e^2a^2$
$r(4a - 4ea\cos\theta) = 4a^2 - 4e^2a^2$
$r = \frac{4a^2 - 4e^2a^2}{4a - 4ea\cos\theta}$. Dividing by $4a$ gives
$r = \frac{a - e^2a}{1 - e\cos\theta}$ or $r = \frac{a(1-e^2)}{1 - e\cos\theta}$.

45. a. $r = \frac{5.790 \times 10^7(1 - 0.2056^2)}{1 - 0.2056\cos\theta}$

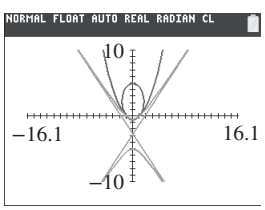
b. $R_p \approx 46{,}000{,}000$ km and $R_a \approx 70{,}000{,}000$ km

47.



The graph of $r_2 = \frac{-2}{1 - 0.6\cos\theta}$ is equivalent to the graph of $-r_2 = \frac{2}{1 - 0.6\cos\theta}$. Replacing r by $-r$ in a polar equation reflects the graph across the pole. The graph of $r_2 = \frac{-2}{1 - 0.6\cos\theta}$ is also equivalent to the graph of $r_2 = \frac{2}{1 + 0.6\cos\theta}$.

49.



When $0 < e < 1$, the graph is an ellipse. When $e = 1$, the graph is a parabola, and when $e > 1$, the graph is a hyperbola.

Section 11.6 Practice Exercises, pp. 1074–1079

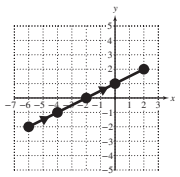
R.1. $\left\{\frac{-1 \pm \sqrt{6}}{5}\right\}$ **R.2.** (4, −9)

1. plane; parametric; parameter **3.** (5, −3) and (2, 3)

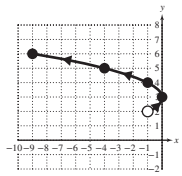
5. a.

t	−3	−2	−1	0	1
x	−6	−4	−2	0	2
y	−2	−1	0	1	2

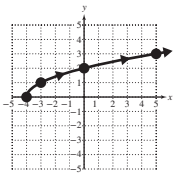
b.



7.

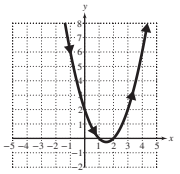


9.



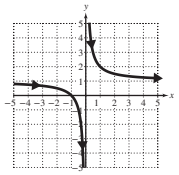
11. a. $y = x^2 - 3x + 2$

b.



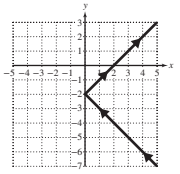
13. a. $y = \frac{x+1}{x}$ or $y = 1 + \frac{1}{x}$, $x \neq 0$

b.



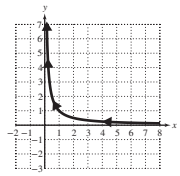
15. a. $x = |y + 2|$

b.



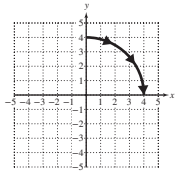
17. a. $y = \frac{1}{x}$, $x > 0$

b.



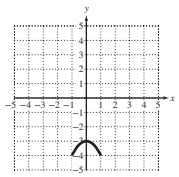
19. a. $x^2 + y^2 = 16$, $0 \le x \le 4$, $0 \le y \le 4$

b.



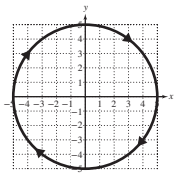
21. a. $y = -x^2 - 3$, $-1 \le x \le 1$, $-4 \le y \le -3$

b. The curve is traced from right to left for t on the interval $(2n\pi, (2n+1)\pi)$ and from left to right for t in the interval $((2n+1)\pi, (2n+2)\pi)$.



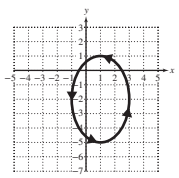
23. a. $x^2 + y^2 = 25$

b.



25. a. $\frac{(x-1)^2}{4} + \frac{(y+2)^2}{9} = 1$

b.



27. $(x-h)^2 + (y-k)^2 = r^2$ **29.** $\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1$

31. a. $x = t$ and $y = 2t - 4$ **b.** $x = \frac{t}{3}$ and $y = \frac{2}{3}t - 4$

c. $x = -3t$ and $y = -6t - 4$

ISTUDY

33. **a.** $x = t$ and $y = t + 4$, $t > 0$ **b.** $x = e^t$ and $y = e^t + 4$

35. $x = 3t$ and $y = 2 - t$ or $x = 3 - 3t$ and $y = 1 + t$

37. $x = 4 + 5\cos t$ and $y = -3 + 5\sin t$

39. $x = 3\tan t$ and $y = 2\sec t$

41. $x = -2 + 3\cos t$ and $y = 1 + 2\sin t$

43. $x = -3 + 4t$ and $y = 5 - 8t$ or $x = 1 - 4t$ and $y = -3 + 8t$ both for $0 \le t \le 1$

45. $x = 2\cos t$ and $y = 3\sin t$, $-\frac{\pi}{2} \le t \le \frac{\pi}{2}$

47. $x = 1 + 3t$ and $y = 5 - t$ for $0 \le t \le 2$

49. **a.** $x = 670 - 105t$ and $y = 450 - 60t$ for $0 \le t \le 4$ **b.** (523, 366)

51. **a.** $x = (96\cos 16°)t$ and $y = -4.9t^2 + (96\sin 16°)t + 1$

b. $t \approx 5.44$ sec **c.** 502 m **d.** $t = \frac{96\sin 16°}{9.8} \approx 2.7$ sec **e.** 37 m

53. **a.** $x = 40\sqrt{3}t$ and $y = -16t^2 + 40t + 3$ **b.** 1.25 sec

c. 28 ft **d.** $t = \frac{5 + \sqrt{23}}{4} \approx 2.45$ sec **e.** 170 ft

55. **a.** Car A: $x = -25 + 40t$ and $y = 0$
Car B: $x = 0$ and $y = 30 - 50t$

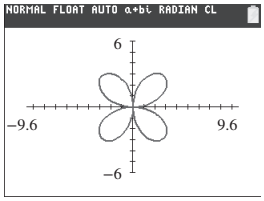
b. Car A: $t = 0.625$ hr
Car B: $t = 0.6$ hr
No. The cars reach the intersection at different times.

c. $d(t) = \sqrt{4100t^2 - 5000t + 1525}$ **d.** $\frac{25}{41}$ hr **e.** 0.78 mi

57. **a.** $x(t) = 100\sqrt{2}t$ and $y(t) = -16t^2 + 100\sqrt{2}t$ **b.** 1250 ft

c. $\left(625, \frac{625}{2}\right)$ **d.** $y = -\frac{x^2}{1250} + x$ **e.** Yes

59. **a.**



b. $x = 4\sin 2\theta\cos\theta$ and $y = 4\sin 2\theta\sin\theta$

c. The graph is the same as part (a).

61. C_1 is the graph of the parabola $y = x^2 - 1$. C_2 is the right branch of the graph of the parabola $y = x^2 - 1$, not including the point $(0, -1)$. C_3 is the graph of the portion of the parabola $y = x^2 - 1$ between $x = -1$ and $x = 1$, inclusive.

63. No; Eliminating the parameter results in the equation $y = x^2 + 5$. However, the parametric equation $x = \sqrt{t}$ imposes the restriction that $x \ge 0$. Thus, the parametric equations define only the right branch of the parabola $y = x^2 + 5$.

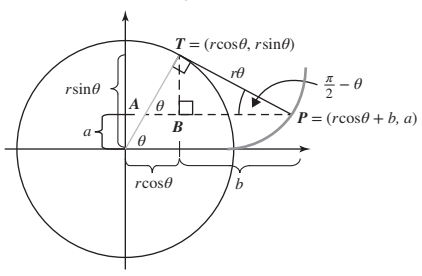
65. **a.** (0, 122.5) **b.** $x(t) = 200t$ and $y(t) = -4.9t^2 + 122.5$

c. (1000, 0)

67. We must find the coordinates of point P on the involute curve that begins at the point $(r, 0)$. The distance from T to P is the same as the length of the arc of the circle subtended by angle θ. Thus $d(T, P) = r\theta$. The coordinates of the point T are given by $x = r\cos\theta$ and $y = r\sin\theta$.

To find the coordinates of point P, draw a horizontal line through point P and a vertical line through point T. Point P is represented by $x = r\cos\theta + b$ and $y = a$.

Use right triangle ΔTBP to find a and b. $\cos\left(\frac{\pi}{2} - \theta\right) = \frac{b}{r\theta}$ and by the cofunction identity $\sin\theta = \frac{b}{r\theta}$, and $b = r\theta\sin\theta$.



Thus, $x = r\cos\theta + b$
$= r\cos\theta + r\theta\sin\theta$
$= r(\cos\theta + \theta\sin\theta)$.

From the same triangle,

$\sin\left(\frac{\pi}{2} - \theta\right) = \frac{r\sin\theta - a}{r\theta}$

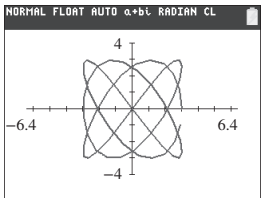
$\cos\theta = \frac{r\sin\theta - a}{r\theta}$

$r\theta\cos\theta = r\sin\theta - a$

$a = r\sin\theta - r\theta\cos\theta$

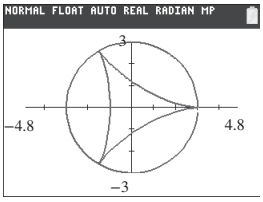
Thus, $y = r(\sin\theta - \theta\cos\theta)$.

69.



71. **a.** $x = 2\cos t + \cos 2t$ and $y = 2\sin t - \sin 2t$

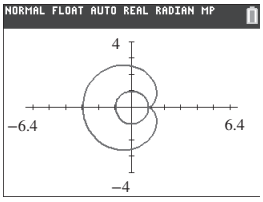
b.



c. $t = 0$, $t = \frac{2\pi}{3}$, $t = \frac{4\pi}{3}$

73. **a.** $x = 2\cos t - \cos 2t$ and $y = 2\sin t - \sin 2t$

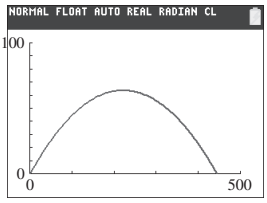
b.



75. **a.** $y = 0$ when $t = \frac{2v_0\sin\theta}{g}$ **b.** 4 sec; 64 ft

c. $y = x\tan\theta - \frac{gx^2}{2v_0^2\cos^2\theta}$

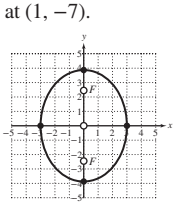
d.



Chapter 11 Review Exercises, pp. 1083–1086

1. Each equation represents an ellipse with a vertical major axis of length 30 units and horizontal minor axis of length 20 units. However, the first equation represents an ellipse centered at (0, 0), whereas the second equation represents an ellipse centered at (1, −7).

3. **a.** (0, 0) **b.** $(0, -\sqrt{15}), (0, \sqrt{15})$ **f.**



c. (3, 0), (−3, 0)

d. $(0, -\sqrt{6}), (0, \sqrt{6})$

e. $\frac{\sqrt{10}}{5}$

101. a. Arithmetic; $1,770,000 **b.** Geometric; $2,059,993
c. $289,993 **103. a.** $a_n = 2^n$ **b.** 1024

105. In an arithmetic sequence, the difference between a term and its predecessor is a fixed constant. In a geometric sequence, the ratio between a term and its predecessor is a fixed constant.

107. Given the sequence $a_1, a_2, a_3, \ldots$, each term after the first is obtained by multiplying the preceding term by r. Therefore, every other term is obtained by multiplying by r^2. Therefore, the sequence $a_1, a_3, a_5, \ldots$ is geometric with common ratio r^2.

109. The sequence $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \frac{1}{a_4}, \ldots$ can be written as $\frac{1}{a_1}, \frac{1}{a_1 r}, \frac{1}{a_1 r^2}, \frac{1}{a_1 r^3}, \ldots$ or equivalently as $\frac{1}{a_1}, \frac{1}{a_1}\left(\frac{1}{r}\right), \frac{1}{a_1}\left(\frac{1}{r}\right)^2, \frac{1}{a_1}\left(\frac{1}{r}\right)^3, \ldots$. Therefore, the sequence is geometric with common ratio $\frac{1}{r}$.

111. Each term of the geometric sequence $a_1, a_2, a_3, \ldots$ can be written in the form $a_1 r^{n-1}$. Therefore, $\log a_1, \log a_2, \log a_3, \ldots = \log a_1, \log a_1 r, \log a_1 r^2, \ldots, \log a_1 r^{n-1}, \log a_1 r^n, \ldots$.
$a_{n+1} - a_n = \log a_1 r^n - \log a_1 r^{n-1}$
$= (\log a_1 + \log r^n) - (\log a_1 + \log r^{n-1})$
$= (\log a_1 + n \log r) - [\log a_1 + (n-1)\log r]$
$= \log r$
The common difference is $\log r$.

Section 12.4 Skill Practice

Answer 1

Let P_n denote the statement that $2 + 4 + \cdots + 2n = n(n+1)$.

1. P_1 is true because for $n = 1$, the sum is 2, which equals $1(1 + 1)$.

2. Assume that $2 + 4 + \cdots + 2k = k(k+1)$ (inductive hypothesis). Show that $2 + 4 + \cdots + 2k + 2(k+1) = (k+1)[(k+1) + 1] = (k+1)(k+2)$.
By the inductive hypothesis, $[2 + 4 + \cdots + 2k] + 2(k+1) = [k(k+1)] + 2k + 2 = k^2 + 3k + 2 = (k+1)(k+2)$ as desired.

Answer 2

Let P_n denote the statement $\frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} + \cdots + \frac{1}{(2n-1)(2n+1)} = \frac{n}{2n+1}$.

1. P_1 is true because for $n = 1$, the sum is $\frac{1}{1 \cdot 3} = \frac{1}{3}$, which equals $\frac{1}{2(1)+1} = \frac{1}{3}$.

ISTUDY

2. Assume that $\frac{1}{1\cdot 3}+\frac{1}{3\cdot 5}+\cdots+\frac{1}{(2k-1)(2k+1)}=\frac{k}{2k+1}$ (inductive hypothesis).
Show that $\frac{1}{1\cdot 3}+\frac{1}{3\cdot 5}+\cdots+\frac{1}{(2k-1)(2k+1)}+\frac{1}{[2(k+1)-1][2(k+1)+1]}=\frac{k+1}{2(k+1)+1}=\frac{k+1}{2k+3}$.
By the inductive hypothesis,
$\left[\frac{1}{1\cdot 3}+\frac{1}{3\cdot 5}+\cdots+\frac{1}{(2k-1)(2k+1)}\right]+\frac{1}{[2(k+1)-1][2(k+1)+1]}=\frac{k}{2k+1}+\frac{1}{(2k+1)(2k+3)}=\frac{2k^2+3k+1}{(2k+1)(2k+3)}=\frac{(2k+1)(k+1)}{(2k+1)(2k+3)}=\frac{k+1}{2k+3}$ as desired.

Answer 3

Let P_n be the statement that 2 is a factor of 5^n+1.

1. P_1 is true because 2 is a factor of $5^1+1=6$.

2. Assume that 2 is a factor of 5^k+1. Then $5^k+1=2a$ for some positive integer a. Equivalently, $5^k=2a-1$. Show that 2 is a factor of $5^{k+1}+1$.
We have $5^{k+1}+1=5\cdot 5^k+1=5(2a-1)+1=10a-4=2(5a-2)$. The value 2 is a factor of $2(5a-2)$, and therefore a factor of $5^{k+1}+1$ as desired.

Answer 4

Let P_n be the statement that $\left(\frac{3}{2}\right)^n>2n$ for $n\geq 7$.

1. Show that P_7 is true. That is, show that $\left(\frac{3}{2}\right)^7>2(7)$. We have $\left(\frac{3}{2}\right)^7=\frac{2187}{128}=17\frac{11}{128}$, which is greater than $2(7)=14$. Therefore, $\left(\frac{3}{2}\right)^7>2(7)$.

2. Assume that $\left(\frac{3}{2}\right)^k>2k$ for $k\geq 7$. Show that $\left(\frac{3}{2}\right)^{k+1}>2(k+1)$.
We have $\left(\frac{3}{2}\right)^{k+1}=\frac{3}{2}\left(\frac{3}{2}\right)^k>\frac{3}{2}(2k)=3k$ for $k\geq 7$. Furthermore, $3k=2k+k>2k+2$ for $k\geq 7$. Therefore, $\left(\frac{3}{2}\right)^{k+1}>2(k+1)$ as desired.

Section 12.4 Practice Exercises, pp. 1135–1136

R.1. $x^2(x^2+1)$ **R.2.** $-15r^3(r+4)$ **R.3.** $(w+2)^2$

R.4. $(v-3)(v-6)$ **R.5.** $\frac{t^2-15}{t+4}$ **R.6.** $\frac{3}{a-3}$

1. induction; P_1; P_{k+1}

3. Let P_n be the statement $2+6+\cdots+(4n-2)=2n^2$.

1. P_1 is true because $2=2(1)^2$.

2. Assume that $2+6+\cdots+(4k-2)=2k^2$ (Inductive hypothesis).
Show that $2+6+\cdots+(4k-2)+[4(k+1)-2]=2(k+1)^2$.
By the inductive hypothesis,
$[2+6+\cdots+(4k-2)]+[4(k+1)-2]$
$=2k^2+(4k+2)=2(k^2+2k+1)=2(k+1)^2$ as desired.

5. Let P_n be the statement $5+8+\cdots+(3n+2)=\frac{n}{2}(3n+7)$.

1. P_1 is true because $5=\frac{1}{2}[3(1)+7]$.

2. Assume that $5+8+\cdots+(3k+2)=\frac{k}{2}(3k+7)$ (Inductive hypothesis).
Show that $5+8+\cdots+(3k+2)+[3(k+1)+2]=\frac{k+1}{2}[3(k+1)+7]=\frac{(k+1)(3k+10)}{2}$.
By the inductive hypothesis,
$[5+8+\cdots+(3k+2)]+[3(k+1)+2]$
$=\frac{k}{2}(3k+7)+3k+5=\frac{3k^2+13k+10}{2}$
$=\frac{(k+1)(3k+10)}{2}$ as desired.

7. Let P_n be the statement $8+4+\cdots+(-4n+12)=-2n(n-5)$.

1. P_1 is true because $8=-2(1)(1-5)$.

2. Assume that $8+4+\cdots+(-4k+12)=-2k(k-5)$ (Inductive hypothesis).
Show that $8+4+\cdots+(-4k+12)+[-4(k+1)+12]$
$=-2(k+1)[(k+1)-5]=-2k^2+6k+8$.
By the inductive hypothesis,
$[8+4+\cdots+(-4k+12)]+[-4(k+1)+12]$
$=-2k(k-5)+(-4k+8)=-2k^2+6k+8$ as desired.

9. Let P_n be the statement $1+2+2^2+\cdots+2^{n-1}=2^n-1$.

1. P_1 is true because $1=2^1-1$.

2. Assume that $1+2+2^2+\cdots+2^{k-1}=2^k-1$ (Inductive hypothesis).
Show that $1+2+2^2+\cdots+2^{k-1}+2^{(k+1)-1}=2^{k+1}-1$.
By the inductive hypothesis,
$[1+2+2^2+\cdots+2^{k-1}]+2^{(k+1)-1}=(2^k-1)+2^k$
$=2\cdot 2^k-1=2^{k+1}-1$ as desired.

11. Let P_n be the statement $\frac{3}{4}+\frac{3}{16}+\cdots+\frac{3}{4^n}=1-\left(\frac{1}{4}\right)^n$.

1. P_1 is true because $\frac{3}{4}=1-\left(\frac{1}{4}\right)^1$.

2. Assume that $\frac{3}{4}+\frac{3}{16}+\cdots+\frac{3}{4^k}=1-\left(\frac{1}{4}\right)^k$ (Inductive hypothesis).
Show that $\frac{3}{4}+\frac{3}{16}+\cdots+\frac{3}{4^k}+\frac{3}{4^{k+1}}=1-\left(\frac{1}{4}\right)^{k+1}$.
By the inductive hypothesis,
$\left[\frac{3}{4}+\frac{3}{16}+\cdots+\frac{3}{4^k}\right]+\frac{3}{4^{k+1}}=\left[1-\left(\frac{1}{4}\right)^k\right]+\frac{3}{4}\left(\frac{1}{4}\right)^k$
$=1-\frac{1}{4}\left(\frac{1}{4}\right)^k=1-\left(\frac{1}{4}\right)^{k+1}$ as desired.

13. Let P_n be the statement $1\cdot 2+2\cdot 3+\cdots+n(n+1)=\frac{n(n+1)(n+2)}{3}$.

1. P_1 is true because $1\cdot 2=\frac{(1)(1+1)(1+2)}{3}$.

2. Assume that $1\cdot 2+2\cdot 3+\cdots+k(k+1)=\frac{k(k+1)(k+2)}{3}$ (Inductive hypothesis).
Show that $[1\cdot 2+2\cdot 3+\cdots+k(k+1)]+(k+1)[(k+1)+1]$
$=\frac{(k+1)[(k+1)+1][(k+1)+2]}{3}=\frac{k^3+6k^2+11k+6}{3}$.
By the inductive hypothesis,
$[1\cdot 2+2\cdot 3+\cdots+k(k+1)]+(k+1)[(k+1)+1]$
$=\frac{k(k+1)(k+2)}{3}+(k+1)(k+2)$
$=\frac{k^3+3k^2+2k}{3}+k^2+3k+2$
$=\frac{k^3+6k^2+11k+6}{3}$ as desired.

15. Let P_n be the statement $\left(1-\frac{1}{2}\right)\left(1-\frac{1}{3}\right)\cdots\left(1-\frac{1}{n+1}\right)=\frac{1}{n+1}$.

1. P_1 is true because $\left(1-\frac{1}{2}\right)=\frac{1}{1+1}$.

2. Assume that $\left(1-\frac{1}{2}\right)\left(1-\frac{1}{3}\right)\cdots\left(1-\frac{1}{k+1}\right)=\frac{1}{k+1}$ (Inductive hypothesis).
Show that $\left(1-\frac{1}{2}\right)\left(1-\frac{1}{3}\right)\cdots\left(1-\frac{1}{k+1}\right)\left[1-\frac{1}{(k+1)+1}\right]$
$=\frac{1}{(k+1)+1}=\frac{1}{k+2}$.
By the inductive hypothesis,
$113.74\%\left[\left(1-\frac{1}{2}\right)\left(1-\frac{1}{3}\right)\cdots\left(1-\frac{1}{k+1}\right)\right]\left[1-\frac{1}{(k+1)+1}\right]$
$=\frac{1}{k+1}\cdot\left(1-\frac{1}{k+2}\right)=\frac{1}{k+1}\cdot\frac{k+1}{k+2}=\frac{1}{k+2}$ as desired.

17. Let P_n be the statement $\sum_{i=1}^{n}1=n$.

1. P_1 is true because $\sum_{i=1}^{1}1=1$.

2. Assume that $\sum_{i=1}^{k}1=k$ (inductive hypothesis).
Show that $\sum_{i=1}^{k+1}1=(k+1)$. By the inductive hypothesis,
$\sum_{i=1}^{k+1}1=\left(\sum_{i=1}^{k}1\right)+1=k+1$ as desired.

ISTUDY

19. Let P_n be the statement $\sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6}$.

1. P_1 is true because $\sum_{i=1}^{1} i^2 = (1)^2 = \frac{1(1+1)[2(1)+1]}{6}$.

2. Assume that $\sum_{i=1}^{k} i^2 = \frac{k(k+1)(2k+1)}{6}$ (Inductive hypothesis).

Show that $\sum_{i=1}^{k+1} i^2 = \frac{(k+1)[(k+1)+1][2(k+1)+1]}{6} = \frac{2k^3+9k^2+13k+6}{6}$.

By the inductive hypothesis,

$$\sum_{i=1}^{k+1} i^2 = \left(\sum_{i=1}^{k} i^2\right) + (k+1)^2 = \frac{k(k+1)(2k+1)}{6} + (k+1)^2$$
$$= \frac{2k^3+9k^2+13k+6}{6} \text{ as desired.}$$

21. Let P_n be the statement 2 is a factor of $5^n - 3$.

1. P_1 is true because 2 is a factor of $(5)^1 - 3 = 2$.

2. Assume that P_k is true; that is, assume that 2 is a factor of $5^k - 3$. This implies that $5^k - 3 = 2a$ and that $5^k = 2a + 3$ for some positive integer a.

Show that P_{k+1} is true; that is, show that 2 is a factor of $5^{k+1} - 3$.

$5^{k+1} - 3 = 5 \cdot 5^k - 3$
$= 5(2a+3) - 3$ Replace 5^k by $2a+3$.
$= 10a + 12$
$= 2(5a+6)$

Therefore, 2 is a factor of $5^{k+1} - 3$ as desired.

23. Let P_n be the statement $4^n - 1$ is divisible by 3. This is equivalent to saying that 3 is a factor of $4^n - 1$.

1. P_1 is true because 3 is a factor of $(4)^1 - 1 = 3$.

2. Assume that P_k is true; that is, assume that 3 is a factor of $4^k - 1$. This implies that $4^k - 1 = 3a$ and that $4^k = 3a + 1$ for some positive integer a.

Show that P_{k+1} is true; that is, show that 3 is a factor of $4^{k+1} - 1$.

$4^{k+1} - 1 = 4 \cdot 4^k - 1$
$= 4 \cdot (3a+1) - 1$ Replace 4^k by $3a+1$.
$= 12a + 3$
$= 3(4a+1)$

Therefore, 3 is a factor of $4^{k+1} - 1$ as desired.

25. $n = 7$ **27.** $n = 4$

29. Let P_n be the statement $n! > 3^n$ for $n \geq 7$.

1. P_7 is true because $7! = 5040$ and $3^7 = 2187$. Therefore, $7! > 3^7$.

2. Assume that $k! > 3^k$ for a positive integer $k \geq 7$.

Show that $(k+1)! > 3^{k+1}$.

$(k+1)! = (k+1) \cdot k!$
$> (k+1)(3^k)$ by the inductive hypothesis.
$> 3(3^k)$ Since $k \geq 7$, then $(k+1) > 3$.
$= 3^{k+1}$

Therefore, $(k+1)! > 3^{k+1}$ as desired.

31. Let P_n be the statement $3n < 2^n$ for $n \geq 4$.

1. P_4 is true because $3(4) = 12$ and $2^4 = 16$. Therefore, $3(4) < 2^{(4)}$.

2. Assume that $3k < 2^k$ for a positive integer $k \geq 4$.

Show that $3(k+1) < 2^{k+1}$.

$3(k+1) = 3k + 3$. Furthermore, since $k \geq 4$, $3k > 3$.
$< 3k + 3k$
$< 2^k + 2^k$ by the inductive hypothesis.
$= 2(2^k)$
$= 2^{k+1}$

Therefore, $3(k+1) < 2^{k+1}$ as desired.

33. Let P_n be the statement $(xy)^n = x^n y^n$.

1. P_1 is true because $(xy)^1 = xy = x^1 y^1$.

2. Assume that $(xy)^k = x^k y^k$ (Inductive hypothesis).

Show that $(xy)^{k+1} = x^{k+1} y^{k+1}$.

Multiplying both sides of the equation $(xy)^k = x^k y^k$ by (xy) gives $(xy)^k(xy) = x^k y^k (xy)$. Using the property $a^n a^m = a^{n+m}$ gives $(xy)^{k+1} = x^{k+1} y^{k+1}$ as desired.

35. Let P_n be the statement if $x > 1$, then $x^n > x^{n-1}$.

1. P_1 is true because $x^1 > 1$ for $x > 1$ and $x^0 = 1$. Therefore, $x^1 > x^0$ for $x > 1$.

2. Assume that $x^k > x^{k-1}$ for $x > 1$.

Show that $x^{(k+1)} > x^{(k+1)-1}$ or equivalently, $x^{k+1} > x^k$.

$x^{(k+1)} = x^k \cdot x$
$> x^{k-1} \cdot x$ by the inductive hypothesis.
$= x^k x^{-1} \cdot x$
$= x^k$ as desired.

37. The statement is false for $n = 11$.

39. The principle of mathematical induction has us test the truth of a statement for $n = 1$. The extended principle of mathematical induction has us test the truth of a statement for the first allowable value of n. In each case, the proof is concluded by showing that the truth of a statement for any other positive integer after the first allowable value of n follows directly from its predecessor.

41. Let P_n be the statement that $n^2 - n$ is even.

1. P_1 is true because $(1)^2 - (1) = 0$, which is even.

2. Assume that P_k is true; that is, assume that $k^2 - k$ is even. This implies that $k^2 - k = 2a$ for some positive integer a, and that $k = k^2 - 2a$.

Show that P_{k+1} is true; that is, show that $(k+1)^2 - (k+1)$ is even.

$(k+1)^2 - (k+1)$
$= k^2 + k$
$= k^2 + (k^2 - 2a)$ by the inductive hypothesis.
$= 2k^2 - 2a$
$= 2(k^2 - a)$, which is an even integer.

43. Let P_n be the statement $F_1 + F_2 + \cdots + F_n = F_{n+2} - 1$ for positive integers $n \geq 3$.

1. P_3 is true because $F_1 + F_2 + F_3 = 1 + 1 + 2 = 4$ and $F_{3+2} - 1 = F_5 - 1 = 5 - 1 = 4$.

2. Assume that P_k is true; that is, assume that $F_1 + F_2 + \cdots + F_k = F_{k+2} - 1$.

Show that P_{k+1} is true; that is, show that $F_1 + F_2 + \cdots + F_k + F_{k+1} = F_{[(k+1)+2]} - 1 = F_{k+3} - 1$.

$F_1 + F_2 + \cdots + F_k + F_{k+1} = (F_1 + F_2 + \cdots + F_k) + F_{k+1}$
$= (F_{k+2} - 1) + F_{k+1}$ by the inductive hypothesis.
$= (F_{k+1} + F_{k+2}) - 1$ Replace $F_{k+1} + F_{k+2}$ by F_{k+3}.
$= F_{k+3} - 1$ as desired.

53. Let P_n be the statement $3+7+\cdots+(4n-1)=n(2n+1)$.

1. P_1 is true because $3=1[2(1)+1]$.

2. Assume that $3+7+\cdots+(4k-1)=k(2k+1)$ (Inductive hypothesis).

Show that $3+7+\cdots+(4k-1)+[4(k+1)-1]=(k+1)[2(k+1)+1]=(k+1)(2k+3)$.

By the inductive hypothesis,

$[3+7+\cdots+(4k-1)]+[4(k+1)-1]=k(2k+1)+(4k+3)$

$=2k^2+5k+3$

$=(k+1)(2k+3)$ as desired.

55. Let P_n be the statement $1+4+\cdots+4^{n-1}=\frac{1}{3}(4^n-1)$.

1. P_1 is true because $1=\frac{1}{3}(4^1-1)$.

2. Assume that $1+4+\cdots+4^{k-1}=\frac{1}{3}(4^k-1)$ (Inductive hypothesis).

Show that $1+4+\cdots+4^{k-1}+4^{(k+1)-1}=\frac{1}{3}(4^{k+1}-1)$.

By the inductive hypothesis,

$[1+4+\cdots+4^{k-1}]+4^{(k+1)-1}=\frac{1}{3}(4^k-1)+4^k$

$=\frac{1}{3}4^k-\frac{1}{3}+4^k$

$=\frac{4}{3}\cdot 4^k-\frac{1}{3}$

$=\frac{1}{3}(4\cdot 4^k-1)$

$=\frac{1}{3}(4^{k+1}-1)$ as desired.

57. Let P_n be the statement $4^n<(n+2)!$ for $n\ge 2$.

1. P_2 is true because $4^2=16$ and $(2+2)!=24$.

Therefore, $4^2<(2+2)!$.

2. Assume that $4^k<(k+2)!$ for an integer $k\ge 2$. Show that $4^{k+1}<[(k+1)+2]!$, or equivalently, that $4^{k+1}<(k+3)!$.

$4^{k+1}=4\cdot 4^k<4\cdot(k+2)!$ by the inductive hypothesis.

If $k\ge 2$, then $(k+3)>4$. Therefore,

$4^{k+1}<4(k+2)!<(k+3)(k+2)!=(k+3)!$ as desired.

59. **a.** 1 **b.** 3 **c.** 3 **d.** 1

The values of $\binom{3}{0}$, $\binom{3}{1}$, $\binom{3}{2}$, and $\binom{3}{3}$ match the entries in the fourth row of Pascal's triangle.

23. Let P_n be the statement $6+10+\cdots+(4n+2)=n(2n+4)$.

1. P_1 is true because $6=1[2(1)+4]$.

2. Assume that $6+10+\cdots+(4k+2)=k(2k+4)$ (Inductive hypothesis).

Show that $6+10+\cdots+(4k+2)+[4(k+1)+2]=(k+1)[2(k+1)+4]=(k+1)(2k+6)$.

By the inductive hypothesis,

$[6+10+\cdots+(4k+2)]+[4(k+1)+2]=k(2k+4)+(4k+6)$

$=2k^2+8k+6$

$=(k+1)(2k+6)$ as desired.

24. Let P_n be the statement $1+5+\cdots+5^{n-1}=\frac{1}{4}(5^n-1)$.

1. P_1 is true because $1=\frac{1}{4}(5^1-1)$.

2. Assume that $1+5+\cdots+5^{k-1}=\frac{1}{4}(5^k-1)$ (Inductive hypothesis).

Show that $1+5+\cdots+5^{k-1}+5^{(k+1)-1}=\frac{1}{4}(5^{k+1}-1)$.

By the inductive hypothesis,

$[1+5+\cdots+5^{k-1}]+5^{(k+1)-1}=\frac{1}{4}(5^k-1)+5^k$

$=\frac{1}{4}5^k-\frac{1}{4}+5^k$

$=\frac{5}{4}\cdot 5^k-\frac{1}{4}$

$=\frac{1}{4}(5\cdot 5^k-1)$

$=\frac{1}{4}(5^{k+1}-1)$ as desired.

ISTUDY

25. Let P_n be the statement that 2 is a factor of $7^n - 5$.

1. P_1 is true because 2 is a factor of $(7)^1 - 5 = 2$.

2. Assume that P_k is true; that is, assume that 2 is a factor of $7^k - 5$. This implies that $7^k - 5 = 2a$ and that $7^k = 2a + 5$ for some positive integer a.

Show that P_{k+1} is true; that is, show that 2 is a factor of $7^{k+1} - 5$.

$$\begin{aligned} 7^{k+1} - 5 &= 7 \cdot 7^k - 5 \\ &= 7 \cdot (2a + 5) - 5 \quad \text{Replace } 7^k \text{ by } 2a + 5. \\ &= 14a + 30 \\ &= 2(7a + 15) \end{aligned}$$

Therefore, 2 is a factor of $7^{k+1} - 5$ as desired.

26. $\frac{x^4}{16} + \frac{3}{2}x^3 + \frac{27}{2}x^2 + 54x + 81$

ASA triangles, law of sines and, 716–718, 754
Associative property
of addition, 10
of matrix addition, 942
of multiplication, 10
Asymptotes
explanation of, 242
horizontal, 368–371, 419
nonlinear, 371–373, 419
slant, 371–373, 419
vertical, 365–367, 419
Augmented matrix
elementary row operations and, 919–920
explanation of, 918, 981
in row-echelon or reduced-echelon form, 920–923
writing and interpreting, 918
Average rate of change, 213–215, 290
Axis of symmetry
explanation of, 302
of parabola, 1026, 1027, 1030

B

Base
explanation of, 8
of exponential functions, 441, 444–445, 512
of logarithmic expressions, 455
Base *e,* 444–445, 498–499
Bearing, 706–709, 753
Bernoulli, Jacob, 1073
Bernoulli, Jacob, 782
Binomial coefficients, 1136–1138, 1173
Binomial expansion
coefficients of, 1137
explanation of, 1136–1137
finding specific term in, 1139–1140
*k*th term of, 1173
Binomials. *See also* Polynomials
explanation of, 41
method to factor, 53, 56–57
square of, 43, 44
Binomial theorem, 1136–1140
in applications, 1138–1139
explanation of, 1138, 1173
Brachistochrone problem, 1073
Brahmagupta, 131
Branches, of hyperbola, 1008

C

Calculators. *See* Graphing utilities
Cardano, Gerolamo, 362
Cartesian coordinate system. *See* Rectangular coordinate system
Center
of ellipse, 991
of hyperbola, 1008
Center, of circle, 187
Center-radius form, 187
Central angle, 522–523
Centroid, 856
Certain event, 1157
Change-of-base formula, 476–477
Circle
area of sector of, 529
computing arc length of sector of, 526–528
explanation of, 187, 664, 990
general form of equation of, 189–190, 290
on graphing utility, 190
graphs of, 780
standard form of equation of, 187–189, 290, 664, 990
Classical and Quantum Gravity (Alcubierre), 108
Clearing fractions, 88, 224
Clearing parentheses, 12
Coefficient matrix, 961–962
Coefficients
binomial, 1136–1138
leading, 41, 54
Cofactor of element of matrix, 971, 983
Cofunction identities
explanation of, 545, 631, 697
method to verify, 658
Cofunctions, 545, 631
Column matrix, 940
Combinations, 1149–1151
in application, 1150
explanation of, 1149, 1174
on graphing utilities, 1151
permutations *vs.,* 1149–1150
Common difference, of sequence, 1104, 1105
Common logarithmic function, 457–458, 483, 513
Common logarithms
approximation of, 458–459
explanation of, 457
to express solution to exponential equations, 483
Common ratio, 1115–1117, 1172
Commutative property
of addition, 10
of matrix addition, 942
of multiplication, 10
Complementary angles, 521
Complementary events, 1158–1159, 1174
Completing the square
explanation of, 121
to graph parabolas, 302, 305
to solve quadratic equations, 122–123
Complex conjugates, 114, 165
Complex fractions
explanation of, 69
method to simplify, 69–71
Complex numbers
absolute value of, 790–791
addition of, 112–113
in complex plane, 790–791
division of, 114–115
evaluating special products with, 113–114
explanation of, 110–111, 165
on graphing utility, 115
graphs of, 790–792, 798
imaginary part of, 110
method to compute powers of, 794–796
multiplication of, 113–114
*n*th root of, 796–798
operations on, 111–115
polar form of, 791–793, 835–836
products and quotients in polar form of, 793–794, 836
real part of, 110
set of, 110, 351
simplifying powers of *i* and, 112
in standard form, 111
subtraction of, 112–113
z as, 792
Complex plane, complex numbers in, 790–791
Complex polynomials, 339–340
Component form
direction and magnitude of vector and, 810–812
performing operations on vectors in, 807–809
of vector, 806–807
Composition, of functions, 280–284, 292
Compound fractions. *See* Complex fractions
Compound inequalities, 153–154, 166
Compound interest, exponential functions to compute, 445–447
Computer, 333
Conditional equations, 89–90, 165
Conditional statement, 175
Conic sections, 1041. *See also* Circle; Ellipse; Hyperbola; Parabola
alternative definitions of, 1055
discriminant to identify, 1048–1051
graph of rotated, 1049–1051
identifying and graphing in polar form, 1055–1061
with no rotation, 1042
polar equations of, 1055–1061
rotating in polar form, 1061
rotation of axes and, 1042–1051
Conjugate axis, 1010
Conjugates
complex, 114, 165
explanation of, 43
product of, 43, 44, 114
to verify identities, 646
Conjugate zeros theorem, 351, 418

Constant functions, 212, 241, 318
Constant of variation, 409, 410, 420
Constraint equations, 308–309
Constraints, 901–902
Continuous functions, 262
Contradictions, 89, 165
Convergence, of series, 1119
Converse, 175
Coordinate plane, 174. *See also* Rectangular coordinate system
Cosecant function
  of acute angles, 537
  even and odd properties of, 575
  graphs of, 601–604, 633–634
  inverse, 623–624
  periodic properties of, 574
  vertical shift and, 603–604
Cosine function
  of acute angles, 537
  amplitude of, 584, 585
  of any angle, 555
  even and odd properties of, 575
  graphs of, 581–591, 632–633
  inverse, 616–618
  periodic properties of, 574, 581, 585, 586
  properties of general, 588
  sum and difference formulas and, 653–656
Cotangent function
  of acute angles, 537
  even and odd properties of, 575
  graphs of, 604–609, 633, 634
  inverse, 623–624
  periodic properties of, 574
Coterminal angles
  explanation of, 524, 631
  method to find, 525–526
Counterexample, 1136
Counting principles
  applying multiple, 1151
  combinations and, 1149–1151, 1174

  permutations and, 1146–1149, 1174
Cramer's rule
  determining applicability of, 976
  explanation of, 973–974, 983
  patterns presented in, 974
  for system of equations with three variables, 976
  for system of n linear equations in n variables, 975
  for system of two linear equations in two variables, 974–975
Cross point, 322
Cryptography, 966–967
Cube functions, 241
Cube root functions, 241
Cubes
  factoring sum or difference of, 57
  volume of, 45
Cubic equations, 362
Cubic polynomial function, 318
Curie, Marie, 448
Curves
  cycloid, 1073–1074
  orientation of, 1065
  plane, 1065–1066, 1068–1069
Cycloids, 1073–1074

D

Damped harmonic motion
  applications with, 747, 752
  comparing models involving, 747
  explanation of, 746, 755
Damping factor, 746, 755
Damping forces, 746
Decay functions, exponential, 443
Decimal degrees, 522
Decimal notation, 24
Decimals, repeating, 1120–1121
Decomposition
  of functions, 283–284
  partial fraction, 870–877
Degenerate cases, 189
Degenerate conic section, 1041
Degree, of polynomial, 41
Degrees
  angle measurement in, 520–522, 630
  converting between radians and, 524
  decimal, 522
  minutes, seconds (DMS) form, 522
Delta (Δ), 180
De Moivre, Abraham, 796
De Moivre's theorem, 795, 836
Denominator
  least common, 67
  rationalizing the, 33–34, 71–72
Dependent equations
  explanation of, 845, 930, 981
  in systems of linear equations in three variables, 861, 931–933
  in systems of linear equations in two variables, 845, 850, 910, 929–931
Depressed polynomials, 348
Descartes, René, 131, 174, 188
Descartes' rule of signs
  application of, 353–355
  explanation of, 354, 418
Determinants
  Cramer's rule and, 973–977
  explanation of, 968
  on graphing utility, 972
  method of diagonals to evaluate, 972
  of $n \times n$ matrix, 968–973, 983
  of 3×3 matrix, 970–972
  of 2×2 matrix, 968, 982
  used to determine with matrix invertible, 972–973
Difference
  of cubes, 57
  of squares, 56–57
Difference quotient
  evaluation of, 278–279
  explanation of, 278, 292
Diophantus, 131, 1134
Direction angle, 810–811
Directrix, conics in polar form and, 1055–1057
Directrix, of parabola, 1026–1028, 1081
Direct variation
  applications involving, 411–412
  explanation of, 409, 420
Discontinuous functions, 262
Discriminant, 125–126, 165, 306
  of equation, 1049
  explanation of, 1049
  to identify conic sections, 1048–1051, 1081
Displacement, 804
Displacement vector, 811
Distance
  absolute value to represent, 8
  methods to find, 665, 705–706
  method to find, 175–176, 290
  perpendicular, 1026
Distance formula, 101, 174–176, 991
Distributive property of multiplication over addition, 11–12
Divergence, of series, 1119
Dividend, 335
Division
  algorithm, 335
  of complex numbers, 114–115
  of complex numbers in polar form, 794
  long, 334–336
  of polynomials, 334–338, 418
  of rational expressions, 66, 67, 79
  synthetic, 336–338
  with zero, 10
Division property, of radicals, 110
Divisor, 335
Domain
  of functions, 198–200, 277–278, 281–282, 290
  of logarithmic functions, 463
  of polynomial functions, 318
  of rational functions, 363
  of relations, 193, 290
  of trigonometric functions, 572–576
Doppler effect, 391
Dot product
  angle between two vectors and, 822–824
  in applications, 828–830
  decomposing vectors into two orthogonal vectors and, 824–827
  explanation of, 821–822, 837
  properties of, 822
  review of, 836
Double-angle formulas
  explanation of, 665, 698
  use of, 665–667

E

Eccentricity
  of ellipse, 999–1000, 1080
  of hyperbola, 1016–1017, 1080
Eccentricity, explanation of, 1055

ISTUDY

  explanation of, 766, 835, 1082
  on graphing utility, 767–768, 777
  graphs of, 766–768, 773–782, 835, 1082
  plotting points to graph, 773–774
  solution to, 773
  symmetry in, 774–779
Polar form
  identifying and graphing conics in, 1055–1061
  rotation of conics in, 1061
Polar form
  complex numbers in, 791–793, 835–836
  conversions between rectangular form and, 792
  explanation of, 791
  products and quotients of complex numbers in, 793–794
  writing complex numbers in, 791–793
Pole, 762, 835
Polynomial equations, 139, 166
Polynomial functions
  domain of, 318
  end behavior of, 317–320
  explanation of, 317–318
  fourth-degree, 318
  on graphing utility, 327
  graphs of, 324–327
  intermediate value theorem and, 323–324, 418
  third-degree, 318
  turning points of, 324
  zeros and multiplicities of zeros in, 320–323, 418
Polynomial inequalities
  in applications, 401–402
  explanation of, 394, 420
  method to solve, 394–397
Polynomials. *See also* Binomials; Factors/factoring; Monomials; Trinomials
  addition of, 42
  complex, 339–340
  degree of, 41
  depressed, 348
  division of, 334–338, 418
  explanation of, 41
  factor theorem and, 340–342
  geometry applications and, 45
  on graphing utilities, 358
  on graphing utility, 327
  multiplication of, 42–43
  prime, 59
  reduced, 348
  remainder theorem and, 338–340
  special case products of, 43–45
  subtraction of, 42
  zeros of, 339–342, 347–355, 418
Population growth model, 497–498
Position vector, 811
Power functions, 318–319
Power property of logarithms, 473, 474, 513
Power-reducing formula
  explanation of, 667, 698
  use of, 668
Powers, 8
Prime meridian, 527
Prime polynomials, 59
Principal square root, 8
Principle of mathematical induction, 1130, 1173
Probability
  empirical, 1159–1160, 1162–1163, 1174
  of event, 1156–1159
  explanation of, 1155
  of sequential independent events, 1163–1164, 1174
  theoretical, 1155–1159, 1174
  of union of two events, 1160–1163
Problem-solving strategies, 98
Product property
  of logarithms, 471–472, 474, 513
  of radicals, 32–34
Products
  of complex numbers in polar form, 793–794
  special case, 43–44, 46, 79, 113–114
Product-to-sum formulas
  derivation of, 675
  explanation of, 675, 698
  historical background of, 678
  use of, 675–676
Projectile motion, 302, 307
  explanation of, 1083
  parametric equations to model, 1070, 1071–1072
Proof by contradiction, 1134
Proper rational expression, 876
Property of equivalent fractions, 67
Proportions, 102–103
Pure imaginary, 110
Pythagorean identities
  alternative forms of, 646, 697
  explanation of, 544, 631, 642, 697
  use of, 562
Pythagorean theorem, 133, 175, 538–539

Q

Quadrantal angles
  evaluation trigonometric functions of, 557
  explanation of, 556
Quadrants, 174
Quadratic equations. *See also* Parabola
  in applications, 132–135, 166
  completing the square to solve, 121
  discriminant and, 125–126, 165
  explanation of, 119, 165
  on graphing utility, 308
  quadratic formula to solve, 123–125, 165
  solved for specified variable, 127
  square root property to solve, 120, 121, 123, 165
  zero product property to solve, 119, 123, 165
Quadratic factors, irreducible, 362, 871, 872, 875–877
Quadratic form
  equations in, 145–146
  explanation of, 145
  exponential equations in, 485
Quadratic formula
  explanation of, 123
  to solve quadratic equations, 123–125, 165

ISTUDY

Quadratic functions
in applications, 302, 307–310
explanation of, 302, 318, 417
graphs of, 241. *See also* Parabola
in vertex form, 302–304, 417
Quadratic inequalities, 394
Quadratic models
applications involving, 133–135
use of regression to create, 309–310
use of system of linear equations to create, 865
Quadratic trigonometric equations, method to solve, 686–687
Quadratic trinomials, method to factor, 53–55
Quartic polynomial function, 318
Quotient identities
explanation of, 542, 631, 642, 697
to simplify expressions, 642
use of, 543–544, 562
Quotient property
of logarithms, 472, 474, 513
of radicals, 32–34
Quotients
of complex numbers in polar form, 793–794
difference, 278–279, 292
explanation of, 335

R

Radians
angle measurement in, 522–523
converting between degrees and, 524
explanation of, 522, 523, 630
one, 522
Radical equations
explanation of, 143
method to solve, 143–144, 166
Radical expressions
multiplication of, 34, 45–46
rationalizing the denominator of, 71–72
Radicals
addition and subtraction of, 35
division property of, 110
method to simplify, 32–34
multiplication of, 34, 45–46, 79
multiplication property of, 110
nested property of, 32
product property of, 32, 34
properties of, 32, 79
quotient property of, 32–34
simplifying special case products involving, 46
solving equations containing two, 144
Radical sign, 29
Radicand, 29
Radius, of circle, 187
Range
of functions, 198–200
of relations, 193, 290
Rate of change, average, 213–215, 290
Rational equations
explanation of, 90
method to solve, 90–92, 140–141
Rational exponents
evaluation of, 29–30
explanation of, 29, 79
factoring expressions containing, 59–60
simplifying expressions with, 31
solving equations containing, 145
Rational expressions
addition and subtraction of, 67–69, 79
division of, 66, 67, 79
equal to zero, 398
explanation of, 64, 79
improper, 875–876
method to simplify, 64–66, 79
multiplication of, 66, 79
proper, 876
restricted values for, 64
undefined, 398
Rational functions, 363–373
in applications, 387–388
domain of, 363
explanation of, 363–364, 419
graphs of, 380–388, 398, 419–420
horizontal asymptotes of, 368–371
identifying asymptotes of, 372–373
vertical asymptotes of, 365–367
Rational inequalities
explanation of, 397–398, 420
method to solve, 398–401
Rationalizing the denominator
explanation of, 33–34
of radical expression, 71–72, 79
Rational numbers
approximation of, 3
explanation of, 2, 78, 347
Rational zeros, 347–350
Rational zero theorem
explanation of, 347, 418
to find zeros of polynomials, 348–350
Ratios, of integers, 2
Ray, 520
Real axis, in complex plane, 790, 835
Real number line, 3, 8
Real numbers
absolute value of, 7, 8, 78
associative properties of, 10
commutative properties of, 10
distributive property of multiplication over addition and, 11, 12
identity properties of, 10
inequality symbols and interval notation and, 3–5
inverse properties of, 11
order of operations and, 8–10
sets and, 2–3, 78
summary of properties of, 10–11
union and intersection of sets and, 5–6
Real numbers
trigonometric functions of, 569
Real part, of complex number, 110
Recamán's sequence, 1104
Reciprocal functions, 241
Reciprocal identities
explanation of, 542, 631, 642, 697
to simplify expressions, 642
use of, 543–544, 562
Rectangles
area of, 45
golden, 138
reference, 1010
Rectangular coordinates
conversions between polar coordinates and, 767–769
parametric equations that represent equations in, 1068–1069
Rectangular coordinate system, 174
Rectangular form, conversions between polar form and, 792
Recursive formula, 1094, 1172
Reduced polynomials, 348
Reduced row-echelon form
explanation of, 920, 922, 923
on graphing utility, 931
Reference angles
evaluating trigonometric functions using, 559–562
explanation of, 558–559, 632
Reference rectangle, 1010
Reflections across the *x*- and *y*-axes, 246–247, 291
Reflective property of ellipse, 998–999
Refractive index, 694
Regression
to create exponential model, 502–503
to create logarithmic model from observed data, 503–504
to create quadratic models, 309–310
multiple, 868
Regression line
explanation of, 208
least-squares, 231–232
Relations
domain and range of, 193, 290
explanation of, 193–194
functions *vs.,* 194–196
graphs of, 195
inverse of, 429
Relative maxima
explanation of, 266–267, 292
on graphing utilitiy, 268
Relative minima
explanation of, 266–267, 292
on graphing utilitiy, 268
Remainder, 335
Remainder theorem
to evaluate polynomials, 339
explanation of, 338, 418
to identify zeros of polynomial, 339–340
Restricted values, for rational expressions, 64, 66
Resultant force, 814–815, 836
Richter, Charles, 469
Richter scale, 469

ISTUDY

Properties of Exponents

$b^m \cdot b^n = b^{m+n}$ $\qquad b^0 = 1$

$\dfrac{b^m}{b^n} = b^{m-n}$ $\quad (b \neq 0)$ $\qquad b^{-n} = \dfrac{1}{b^n}$ $\quad (b \neq 0)$

$(b^m)^n = b^{m \cdot n}$

$(ab)^m = a^m b^m$ $\qquad \left(\dfrac{a}{b}\right)^m = \dfrac{a^m}{b^m}$ $\quad (b \neq 0)$

Properties of Radicals

If $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real,

$a^{m/n} = (\sqrt[n]{a})^m = \sqrt[n]{a^m}$

$\sqrt[m]{\sqrt[n]{a}} = \sqrt[m \cdot n]{a}$

$\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$ $\qquad \dfrac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\dfrac{a}{b}}$ $\quad (b \neq 0)$

Factoring and Special Case Products

$a^2 + 2ab + b^2 = (a + b)^2$

$a^2 - 2ab + b^2 = (a - b)^2$

$a^2 - b^2 = (a + b)(a - b)$

$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$

$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$

Complex Numbers

$i = \sqrt{-1}$ and $i^2 = -1$

For a real number $b > 0$, $\sqrt{-b} = i\sqrt{b}$

The complex numbers $a + bi$ and $a - bi$ are conjugates, and $(a + bi)(a - bi) = a^2 + b^2$.

Quadratic Formula

Given $ax^2 + bx + c = 0$, $a \neq 0$, the solutions are

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Absolute Value Equations and Inequalities

If $k \geq 0$, then

$|u| = k$ is equivalent to $u = k$ or $u = -k$.

$|u| = |w|$ is equivalent to $u = w$ or $u = -w$.

$|u| < k$ is equivalent to $-k < u < k$.

$|u| > k$ is equivalent to $u < -k$ or $u > k$.

Distance Formulas

The distance between two points a and b on a number line is given by $|a - b|$ or $|b - a|$.

The distance between (x_1, y_1) and (x_2, y_2) is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

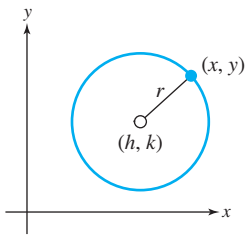
Midpoint Formula

The midpoint of the line segment between (x_1, y_1) and (x_2, y_2) is

$$M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$

Circles

$(x - h)^2 + (y - k)^2 = r^2$ where $r > 0$



Quadratic Functions

$f(x) = ax^2 + bx + c$ $(a \neq 0)$ $\qquad$ Vertex: $\left(\frac{-b}{2a}, f\left(\frac{-b}{2a}\right)\right)$

$f(x) = a(x - h)^2 + k$ $(a \neq 0)$ $\qquad$ Vertex: (h, k)

Slope of a line through (x_1, y_1) and (x_2, y_2): $m = \dfrac{\Delta y}{\Delta x} = \dfrac{y_2 - y_1}{x_2 - x_1}$

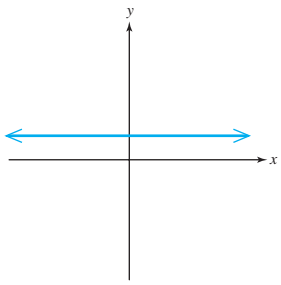
Average rate of change of $f(x)$ between (x_1, y_1) and (x_2, y_2): $\dfrac{f(x_2) - f(x_1)}{x_2 - x_1}$

Difference quotient: $\dfrac{f(x + h) - f(x)}{h}$

Graphs of Basic Functions

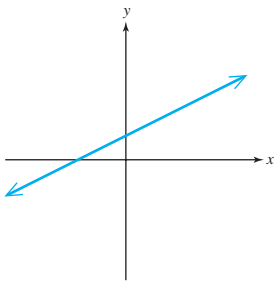
Constant Function

$f(x) = b$



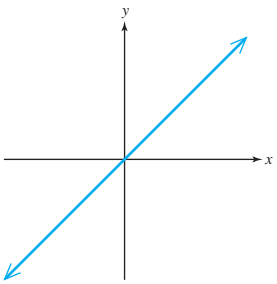
Linear Function

$f(x) = mx + b$



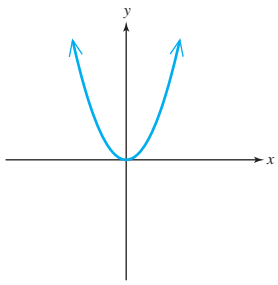
Identity Function

$f(x) = x$



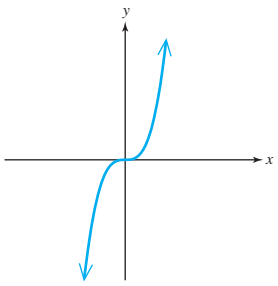
Quadratic Function

$f(x) = x^2$



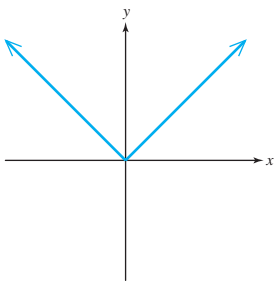
Cubic Function

$f(x) = x^3$



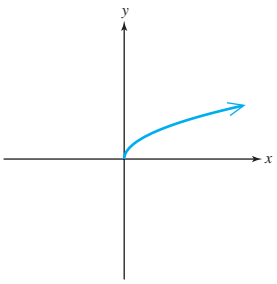
Absolute Value Function

$f(x) = |x|$



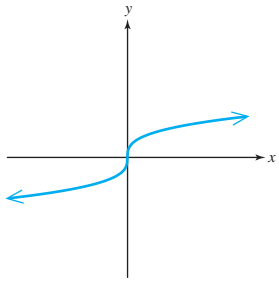
Square Root Function

$f(x) = \sqrt{x}$



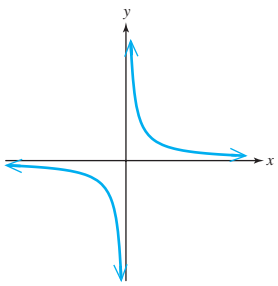
Cube Root Function

$f(x) = \sqrt[3]{x}$



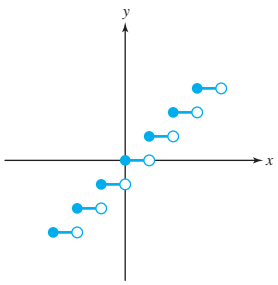
Reciprocal Function

$f(x) = \dfrac{1}{x}$



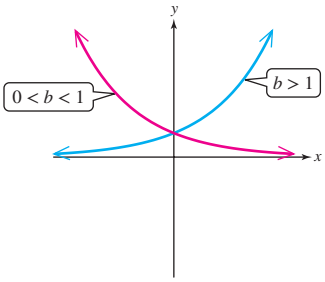
Greatest Integer Function

$f(x) = [\![x]\!]$



Exponential Function

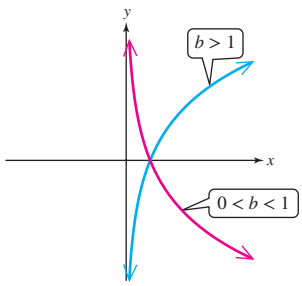
$f(x) = b^x$, where $b > 0$ and $b \neq 1$



Logarithmic Function

$f(x) = \log_b x$, where $b > 0$ and $b \neq 1$

$y = \log_b x \Leftrightarrow b^y = x$



ISTUDY

Transformations of Graphs

Given $c > 0$ and $h > 0$, the graph of the given function is related to the graph of $y = f(x)$ as follows:

$y = f(x) + c$ Shift the graph of $y = f(x)$ up c units.
$y = f(x) - c$ Shift the graph of $y = f(x)$ down c units.

$y = f(x - h)$ Shift the graph of $y = f(x)$ to the right h units.
$y = f(x + h)$ Shift the graph of $y = f(x)$ to the left h units.

$y = -f(x)$ Reflect the graph of $y = f(x)$ over the x-axis.
$y = f(-x)$ Reflect the graph of $y = f(x)$ over the y-axis.

$y = af(x)$ If $a > 1$, stretch the graph of $y = f(x)$ vertically by a factor of a.
If $0 < a < 1$, shrink the graph of $y = f(x)$ vertically by a factor of a.

$y = f(ax)$ If $a > 1$, shrink the graph of $y = f(x)$ horizontally by a factor of $\frac{1}{a}$.
If $0 < a < 1$, stretch the graph of $y = f(x)$ horizontally by a factor of $\frac{1}{a}$.

Tests for Symmetry

Consider the graph of an equation in x and y. The graph of the equation is

- Symmetric to the ***y*-axis** if substituting $-x$ for x results in an equivalent equation.
- Symmetric to the ***x*-axis** if substituting $-y$ for y results in an equivalent equation.
- Symmetric to the **origin** if substituting $-x$ for x and $-y$ for y results in an equivalent equation.

Even and Odd Functions

- f is an **even function** if $f(-x) = f(x)$ for all x in the domain of f.
- f is an **odd function** if $f(-x) = -f(x)$ for all x in the domain of f.

Properties of Logarithms

$\log_b 1 = 0$ $\quad \log_b (xy) = \log_b x + \log_b y$

$\log_b b = 1$ $\quad \log_b\left(\frac{x}{y}\right) = \log_b x - \log_b y$

$\log_b b^x = x$ $\quad \log_b x^p = p \log_b x$

$b^{\log_b x} = x$

Change-of-base formula: $\log_b x = \frac{\log_a x}{\log_a b}$

$b^x = b^y$ implies that $x = y$.

$\log_b x = \log_b y$ implies that $x = y$.

Variation

y varies **directly** as x.
y is **directly** proportional to x. $\Big\}\ y = kx$

y varies **inversely** as x.
y is **inversely** proportional to x. $\Big\}\ y = \frac{k}{x}$

y varies **jointly** as w and x.
y is **jointly** proportional to w and x. $\Big\}\ y = kwx$

Additional Topics Appendix

A

SECTION A.1 Proof of the Binomial Theorem

OBJECTIVES

1. Prove that $\binom{k}{r-1} + \binom{k}{r} = \binom{k+1}{r}$
2. Prove the Binomial Theorem

1. Prove that $\binom{k}{r-1} + \binom{k}{r} = \binom{k+1}{r}$

In this appendix, we prove the binomial theorem. First we show that for nonnegative integers r and k, with $r \le k$

$$\binom{k}{r-1} + \binom{k}{r} = \binom{k+1}{r}, \tag{1}$$

$$\binom{k}{r-1} + \binom{k}{r} = \frac{k!}{(r-1)![k-(r-1)]!} + \frac{k!}{r!(k-r)!}$$

$$= \frac{k!}{(r-1)!(k-r+1)!} + \frac{k!}{r!(k-r)!}$$

$$= \frac{k!}{(r-1)!(k-r+1)(k-r)!} + \frac{k!}{r(r-1)!(k-r)!}$$

Note that $(k-r+1)! = (k-r+1)\cdot(k-r)!$ and $r! = r(r-1)!$.

$$= \frac{rk!}{r(r-1)!(k-r+1)(k-r)!} + \frac{k!(k-r+1)}{r(r-1)!(k-r+1)(k-r)!}$$

Common denominator

$$= \frac{rk! + k!(k-r+1)}{r(r-1)!(k-r+1)(k-r)!}$$

Add the fractions.

$$= \frac{k![r+k-r+1]}{r!(k-r+1)!}$$

Factor the numerator. Simplify the denominator.

$$= \frac{k!(k+1)}{r![(k+1)-r]!}$$

Simplify the numerator. Rearrange terms in the denominator.

$$= \frac{(k+1)!}{r![(k+1)-r]!}$$

Write the numerator in factorial notation.

$$= \binom{k+1}{r}$$

This verifies statement (1).

ISTUDY

2. Prove the Binomial Theorem

In the text that follows, we prove the binomial theorem using mathematical induction.

Proof:

For a positive integer n, let S_n denote the statement

$$(a+b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \cdots + \binom{n}{n-1}ab^{n-1} + \binom{n}{n}b^n$$

1. S_1 is true because $(a+b)^1 = \binom{1}{0}a^1 + \binom{1}{1}b^1 = a + b$.
2. Assume that S_k is true; that is, assume that

$$(a+b)^k = \binom{k}{0}a^k + \binom{k}{1}a^{k-1}b + \binom{k}{2}a^{k-2}b^2 + \cdots + \binom{k}{k-1}ab^{k-1} + \binom{k}{k}b^k$$ Inductive hypothesis

Show that S_{k+1} is true; that is, show that

$$(a+b)^{k+1} = \binom{k+1}{0}a^{k+1} + \binom{k+1}{1}a^k b + \binom{k+1}{2}a^{k-1}b^2 + \cdots + \binom{k+1}{k}ab^k + \binom{k+1}{k+1}b^{k+1} \quad (2)$$

Begin by noting that

$$(a+b)^{k+1} = (a+b)\left[(a+b)^k\right]$$

$$= (a+b)\left[\binom{k}{0}a^k + \binom{k}{1}a^{k-1}b + \binom{k}{2}a^{k-2}b^2 + \cdots + \binom{k}{k-1}ab^{k-1} + \binom{k}{k}b^k\right]$$

$$= a\left[\binom{k}{0}a^k + \binom{k}{1}a^{k-1}b + \binom{k}{2}a^{k-2}b^2 + \cdots + \binom{k}{k-1}ab^{k-1} + \binom{k}{k}b^k\right] + b\left[\binom{k}{0}a^k + \binom{k}{1}a^{k-1}b + \binom{k}{2}a^{k-2}b^2 + \cdots + \binom{k}{k-1}ab^{k-1} + \binom{k}{k}b^k\right]$$ Distributive property

$$= \binom{k}{0}a^{k+1} + \binom{k}{1}a^k b + \binom{k}{2}a^{k-1}b^2 + \cdots + \binom{k}{k-1}a^2b^{k-1} + \binom{k}{k}ab^k + \binom{k}{0}a^k b + \binom{k}{1}a^{k-1}b^2 + \binom{k}{2}a^{k-2}b^3 + \cdots + \binom{k}{k-1}ab^k + \binom{k}{k}b^{k+1}$$ Distributive property

$$= \binom{k}{0}a^{k+1} + \left[\binom{k}{0} + \binom{k}{1}\right]a^k b + \left[\binom{k}{1} + \binom{k}{2}\right]a^{k-1}b^2 + \cdots + \left[\binom{k}{k-1} + \binom{k}{k}\right]ab^k + \binom{k}{k}b^{k+1}$$ Collect like terms.

ISTUDY

Note that $\binom{k}{0} = 1$ and $\binom{k}{k} = 1$ (see Exercise 58 from Section 12.5). These can be replaced by $\binom{k+1}{0}$ and $\binom{k+1}{k+1}$, which also equal 1. Furthermore, because $\binom{k}{r-1} + \binom{k}{r} = \binom{k+1}{r}$ from statement (1), we can write each expression in square brackets as a single binomial coefficient. Thus, we have verified statement (2), and that S_k implies S_{k+1}.

$$(a+b)^{k+1} = \binom{k+1}{0}a^{k+1} + \binom{k+1}{1}a^k b + \binom{k+1}{2}a^{k-1}b^2 + \cdots + \binom{k+1}{k}ab^k + \binom{k+1}{k+1}b^{k+1} \quad (2)$$

SECTION A.2 Conic Sections Defined by a Fixed Point and a Fixed Line

OBJECTIVE

1. Define the Conics Using a Fixed Point and Fixed Line

1. Define the Conics Using a Fixed Point and Fixed Line

In Section 11.5, we presented alternative definitions of conics where the ellipse, hyperbola, and parabola are all defined in terms of a fixed point and fixed line.

Alternate Definitions of Conics

Let l be a fixed line (**directrix**) in a plane and let F be a fixed point (**focus**) in the plane, not on the line. A **conic** is the set of points P in the plane such that the ratio of the distance between P and F to the distance from P to l is a constant positive real number e (the **eccentricity**). That is,

$$\frac{d(P,F)}{d(P,l)} = e \quad (1)$$

(Distance between P and F / Distance between P and l)

Furthermore,

1. If $e = 1$, the conic is a parabola.
2. If $e < 1$, the conic is an ellipse.
3. If $e > 1$, the conic is a hyperbola.

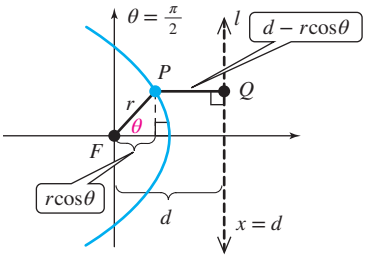

Figure A-1

Proof:

- If $e = 1$, then statement (1) becomes $\frac{d(P,F)}{d(P,l)} = 1$ or $d(P,F) = d(P,l)$. This is the definition of a parabola given in Section 11.3.
- Now suppose that $0 < e < 1$. Place the origin (pole) at the focus F and the directrix l parallel to the y-axis (line $\theta = \frac{\pi}{2}$), $d > 0$ units to the right of the y-axis (Figure A-1). Let Q represent the point on l closest to P (the distance between P and l is the perpendicular distance between P and l).

The directrix is perpendicular to the polar axis and is represented in rectangular coordinates as $x = d$. Suppose that point P has rectangular coordinates (x, y) and polar coordinates (r, θ). Then from Figure A-1, $d(P,F) = r$ and $d(P,Q) = d - r\cos\theta$.

ISTUDY

The condition $\frac{d(P, F)}{d(P, Q)} = e$ can be written as $d(P, F) = e \cdot d(P, Q)$ or as $r = e(d - r\cos\theta)$. We can write this equation in rectangular coordinates by squaring both sides and using the relationships $r^2 = x^2 + y^2$, $x = r\cos\theta$, and $y = r\sin\theta$.

$r = e(d - r\cos\theta)$

$r^2 = e^2(d - r\cos\theta)^2$ Square both sides.

$x^2 + y^2 = e^2(d - x)^2$ Replace r^2 by $x^2 + y^2$ and $r\cos\theta$ by x.

$x^2 + y^2 = e^2(x^2 - 2dx + d^2)$ Expand the binomial.

$x^2 + y^2 = e^2x^2 - 2e^2dx + e^2d^2$ Apply the distributive property.

$x^2 - e^2x^2 + 2e^2dx + y^2 = e^2d^2$ Collect variable terms involving x and y to the left.

$(1 - e^2)x^2 + 2e^2dx + y^2 = e^2d^2$ Factor out x^2 from the first two terms.

$x^2 + \frac{2e^2dx}{1 - e^2} + \frac{y^2}{1 - e^2} = \frac{e^2d^2}{1 - e^2}$ Divide both sides by $(1 - e^2)$ where $e \neq 1$.

$x^2 + \frac{2e^2dx}{1 - e^2} + \left(\frac{e^2d}{1 - e^2}\right)^2 + \frac{y^2}{1 - e^2} = \frac{e^2d^2}{1 - e^2} + \left(\frac{e^2d}{1 - e^2}\right)^2$ Complete the square by adding $\left[\frac{1}{2} \cdot \left(\frac{2e^2d}{1 - e^2}\right)\right]^2 = \left(\frac{e^2d}{1 - e^2}\right)^2$ to both sides.

$\left(x + \frac{e^2d}{1 - e^2}\right)^2 + \frac{y^2}{1 - e^2} = \frac{e^2d^2}{(1 - e^2)} \cdot \frac{(1 - e^2)}{(1 - e^2)} + \frac{e^4d^2}{(1 - e^2)^2}$ Factor the x terms on the left. Write the terms on the right with a common denominator.

$$\left(x + \frac{e^2d}{1 - e^2}\right)^2 + \frac{y^2}{1 - e^2} = \frac{e^2d^2}{(1 - e^2)^2} \tag{2}$$

Equation (2) looks similar to a standard form of an ellipse $\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1$. This motivates the next step. To obtain 1 on the right side of equation (2), we divide both sides by $\frac{e^2d^2}{(1 - e^2)^2}$. We also substitute $h = -\frac{e^2d}{1 - e^2}$ into equation (2) to get

$\frac{(x - h)^2}{\frac{e^2d^2}{(1 - e^2)^2}} + \frac{\frac{y^2}{1 - e^2}}{\frac{e^2d^2}{(1 - e^2)^2}} = \frac{\frac{e^2d^2}{(1 - e^2)^2}}{\frac{e^2d^2}{(1 - e^2)^2}}$ Divide both sides by $\frac{e^2d^2}{(1 - e^2)^2}$ and substitute $h = -\frac{e^2d}{1 - e^2}$ into equation (2).

$\frac{(x - h)^2}{\frac{e^2d^2}{(1 - e^2)^2}} + \frac{y^2}{\frac{e^2d^2}{1 - e^2}} = 1$ Simplify each term.

This is an equation of an ellipse $\frac{(x - h)^2}{a^2} + \frac{y^2}{b^2} = 1$ with center $(h, 0)$, $a^2 = \frac{e^2d^2}{(1 - e^2)^2}$, and $b^2 = \frac{e^2d^2}{1 - e^2}$.

ISTUDY

From Section 11.1, we know that the foci of an ellipse are located $c > 0$ units from the center, where $c^2 = a^2 - b^2$. Thus,

$$c^2 = \frac{e^2d^2}{(1-e^2)^2} - \frac{e^2d^2}{1-e^2}$$

$$= \frac{e^2d^2}{(1-e^2)^2} - \frac{e^2d^2}{(1-e^2)} \cdot \frac{(1-e^2)}{(1-e^2)}$$

$$= \frac{e^4d^2}{(1-e^2)^2}$$

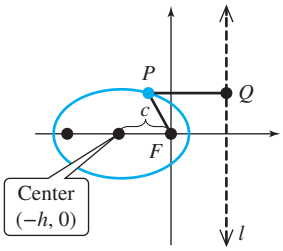

Figure A-2

Therefore, $c = \dfrac{e^2d}{1-e^2}$, which equals $-h$. This confirms that the focus F defined in equation (1) is the same as the focus defined in Section 11.1 and that $e = \dfrac{c}{a}$ (Figure A-2).

- If $e > 0$, a similar proof shows that the conic is a hyperbola with $c^2 = a^2 + b^2$ and $e = \dfrac{c}{a}$.

ISTUDY

CHAPTER R DETAILED SUMMARY

SECTION R.1 Sets and the Real Number Line

KEY CONCEPTS

Important subsets of the set of real numbers:

Natural Numbers: $\mathbb{N} = \{1, 2, 3, \ldots\}$
Whole Numbers: $\mathbb{W} = \{0, 1, 2, 3, \ldots\}$
Integers: $\mathbb{Z} = \{\ldots, -3, -2, -1, 0, 1, 2, 3, \ldots\}$

Rational Numbers:

$$\mathbb{Q} = \left\{\frac{p}{q} \middle| \, p, q \in \mathbb{Z} \quad \text{and} \quad q \neq 0\right\}$$

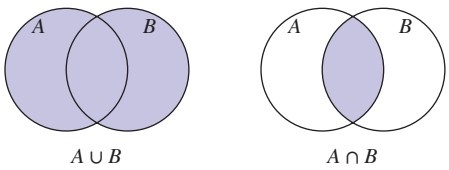
Irrational Numbers: $\mathbb{H}$ is the set of real numbers that cannot be expressed as a ratio of integers.

Set-builder and interval notation:

An interval on the real number line can be represented in set-builder notation or in interval notation.

$A \cup B$ is the **union** of A and B. This is the set of elements that belong to set A or set B or to both sets A and B.

$A \cap B$ is the **intersection** of A and B. This is the set of elements common to both A and B.



Absolute value:

For a real number x, the **absolute value of x** is

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

Distance between points on a number line:

The distance between two points a and b on a number line is given by $|a - b|$ or $|b - a|$.

Order of operations:

1. Simplify expressions within grouping symbols. If nested grouping symbols are present, start with the innermost symbols.
2. Evaluate expressions involving exponents.
3. Perform multiplication or division from left to right.
4. Perform addition or subtraction from left to right.

EXAMPLES

Example 1:

$\frac{2}{3} \in \mathbb{Q}$ $\frac{2}{3}$ is an element of the set of rational numbers.
$-2 \notin \mathbb{N}$ -2 is not an element of the set of natural numbers.

Example 2:

Set-builder notation	Graph	Interval notation
$\{x \mid x < 3\}$		$(-\infty, 3)$
$\{x \mid -2 < x \leq 5\}$		$(-2, 5]$

Example 3:

Given $A = \{x \mid x < 2\}$ and $B = \{x \mid x \leq 4\}$

A: 
B: 

$A \cup B = \{x \mid x \leq 4\}$ and $A \cap B = \{x \mid x < 2\}$

Example 4:

$|2 - \sqrt{7}| = -(2 - \sqrt{7})$ because $2 - \sqrt{7} < 0$.
$= \sqrt{7} - 2$

Example 5:

The distance between 6 and -4 on the number line is $|6 - (-4)| = 10$ units or $|-4 - 6| = 10$ units.

Example 6:

Simplify. $12 - 2(5 - 8)^2 + \sqrt{5^2 - 4^2}$

$= 12 - 2(-3)^2 + \sqrt{25 - 16}$
$= 12 - 2(9) + \sqrt{9}$
$= 12 - 18 + 3$
$= -6 + 3$
$= -3$

ISTUDY

Properties of real numbers:

- Commutative property of addition
- Commutative property of multiplication
- Associative property of addition
- Associative property of multiplication
- Identity property of addition
- Identity property of multiplication
- Inverse property of addition
- Inverse property of multiplication
- Distributive property of multiplication over addition

Simplifying algebraic expressions:

Simplify an algebraic expression by applying the distributive property to clear parentheses. Then combine like terms.

A formula relating two or more variables is one type of mathematical model.

Example 9:

A city law states that an individual caught speeding between 31–50 km/hr (inclusive) over the limit would pay a \$70 surcharge plus \$2 for every km/hr over the posted limit.

The cost C (in \$) for a ticket in this situation is given by:

$C = 70 + 2x$ where x is the number of km/hr above the posted speed limit.

Example 7:

$a + b = b + a$
$a \cdot b = b \cdot a$

$(a + b) + c = a + (b + c)$
$(a \cdot b) \cdot c = a \cdot (b \cdot c)$

$a + 0 = a$ and $0 + a = a$
$a \cdot 1 = a$ and $1 \cdot a = a$

$a + (-a) = 0$ and $(-a) + a = 0$
$a \cdot \frac{1}{a} = 1$ and $\frac{1}{a} \cdot a = 1$, where $a \neq 0$

$a \cdot (b + c) = a \cdot b + a \cdot c$

Example 8:

Simplify. $4(8 - y) - 2(3y + 9) + 1$

$= 32 - 4y - 6y - 18 + 1$
$= -10y + 15$

Example 10:

Use the model from Example 9 to determine the cost of a speeding ticket for an individual traveling 40 km/hr over the posted speed limit.

$C = 70 + 2x$
$C = 70 + 2(40)$ Substitute 40 km/hr for x.
$= 70 + 80$
$= 150$ The driver would pay \$150.

SECTION R.2 Integer Exponents and Scientific Notation

KEY CONCEPTS

Definition of b^0 and b^{-n}:

If b is a nonzero real number and n is a positive integer, then

$$b^0 = 1 \quad \text{and} \quad b^{-n} = \frac{1}{b^n}$$

Properties of exponents:

1. $b^m \cdot b^n = b^{m+n}$
2. $\frac{b^m}{b^n} = b^{m-n}$
3. $(b^m)^n = b^{m \cdot n}$
4. $(ab)^m = a^m b^m$
5. $\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$

EXAMPLES

Example 1:

$(-4p)^0 = 1$

$w^{-6} = \frac{1}{w^6}$

Example 2:

1. $x^7 \cdot x^{-2} = x^{7+(-2)} = x^5$
2. $\frac{z^9}{z^5} = z^{9-5} = z^4$
3. $\left(y^{-2}\right)^4 = y^{-2 \cdot 4} = y^{-8} = \frac{1}{y^8}$
4. $(2x)^4 = 2^4 \cdot x^4 = 16x^4$
5. $\left(\frac{5}{x^2}\right)^3 = \frac{5^3}{(x^2)^3} = \frac{125}{x^6}$

ISTUDY

Scientific notation:
A number expressed in the form $a \times 10^n$, where $1 \le |a| < 10$ and n is an integer, is said to be in **scientific notation.**

Example 3:
$54{,}000 = 5.4 \times 10^4$
$0.000\ 000\ 000\ 568 = 5.68 \times 10^{-10}$
$8.75 = 8.75 \times 10^0$

Example 4:
$$\begin{aligned}(2.5 \times 10^8)(6.0 \times 10^3) &= (2.5)(6.0) \times (10^8)(10^3)\\ &= 15 \times 10^{11}\\ &= (1.5 \times 10^1) \times 10^{11}\\ &= 1.5 \times 10^{12}\end{aligned}$$

SECTION R.3 Rational Exponents and Radicals

KEY CONCEPTS

Definition of an *n*th-root:
b is an nth-root of a if $b^n = a$.
$\sqrt[n]{a}$ represents the principal nth-root of a.

Definition of $a^{1/n}$ and $a^{m/n}$:
If $n > 1$ is an integer and $\sqrt[n]{a}$ is a real number, then

- $a^{1/n} = \sqrt[n]{a}$
- $a^{m/n} = \left(\sqrt[n]{a}\right)^m$ and $a^{m/n} = \sqrt[n]{a^m}$

Properties of rational exponents:
The properties of integer exponents learned in Section R.2 can be extended to rational exponents, provided that all roots represent real numbers.

Simplifying radicals:
Let $n > 1$ be an integer and a and b be real numbers.

- If n is *even* then $\sqrt[n]{a^n} = |a|$.
- If n is *odd* then $\sqrt[n]{a^n} = a$.

Product property of radicals: $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$.

Quotient property of radicals: $\dfrac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\dfrac{a}{b}}$.

Property of nested radicals: $\sqrt[m]{\sqrt[n]{a}} = \sqrt[m \cdot n]{a}$.

Guidelines to simplify a radical:
1. Write the radicand as a product of prime factors.
2. Apply the product property or quotient property of radicals.

Operations on radicals:
To multiply radicals, apply the product property of radicals.

To add or subtract like radicals, apply the distributive property.

EXAMPLES

Example 1:
7 is a square root of 49 because $(7)^2 = 49$.
-7 is a square root of 49 because $(-7)^2 = 49$.
$\sqrt{49} = 7$ because $7 \ge 0$ and $(7)^2 = 49$.

Example 2:
$(-64)^{1/3} = \sqrt[3]{-64} = -4$
$(-16)^{1/4}$ is undefined because $\sqrt[4]{-16}$ is not a real number.
$125^{2/3} = \left(\sqrt[3]{125}\right)^2 = (5)^2 = 25$

Example 3:
$$\left(\frac{x^{1/5}x^{2/5}}{x^{4/5}}\right)^{10} = \left(\frac{x^{3/5}}{x^{4/5}}\right)^{10} = (x^{3/5-4/5})^{10}$$
$$= (x^{-1/5})^{10} = x^{(-1/5)(10)} = x^{-2} = \frac{1}{x^2}$$

Example 4:
$\sqrt[6]{y^6} = |y|$ and $\sqrt[5]{y^5} = y$
$\sqrt[3]{x^{13}} = \sqrt[3]{x^{12} \cdot x} = \sqrt[3]{x^{12}} \cdot \sqrt[3]{x} = x^4\sqrt[3]{x}$
$\dfrac{\sqrt[3]{2x^4}}{\sqrt[3]{16x}} = \sqrt[3]{\dfrac{2x^4}{16x}} = \sqrt[3]{\dfrac{x^3}{8}} = \dfrac{x}{2}$
$\sqrt[5]{\sqrt[3]{x}} = \sqrt[15]{x}$

Example 5:
$$\sqrt[3]{24x^5y^7z^3} = \sqrt[3]{2^3 \cdot 3x^5y^7z^3}$$
$$= \sqrt[3]{(2^3x^3y^6z^3)(3x^2y)}$$
$$= \sqrt[3]{2^3x^3y^6z^3} \cdot \sqrt[3]{3x^2y}$$
$$= 2xy^2z\sqrt[3]{3x^2y}$$

Example 6:
$\sqrt[3]{4x^2} \cdot \sqrt[3]{6x} = \sqrt[3]{24x^3} = 2x\sqrt[3]{3}$
$4\sqrt{3x^3} + x\sqrt{12x} - 5x\sqrt{3x}$
$= 4x\sqrt{3x} + 2x\sqrt{3x} - 5x\sqrt{3x}$
$= (4 + 2 - 5)x\sqrt{3x}$
$= x\sqrt{3x}$

Simplify each radical, then combine like radicals.

ISTUDY

SECTION R.4 Polynomials and Multiplication of Radicals

KEY CONCEPTS

Definition of a polynomial:
A **polynomial in the variable x** is an expression of the form:

$$a_n x^n + a_{n-1}x^{n-1} + a_{n-2}x^{n-2} + \cdots + a_1 x + a_0$$

The coefficients a_n, a_{n-1}, a_{n-2}, … , a_0 are real numbers, where $a_n \neq 0$, and the exponents are whole numbers. The term $a_n x^n$ is the **leading term,** and a_n is the **leading coefficient.**

The **degree of a term** is the sum of the exponents on the variable factors. The **degree of the polynomial** is the same as the degree of the leading term.

Addition and subtraction of polynomials:
To add or subtract polynomials, combine like terms.

Multiplication of polynomials:
To multiply polynomials and radical expressions with multiple terms, use the distributive property to multiply each term in the first expression by each term in the second.

Special case products:

$(a + b)(a - b) = a^2 - b^2$

$(a + b)^2 = a^2 + 2ab + b^2$

$(a - b)^2 = a^2 - 2ab + b^2$

EXAMPLES

Example 1:
$9x^5 - 5x^7 + 3x - 4$ can be written in descending order as $-5x^7 + 9x^5 + 3x + (-4)$.

The leading term is $-5x^7$ and the leading coefficient is -5. The degree of the polynomial is 7.

The degree of the term $6a^7b^4c$ is 12 because the sum of the exponents $7 + 4 + 1$ is 12.

Example 2:

$$\begin{aligned}(7x^2 - 3x + 6) - (2x^2 - 8x) &= 7x^2 - 3x + 6 + (-2x^2) + 8x \\ &= 5x^2 + 5x + 6\end{aligned}$$

Example 3:

$$(3y - 4)(2y + 5) = 6y^2 + 15y - 8y - 20 = 6y^2 + 7y - 20$$

$$\begin{aligned}2\sqrt{x}(3\sqrt{x} + 5\sqrt{z} - 4) &= 2\sqrt{x}(3\sqrt{x}) + 2\sqrt{x}(5\sqrt{z}) + 2\sqrt{x}(-4) \\ &= 6x + 10\sqrt{xz} - 8\sqrt{x}\end{aligned}$$

Example 4:

$(2x + 7)(2x - 7) = (2x)^2 - (7)^2 = 4x^2 - 49$

$$\begin{aligned}(3x + 2)^2 &= (3x)^2 + 2(3x)(2) + (2)^2 \\ &= 9x^2 + 12x + 4\end{aligned}$$

$$\begin{aligned}(5\sqrt{x} - 3)^2 &= (5\sqrt{x})^2 - 2(5\sqrt{x})(3) + (3)^2 \\ &= 25x - 30\sqrt{x} + 9\end{aligned}$$

SECTION R.5 Factoring

KEY CONCEPTS

General factoring strategy:

1. Factor out the GCF.
2. Identify the number of terms in the polynomial.
   - 4 terms: Factor by grouping either 2 terms with 2 terms or 3 terms with 1 term.
   - 3 terms: If the trinomial is a perfect square trinomial, factor as the square of a binomial.

     $a^2 + 2ab + b^2 = (a + b)^2$

     $a^2 - 2ab + b^2 = (a - b)^2$

     Otherwise, factor by the trial-and-error method.

EXAMPLES

Example 1:

$$\begin{aligned}30ax + 150a + 20cx + 100c &= 10[3ax + 15a + 2cx + 10c] && \text{GCF} \\ &= 10[3a(x + 5) + 2c(x + 5)] && \text{Grouping} \\ &= 10(x + 5)(3a + 2c)\end{aligned}$$

Perfect square trinomial: $9x^2 + 6x + 1 = (3x + 1)^2$

$2x^2 + 11x + 5 \stackrel{?}{=} (2x + 5)(x + 1)$ No

$2x^2 + 11x + 5 \stackrel{?}{=} (2x + 1)(x + 5)$ ✓ Yes

ISTUDY

2 terms: Determine whether the binomial fits one of the following patterns:

$a^2 - b^2 = (a + b)(a - b)$

$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$

$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$

Factoring using substitution:

Sometimes we make an appropriate substitution to convert a cumbersome expression to one that is more easily recognizable and factorable.

Factoring out negative and rational exponents:

To factor out a common variable factor raised to a negative or rational exponent, factor out the variable raised to the smallest exponent.

The exponents on the variables within parentheses are found by subtraction.

Difference of squares: $x^2 - y^4 = (x - y^2)(x + y^2)$

Sum of cubes: $8z^3 + 27 = (2x + 3)(4x^2 - 6x + 9)$

Difference of cubes:

$$125y^6 - 1 = (5y^2 - 1)(25y^4 + 5y^2 + 1)$$

Example 2:

$y^2 + 10y + 25 \,|\, - z^2$ Group 3 terms with 1 term. The first 3 terms form a perfect square trinomial.

$= (y + 5)^2 - z^2$

$= u^2 - z^2$ Substitute $u = y + 5$.

$= (u + z)(u - z)$ Factor as a difference of squares.

$= (y + 5 + z)(y + 5 - z)$ Back substitute.

Example 3:

$-8 - (-8)$ $-7 - (-8)$ $-6 - (-8)$

$7z^{-8} + 6z^{-7} - 5z^{-6} = z^{-8}(7z^0 + 6z^1 - 5z^2)$

$= z^{-8}(7 + 6z - 5z^2)$ or $\dfrac{7 + 6z - 5z^2}{z^8}$

SECTION R.6 Rational Expressions and More Operations on Radicals

KEY CONCEPTS

Definition of a rational expression:

A **rational expression** is a ratio of two polynomials. Values of the variable that make the denominator equal to zero are called restricted values of the variable.

Simplify rational expressions:

To simplify a rational expression, use the property of equivalent algebraic fractions.

$$\frac{ac}{bc} = \frac{a}{b} \quad \text{for } b \neq 0, c \neq 0$$

Multiply and divide rational expressions:

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd} \quad \text{for } b \neq 0, d \neq 0$$

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc} \quad \text{for } b \neq 0, c \neq 0, d \neq 0$$

Add and subtract rational expressions:

Write each fraction as an equivalent fraction with a common denominator. Then apply the following properties.

$$\frac{a}{b} + \frac{c}{b} = \frac{a + c}{b} \quad \text{and} \quad \frac{a}{b} - \frac{c}{b} = \frac{a - c}{b} \quad \text{for } b \neq 0$$

EXAMPLES

Example 1:

$\dfrac{x + 5}{x + 7}$ is a rational expression with the restriction that $x \neq -7$.

Example 2:

$$\frac{2x^2 - 9x - 5}{6x^2 - 30x} = \frac{(2x + 1)(x - 5)}{6x(x - 5)}$$

$$= \frac{2x + 1}{6x} \text{ for } x \neq 0, x \neq 5$$

Example 3:

$$\frac{12 - 3x}{2x + 1} \div \frac{x^2 - 3x - 4}{2x^2 + 15x + 7}$$

$$= \frac{12 - 3x}{2x + 1} \cdot \frac{2x^2 + 15x + 7}{x^2 - 3x - 4}$$

$$= \frac{3(4 - x)}{(2x + 1)} \cdot \frac{(2x + 1)(x + 7)}{(x - 4)(x + 1)} = -\frac{3(x + 7)}{x + 1}$$

Example 4:

$$\frac{x}{x - 1} + \frac{2}{x} = \frac{x(x)}{(x - 1)(x)} + \frac{2(x - 1)}{x(x - 1)} \quad \text{LCD} = x(x - 1)$$

$$= \frac{x^2 + 2(x - 1)}{x(x - 1)} = \frac{x^2 + 2x - 2}{x(x - 1)}$$

ISTUDY

Simplifying a complex fraction:

Example 5 (Method I):
Use the order of operations to combine fractions in the numerator and denominator of the complex fraction. Then divide the resulting fractions.

$$\frac{\frac{1}{x}+\frac{1}{2}}{1+\frac{2}{x}} = \frac{\frac{1(2)}{x(2)}+\frac{1(x)}{2(x)}}{\frac{1(x)}{1(x)}+\frac{2}{x}} = \frac{\frac{2+x}{2x}}{\frac{x+2}{x}}$$

$$= \frac{2+x}{2x} \cdot \frac{x}{x+2} = \frac{1}{2}$$

Rationalizing the denominator:
Removing a radical from the denominator of a fraction is called **rationalizing the denominator.**

Example 6 (Method II):
Multiply numerator and denominator of the complex fraction by the LCD of all individual fractions.

$$\frac{\frac{1}{x}+\frac{1}{2}}{1+\frac{2}{x}} = \frac{2x \cdot \left(\frac{1}{x}+\frac{1}{2}\right)}{2x \cdot \left(\frac{1}{1}+\frac{2}{x}\right)} = \frac{2+x}{2x+4}$$

$$= \frac{2+x}{2(x+2)} = \frac{1}{2}$$

Example 7:

$$\frac{5}{\sqrt[3]{2y^2}} = \frac{5 \cdot \sqrt[3]{2^2 y}}{\sqrt[3]{2y^2} \cdot \sqrt[3]{2^2 y}} = \frac{5\sqrt[3]{4y}}{\sqrt[3]{2^3 y^3}} = \frac{5\sqrt[3]{4y}}{2y}$$

Example 8:
Multiply numerator and denominator by the conjugate of the denominator.

$$\frac{8}{\sqrt{13}-\sqrt{11}} = \frac{8 \cdot (\sqrt{13}+\sqrt{11})}{(\sqrt{13}-\sqrt{11}) \cdot (\sqrt{13}+\sqrt{11})}$$

$$= \frac{8(\sqrt{13}+\sqrt{11})}{13-11} = \frac{8(\sqrt{13}+\sqrt{11})}{2} = 4(\sqrt{13}+\sqrt{11})$$

CHAPTER 1 DETAILED SUMMARY

SECTION 1.1 Linear Equations and Rational Equations

KEY CONCEPTS

A **linear equation in one variable** is an equation that can be written in the form $ax + b = 0$, where a and b are real numbers and $a \neq 0$.

Solving a linear equation in one variable:

1. Simplify both sides of the equation.
2. Collect variable terms on one side of the equation and constants on the other side.
3. Apply the multiplication property of equality to obtain a coefficient of 1 on the variable.
4. Check the potential solution.
5. Write the solution set.

A **conditional equation** is an equation that is true for some values of the variable but false for others.

A **contradiction** is false for all values of the variable.

An **identity** is true for all values of the variable for which the expressions in the equation are defined.

Solve a rational equation by multiplying both sides of the equation by the LCD of all fractions in the equation.

To solve an equation for a specific variable when the equation contains multiple variables, use the properties of equality to isolate the variable.

EXAMPLES

Example 1:
The equation $2x + 3 = 0$ is a linear equation.

Example 2:
Solve. $-2(x - 3) + 5x = 12$

$$\begin{aligned} -2x + 6 + 5x &= 12 \\ 3x + 6 &= 12 \\ 3x &= 6 \\ x &= 2 \end{aligned}$$

The solution checks.
The solution set is $\{2\}$.

Example 3:
$2x = 16$ is a conditional equation because it is true on the condition that $x = 8$. The solution set is $\{8\}$.

$2x + 1 = 2x + 3$ or equivalently $1 = 3$ is a contradiction because this statement is false for all values of x. The solution set is $\{\ \}$.

$3x + 6 = 3(x + 2)$ or equivalently $6 = 6$ is an identity. It is true for all real numbers, x. The solution set is $\mathbb{R}$.

Example 4:
Solve. $\dfrac{4}{y} = \dfrac{18}{3y} + 1$

$$3y \cdot \left(\frac{4}{y}\right) = 3y \cdot \left(\frac{18}{3y} + 1\right)$$

$$\begin{aligned} 12 &= 18 + 3y \\ -6 &= 3y \\ y &= -2 \end{aligned}$$

The solution checks.
The solution set is $\{-2\}$.

Example 5:
Solve $3x - 2y = 24$ for y.

$$\begin{aligned} -2y &= -3x + 24 \\ \frac{-2y}{-2} &= \frac{-3x + 24}{-2} \\ y &= \frac{3}{2}x - 12 \end{aligned}$$

ISTUDY

SECTION 1.2 Applications with Linear and Rational Equations

KEY CONCEPTS

Equations in algebra can be used to organize information from a physical situation. The following are suggested guidelines to solve an application.

1. Read the problem carefully. Assign variables to the unknown quantities.
2. Make an appropriate figure or table, if applicable, and label the given information and variables in the figure or table.
3. Write an equation that represents the verbal model.
4. Solve the equation from step 3.
5. Interpret the solution and check that the answer is reasonable.

EXAMPLES

Example 1:
How much 20% acid solution should be mixed with 400 mL of a 5% acid solution to bring the concentration rate up to 10%?

Let x represent the amount of 20% solution.

Then $400 + x$ is the amount of 10% solution.

	20% solution	5% solution	10% solution
Mixture	x	400	$400 + x$
Pure acid	$0.20x$	$0.05(400)$	$0.10(400 + x)$

$$\begin{pmatrix}\text{Acid from}\\ \text{20\% solution}\end{pmatrix} + \begin{pmatrix}\text{Acid from}\\ \text{5\% solution}\end{pmatrix} = \begin{pmatrix}\text{Acid from}\\ \text{10\% solution}\end{pmatrix}$$

$$\begin{aligned} 0.20x + 0.05(400) &= 0.10(400 + x) \\ 0.20x + 20 &= 40 + 0.10x \\ 0.10x &= 20 \\ x &= 200 \end{aligned}$$

200 mL of a 20% acid solution is needed.

Check: $0.20(200 \text{ mL}) = 40 \text{ mL pure acid}$
$0.05(400 \text{ mL}) = 20 \text{ mL pure acid}$
Total: $0.10(600 \text{ mL}) = 60 \text{ mL pure acid}$ ✓

SECTION 1.3 Complex Numbers

KEY CONCEPTS

$i = \sqrt{-1}$ and $i^2 = -1$.

For a real number $b > 0$, $\sqrt{-b} = i\sqrt{b}$.

If a and b are real numbers, then a number written in the form $a + bi$ is called a **complex number.** The value a is called the **real part,** and b is called the **imaginary part.**

To add or subtract complex numbers, combine the real parts, and combine the imaginary parts.

To evaluate i raised to an integer power, we first recognize the following pattern.

$i^1 = i$
$i^2 = -1$
$i^3 = i^2 \cdot i = (-1)i = -i$
$i^4 = i^2 \cdot i^2 = (-1)(-1) = 1$

Then write a power of i as a product of the largest fourth power of i and a remaining factor.

EXAMPLES

Example 1:
$$\begin{aligned} \sqrt{-9} \cdot \sqrt{-16} &= (3i) \cdot (4i) = 12i^2 \\ &= 12(-1) = -12 \end{aligned}$$

Example 2:
The number $3 + 8i$ is a complex number with real part 3 and imaginary part 8.

Example 3:
$$\begin{aligned} &(4 + 7i) - (3 + 6i) + (2 + 10i) \\ &= (4 - 3 + 2) + (7 - 6 + 10)i \\ &= 3 + 11i \end{aligned}$$

Example 4:
$$\begin{aligned} i^{63} &= i^{60} \cdot i^3 \\ &= (i^4)^{15} i^3 \\ &= (1)^{15} \cdot (-i) \\ &= -i \end{aligned}$$

$i^{42} = i^{40} \cdot i^2 = (1)(-1) = -1$
$i^{25} = i^{24} \cdot i = 1 \cdot i = i$

Multiply complex numbers by using the distributive property.

Divide complex numbers by multiplying the numerator and denominator by the conjugate of the denominator.

The product of complex conjugates:

$$\begin{aligned}(a+bi)(a-bi) &= (a)^2-(bi)^2\\ &= a^2-b^2i^2\\ &= a^2-b^2(-1)\\ &= a^2+b^2\end{aligned}$$

Example 5:

$$\begin{aligned}(1-4i)(2+3i) &= 2+3i-8i-12i^2\\ &= 2-5i-12(-1)\\ &= 2-5i+12\\ &= 14-5i\end{aligned}$$

Example 6:

$$\frac{4}{3+5i}=\frac{4\cdot(3-5i)}{(3+5i)\cdot(3-5i)}=\frac{12-20i}{(3)^2+(5)^2}$$
$$=\frac{12-20i}{9+25}=\frac{12}{34}-\frac{20}{34}i=\frac{6}{17}-\frac{10}{17}i$$

SECTION 1.4 Quadratic Equations

KEY CONCEPTS

Let a, b, and c represent real numbers. A **quadratic equation** in the variable x is an equation of the form $ax^2+bx+c=0$, where $a\neq 0$.

Zero product property:
If $mn=0$, then $m=0$ or $n=0$.

Square root property:
If $x^2=k$, then $x=\pm\sqrt{k}$.

Completing the square:
For an equation $ax^2+bx+c=0$ $(a\neq 0)$, follow these steps to complete the square and solve the equation.

1. Divide both sides by a to make the leading coefficient 1.
2. Isolate the variable terms on one side.
3. Complete the square by adding the square of one-half the linear term coefficient to both sides. Then factor the resulting perfect square trinomial.
4. Apply the square root property and solve for x.

Quadratic formula:
The solutions to $ax^2+bx+c=0$ $(a\neq 0)$ are given by the quadratic formula.

$$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$$

EXAMPLES

Example 1:

Solve. $x^2-x-12=0$

$(x-4)(x+3)=0$ Factor.

$x-4=0$ or $x+3=0$ Apply the zero product property.

$x=4$ or $x=-3$

The solution set is $\{4,-3\}$.

Example 2:

Solve. $(x-3)^2=5$

$x-3=\pm\sqrt{5}$

$x=3\pm\sqrt{5}$

Solution set: $\{3\pm\sqrt{5}\}$

Example 3:

Solve. $2x^2-8x-16=0$

$\frac{2x^2}{2}-\frac{8x}{2}-\frac{16}{2}=\frac{0}{2}$

$x^2-4x-8=0$

$x^2-4x+\_\_\_\_=8+\_\_\_\_$

$x^2-4x+4=8+4$ *Note:* $\left[\frac{1}{2}(-4)\right]^2=4$

$(x-2)^2=12$

$x-2=\pm\sqrt{12}$

$x=2\pm 2\sqrt{3}$

Solution set: $\{2\pm 2\sqrt{3}\}$

Example 4:

Solve. $2x^2-3x+7=0$ $a=2, b=-3, c=7$

$$x=\frac{-(-3)\pm\sqrt{(-3)^2-4(2)(7)}}{2(2)}$$

$$x=\frac{3\pm\sqrt{-47}}{4}=\frac{3}{4}\pm\frac{\sqrt{47}}{4}i$$

Solution set: $\left\{\frac{3}{4}\pm\frac{\sqrt{47}}{4}i\right\}$

ISTUDY

Discriminant:

The discriminant to the equation $ax^2 + bx + c = 0$ $(a \neq 0)$ is given by $b^2 - 4ac$.

The discriminant indicates the number of and type of solutions to the equation.

- If $b^2 - 4ac < 0$, the equation has 2 nonreal solutions.
- If $b^2 - 4ac = 0$, the equation has 1 real solution.
- If $b^2 - 4ac > 0$, the equation has 2 real solutions.

The quadratic formula can also be used to solve a quadratic equation for a specified variable.

Example 5:

Determine the number and type of solutions for the equation. $4x^2 - 5x + 11 = 0$

$a = 4,\ b = -5,\ c = 11$

$b^2 - 4ac = (-5)^2 - 4(4)(11)$

$= -151$

Because $-151 < 0$, the equation has two nonreal solutions.

Example 6:

Solve for t. $wt^2 = zt - y$

The equation is quadratic in the variable t.

$wt^2 - zt + y = 0$ $(a = w,\ b = -z,\ c = y)$

$$t = \frac{-(-z) \pm \sqrt{(-z)^2 - 4(w)(y)}}{2(w)}$$

$$= \frac{z \pm \sqrt{z^2 - 4wy}}{2w}$$

SECTION 1.5 Applications of Quadratic Equations

KEY CONCEPTS

Quadratic equations are used to model applications with the Pythagorean theorem, volume, area, and objects moving vertically under the influence of gravity.

The vertical position s of an object moving vertically under the influence of gravity is approximated by $s = -\frac{1}{2}gt^2 + v_0t + s_0$, where

- g is the acceleration due to gravity (at sea level on Earth: $g = 32$ ft/sec^2 or 9.8 m/sec^2).
- t is the time after the start of the experiment.
- v_0 is the initial velocity.
- s_0 is the initial position (height).
- s is the position of the object at time t.

EXAMPLES

Example 1:

A diver jumps approximately straight upward from a diving board 3 m above the water with an initial velocity of 5 m/sec.

a. Write a model to express the height s (in meters) of the diver.

$$s = -\frac{1}{2}(9.8)t^2 + 5t + 3$$

$$s = -4.9t^2 + 5t + 3$$

b. Find the time required for the diver to hit the water.

$$0 = -4.9t^2 + 5t + 3$$

$$t = \frac{-(5) \pm \sqrt{(5)^2 - 4(-4.9)(3)}}{2(-4.9)}$$

$$t = \frac{-5 \pm \sqrt{83.8}}{-9.8} \approx -0.42 \text{ sec (reject)},\ \approx 1.44 \text{ sec}$$

Rejecting the negative solution, the diver will hit the water approximately 1.44 sec after leaving the board.

SECTION 1.6 More Equations and Applications

KEY CONCEPTS

Solving polynomial equations:
A polynomial equation with one side equal to zero and the other factored as a product of linear or quadratic factors can be solved by applying the zero product property.

Solving rational equations:
Multiply both sides of the equation by the LCD of all terms in the equation. Be sure to check the potential solutions.

Properties involving absolute value equations:
Let k represent a positive real number.

1. $|u| = k$ is equivalent to $u = k$ or $u = -k$.
2. $|u| = 0$ is equivalent to $u = 0$.
3. $|u| = -k$ has no solution.
4. $|u| = |w|$ is equivalent to $u = w$ or $u = -w$.

EXAMPLES

Example 1:
Solve. $8x^3 + 125 = 0$

$(2x + 5)(4x^2 - 10x + 25) = 0$

$2x + 5 = 0$ or $4x^2 - 10x + 25 = 0$

$x = -\frac{5}{2}$ or $x = \frac{-(-10) \pm \sqrt{(-10)^2 - 4(4)(25)}}{2(4)}$

$x = \frac{10 \pm \sqrt{-300}}{8} = \frac{10 \pm 10i\sqrt{3}}{8}$

$x = \frac{5}{4} \pm \frac{5\sqrt{3}}{4}i$

Solution set: $\left\{-\frac{5}{2}, \frac{5}{4} \pm \frac{5\sqrt{3}}{4}i\right\}$

Example 2:

$$\frac{x}{x-5} + \frac{1}{5} = \frac{5}{x-5}$$

$$5(x-5)\left(\frac{x}{x-5}\right) + 5(x-5)\left(\frac{1}{5}\right) = 5(x-5)\left(\frac{5}{x-5}\right)$$

$$5x + x - 5 = 25$$
$$6x = 30$$
$$x = 5$$

The value 5 does not check in the original equation because it makes the denominator zero. The solution set is { }.

Example 3:
Solve. $|x - 3| + 5 = 10$

$|x - 3| = 5$ Isolate the absolute value.

$x - 3 = 5$ or $x - 3 = -5$

$x = 8$ or $x = -2$

The solution set is $\{8, -2\}$.

Example 4:
The equation $|2x + 3| = -9$ has no solution.

Example 5:
Solve. $|2x - 10| = |x + 2|$

$2x - 10 = x + 2$ or $2x - 10 = -(x + 2)$

$x = 12$ or $2x - 10 = -x - 2$

$3x = 8$

$x = \frac{8}{3}$

The solution set is $\left\{12, \frac{8}{3}\right\}$.

ISTUDY

Solving radical equations:

1. Isolate the radical. If an equation has more than one radical, choose one of the radicals to isolate.
2. Raise each side of the equation to a power equal to the index of the radical.
3. Solve the resulting equation. If the equation still has a radical, repeat steps 1 and 2.
4. Check the potential solutions in the original equation and write the solution set.

Example 6:

Solve. $\sqrt[3]{x-1}+2=6$

$\sqrt[3]{x-1}=4$ Subtract 2 to isolate the radical.

$(\sqrt[3]{x-1})^3=(4)^3$ Cube both sides.

$x-1=64$ Solve for x.

$x=65$

Solution set: $\{65\}$ The solution checks in the original equation.

Solving equations of the form $u^{m/n}=k$:

Write the equation in radical form and solve as a radical equation.

Example 7:

$c^{2/5}=4$

$\sqrt[5]{c^2}=4$

$(\sqrt[5]{c^2})^5=(4)^5$

$c^2=1024$

$c=\pm\sqrt{1024}$

$c=\pm 32$ Both solutions check.

The solution set is $\{\pm 32\}$.

Solving equations in quadratic form:

Substitution can be used to solve equations that are in quadratic form.

Example 8:

Solve. $x^{2/3}-3x^{1/3}-4=0$ Let $u=x^{1/3}$.

$u^2-3u-4=0$

$(u-4)(u+1)=0$

$u=4$ or $u=-1$

$x^{1/3}=4$ or $x^{1/3}=-1$

$(x^{1/3})^3=(4)^3$ or $(x^{1/3})^3=(-1)^3$

$x=64$ or $x=-1$

Solution set: $\{64,-1\}$

SECTION 1.7 Linear, Compound, and Absolute Value Inequalities

KEY CONCEPTS

An inequality that can be written in one of the following forms is a **linear inequality in one variable.**

$ax+b<0$, $ax+b\le 0$,
$ax+b>0$, or $ax+b\ge 0$

***Properties of inequalities:**

Let a, b, and c represent real numbers.

1. If $a<b$, then $a+c<b+c$.
2. If $a<b$, then $a-c<b-c$.
3. If c is *positive* and $a<b$, then

   $a\cdot c<b\cdot c$ and $\frac{a}{c}<\frac{b}{c}$.
4. If c is *negative* and $a<b$, then

   $a\cdot c>b\cdot c$ and $\frac{a}{c}>\frac{b}{c}$.

*These properties of inequality are also true for statements expressed with the symbols $\le$, $>$, and $\ge$.

EXAMPLES

Example 1:

Solve. $-4x-7\ge 9$

$-4x\ge 16$

$\frac{-4x}{-4}\le\frac{16}{-4}$

$x\le -4$

Solution set: $\{x\mid x\le -4\}$

Interval notation: $(-\infty,-4]$

Solving compound inequalities:

- If two inequalities are joined by the word "and," take the *intersection* of the individual solution sets.

Example 2:

Solve. $2x < 6$ and $4 \le x + 5$

$x < 3$ and $-1 \le x$

The solution set is $[-1, 3)$.

- The inequality $a < x < b$ is equivalent to $a < x$ and $x < b$.

Example 3:

Solve. $-7 < x + 4 \le 8$

$-7 - 4 < x + 4 - 4 \le 8 - 4$

$-11 < x \le 4$

The solution set is $(-11, 4]$.

- If two inequalities are joined by the word "or," take the *union* of the individual solution sets.

Example 4:

Solve. $-3y > 12$ or $y + 7 \ge 9$

$y < -4$ or $y \ge 2$

The solution set is $(-\infty, -4) \cup [2, \infty)$.

***Properties involving absolute value inequalities:**

For a positive real number k,

5. $|u| < k$ is equivalent to $-k < u < k$.

Example 5:

Solve. $|x + 7| - 3 \le 4$

$|x + 7| \le 7$ Isolate the absolute value.

$-7 \le x + 7 \le 7$ Equivalent form

$-14 \le x \le 0$ Interval notation: $[-14, 0]$

6. $|u| > k$ is equivalent to $u < -k$ or $u > k$.

*The statements also hold true for the inequality symbols $\le$ and $\ge$, respectively.

Example 6:

Solve. $|x + 1| > 5$

$x + 1 < -5$ or $x + 1 > 5$

$x < -6$ or $x > 4$

Interval notation: $(-\infty, -6) \cup (4, \infty)$

Absolute value inequalities with special case solution sets:

$|u| < 0$ has no solution.

$|u| \le 0$ is true for $u = 0$.

$|u| > 0$ is true for $u < 0$ or $u > 0$.

$|u| \ge 0$ is true for all real numbers.

Example 7:

$|x - 4| < 0$ Solution set: $\{\ \}$

$|x - 4| \le 0$ Solution set: $\{4\}$

$|u - 4| > 0$ Solution set: $(-\infty, 4) \cup (4, \infty)$

$|u - 4| \ge 0$ Solution set: $(-\infty, \infty)$

Example 8:

$|5x + 6| < -4$ has no solution.

$|3y + 9| > -3$ is true for all real numbers, $\mathbb{R}$.

ISTUDY

CHAPTER 2 DETAILED SUMMARY

SECTION 2.1 The Rectangular Coordinate System and Graphing Utilities

KEY CONCEPTS

The **distance** between two points (x_1, y_1) and (x_2, y_2) in a rectangular coordinate system is given by

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

The **midpoint** between the points is given by

$$M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$

Graphing an equation:
To graph an equation in a rectangular coordinate system, plot several solutions to the equation to form a general outline of the curve. Then connect the points to form a smooth line or curve.

Determining *x*- and *y*-intercepts:
To find an x-intercept $(a, 0)$ of the graph of an equation, substitute 0 for y and solve for x.

To find a y-intercept $(0, b)$ of the graph of an equation, substitute 0 for x and solve for y.

EXAMPLES

Example 1:
Given $(-4, -5)$ and $(6, -1)$, find the distance between the points and the midpoint of the line segment between the points.

$$d = \sqrt{[6 - (-4)]^2 + [-1 - (-5)]^2}$$

$$d = \sqrt{(10)^2 + (4)^2} = \sqrt{116} = 2\sqrt{29}$$

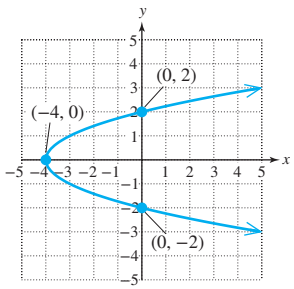
$$M = \left(\frac{-4 + 6}{2}, \frac{-5 + (-1)}{2}\right) = (1, -3)$$

Example 2:
Graph $x = y^2 - 4$.

x	5	0	−3	−4	−3	0	5
y	−3	−2	−1	0	1	2	3

***x*-intercept:**
$x = y^2 - 4$
$x = (0)^2 - 4$
$x = -4$

***y*-intercepts:**
$x = y^2 - 4$
$0 = y^2 - 4$
$y = 2$ or $y = -2$



SECTION 2.2 Circles

KEY CONCEPTS

A **circle** is the set of all points in a plane that are equidistant from a fixed point called the **center.** The fixed distance between the center and any point on the circle is called the **radius** of the circle.

The **standard form** of an equation of a circle with radius r and center (h, k) is

$$(x - h)^2 + (y - k)^2 = r^2$$

An equation of a circle written in the form $x^2 + y^2 + Ax + By + C = 0$ is called the **general form** of an equation of a circle.

Writing an equation in standard form:
By completing the square, we can write an equation of a circle given in general form as an equation in standard form. The purpose is to identify the center and radius from the standard form.

EXAMPLES

Example 1:
Write the standard form of an equation of the circle whose center is $\left(3, -\frac{1}{2}\right)$ and whose radius is 5.

$$(x - h)^2 + (y - k)^2 = r^2$$

$$(x - 3)^2 + \left[y - \left(-\frac{1}{2}\right)\right]^2 = (5)^2$$

$$(x - 3)^2 + \left(y + \frac{1}{2}\right)^2 = 25$$

Example 2:
Write the equation of the circle in standard form. Then identify the center and radius.

$$x^2 + y^2 - 12x + 8y + 5 = 0$$

$$x^2 - 12x + 36 + y^2 + 8y + 16 = -5 + 36 + 16$$

$$(x - 6)^2 + (y + 4)^2 = 47$$

The center is $(6, -4)$ and the radius is $\sqrt{47}$.

ISTUDY

Not all equations of the form $x^2 + y^2 + Ax + By + C = 0$ represent the graph of a circle. Completing the square results in an equation of the form $(x - h)^2 + (y - k)^2 = c$ where c is a constant.

- If $c > 0$, then the graph will be a circle with radius $r = \sqrt{c}$.
- If $c = 0$, then the graph will be a single point (h, k). The solution set is $\{(h, k)\}$. (Degenerate case)
- If $c < 0$, then the solution set is the empty set $\{\ \}$. (Degenerate case)

Example 3:

$$x^2 + y^2 - 8x + 2y + 17 = 0$$
$$x^2 - 8x + 16 + y^2 + 2y + 1 = -17 + 16 + 1$$
$$(x - 4)^2 + (y + 1)^2 = 0$$

The sum of two squares will equal zero only if each individual term is zero. Therefore, $x = 4$ and $y = -1$.

The solution set is $\{(4, -1)\}$.

SECTION 2.3 Functions and Relations

KEY CONCEPTS

A set of ordered pairs (x, y) is called a **relation** in x and y. The set of x values is the **domain** of the relation, and the set of y values is the **range** of the relation.

Given a relation in x and y, we say that ***y* is a function of *x*** if for each value of x in the domain, there is exactly one value of y in the range.

Vertical line test:
The graph of a relation defines y as a function of x if no vertical line intersects the graph in more than one point.

Evaluating a function for different values of *x*:
A function may be evaluated at different values of x by using substitution.

Determining *x*- and *y*-intercepts:
Given a function defined by $y = f(x)$,

- The x-intercept(s) are the real solutions to $f(x) = 0$.
- The y-intercept is given by $f(0)$.

EXAMPLES

Example 1:
Given the relation $\{(8, 2), (3, 2), (9, 5)\}$,

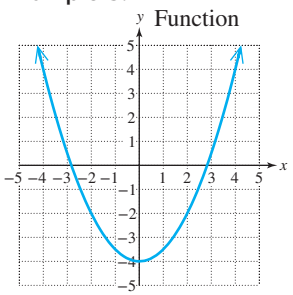
The domain is $\{8, 3, 9\}$.
The range is $\{2, 5\}$.

Example 2:

The relation $\{(4, 6), (3, 5), (4, 1)$ is *not* a function. (same x; different y)

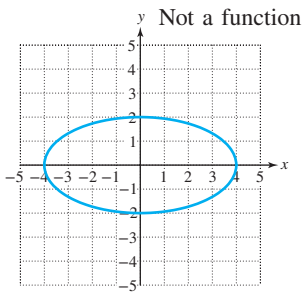
The relation $\{(3, 5), (2, 1), (9, 0)\}$ is a function because no two ordered pairs have the same x value but different y values.

Example 3:



Function

Domain: $(-\infty, \infty)$
Range: $[-4, \infty)$



Not a function

Domain: $[-4, 4]$
Range: $[-2, 2]$

Example 4:
Given $f(x) = 2x^2 + 3x$,

$$f(2) = 2(2)^2 + 3(2) = 14$$
$$f(x + 4) = 2(x + 4)^2 + 3(x + 4)$$
$$= 2(x^2 + 8x + 16) + 3x + 12$$
$$= 2x^2 + 19x + 44$$

Example 5:
Given $f(x) = |x| - 2$,

- To find the x-intercept(s), substitute 0 for $f(x)$:
  $0 = |x| - 2$
  $x = 2$ or $x = -2$
  The x-intercepts are $(2, 0), (-2, 0)$.
- To find the y-intercept, evaluate $f(0)$.
  $f(0) = |0| - 2 = -2$ The y-intercept is $(0, -2)$.

Determining domain from $y = f(x)$:
Given $y = f(x)$, the domain of f is the set of real numbers x that when substituted into the function produce a real number. This excludes

- Values of x that make the denominator zero.
- Values of x that make a radicand negative within an even-indexed root.

Function values and the domain and range of a function can be estimated from the graph of the function.

Example 6:

- Given $f(x) = \dfrac{x+5}{x-3}$, the domain is $(-\infty, 3) \cup (3, \infty)$.
- Given $g(x) = \sqrt{x-3}$, the domain is $[3, \infty)$.

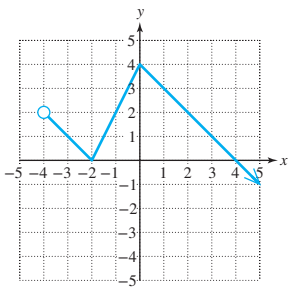
Example 7:
From the graph, find

a. the domain

b. the range

c. $f(3)$

d. the values of x for which $f(x) = 2$



a. $(-4, \infty)$

b. $(-\infty, 4]$

c. $f(3) = 1$

d. $x = -1, x = 2$

SECTION 2.4 Linear Equations in Two Variables and Linear Functions

KEY CONCEPTS

Let A, B, and C represent real numbers, where A and B are not both zero. A **linear equation** in the variables x and y is an equation that can be written as $Ax + By = C$.

The graph of a linear equation is a line.

- A horizontal line has an equation of the form $y = k$, where k is a constant real number.
- A vertical line has an equation of the form $x = k$, where k is a constant real number.

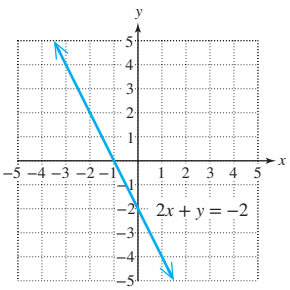
The slope of a line passing through the distinct points (x_1, y_1) and (x_2, y_2) is given by

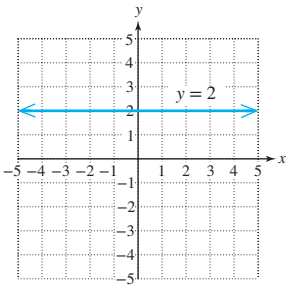
$$m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$$

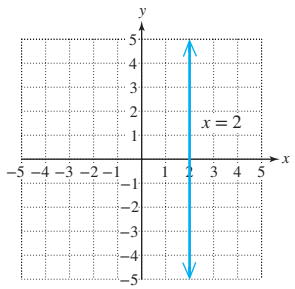
- The slope of a horizontal line is 0.
- The slope of a vertical line is undefined.

EXAMPLES

Example 1:







Example 2:
Given $(-4, 5)$ and $(6, 3)$,

(x_1, y_1) and (x_2, y_2) Label the points.

$$m = \frac{3-5}{6-(-4)} = \frac{-2}{10} = -\frac{1}{5}$$

ISTUDY

Slope-intercept form of a line:
Given a line with slope m and y-intercept $(0, b)$, the **slope-intercept form** of the line is given by

$$y = mx + b$$

- A function defined by $f(x) = mx + b$ $(m \neq 0)$ is a **linear function** (graph is a slanted line).
- A function defined by $f(x) = b$ is a **constant function** (graph is a horizontal line).

Average rate of change:
If f is defined on the interval $[x_1, x_2]$, then the **average rate of change** of f on the interval $[x_1, x_2]$ is the slope of the secant line containing $(x_1, f(x_1))$ and $(x_2, f(x_2))$ and is given by

$$m = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

Solving equations and inequalities graphically:
The x-coordinates of the points of intersection between the graphs of $Y_1 = f(x)$ and $Y_2 = g(x)$ are the solutions to the equation $Y_1 = Y_2$.

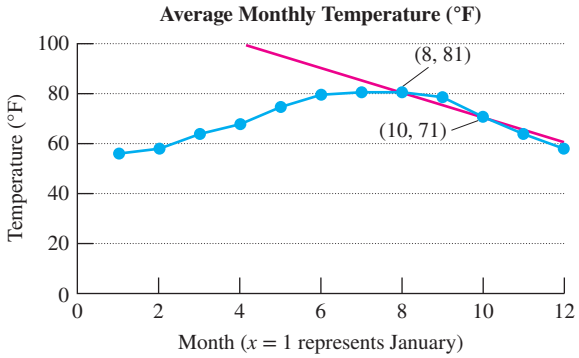
Example 3:
Given $2x + 9y = 18$, write the equation in slope-intercept form.

$$2x + 9y = 18 \qquad \text{Solve for } y.$$
$$9y = -2x + 18$$
$$y = -\frac{2}{9}x + 2 \quad \text{or} \quad f(x) = -\frac{2}{9}x + 2$$

The slope is $-\frac{2}{9}$. The y-intercept is $(0, 2)$.

Example 4:
The average rate of change from $x_1 = 8$ to $x_2 = 10$ is

$$m = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{71 - 81}{10 - 8} = \frac{-10}{2} = -5$$



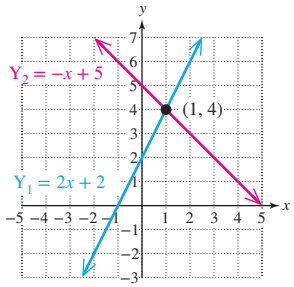
The average monthly temperature between August and October decreased by an average of 5°F per month.

Example 5:
Solve the equation and inequalities graphically.

a. $2x + 2 = -x + 5$

b. $2x + 2 < -x + 5$

c. $2x + 2 \geq -x + 5$



Solutions:

a. $\{1\}$

b. $(-\infty, 1)$

c. $[1, \infty)$

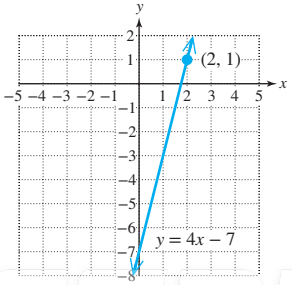
SECTION 2.5 Applications of Linear Equations and Modeling

KEY CONCEPTS

The **point-slope formula** for a line is given by $y - y_1 = m(x - x_1)$, where m is the slope of the line and (x_1, y_1) is a point on the line.

EXAMPLES

Example 1:
Use the point-slope formula to find an equation of the line passing through the point $(2, 1)$ and having a slope of 4.



$$y - y_1 = m(x - x_1)$$
$$y - 1 = 4(x - 2)$$
$$y - 1 = 4x - 8$$
$$y = 4x - 7$$

ISTUDY

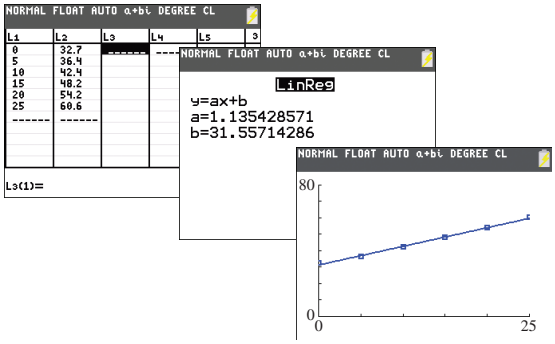
Slopes of parallel and perpendicular lines:

- If m_1 and m_2 represent the slopes of two nonvertical parallel lines, then $m_1 = m_2$.
- If m_1 and m_2 represent the slopes of two nonvertical perpendicular lines, then $m_1 = -\dfrac{1}{m_2}$ or equivalently $m_1 m_2 = -1$.

Applications of linear equations in two variables:

In many-day-to-day applications, two variables are related linearly.

- A linear model can be made from two data points that represent the general trend of the data.
- Alternatively, the least-squares regression line is a model that utilizes *all* observed data points. From Example 3 we have



Least-squares regression line: $y = 1.14x + 31.6$

Linear cost, revenue, and profit functions:

A **linear cost function** models the cost $C(x)$ to produce x items.

$$C(x) = mx + b$$

where m is the variable cost per item, and b is the fixed cost.

A **linear revenue function** models the revenue $R(x)$ for selling x items.

$$R(x) = px$$

where p is the price per item.

A **profit function** models the profit for producing and selling x items.

$$P(x) = R(x) - C(x)$$

Profit is revenue minus cost. The break-even point is where profit is zero (that is, where revenue equals cost).

Example 2:

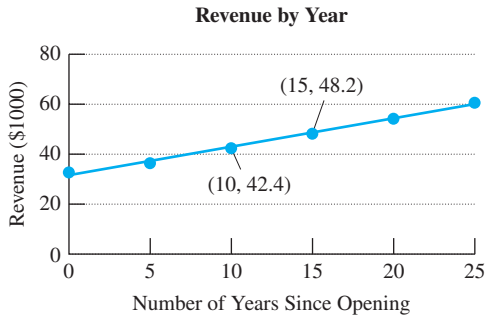
The slope of a line is $-\frac{1}{5}$.

- The slope of a line parallel to this line is $-\frac{1}{5}$.
- The slope of a line perpendicular to this line is 5.

Example 3:

The yearly revenue y (in \$1000) for a small business has increased since the year the business opened. Use the points (10, 42.4) and (15, 48.2) to write a linear model that approximates the revenue as a function of the number of years x since the business opened.

x	0	5	10	15	20	25
y	32.7	36.4	42.4	48.2	54.2	60.6



$$m = \frac{48.2 - 42.4}{15 - 10} = 1.16$$

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - 42.4 &= 1.16(x - 10) \\ y &= 1.16x + 30.8 \end{aligned}$$

Example 4:

An herbal tea company sells tea for \$3.50 per box. The tea and packaging materials cost \$0.60 per box, and the fixed monthly costs (labor, rent, and so on) are \$3800 per month.

The cost to produce x boxes of tea during a given month is

$$C(x) = 0.60x + 3800$$

The revenue for selling x boxes of tea during a given month is

$$R(x) = 3.50x$$

The profit for producing and selling x boxes during a given month is

$$\begin{aligned} P(x) &= 3.50x - (0.60x + 3800) \\ &= 2.90x - 3800 \end{aligned}$$

To make a profit,

$$\begin{aligned} P(x) &> 0 \\ 2.90x - 3800 &> 0 \\ 2.90x &> 3800 \\ x &> 1310 \end{aligned}$$

The company will make a profit if more than 1310 boxes of tea are sold.

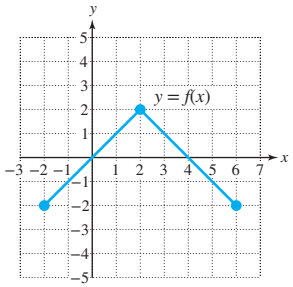
SECTION 2.6 Transformations of Graphs

KEY CONCEPTS

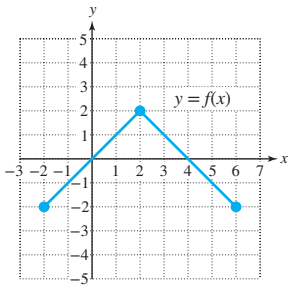
Transformations of graphs:
Consider a function defined by $y = f(x)$. Let k, h, and a represent positive real numbers. The graphs of the following functions are related to $y = f(x)$ as follows:

- Vertical translation (shift)
  - $y = f(x) + k$ Shift upward
  - $y = f(x) - k$ Shift downward
- Horizontal translation (shift)
  - $y = f(x - h)$ Shift to the right
  - $y = f(x + h)$ Shift to the left

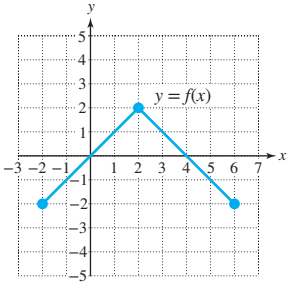
- Vertical stretch/shrink
  - $y = af(x)$ Vertical stretch (if $a > 1$)
    Vertical shrink (if $0 < a < 1$)



- Horizontal stretch/shrink
  - $y = f(ax)$ Horizontal shrink (if $a > 1$)
    Horizontal stretch (if $0 < a < 1$)

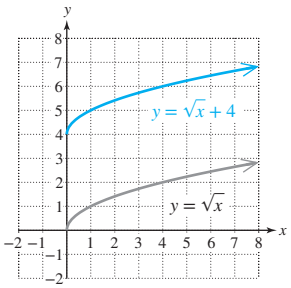


- Reflection
  - $y = -f(x)$ Reflection across the x-axis
  - $y = f(-x)$ Reflection across the y-axis

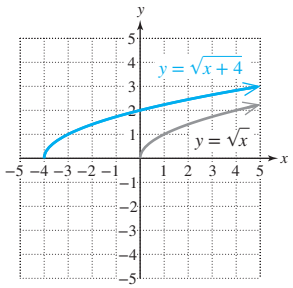


EXAMPLES

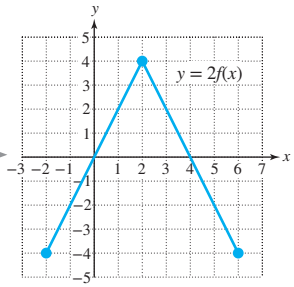
Example 1:

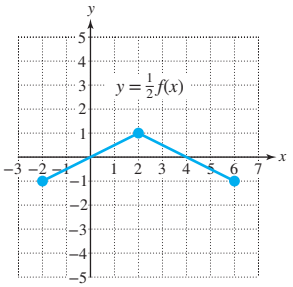


Example 2:

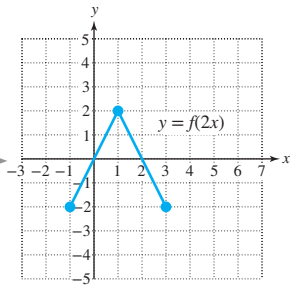


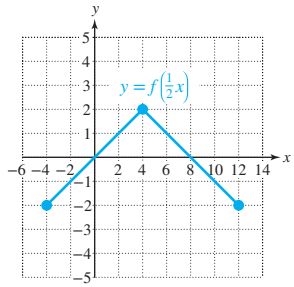
Example 3:



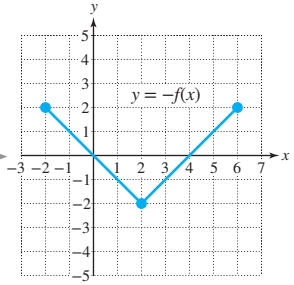


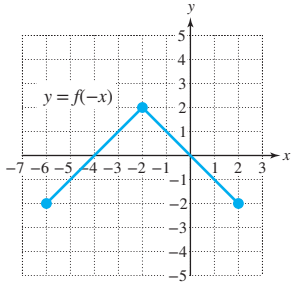
Example 4:





Example 5:





Steps for graphing multiple transformations:

1. Horizontal translation (shift)
2. Horizontal and vertical stretch and shrink
3. Reflections across the x- and y-axes
4. Vertical translation (shift)

Example 6:

To graph $f(x) = 2\sqrt[3]{-x - 1} + 5$, perform the following transformations on the graph of $y = \sqrt[3]{x}$ in the following order.

1. Shift the graph to the right 1 unit.
2. Stretch the graph vertically by a factor of 2.
3. Reflect the graph across the y-axis.
4. Shift the graph 5 units upward.

SECTION 2.7 Analyzing Graphs of Functions and Piecewise-Defined Functions

KEY CONCEPTS

Testing for symmetry:

Consider the graph of an equation in x and y.

- The graph of the equation is symmetric to the y-axis if substituting $-x$ for x results in an equivalent equation.
- The graph of the equation is symmetric to the x-axis if substituting $-y$ for y results in an equivalent equation.
- The graph of the equation is symmetric to the origin if substituting $-x$ for x and $-y$ for y results in an equivalent equation.

Even and odd functions:

- f is an even function if $f(-x) = f(x)$ for all x in the domain of f.
- f is an odd function if $f(-x) = -f(x)$ for all x in the domain of f.

Graphing a piecewise-defined function:

To graph a piecewise-defined function, graph each individual function on its domain.

The **greatest integer function,** denoted by $f(x) = [\![x]\!]$ or $f(x) = \text{int}(x)$ or $f(x) = \text{floor}(x)$ defines $f(x)$ as the greatest integer less than or equal to x.

Increasing, decreasing, and constant behavior:

Suppose that I is an interval contained within the domain of a function f.

- f is increasing on I if $f(x_1) < f(x_2)$ for all $x_1 < x_2$ on I.
- f is decreasing on I if $f(x_1) > f(x_2)$ for all $x_1 < x_2$ on I.
- f is constant on I if $f(x_1) = f(x_2)$ for all x_1 and x_2 on I.

EXAMPLES

Example 1:

$4x^2 + 9y^2 = 1$ is symmetric to the *y-axis* because $4(-x)^2 + 9y^2 = 1$ is equivalent to $4x^2 + 9y^2 = 1$.

$4x^2 + 9y^2 = 1$ is symmetric to the *x-axis* because $4x^2 + 9(-y)^2 = 1$ is equivalent to $4x^2 + 9y^2 = 1$.

$4x^2 + 9y^2 = 1$ is symmetric to the *origin* because $4(-x)^2 + 9(-y)^2 = 1$ is equivalent to $4x^2 + 9y^2 = 1$.

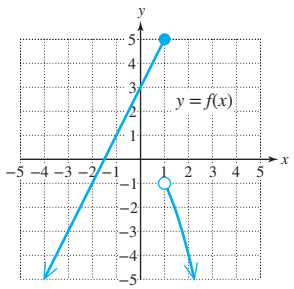
Example 2:

$f(x) = 2|x|$ (same) The function f is even.
$f(-x) = 2|-x| = 2|x|$

$g(x) = x^3 - 5x$ The function g is odd.
$-g(x) = -(x^3 - 5x) = -x^3 + 5x$
$g(-x) = (-x)^3 - 5(-x) = -x^3 + 5x$ (same)

Example 3:

$$f(x) = \begin{cases} 2x + 3 & \text{for } x \le 1 \\ -x^2 & \text{for } x > 1 \end{cases}$$



Example 4:

Given $f(x) = [\![x]\!]$,

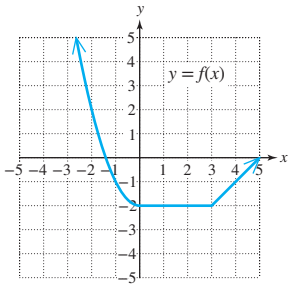
$f(2.4) = [\![2.4]\!] = 2$ and $f(-2.4) = [\![-2.4]\!] = -3$

Example 5:

f is increasing on $(3, \infty)$.

f is decreasing on $(-\infty, 0)$.

f is constant on $(0, 3)$.



ISTUDY

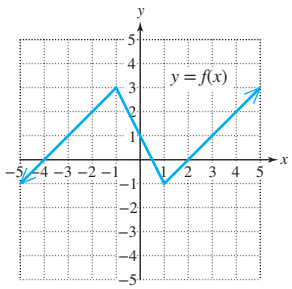
Determining relative maxima and minima:

- $f(a)$ is a **relative maximum** of f if there exists an open interval containing a such that $f(a) \geq f(x)$ for all x in the interval.
- $f(b)$ is a **relative minimum** of f if there exists an open interval containing b such that $f(b) \leq f(x)$ for all x in the interval.

Example 6:

f has a relative maximum of 3 at $x = -1$.

f has a relative minimum of -1 at $x = 1$.



SECTION 2.8 Algebra of Functions and Function Composition

KEY CONCEPTS

Operations on functions:

Given functions f and g, the functions $f + g$, $f - g$, $f \cdot g$, and $\frac{f}{g}$ are defined by

$$(f+g)(x) = f(x) + g(x)$$
$$(f-g)(x) = f(x) - g(x)$$
$$(f \cdot g)(x) = f(x) \cdot g(x)$$
$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)} \text{ provided that } g(x) \neq 0$$

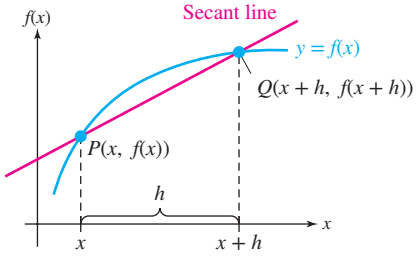
The **composition of f and g,** denoted $f \circ g$, is defined by $(f \circ g)(x) = f(g(x))$.

The domain of $f \circ g$ is the set of real numbers x in the domain of g such that $g(x)$ is in the domain of f.

Evaluate a difference quotient:

The **difference quotient** represents the average rate of change of a function f between two points $(x, f(x))$ and $(x + h, f(x + h))$.

$$\frac{f(x+h) - f(x)}{h} \quad \text{Difference quotient}$$



EXAMPLES

Example 1:

Given $f(x) = x - 3$ and $g(x) = x^2 - 7x$

$$(f+g)(x) = f(x) + g(x) = (x-3) + (x^2 - 7x)$$
$$= x^2 - 6x - 3$$

$$\left(\frac{g}{f}\right)(x) = \frac{g(x)}{f(x)} = \frac{x^2 - 7x}{x - 3} \text{ provided } x \neq 3.$$

Example 2:

Given $f(x) = \dfrac{1}{x + 12}$ and $g(x) = x^2 - 7x$

$$(f \circ g)(x) = f(g(x)) = \frac{1}{(g(x)) + 12}$$

$$= \frac{1}{(x^2 - 7x) + 12} = \frac{1}{(x-3)(x-4)}$$

The domain of $f \circ g$ is $\{x | x \neq 3 \text{ and } x \neq 4\}$.

In interval notation: $(-\infty, 3) \cup (3, 4) \cup (4, \infty)$.

Example 3:

Given $f(x) = 4x^2 - 5x$ evaluate the difference quotient.

$$\frac{f(x+h) - f(x)}{h}$$

$$= \frac{\overbrace{[4(x+h)^2 - 5(x+h)]}^{f(x+h)} - \overbrace{(4x^2 - 5x)}^{f(x)}}{h}$$

$$= \frac{[4(x^2 + 2xh + h^2) - 5x - 5h] - (4x^2 - 5x)}{h}$$

$$= \frac{4x^2 + 8xh + 4h^2 - 5x - 5h - 4x^2 + 5x}{h}$$

$$= \frac{8xh + 4h^2 - 5h}{h}$$

$$= 8x + 4h - 5$$

ISTUDY

CHAPTER 3 DETAILED SUMMARY

SECTION 3.1 Quadratic Functions and Applications

KEY CONCEPTS

Quadratic function:
The function defined by $f(x) = ax^2 + bx + c$ $(a \neq 0)$ is called a **quadratic function.**

A quadratic function can be written in **vertex form:** $f(x) = a(x - h)^2 + k$ by completing the square.

Graph of a quadratic function $f(x) = a(x - h)^2 + k$:

- The graph of a quadratic function is a parabola.
- The vertex is (h, k).
- If $a > 0$, the parabola opens upward, and the minimum value of the function is k.
- If $a < 0$, the parabola opens downward, and the maximum value of the function is k.
- The axis of symmetry is the line $x = h$.
- The x-intercepts are determined by the real solutions to the equation $f(x) = 0$.
- The y-intercept is determined by $f(0)$.

Vertex formula:
The vertex of a parabola can also be found by using the vertex formula.

Given $f(x) = ax^2 + bx + c$ $(a \neq 0)$, the vertex of the parabola is

$$\left(\frac{-b}{2a}, f\left(\frac{-b}{2a}\right)\right)$$

EXAMPLES

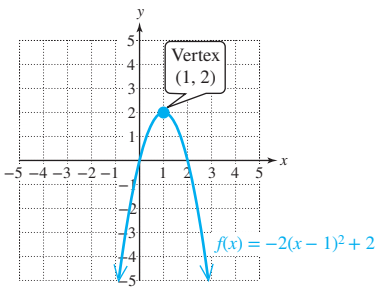
Example 1:
Given $f(x) = -2x^2 + 4x$,

$$\begin{aligned} f(x) &= -2(x^2 - 2x\quad\quad) + 0 \\ &= -2(x^2 - 2x + 1 - 1) + 0 \\ &= -2(x^2 - 2x + 1) - 2(-1) + 0 \\ &= -2(x - 1)^2 + 2 \end{aligned}$$

- Since $a = -2 < 0$, the parabola opens downward.
- The vertex is $(1, 2)$.
- The maximum value of the function is 2.
- The axis of symmetry is $x = 1$.

***x*-intercepts:**
Solve $-2x^2 + 4x = 0$
$-2x(x - 2) = 0$
$x = 0$ or $x = 2$
x-intercepts $(0, 0)$ and $(2, 0)$.

***y*-intercept:**
$f(0) = -2(0)^2 + 4(0) = 0$
y-intercept $(0, 0)$.



Example 2:
Given $f(x) = 2x^2 - 8x + 1$, the x-coordinate of the vertex is $\dfrac{-b}{2a} = \dfrac{-(-8)}{2(2)} = 2$.

The y-coordinate is: $f(2) = 2(2)^2 - 8(2) + 1$
$= -7$

The vertex is $(2, -7)$.

ISTUDY

SECTION 3.2 Introduction to Polynomial Functions

KEY CONCEPTS

Polynomial function:
Let n be a whole number and $a_n, a_{n-1}, a_{n-2}, \ldots, a_1, a_0$ be real numbers, where $a_n \neq 0$. Then a function defined by

$$f(x) = a_n x^n + a_{n-1}x^{n-1} + a_{n-2}x^{n-2} + \cdots + a_1 x + a_0$$

is called a **polynomial function of degree *n*.**

The far left and far right behavior of the graph of a polynomial function is determined by the leading term of the polynomial, $a_n x^n$.

n is even and $a_n > 0$ ↖ ↗

n is even and $a_n < 0$ ↙ ↘

n is odd and $a_n > 0$ ↙ ↗

n is odd and $a_n < 0$ ↖ ↘

The **zeros** of a polynomial function defined by $y = f(x)$ are the values of x in the domain of f for which $f(x) = 0$. These are the real solutions (or **roots**) of the equation $f(x) = 0$.

If a polynomial function f has a factor $(x - c)$ that appears exactly k times, then c is a **zero of multiplicity *k*.**

- If c is a real zero of odd multiplicity, then the graph of $y = f(x)$ *crosses* the x-axis at c.
- If c is a real zero of even multiplicity, then the graph of $y = f(x)$ *touches* the x-axis (but does not cross) at c.

The graph of a polynomial function of degree n will have at most $n - 1$ turning points.

Intermediate value theorem:
Let f be a polynomial function. For $a < b$, if $f(a)$ and $f(b)$ have opposite signs, then f has at least one zero on the interval $[a, b]$.

EXAMPLES

Example 1:
$f(x) = -3x^5 - 5x^3 + 4x^2 - 7x + 2$ is a fifth-degree polynomial function.

$g(x) = 4\sqrt{x} - \frac{3}{x}$ is not a polynomial function.

Example 2:
Given $f(x) = -\frac{1}{2}x^2(2x - 3)^2(x + 2)$, the leading term is $-2x^5$.

$n = 5$ (odd) and $a_n = -2$ (negative)

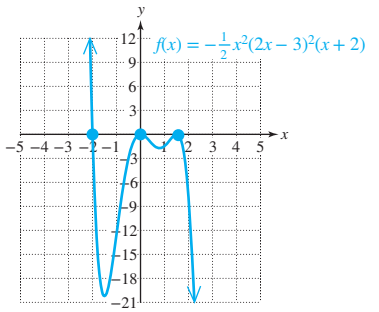
The end behavior is up to the left and down to the right.

That is, as $x \to -\infty$, $f(x) \to \infty$, and as $x \to \infty$, $f(x) \to -\infty$.

Example 3:
The zeros of $f(x) = -\frac{1}{2}x^2(2x - 3)^2(x + 2)$ are 0, $\frac{3}{2}$, and -2.

Example 4:
Given $f(x) = -\frac{1}{2}x^2(2x - 3)^2(x + 2)$,

- 0 is a zero of multiplicity 2.
  The graph touches the x-axis at $(0, 0)$.
- $\frac{3}{2}$ is a zero of multiplicity 2.
  The graph touches the x-axis at $\left(\frac{3}{2}, 0\right)$.
- -2 is a zero of multiplicity 1.
  The graph crosses the x-axis at $(-2, 0)$.



Example 5:
$f(x) = x^3 - 2x^2 + 3x - 8$ has at least one zero on the interval $[2, 3]$ because $f(2)$ and $f(3)$ have opposite signs.

$f(2) = (2)^3 - 2(2)^2 + 3(2) - 8 = -2$ ← opposite signs
$f(3) = (3)^3 - 2(3)^2 + 3(3) - 8 = 10$ ←

SECTION 3.3 Division of Polynomials and the Remainder and Factor Theorems

KEY CONCEPTS

Long division can be used to divide two polynomials.

In Example 1,

$$\frac{6x^4 + x^3 - 7x + 1}{2x^2 - x} = 3x^2 + 2x + 1 + \frac{-6x + 1}{2x^2 - x}$$

The result can be checked by using the division algorithm:

dividend

$6x^4 + x^3 - 7x + 1$ quotient divisor remainder

$\stackrel{?}{=} (3x^2 + 2x + 1)(2x^2 - x) + (-6x + 1)$ ✓

Synthetic division can be used to divide polynomials if the divisor is of the form $x - c$.

In Example 2, the quotient is $4x^2 - 10x + 20$, and the remainder is -35.

Remainder theorem:

If a polynomial $f(x)$ is divided by $x - c$, then the remainder is $f(c)$.

Factor theorem:

Let $f(x)$ be a polynomial.

1. If $f(c) = 0$, then $(x - c)$ is a factor of $f(x)$.
2. If $(x - c)$ is a factor of $f(x)$, then $f(c) = 0$.

EXAMPLES

Example 1:

$$\begin{array}{r} 3x^2 + 2x + 1 \\ 2x^2 - x \overline{)\,6x^4 + x^3 + 0x^2 - 7x + 1} \\ -(6x^4 - 3x^3) \\ \hline 4x^3 + 0x^2 \\ -(4x^3 - 2x^2) \\ \hline 2x^2 - 7x \\ -(2x^2 - x) \\ \hline -6x + 1 \end{array}$$

Example 2:

Divide. $(4x^3 - 2x^2 + 5) \div (x + 2)$

$$\begin{array}{r|rrrr} -2 & 4 & -2 & 0 & 5 \\ & & -8 & 20 & -40 \\ \hline & 4 & -10 & 20 & -35 \end{array}$$

Example 3:

Consider $f(x) = 4x^3 - 2x^2 + 5$.

From the result of Example 2, we see that $f(-2) = -35$ because when $(4x^3 - 2x^2 + 5)$ is divided by $(x + 2)$, the remainder is -35.

Example 4:

Determine if $(x - 3)$ is a factor of $f(x) = x^3 - 7x - 6$.

$$\begin{array}{r|rrrr} 3 & 1 & 0 & -7 & -6 \\ & & 3 & 9 & 6 \\ \hline & 1 & 3 & 2 & 0 \end{array}$$

Since the remainder is 0, then $(x - 3)$ is a factor of $f(x)$. Furthermore, because $f(3) = 0$, we know that 3 is a zero of $f(x)$.

ISTUDY

SECTION 3.4 Zeros of Polynomials

KEY CONCEPTS

Rational zero theorem:
If $f(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0$ has integer coefficients and $a_n \neq 0$, and if $\frac{p}{q}$ (written in lowest terms) is a rational zero of f, then

- p is a factor of the constant term, a_0.
- q is a factor of the leading coefficient a_n.

Fundamental theorem of algebra:
If $f(x)$ is a polynomial of degree $n \geq 1$ with complex coefficients, then $f(x)$ has at least one complex zero.

Linear factorization theorem:
If $f(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0$, where $n \geq 1$ and $a_n \neq 0$, then

$f(x) = a_n(x - c_1)(x - c_2) \ldots (x - c_n)$, where $c_1, c_2, \ldots, c_n$ are complex numbers.

If $f(x)$ is a polynomial of degree $n \geq 1$ with complex coefficients, then $f(x)$ has exactly n complex zeros provided that each zero is counted by its multiplicity.

Conjugate zeros theorem:
If $f(x)$ is a polynomial with real coefficients and if $a + bi$ is a zero of $f(x)$, then its conjugate $a - bi$ is also a zero of $f(x)$.

Descartes' rule of signs:
Let $f(x)$ be a polynomial with real coefficients and a nonzero constant term. Then,

1. The number of *positive* real zeros is either the same as the number of sign changes in $f(x)$ or less than the number of sign changes in $f(x)$ by a positive even integer.
2. The number of *negative* real zeros is either the same as the number of sign changes in $f(-x)$ or less than the number of sign changes in $f(-x)$ by a positive even integer.

Upper and lower bounds:
Let $f(x)$ be a polynomial of degree $n \geq 1$ with real coefficients and a positive leading coefficient. Further suppose that $f(x)$ is divided by $(x - c)$.

1. If $c > 0$ and if both the remainder and the coefficients of the quotient are nonnegative, then c is an upper bound for the real zeros of $f(x)$.
2. If $c < 0$ and the coefficients of the quotient and the remainder alternate in sign (with 0 being considered either positive or negative as needed), then c is a lower bound for the real zeros of $f(x)$.

EXAMPLES

Example 1:
Given $f(x) = 2x^3 + x^2 - 4x - 3$, the possible rational zeros are $\pm 1, \pm 3, \pm\frac{1}{2}, \pm\frac{3}{2}$.

After testing several potential rational zeros, we find that -1 is a zero of $f(x)$.

$$\begin{array}{r|cccc} -1 & 2 & 1 & -4 & -3 \\ & & -2 & 1 & 3 \\ \hline & 2 & -1 & -3 & 0 \end{array}$$

$f(x)$ factors as: $f(x) = (x + 1)(2x^2 - x - 3)$
$= (x + 1)(x + 1)(2x - 3)$
The zeros are -1 (multiplicity 2) and $\frac{3}{2}$ (multiplicity 1).

Example 2:
From Example 1, $f(x) = 2x^3 + x^2 - 4x - 3$ is a degree 3 polynomial, and has 3 zeros (including multiplicities).

Example 3:
Write a third-degree polynomial $f(x)$ with integer coefficients and with zeros of $3i$ and 4.

From the conjugate zeros theorem, since the polynomial $f(x)$ is to have real coefficients, then if $3i$ is a zero of $f(x)$, then $-3i$ must also be a zero.

$$f(x) = (x - 3i)(x + 3i)(x - 4)$$
$$= x^3 - 4x^2 + 9x - 36$$

Example 4:
Determine the number of possible positive and negative real zeros of $y = f(x)$.

$f(x) = 3x^5 - 2x^3 - 5x^2 - 8x + 1$ 2 sign changes

There are 2 or 0 possible positive real zeros.

$f(-x) = 3(-x)^5 - 2(-x)^3 - 5(-x)^2 - 8(-x) + 1$
$= -3x^5 + 2x^3 - 5x^2 + 8x + 1$ 3 sign changes

There are 3 or 1 possible negative real zeros.

Example 5:
Given $f(x) = 2x^3 - 7x^2 - 3x + 18$,

a. Determine if 4 is an upper bound for the real zeros of $f(x)$.

$$\begin{array}{r|cccc} 4 & 2 & -7 & -3 & 18 \\ & & 8 & 4 & 4 \\ \hline & 2 & 1 & 1 & 22 \end{array}$$

This row all positive

The value 4 is an upper bound.

b. Determine if -1 is a lower bound for the real zeros of $f(x)$.

$$\begin{array}{r|cccc} -1 & 2 & -7 & -3 & 18 \\ & & -2 & 9 & -6 \\ \hline & 2 & -9 & 6 & 12 \end{array}$$

No sign change

The lower bound theorem does not identify -1 as a lower bound of the zeros of $f(x)$.

ISTUDY

SECTION 3.5 Introduction to Rational Functions

KEY CONCEPTS

Rational function:

Let $p(x)$ and $q(x)$ be polynomials where $q(x) \neq 0$. A function f defined by

$f(x) = \dfrac{p(x)}{q(x)}$ is called a **rational function.**

Vertical asymptote:

The line $x = c$ is a **vertical asymptote** of the graph of $y = f(x)$ if $f(x)$ approaches infinity or negative infinity as x approaches c from either side.

To locate the vertical asymptotes of a function, determine the real numbers x where the denominator is zero, but the numerator is nonzero.

Note: If both the numerator and denominator are zero for a given value of x, then the graph of the function has a "hole" at x.

Horizontal asymptote:

The line $y = d$ is a **horizontal asymptote** of the graph of $y = f(x)$ if $f(x)$ approaches d as x approaches infinity or negative infinity.

Let f be a rational function defined by

$$f(x) = \frac{a_n x^n + a_{n-1}x^{n-1} + a_{n-2}x^{n-2} + \cdots + a_1 x + a_0}{b_m x^m + b_{m-1}x^{m-1} + b_{m-2}x^{m-2} + \cdots + b_1 x + b_0}$$

1. If $n > m$, then f has no horizontal asymptote.
2. If $n < m$, then the line $y = 0$ (the x-axis) is the horizontal asymptote of f.
3. If $n = m$, then the line $y = \dfrac{a_n}{b_m}$ is the horizontal asymptote of f.

EXAMPLES

Example 1:

Given $f(x) = \dfrac{3x + 3}{x^2 + 10x + 9}$, to find the vertical asymptotes, first factor the numerator and denominator.

$$f(x) = \frac{3x + 3}{x^2 + 10x + 9}$$
$$= \frac{3(x + 1)}{(x + 1)(x + 9)}$$
$$= \frac{3}{x + 9} \text{ for } x \neq -1 \text{ and } x \neq -9$$

- The function has a vertical asymptote where the denominator is zero, but the numerator is nonzero. This occurs at $x = -9$.
- *Note*: At $x = -1$, both the numerator and denominator are zero, indicating that the function has a "hole" at $x = -1$.
- The degree of the numerator is less than the degree of the denominator; therefore, the function has a horizontal asymptote of $y = 0$.

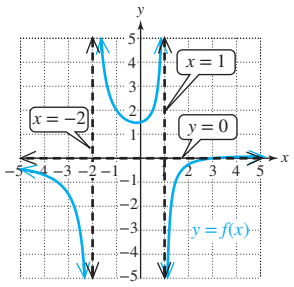
Vertical asymptote: $x = -9$

"Hole" at $x = -1$

Horizontal asymptote: $y = 0$

Example 2:

Given $f(x) = \dfrac{x - 3}{x^2 + x - 2}$, the degree of the numerator (1) is less than the degree of the denominator (2). Thus, the line $y = 0$ is a horizontal asymptote of the graph of f.



ISTUDY

Slant and nonlinear asymptotes:

Let f be a rational function defined by

$$f(x) = \frac{a_n x^n + a_{n-1}x^{n-1} + a_{n-2}x^{n-2} + \cdots + a_1 x + a_0}{b_m x^m + b_{m-1}x^{m-1} + b_{m-2}x^{m-2} + \cdots + b_1 x + b_0}$$

1. If $n = m + 1$ (that is, the degree of the numerator is exactly 1 greater than the degree of the denominator), the function has a **slant asymptote.**
2. If $n > m + 1$ (that is, the degree of the numerator is more than 1 greater than the degree of the denominator), the end behavior of the function resembles the end behavior of the power function $y = \frac{a_n x^n}{b_m x^m}$.

To find an equation of a slant or nonlinear asymptote, divide the numerator of $f(x)$ by the denominator and determine the quotient $Q(x)$. The equation $y = Q(x)$ is an equation of the asymptote.

Example 3:

Given $f(x) = \frac{2x^2 - 4}{x + 1}$, the degree of the numerator is exactly 1 greater than the degree of the denominator. Therefore, the graph of the function has a slant asymptote.

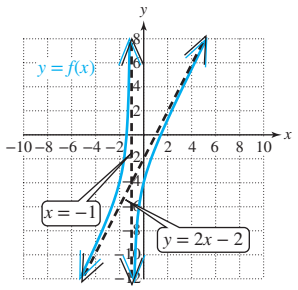
To find an equation of the slant asymptote, divide: $(2x^2 - 4) \div (x + 1)$.

$$\begin{array}{r|rrr} -1 & 2 & 0 & -4 \\ & & -2 & 2 \\ \hline & 2 & -2 & \boxed{-2} \end{array}$$

The quotient is $y = 2x - 2$

The slant asymptote is $y = 2x - 2$.

The graph of f also has a vertical asymptote of $x = -1$.



SECTION 3.6 Graphs of Rational Functions

KEY CONCEPTS

Graph rational functions:

Consider a rational function f defined by $f(x) = \frac{p(x)}{q(x)}$, where $p(x)$ and $q(x)$ are polynomials with no common factors.

1. Determine the y-intercept by evaluating $f(0)$.
2. Determine the x-intercept(s) by finding the real solutions of $f(x) = 0$. The value $f(x)$ equals zero when the numerator $p(x) = 0$.
3. Identify any vertical asymptotes and graph them as dashed lines.
4. Determine whether the function has a horizontal asymptote or a slant asymptote (or neither), and graph the asymptote as a dashed line.
5. Determine where the function crosses the horizontal or slant asymptote (if applicable).
6. If a test for symmetry is easy to apply, use symmetry to plot additional points. Recall:
   - f is an even function (symmetric to the y-axis) if $f(-x) = f(x)$.
   - f is an odd function (symmetric to the origin) if $f(-x) = -f(x)$.
7. Plot at least one point on the intervals defined by the x-intercepts, vertical asymptotes, and points where the function crosses a horizontal or slant asymptote.
8. Sketch the function based on the information found in steps 1–7.

EXAMPLES

Example 1:

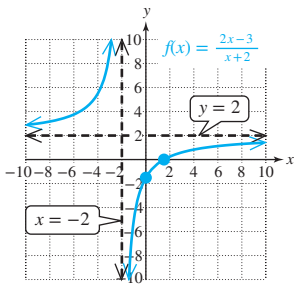
Given $f(x) = \frac{2x - 3}{x + 2}$,

- $f(0) = \frac{2(0) - 3}{(0) + 2} = -\frac{3}{2}$ y-intercept: $\left(0, -\frac{3}{2}\right)$
- Solving the equation $\frac{2x - 3}{x + 2} = 0$ gives $x = \frac{3}{2}$. The x-intercept is $\left(\frac{3}{2}, 0\right)$.
- The vertical asymptote is $x = -2$.
- The horizontal asymptote is $y = \frac{2}{1}$ or $y = 2$.

To determine if the graph of f crosses the horizontal asymptote, solve $f(x) = 2$.

$$\frac{2x - 3}{x + 2} = 2$$
$$2x - 3 = 2(x + 2)$$
$$2x - 3 = 2x + 4$$
$$-3 = 4 \quad \text{No solution}$$

The graph of f does not cross its horizontal asymptote.



SECTION 3.7 Polynomial and Rational Inequalities

KEY CONCEPTS

Polynomial inequality:

Let $f(x)$ be a polynomial. Then an inequality of the form

$$f(x) < 0, \quad f(x) > 0, \quad f(x) \le 0, \quad \text{or} \quad f(x) \ge 0$$

is called a **polynomial inequality.**

Rational inequality:

Let $f(x)$ be a rational expression. Then an inequality of the form

$$f(x) < 0, \quad f(x) > 0, \quad f(x) \le 0, \quad \text{or} \quad f(x) \ge 0$$

is called a **rational inequality.**

Solving nonlinear inequalities:

1. Express the inequality as $f(x) < 0, f(x) > 0, f(x) \le 0$, or $f(x) \ge 0$.
2. Find the real solutions of the related equation $f(x) = 0$ and the values of x where $f(x)$ is undefined. These are the "boundary" points for the solution set to the inequality.
3. Determine the sign of $f(x)$ on the intervals defined by the boundary points.
   - If $f(x)$ is positive, then the values of x on the interval are solutions to $f(x) > 0$.
   - If $f(x)$ is negative, then the values of x on the interval are solutions to $f(x) < 0$.
4. Determine whether the boundary points are included in the solution set.
5. Write the solution set.

EXAMPLES

Example 1:

Solve: $-3x(2 - x)(x + 4)^2 < 0$

Sign of $-3x$	+	+	−	−
Sign of $(2 - x)$	+	+	+	−
Sign of $(x + 4)^2$	+	+	+	+
Sign of $-3x(2 - x)(x + 4)^2$	+	+	−	+
		-4	0	2

The solution set is $(0, 2)$.

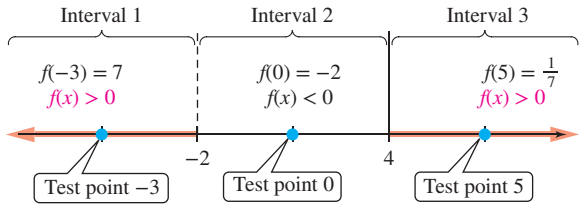
Example 2:

Solve: $\dfrac{x - 4}{x + 2} \ge 0$

This inequality is in the form $f(x) \ge 0$, where $f(x) = \dfrac{x - 4}{x + 2}$.

$f(x) = 0$ at $x = 4$.

$f(x)$ is undefined at $x = -2$.



The solution set is $(-\infty, -2) \cup [4, \infty)$.

-2 is excluded because $f(x)$ is undefined at -2.

SECTION 3.8 Variation

KEY CONCEPTS

Direct, inverse, and joint variation:

Let k be a nonzero constant real number. Then the statements on the left are equivalent to the equations on the right.

1. y varies **directly** as x.
   y is **directly** proportional to x. $\Big\} y = kx$
2. y varies **inversely** as x.
   y is **inversely** proportional to x. $\Big\} y = \dfrac{k}{x}$
3. y varies **jointly** as w and x.
   y is **jointly** proportional to w and x. $\Big\} y = kwx$

The value of k is called the **constant of variation.**

In Example 1, when the distance between the two charges is halved, the force between the charges is 2^2 or 4 times as great. Note that $4(0.0899 \text{ N}) = 0.3596 \text{ N}$.

EXAMPLES

Example 1:

The force F between two electrical charges q_1 and q_2 is jointly proportional to q_1 and q_2 and inversely proportional to the square of the distance d between them.

A force of 0.0899 newtons (N) is measured between two charges of 4×10^{-7} coulombs (C) and 1×10^{-4} C at a distance of 2 m.

a. A general variation model is given by $F = \dfrac{kq_1q_2}{d^2}$.

b. Solve for the constant of variation k by substituting known values of F, q_1, q_2, and d into the model.

$$0.0899 = \frac{k(4 \times 10^{-7})(1 \times 10^{-4})}{(2)^2}$$

$$k = \frac{0.0899(2)^2}{(4 \times 10^{-7})(1 \times 10^{-4})} = 8.99 \times 10^9$$

c. Find the force if the charges are 1 m apart.

$$F = \frac{(8.99 \times 10^9)(4 \times 10^{-7})(1 \times 10^{-4})}{(1)^2}$$

$$= 0.3596 \text{ N}$$

CHAPTER 4 DETAILED SUMMARY

SECTION 4.1 Inverse Functions

KEY CONCEPTS

A function f is **one-to-one** if for a and b in the domain of f,

if $a \neq b$, then $f(a) \neq f(b)$

or equivalently

if $f(a) = f(b)$, then $a = b$.

Horizontal line test:

A function defined by $y = f(x)$ is one-to-one if no horizontal line intersects the graph in more than one point.

Function g **is the inverse of** f if

$(f \circ g)(x) = x$ for all x in the domain of g

and

$(g \circ f)(x) = x$ for all x in the domain of f.

The inverse of f is denoted by $f^{-1}(x)$.

Procedure to find $f^{-1}(x)$:

1. Replace $f(x)$ by y.
2. Interchange x and y.
3. Solve for y.
4. Replace y by $f^{-1}(x)$.

The graph of a function and its inverse are symmetric with respect to the line $y = x$.

EXAMPLES

Example 1:

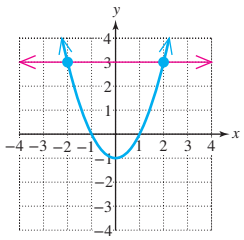
$f = \{(1, 3), (2, 4), (6, -2)\}$ is one-to-one because no two x values have the same y value.

$g = \{(1, 3), (2, 4), (6, 3)\}$ is not one-to-one.

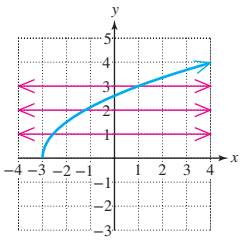
same y

different x

Example 2:



A horizontal line intersects more than once. f is not one-to-one.



No horizontal line intersects more than once. f is one-to-one.

Example 3:

Given $f(x) = 3x - 2$, find $f^{-1}(x)$.

$y = 3x - 2$ 1. Replace $f(x)$ by y.

$x = 3y - 2$ 2. Interchange x and y.

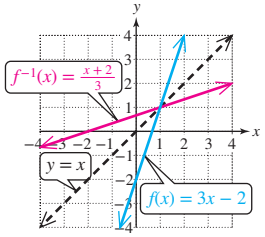
$\frac{x+2}{3} = y$ 3. Solve for y.

$f^{-1}(x) = \frac{x+2}{3}$ 4. Replace y by $f^{-1}(x)$.

Check:

$(f \circ f^{-1})(x) = 3\left(\frac{x+2}{3}\right) - 2 = x + 2 - 2 = x$ ✓

$(f^{-1} \circ f)(x) = \frac{(3x-2)+2}{3} = \left(\frac{3x}{3}\right) = x$ ✓



SECTION 4.2 Exponential Functions

KEY CONCEPTS

Let b be a real number with $b > 0$ and $b \neq 1$. Then for any real number x, a function of the form

$$f(x) = b^x \text{ is an } \textbf{exponential function of base } \boldsymbol{b}.$$

For the graph of an exponential function $f(x) = b^x$,

- If $b > 1$, f is an increasing function.
- If $0 < b < 1$, f is a decreasing function.
- The domain is $(-\infty, \infty)$.
- The range is $(0, \infty)$.
- The line $y = 0$ is a horizontal asymptote.
- The function passes through $(0, 1)$.

The irrational number e is the limiting value of the expression $\left(1 + \frac{1}{x}\right)^x$ as x approaches ∞.

$$e \approx 2.71828$$

Transformations can be used to graph an exponential function.

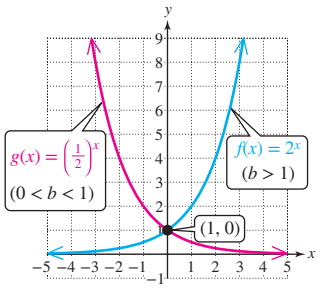
If P dollars in principal is invested or borrowed at an annual interest rate r for t years, then

$I = Prt$	Amount of simple interest I
$A = P\left(1 + \frac{r}{n}\right)^{nt}$	Future value A with interest compounded n times per year
$A = Pe^{rt}$	Future value A with interest compounded continuously

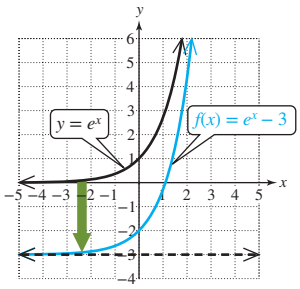
EXAMPLES

Example 1:
$f(x) = 2^x$ is an exponential function.
$g(x) = x^2$ is not an exponential function.

Example 2:



Example 3:
The graph of $f(x) = e^x - 3$ is the graph of $y = e^x$ shifted down 3 units.



Example 4:
Suppose that \$8000 is invested at 5.4% interest. Compute the amount in the account at the end of 3 yr under the following compounding options.

a. Quarterly $(n = 4)$

$$A = P\left(1 + \frac{r}{n}\right)^{nt} = \$8000\left(1 + \frac{0.054}{4}\right)^{(4 \cdot 3)}$$
$$\approx \$9396.69$$

b. Continuously

$$A = Pe^{rt} = \$8000e^{(0.054 \cdot 3)} \approx \$9406.88$$

SECTION 4.3 Logarithmic Functions

KEY CONCEPTS

If x and b are positive real numbers such that $b \neq 1$, then $y = \log_b x$ is called the **logarithmic function** base b, where

$$y = \log_b x \text{ is equivalent to } b^y = x.$$

logarithmic form exponential form

The functions $f(x) = \log_b x$ and $g(x) = b^x$ are inverses.

$y = \log_{10} x$ is written as $y = \log x$ and is called the **common logarithmic function.**

$y = \log_e x$ is written as $y = \ln x$ and is called the **natural logarithmic function.**

Basic properties of logarithms:

1. $\log_b 1 = 0$
2. $\log_b b = 1$
3. $\log_b b^x = x$
4. $b^{\log_b x} = x$

The graph of a logarithmic function:

Given $f(x) = \log_b x$,

- If $b > 1$, f is an increasing function.
- If $0 < b < 1$, f is a decreasing function.
- The domain is $(0, \infty)$.
- The range is $(-\infty, \infty)$.
- The line $x = 0$ is a vertical asymptote.
- The function passes through $(1, 0)$.

The argument to a logarithmic function must be a positive real number.

EXAMPLES

Example 1:

$y = \log_2 x$ is a logarithmic function and is equivalent to $2^y = x$.

The value of y is called the **logarithm.**

The value 2 is the **base,** and x is the **argument.**

Example 2:

Evaluate the logarithms.

a. $\log_2 16 = 4$ because $2^4 = 16$

b. $\log 100 = 2$ because $10^2 = 100$

c. $\ln\left(\frac{1}{e}\right) = -1$ because $e^{-1} = \frac{1}{e}$

Example 3:

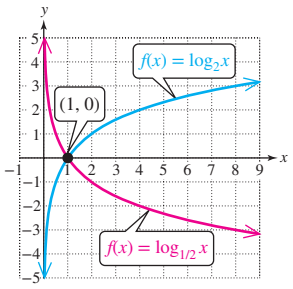
a. $\log_5 1 = 0$

b. $\log_7 7 = 1$

c. $\ln e^5 = 5$

d. $10^{\log(x+5)} = x + 5$

Example 4:



Example 5:

Given $f(x) = \ln(3 - x)$, write the domain of f in interval notation.

$3 - x > 0$	Set the argument greater than 0.
$-x > -3$	Solve for x.
$x < 3$	The domain is: $(-\infty, 3)$.

ISTUDY

SECTION 4.4 Properties of Logarithms

KEY CONCEPTS

Additional properties of logarithms:
Let b, x, and y be positive real numbers with $b \neq 1$.
Let p be any real number. Then,

$\log_b(xy) = \log_b x + \log_b y$ (Product property)

$\log_b\left(\frac{x}{y}\right) = \log_b x - \log_b y$ (Quotient property)

$\log_b x^p = p \log_b x$ (Power property)

A single logarithmic expression can be written as the sum or difference of logarithms.

A sum or difference of logarithms can be written as a single logarithm.

Change-of-base formula:
For positive real numbers a and b, where $a \neq 1$ and $b \neq 1$,

$$\log_b x = \frac{\log_a x}{\log_a b} \quad \text{Change-of-base formula}$$

Note: The change-of-base formula is often used with base 10 or base e so that a calculator can be used to approximate the value of the logarithm.

EXAMPLES

Example 1:

a. $\log_3(9y) = \log_3 9 + \log_3 y = 2 + \log_3 y$

b. $\log\left(\frac{100}{t}\right) = \log 100 - \log t = 2 - \log t$

c. $\ln \sqrt[3]{w} = \ln w^{1/3} = \frac{1}{3}\ln w$

Example 2:

$\log\left(\frac{5x^7}{\sqrt{y}}\right) = \log(5x^7) - \log\sqrt{y}$ Quotient property

$= \log 5 + \log x^7 - \log y^{1/2}$ Product property

$= \log 5 + 7 \log x - \frac{1}{2}\log y$ Power property

Example 3:

$\ln c + \ln(a^2 - b^2) - \ln(a + b)$

$= \ln[c(a^2 - b^2)] - \ln(a + b)$ Product property

$= \ln\left[\frac{c(a^2 - b^2)}{a + b}\right]$ Quotient property

$= \ln\left[\frac{c(a + b)(a - b)}{a + b}\right]$ Factor.

$= \ln[c(a - b)]$ Simplify.

Example 4:
Use a calculator to approximate $\log_2 806$.

$\log_2 806 = \frac{\log 806}{\log 2} \approx 9.6546$

$\log_2 806 = \frac{\ln 806}{\ln 2} \approx 9.6546$

Check: $2^{9.6546} \approx 806$ ✓

SECTION 4.5 Exponential and Logarithmic Equations and Applications

KEY CONCEPTS

Equivalence property of exponential expressions:
If b, x, and y are real numbers with $b > 0$ and $b \neq 1$, then

$b^x = b^y$ implies that $x = y$.

EXAMPLES

Example 1:

Solve. $27^{-2x+1} = \left(\frac{1}{9}\right)^x$

$(3^3)^{-2x+1} = (3^{-2})^x$

$3^{-6x+3} = 3^{-2x}$ implies that $-6x + 3 = -2x$

$-4x = -3$

$x = \frac{3}{4}$

The solution set is $\left\{\frac{3}{4}\right\}$.

ISTUDY

Steps to solve an exponential equation by using logarithms:

1. Isolate the exponential expression on one side of the equation.
2. Take a logarithm of the same base on both sides of the equation.
3. Use the power property of logarithms to "bring down" the exponent.
4. Solve the resulting equation.

Equivalence property of logarithmic expressions:

If b, x, and y are positive real numbers and $b \neq 1$, then

$$\log_b x = \log_b y \text{ implies that } x = y.$$

Guidelines to solve a logarithmic equation:

1. Isolate the logarithms on one side of the equation.
2. Use the properties of logarithms to write the equation in the form $\log_b x = k$, where k is a constant.
3. Write the equation in exponential form.
4. Solve the equation from step 3.
5. Check the potential solution(s) in the original equation.

In Example 4, the solution 6 checks. However, 2 does not check because 2 is undefined in the original equation in the expressions $\log_3(x - 5)$ and $\log_3(x - 3)$.

Example 2:

$$5^x - 2 = 87$$
$$5^x = 89$$
$$\log 5^x = \log 89$$
$$x \log 5 = \log 89$$
$$x = \frac{\log 89}{\log 5} \approx 2.7889$$

The solution set is $\left\{\frac{\log 89}{\log 5}\right\}$.

Example 3:

Solve. $\log(5x - 1) = \log(4x + 6)$

$$5x - 1 = 4x + 6$$
$$x = 7$$

Check: $\log[5(7) - 1] \stackrel{?}{=} \log[4(7) + 6]$

$$\log 34 = \log 34 \checkmark$$

The solution set is $\{7\}$.

Example 4:

Solve. $\log_3(x - 5) = 1 - \log_3(x - 3)$

$$\log_3(x - 5) + \log_3(x - 3) = 1$$
$$\log_3[(x - 5)(x - 3)] = 1$$
$$\log_3(x^2 - 8x + 15) = 1$$
$$x^2 - 8x + 15 = 3^1$$
$$x^2 - 8x + 12 = 0$$
$$(x - 6)(x - 2) = 0$$
$$x = 6 \quad \text{or} \quad x = 2 \quad (2 \text{ does not check.})$$

The solution set is $\{6\}$.

SECTION 4.6 Modeling with Exponential and Logarithmic Functions

KEY CONCEPTS

Exponential growth and decay models:

Let y be a variable changing exponentially with respect to time t and let y_0 represent the initial value of y when $t = 0$. Then for a constant k, the model $y = y_0e^{kt}$ represents

- exponential growth if the constant $k > 0$.
- exponential decay if the constant $k < 0$.

EXAMPLES

Example 1:

The population of Virginia was 7.1 million in the year 2000 and grew to 8.0 million by 2010. Write a model of the form $P(t) = P_0e^{kt}$, where P_0 represents the initial population and t represents the number of years since 2000.

$$P(t) = P_0e^{kt}$$
$$P(t) = 7.1e^{kt} \qquad \text{Substitute 7.1 for } P_0.$$
$$8.0 = 7.1e^{k(10)} \qquad P(10) = 8.0.$$
$$\frac{8.0}{7.1} = e^{10k}$$
$$\ln\left(\frac{8.0}{7.1}\right) = 10k$$
$$k = \frac{\ln\left(\frac{8.0}{7.1}\right)}{10} \approx 0.0119 \qquad \text{Solve for } k.$$
$$P(t) = 7.1e^{0.0119t}$$

ISTUDY

Changing bases in an exponential model:
An exponential expression can be rewritten as an expression of a different base. In particular, to convert to base e, we have

$$b^t \text{ is equivalent to } e^{(\ln b)\,t}$$

A **logistic growth function** is a function of the form:

$$y = \frac{c}{1 + ae^{-bt}}$$

A logistic growth function imposes a limiting value on the dependent variable.

A graphing utility and regression techniques can be used to model data that exhibit an exponential or logarithmic trend.

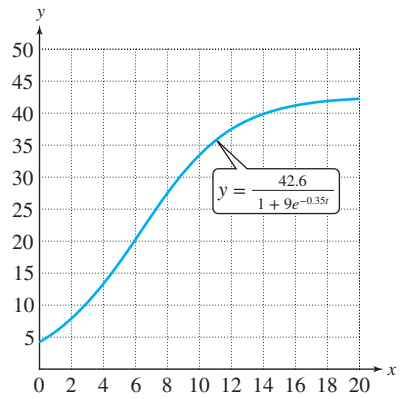
Exponential model: $y = ab^x$
Logarithmic model: $y = a + b \ln x$

Example 2:

$$\begin{aligned} y = 400(0.5)^{0.03t} &= 400\left[(0.5)^t\right]^{0.03} \\ &= 400\left[e^{(\ln 0.5)t}\right]^{0.03} \\ &= 400\left[e^{(\ln 0.5)(0.03)}\right]^t \\ &\approx 400e^{-0.0208t} \end{aligned}$$

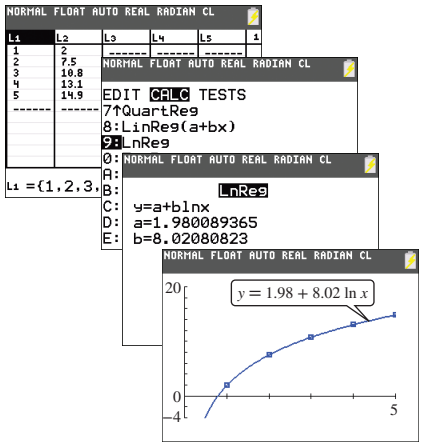
Example 3:

$y = \dfrac{42.6}{1 + 9e^{-0.35t}}$ defines a logistic function.



Example 4:

x	1	2	3	4	5
y	2	7.5	10.8	13.1	14.9



CHAPTER 5 DETAILED SUMMARY

SECTION 5.1 Angles and Their Measure

KEY CONCEPTS

The measure of an angle may be given in **degrees,** where $1°$ is $\frac{1}{360}$ of a full rotation. A measure of $1°$ can be further divided into 60 equal parts called **minutes.** Each minute can be divided into 60 equal parts called **seconds.**

The measure of an angle may be given in **radians,** where one radian is the measure of the central angle that intercepts an arc equal in length to the radius of the circle.

Radian measure:

$\theta = \frac{s}{r}$ gives the measure of a central angle θ in radians where s is the length of the arc intercepted by θ and r is the radius of the circle.

Conversion between degrees and radians:

The relationship $180° = \pi$ radians provides the conversion factors to convert from radians to degrees and from degrees to radians.

When given the measure of an angle in radians, the unit "radians" does not need to be explicitly stated. It is understood. For example:

$$\theta = 4 \text{ radians or } \theta = 4$$

Coterminal angles:

Two angles in standard position with the same initial and terminal sides are called **coterminal angles.** Coterminal angles differ in measure by an integer multiple of $360°$ or 2π radians.

EXAMPLES

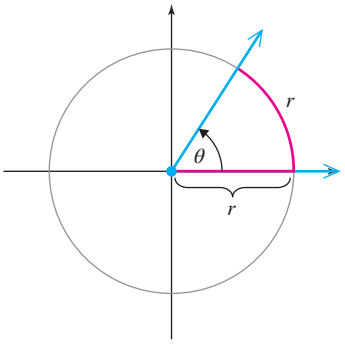
Example 1:

$134°16'12''$ represents

$$134° + \left(\frac{16}{60}\right)^\circ + \left(\frac{12}{3600}\right)^\circ = 134.27°$$

Example 2:

$\theta = 1$ radian



Example 3:

An arc of 15 in. on a circle of radius 5 in. intercepts an angle of $\theta = \frac{15 \text{ in.}}{5 \text{ in.}} = 3$ radians.

Example 4:

$$\frac{11\pi}{9} = \frac{11\pi}{9} \cdot \left(\frac{180°}{\pi}\right) = 220°$$

Example 5:

$$-305° = -305° \cdot \left(\frac{\pi}{180°}\right) = -\frac{61\pi}{36} \text{ radians}$$

Example 6:

Given $\theta = 20°$, the following angles are coterminal to θ.

$380°, 740°, 1100°, \ldots$ and $-340°, -700°, \ldots$

Given $\theta = \frac{\pi}{12}$, the following angles are coterminal to θ.

$\frac{25\pi}{12}, \frac{49\pi}{12}, \ldots$ and $-\frac{23\pi}{12}, -\frac{47\pi}{12}, \ldots$

ISTUDY

Arc length:
Given a circle of radius r, the length s of an arc intercepted by a central angle θ (in radians) is given by $s = r\theta$.

Points on the Earth are identified by their latitude and longitude. **Latitude** is the angular measure of a central angle measured north or south from the equator. Lines of **longitude,** also called meridians, are circles passing through both poles and running perpendicular to the equator.

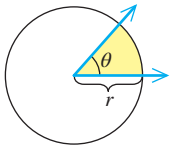
Linear and angular speed:
Suppose that a point on a circle of radius r moves through an angle of θ radians in time t. Then the angular and linear speeds of the point are given by:

angular speed: $\omega = \dfrac{\theta}{t}$

linear speed: $v = \dfrac{s}{t}$ or $v = \dfrac{r\theta}{t}$ or $v = r\omega$

Area of a sector:
The area A of a sector of a circle of radius r with central angle θ (in radians) is given by

$A = \dfrac{1}{2}r^2\theta.$



Example 7:
San Francisco, California, is located at 37.8°N 122.4°W, and Seattle, Washington, is located at 47.6°N, 122.3°W. The longitudes of the two cities are approximately equal, indicating that the cities are approximately due north/south of each other. Use the difference in latitudes and the arc length formula to approximate the distance between the cities. Assume that the radius of the Earth is 3960 mi.

$\theta = (47.6° - 37.8°) \cdot \dfrac{\pi}{180°} \approx 0.171$

$s = r\theta$
$= (3960 \text{ mi})(0.171)$
$\approx 677 \text{ mi}$

The distance between San Francisco and Seattle is approximately 677 mi.

Example 8:
A spinning disk with radius 10 cm rotates at 120 rpm.

a. The angular speed is given by:

$\omega = \dfrac{120 \text{ revolutions}}{\text{min}} \cdot \dfrac{2\pi \text{ rad}}{\text{revolution}}$

$= 240\pi \text{ rad/min or } 240\pi/\text{min}$

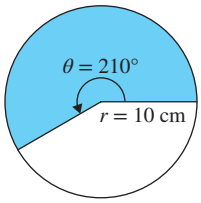
b. The linear speed is given by
$v = r\omega$
$v = (10 \text{ cm})(240\pi/\text{min})$
$= 2400\pi \text{ cm/min}$
$\approx 7540 \text{ cm/min}$

Example 9:
The radian measure of the central angle of the sector shown in the figure is

$\theta = 210° \cdot \dfrac{\pi}{180} = \dfrac{7\pi}{6}.$

The area of the sector is

$A = \dfrac{1}{2}(10)^2 \cdot \dfrac{7\pi}{6} = \dfrac{175\pi}{3} \approx 183 \text{ cm}^2.$



ISTUDY

SECTION 5.2 Right Triangle Trigonometry

KEY CONCEPTS

Each trigonometric function of an acute angle θ is one of the six possible ratios of the sides of a right triangle containing θ.

$$\sin\theta = \frac{\text{opp}}{\text{hyp}}, \quad \cos\theta = \frac{\text{adj}}{\text{hyp}}, \quad \tan\theta = \frac{\text{opp}}{\text{adj}},$$

$$\csc\theta = \frac{\text{hyp}}{\text{opp}}, \quad \sec\theta = \frac{\text{hyp}}{\text{adj}}, \quad \cot\theta = \frac{\text{adj}}{\text{opp}}$$

Reciprocal identities:

$$\csc\theta = \frac{1}{\sin\theta}, \quad \sec\theta = \frac{1}{\cos\theta}, \quad \cot\theta = \frac{1}{\tan\theta}$$

$$\sin\theta = \frac{1}{\csc\theta}, \quad \cos\theta = \frac{1}{\sec\theta}, \quad \tan\theta = \frac{1}{\cot\theta}$$

Quotient identities:

$$\tan\theta = \frac{\sin\theta}{\cos\theta}, \quad \cot\theta = \frac{\cos\theta}{\sin\theta}$$

Pythagorean identities:

$$\sin^2\theta + \cos^2\theta = 1$$

$$\tan^2\theta + 1 = \sec^2\theta$$

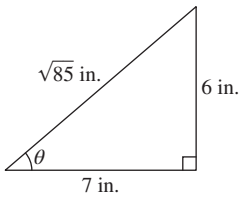
$$1 + \cot^2\theta = \csc^2\theta$$

The **cofunction identities** indicate that cofunctions of complementary angles are equal.

EXAMPLES

Example 1:

The values of the six trigonometric functions for the acute angle θ are as follows.



$$\sin\theta = \frac{6}{\sqrt{85}} = \frac{6\sqrt{85}}{85} \qquad \csc\theta = \frac{\sqrt{85}}{6}$$

$$\cos\theta = \frac{7}{\sqrt{85}} = \frac{7\sqrt{85}}{85} \qquad \sec\theta = \frac{\sqrt{85}}{7}$$

$$\tan\theta = \frac{6}{7} \qquad \cot\theta = \frac{7}{6}$$

Example 2:

If $\sin\theta = \frac{15}{17}$ for an acute angle θ, find the values of the remaining trigonometric functions of θ.

From $\sin^2\theta + \cos^2\theta = 1$, we have:

$$\cos\theta = \sqrt{1 - \sin^2\theta}$$

$$= \sqrt{1 - \left(\frac{15}{17}\right)^2} = \sqrt{\frac{289}{289} - \frac{225}{289}} = \sqrt{\frac{64}{289}} = \frac{8}{17}$$

$$\csc\theta = \frac{1}{\sin\theta} = \frac{17}{15}, \quad \sec\theta = \frac{1}{\cos\theta} = \frac{17}{8},$$

$$\tan\theta = \frac{\sin\theta}{\cos\theta} = \frac{\frac{15}{17}}{\frac{8}{17}} = \frac{15}{8},$$

$$\cot\theta = \frac{1}{\tan\theta} = \frac{8}{15}$$

Example 3:

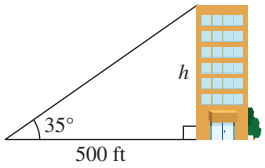
Given $\theta = 31°$, the complement of θ is $90° - 31° = 59°$.

$$\sin 31° = \cos 59° \quad \sin 59° = \cos 31°$$
$$\sec 31° = \csc 59° \quad \sec 59° = \csc 31°$$
$$\tan 31° = \cot 59° \quad \tan 59° = \cot 31°$$

ISTUDY

An **angle of elevation** or **depression** from an observer to an object is measured upward or downward relative to a horizontal line from the observer.

Example 4:
From ground level at a point 500 ft from the base of a building, the angle of elevation to the top of the building is 35°. Find the height of the building.



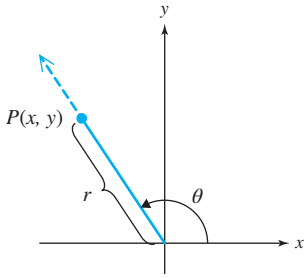
$$\tan 35° = \frac{h}{500} \Rightarrow h = 500 \tan 35°$$
$$h \approx 350$$

The building is approximately 350 ft high.

SECTION 5.3 Trigonometric Functions of Any Angle

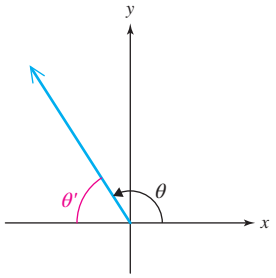
KEY CONCEPTS

Let $P(x, y)$ be a point on the terminal side of angle θ drawn in standard position, and let $r = \sqrt{x^2 + y^2}$ be the distance from P to the origin.



$$\sin\theta = \frac{y}{r} \qquad \csc\theta = \frac{r}{y} (y \neq 0)$$
$$\cos\theta = \frac{x}{r} \qquad \sec\theta = \frac{r}{x} (x \neq 0)$$
$$\tan\theta = \frac{y}{x} (x \neq 0) \qquad \cot\theta = \frac{x}{y} (y \neq 0)$$

Let θ be a nonquadrantal angle in standard position. The **reference angle** for θ is the acute angle θ' formed by the terminal side of θ and the horizontal axis.



EXAMPLES

Example 1:
Given a point $P(-3, 7)$ on the terminal side of an angle in standard position, find the values of the six trigonometric functions.

$$r = \sqrt{x^2 + y^2} = \sqrt{(-3)^2 + (7)^2} = \sqrt{58}$$
$$\sin\theta = \frac{y}{r} = \frac{7}{\sqrt{58}} = \frac{7\sqrt{58}}{58}$$
$$\cos\theta = \frac{x}{r} = \frac{-3}{\sqrt{58}} = -\frac{3\sqrt{58}}{58}$$
$$\tan\theta = \frac{y}{x} = \frac{7}{-3} = -\frac{7}{3}$$
$$\csc\theta = \frac{r}{y} = \frac{\sqrt{58}}{7}$$
$$\sec\theta = \frac{r}{x} = \frac{\sqrt{58}}{-3} = -\frac{\sqrt{58}}{3}$$
$$\cot\theta = \frac{x}{y} = \frac{-3}{7} = -\frac{3}{7}$$

Example 2:
Determine the reference angle θ'.

a. $\theta = 317°$ is a fourth quadrant angle. Thus, $\theta' = 360° - 317° = 43°$.

b. $\theta = -\frac{2\pi}{7}$ is a negative fourth quadrant angle. Thus, $\theta' = \frac{2\pi}{7}$.

c. $\theta = 4$ is a third quadrant angle measured in radians. Furthermore, because $\pi < 4 < \frac{3\pi}{2}$, $\theta' = 4 - \pi$.

ISTUDY

The value of each trigonometric function of θ is the same as the corresponding function of the reference angle θ' except possibly for the sign.

Example 3:

Evaluate $\sin\frac{4\pi}{3}$ using a reference angle.

The reference angle for $\frac{4\pi}{3}$ is $\frac{\pi}{3}$. Since $\frac{4\pi}{3}$ is a third quadrant angle, $\sin\frac{4\pi}{3}$ is negative. Thus,

$$\sin\frac{4\pi}{3} = -\sin\frac{\pi}{3} = -\frac{\sqrt{3}}{2}.$$

SECTION 5.4 Trigonometric Functions Defined on the Unit Circle

KEY CONCEPTS

The **unit circle** is a circle of radius r with center at the origin of a rectangular coordinate system: $x^2 + y^2 = 1$.

Let $P(x, y)$ be the point associated with a real number t measured along the circumference of the unit circle from the point $(1, 0)$.

$\sin t = y$ $\quad$ $\csc t = \frac{1}{y} (y \neq 0)$

$\cos t = x$ $\quad$ $\sec t = \frac{1}{x} (x \neq 0)$

$\tan t = \frac{y}{x} (x \neq 0)$ $\quad$ $\cot t = \frac{x}{y} (y \neq 0)$

The real number t taken along the circumference of the unit circle gives the number of radians of the corresponding central angle θ. That is, $\theta = t$ radians.

- The domain of both the sine function and cosine function is all real numbers.
- The domain of both the tangent function and secant function excludes real numbers t that are odd multiples of $\frac{\pi}{2}$.
- The domain of both the cotangent function and cosecant function excludes real numbers t that are multiples of π.

EXAMPLES

Example 1:

Suppose that the real number t corresponds to the point $\left(\frac{1}{3}, -\frac{2\sqrt{2}}{3}\right)$ on the unit circle. Find the values of the six trigonometric functions of t.

$$\sin t = y = -\frac{2\sqrt{2}}{3} \qquad \cos\theta = x = \frac{1}{3}$$

$$\tan\theta = \frac{y}{x} = \frac{-\frac{2\sqrt{2}}{3}}{\frac{1}{3}} = -2\sqrt{2}$$

$$\csc\theta = \frac{1}{y} = \frac{1}{-\frac{2\sqrt{2}}{3}} = -\frac{3}{2\sqrt{2}} = -\frac{3\sqrt{2}}{4}$$

$$\sec\theta = \frac{1}{x} = \frac{1}{\frac{1}{3}} = 3$$

$$\cot\theta = \frac{x}{y} = \frac{\frac{1}{3}}{-\frac{2\sqrt{2}}{3}} = \frac{1}{3}\cdot\left(-\frac{3}{2\sqrt{2}}\right) = -\frac{1}{2\sqrt{2}} = -\frac{\sqrt{2}}{4}$$

Example 2:

The real number $t = \frac{\pi}{2}$ on the unit circle corresponds to a central angle of $\theta = \frac{\pi}{2}$.

Example 3:

$\tan\frac{\pi}{2}$ is undefined. $\sec\frac{3\pi}{2}$ is undefined.

$\sec\pi$ is undefined. $\cot\theta$ is undefined.

ISTUDY

A function f is **periodic** if $f(t + p) = f(t)$ for some constant p. The smallest positive value p for which f is periodic is called the **period** of f.

- The period of the sine, cosine, secant, and cosecant functions is 2π.
- The period of the tangent and cotangent functions is π.

- The cosine and secant functions are even functions.
  $\cos(-x) = \cos x$ and $\sec(-x) = \sec x$
- The sine, cosecant, tangent, and cotangent functions are odd functions.
  $\sin(-x) = -\sin x$ and $\csc(-x) = -\csc x$
  $\tan(-x) = -\tan x$ and $\cot(-x) = -\cot x$

Example 4:

a. $\sin\frac{14\pi}{3} = \sin\left(\frac{2\pi}{3} + \frac{12\pi}{3}\right) = \sin\left(\frac{2\pi}{3} + 4\pi\right)$

$= \sin\left[\frac{2\pi}{3} + 2(2\pi)\right] = \sin\frac{2\pi}{3} = \frac{\sqrt{3}}{2}$

b. $\tan\frac{5\pi}{4} = \tan\left(\frac{\pi}{4} + \pi\right) = \tan\frac{\pi}{4} = 1$

Example 5:

Simplify.

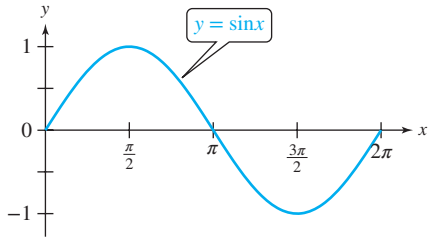
a. $\cos(-\theta) + 5\cos\theta$
$= \cos\theta + 5\cos\theta$
$= 6\cos\theta$

b. $\sin(-x) + \sin(x + 8\pi) + 4\sin x$
$= -\sin x + \sin x + 4\sin x$
$= 4\sin x$

SECTION 5.5 Graphs of Sine and Cosine Functions

KEY CONCEPTS

The graph of $y = \sin x$ (for one period):

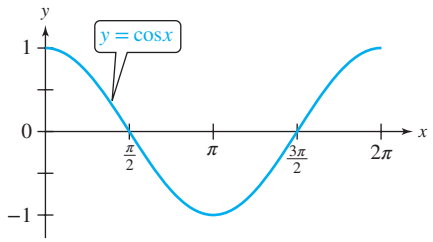


Period: 2π Amplitude: 1

Domain: $(-\infty, \infty)$ Range: $[-1, 1]$

Symmetric to the origin

The graph of $y = \cos x$ (for one period):



Period: 2π Amplitude: 1

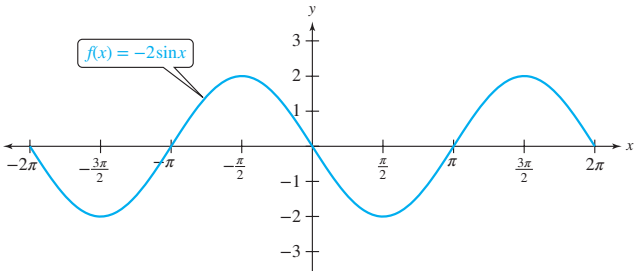
Domain: $(-\infty, \infty)$ Range: $[-1, 1]$

Symmetric to the y-axis

EXAMPLES

Example 1:

The graph of $f(x) = -2\sin x$ is the graph of the parent function $y = \sin x$ with a vertical stretch by a factor of 2 and a reflection across the x-axis. The amplitude is $|-2| = 2$.



ISTUDY

Characteristics of $y = A\sin(Bx - C) + D$ and $y = A\cos(Bx - C) + D$ with $B > 0$:

1. The amplitude is $|A|$.
2. The period is $\frac{2\pi}{B}$.
3. The phase shift is $\frac{C}{B}$.
4. The vertical shift is D.
5. One full cycle is given on the interval $0 \le Bx - C \le 2\pi$.
6. The domain is the set of real numbers.
7. The range is $-|A| + D \le y \le |A| + D$.

Example 2:

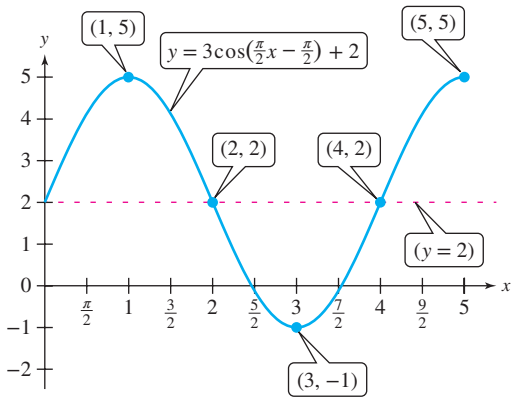
$y = 3\cos\left(\frac{\pi}{2}x - \frac{\pi}{2}\right) + 2$

The amplitude is $|3| = 3$.

The period is $\frac{2\pi}{\frac{\pi}{2}} = 4$.

The phase shift is $\frac{\frac{\pi}{2}}{\frac{\pi}{2}} = 1$ (to the right).

The vertical shift is 2.



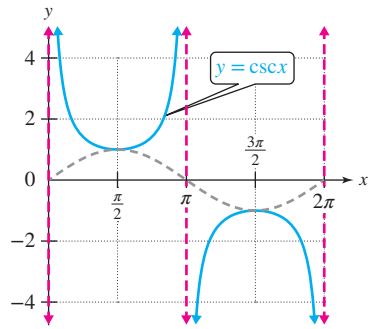
The domain is all real numbers.

The range is $[-1, 5]$.

SECTION 5.6 Graphs of Other Trigonometric Functions

KEY CONCEPTS

The graph of $y = \csc x = \frac{1}{\sin x}$ has vertical asymptotes where $\sin x = 0$.

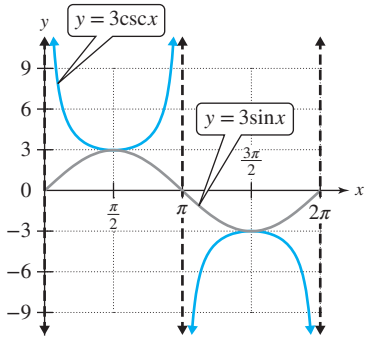


Period: 2π
Amplitude: None
Domain: $\{x | x \ne n\pi$ for integers $n\}$
Range: $(-\infty, -1] \cup [1, \infty)$
Vertical asymptotes: $x = n\pi$
Symmetric to the origin (odd function)

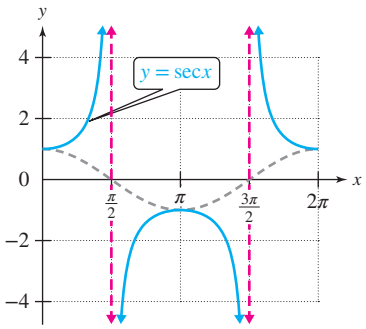
EXAMPLES

Example 1:

To graph $y = 3\csc x$, first graph $y = 3\sin x$ (shown in gray) for reference. The asymptotes of $y = 3\csc x$ correspond to the x-intercepts of $y = 3\sin x$.



The graph of $y = \sec x = \dfrac{1}{\cos x}$ has vertical asymptotes where $\cos x = 0$.

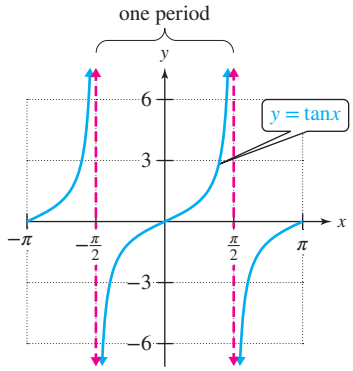


Period: 2π
Amplitude: None
Domain: $\left\{x \mid x \neq \frac{(2n+1)\pi}{2} \text{ for integers } n\right\}$
Range: $(-\infty, -1] \cup [1, \infty)$
Vertical asymptotes: $x = \frac{(2n+1)\pi}{2}$
Symmetric to the y-axis (even function)

To graph variations of $y = \tan x$ and $y = \cot x$, graph the function without the vertical shift first.

1. First graph two consecutive asymptotes.
2. Plot an x-intercept halfway between the asymptotes.
3. Sketch the general shape of the "parent" function between the asymptotes.
4. Apply a vertical shift if applicable.
5. Sketch additional cycles to the right or left as desired.

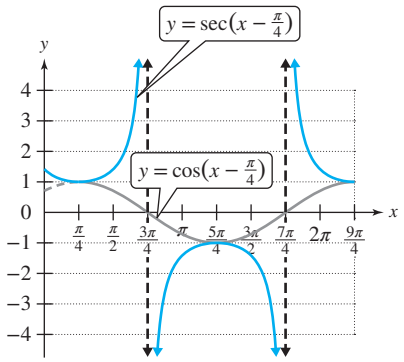
The graph of $y = \tan x = \dfrac{\sin x}{\cos x}$ has vertical asymptotes where $\cos x = 0$.



Period: π
Amplitude: None
Domain: $\left\{x \mid x \neq \frac{(2n+1)\pi}{2} \text{ for integers } n\right\}$
Range: $(-\infty, \infty)$
Vertical asymptotes: $x = \frac{(2n+1)\pi}{2}$
Symmetric to the origin (odd function)

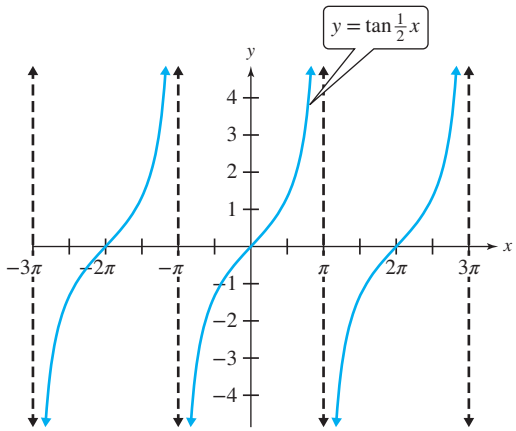
Example 2:

To graph $y = \sec\left(x - \frac{\pi}{4}\right)$, first graph $y = \cos\left(x - \frac{\pi}{4}\right)$ (shown in gray) for reference. The asymptotes of $y = \sec\left(x - \frac{\pi}{4}\right)$, correspond to the x-intercepts of $y = \cos\left(x - \frac{\pi}{4}\right)$.

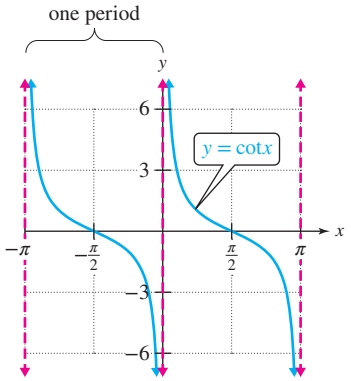


Example 3:

To graph $y = \tan\frac{1}{2}x$, first note that the period is given by $P = \dfrac{\pi}{\frac{1}{2}} = 2\pi$. One pair of consecutive asymptotes are found by solving the inequality $-\frac{\pi}{2} < \frac{1}{2}x < \frac{\pi}{2}$. The solution is $-\pi < x < \pi$. The remaining asymptotes are at odd multiples of π, and the x-intercepts are halfway between the asymptotes at even multiples of π.

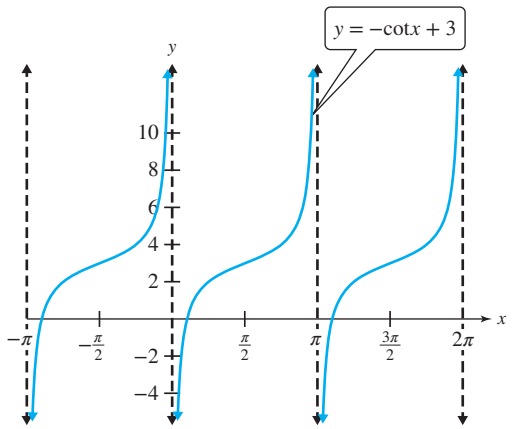


The graph of $y = \cot x = \dfrac{\cos x}{\sin x}$ has vertical asymptotes where $\sin x = 0$.



Period: π
Amplitude: None
Domain: $\{x \mid x \neq n\pi \text{ for integers } n\}$
Range: $(-\infty, \infty)$
Vertical asymptotes: $x = n\pi$
Symmetric to the origin (odd function)

Example 4:
The graph of $y = -\cot x + 3$ is the graph of $y = \cot x$ reflected over the x-axis and shifted upward 3 units. The period is π, and the asymptotes are at multiples of π. The x-intercepts of the parent function $y = \cot x$ are halfway between the asymptotes at odd multiples of $\dfrac{\pi}{2}$. These points will be shifted up 3 units on the graph of $y = -\cot x + 3$ and will result in the points $\left(-\frac{\pi}{2}, 3\right)$, $\left(\frac{\pi}{2}, 3\right)$, $\left(\frac{3\pi}{2}, 3\right)$, and so on.



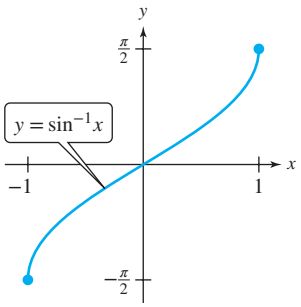
SECTION 5.7 Inverse Trigonometric Functions

KEY CONCEPTS

The **inverse sine function** (or arcsine), denoted by $\sin^{-1}$ or arcsin, is defined by

$$y = \sin^{-1} x \quad \Leftrightarrow \quad \sin y = x$$

for $-1 \leq x \leq 1$ and $-\dfrac{\pi}{2} \leq y \leq \dfrac{\pi}{2}$.



EXAMPLES

Example 1:

a. $\arcsin\left(-\dfrac{\sqrt{3}}{2}\right) = -\dfrac{\pi}{3}$

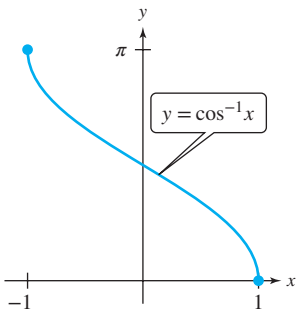
b. $\sin^{-1}\dfrac{1}{2} = \dfrac{\pi}{6}$

ISTUDY

The **inverse cosine function** (or arccosine), denoted by $\cos^{-1}$ or arccos, is defined by

$$y = \cos^{-1} x \quad \Leftrightarrow \quad \cos y = x$$

for $-1 \le x \le 1$ and $0 \le y \le \pi$.

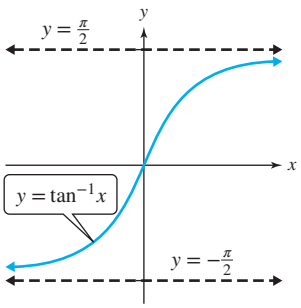


The **inverse tangent function** (or arctangent), denoted by $\tan^{-1}$ or arctan, is defined by

$$y = \tan^{-1} x \quad \Leftrightarrow \quad \tan y = x$$

for $x \in \mathbb{R}$ and $-\frac{\pi}{2} < y < \frac{\pi}{2}$.

The graph of the inverse tangent function has horizontal asymptotes $y = -\frac{\pi}{2}$ and $y = \frac{\pi}{2}$.



To compose a trigonometric function and an inverse trigonometric function in either order requires that the argument to each function be within the domain of that function.

Example 2:

a. $\cos^{-1}\left(-\frac{\sqrt{3}}{2}\right) = \frac{5\pi}{6}$

b. $\arccos(1) = 0$

Example 3:

a. $\arctan(-1) = -\frac{\pi}{4}$

b. $\tan^{-1} 1 = \frac{\pi}{4}$

Example 4:

a. $\sin\left(\cos^{-1}\left(-\frac{1}{2}\right)\right) = \sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2}$

b. $\sin^{-1}\left(\cos\frac{2\pi}{3}\right) = \sin^{-1}\left(-\frac{1}{2}\right) = -\frac{\pi}{6}$

c. $\tan(\tan^{-1} 5) = 5$

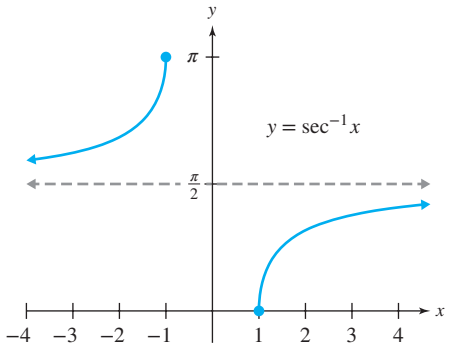
d. $\tan^{-1}\left(\tan\frac{4\pi}{3}\right) = \tan^{-1}\sqrt{3} = \frac{\pi}{3}$

ISTUDY

The **inverse secant function** (or arcsecant), denoted by $\sec^{-1}$ or arcsec, is defined by

$y = \sec^{-1} x \quad \Leftrightarrow \quad \sec y = x$, where $|x| \geq 1$ and

$0 \leq y < \frac{\pi}{2}$ or $\frac{\pi}{2} < y \leq \pi$.



Example 5:

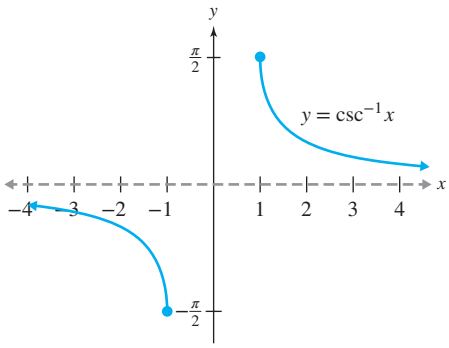
a. $\sec^{-1} 2 = \frac{\pi}{3}$

b. $\sec^{-1}(-2) = \frac{2\pi}{3}$

The **inverse cosecant function** (or arccosecant), denoted by $\csc^{-1}$ or arccsc, is defined by

$y = \csc^{-1} x \quad \Leftrightarrow \quad \csc y = x$, where $|x| \geq 1$ and

$-\frac{\pi}{2} \leq y < 0$ or $0 < y \leq \frac{\pi}{2}$.



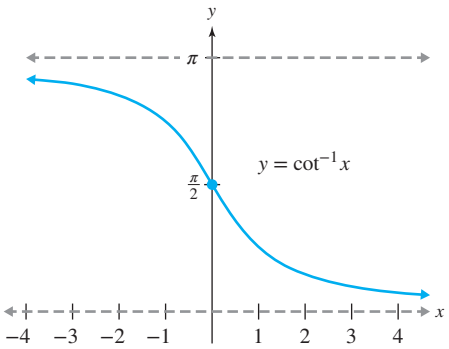
Example 6:

a. $\csc^{-1} 1 = \frac{\pi}{2}$

b. $\csc^{-1}(-1) = -\frac{\pi}{2}$

The **inverse cotangent function** (or arccotangent), denoted by $\cot^{-1}$ or arccot, is defined by

$y = \cot^{-1} x \quad \Leftrightarrow \quad \cot y = x$, where x is any real number and $0 < y < \pi$.



Example 7:

a. $\cot^{-1}\sqrt{3} = \frac{\pi}{6}$

b. $\cot^{-1}(-\sqrt{3}) = \frac{5\pi}{6}$

CHAPTER 6 DETAILED SUMMARY

SECTION 6.1 Fundamental Trigonometric Identities

KEY CONCEPTS

The fundamental trigonometric identities are used to simplify trigonometric expressions and to prove other trigonometric relationships.

Reciprocal and quotient identities:

$$\sin x = \frac{1}{\csc x} \qquad \cos x = \frac{1}{\sec x}$$

$$\csc x = \frac{1}{\sin x} \qquad \sec x = \frac{1}{\cos x}$$

$$\tan x = \frac{1}{\cot x} \qquad \cot x = \frac{1}{\tan x}$$

$$\tan x = \frac{\sin x}{\cos x} \qquad \cot x = \frac{\cos x}{\sin x}$$

The Pythagorean identities:

$$\sin^2 x + \cos^2 x = 1$$

$$\tan^2 x + 1 = \sec^2 x$$

$$1 + \cot^2 x = \csc^2 x$$

Even and odd identities:

$$\cos(-x) = \cos x \qquad \sec(-x) = \sec x$$

$$\sin(-x) = -\sin x \qquad \csc(-x) = -\csc x$$

$$\tan(-x) = -\tan x \qquad \cot(-x) = -\cot x$$

EXAMPLES

Example 1:

Simplify. $\sec x \cot x \csc x$

$$\sec x \cot x \csc x = \frac{1}{\cos x} \cdot \frac{\cos x}{\sin x} \cdot \frac{1}{\sin x}$$
$$= \frac{1}{\sin^2 x}$$
$$= \csc^2 x$$

Example 2:

Verify the identity. $\dfrac{\sin^2 x + 2\cos x - 2}{\cos x - 1} = 1 - \cos x$

To begin, use the identity $\sin^2 x = 1 - \cos^2 x$.

$$\frac{\sin^2 x + 2\cos x - 2}{\cos x - 1} = \frac{1 - \cos^2 x + 2\cos x - 2}{\cos x - 1}$$
$$= \frac{-\cos^2 x + 2\cos x - 1}{\cos x - 1}$$
$$= \frac{-(\cos^2 x - 2\cos x + 1)}{\cos x - 1}$$
$$= \frac{-(\cos x - 1)^2}{\cos x - 1}$$
$$= -(\cos x - 1)$$
$$= 1 - \cos x$$

Example 3:

Verify the identity. $\dfrac{\sin(-x) + 1}{\sin x + 1} = (\tan x - \sec x)^2$

$$\frac{\sin(-x) + 1}{\sin x + 1} = \frac{-\sin x + 1}{\sin x + 1}$$
$$= \frac{(1 - \sin x)}{(\sin x + 1)} \cdot \frac{(\sin x - 1)}{(\sin x - 1)}$$
$$= \frac{-(\sin x - 1)(\sin x - 1)}{\sin^2 x - 1}$$
$$= \frac{-(\sin x - 1)^2}{-(1 - \sin^2 x)}$$
$$= \frac{(\sin x - 1)^2}{\cos^2 x}$$
$$= \left(\frac{\sin x - 1}{\cos x}\right)^2$$
$$= (\tan x - \sec x)^2$$

ISTUDY

SECTION 6.2 Sum and Difference Formulas

KEY CONCEPTS

The sine, cosine, or tangent of a sum or difference of angles can be expressed in terms of the sine, cosine, or tangent of the individual angles.

Sum and difference formulas:

$$\sin(u+v) = \sin u\cos v + \cos u\sin v$$
$$\sin(u-v) = \sin u\cos v - \cos u\sin v$$
$$\cos(u+v) = \cos u\cos v - \sin u\sin v$$
$$\cos(u-v) = \cos u\cos v + \sin u\sin v$$
$$\tan(u+v) = \frac{\tan u + \tan v}{1 - \tan u\tan v}$$
$$\tan(u-v) = \frac{\tan u - \tan v}{1 + \tan u\tan v}$$

The cofunction and periodic identities can be verified using the sum and difference formulas.

Cofunction identities:

$$\sin\theta = \cos\left(\frac{\pi}{2} - \theta\right) \qquad \cos\theta = \sin\left(\frac{\pi}{2} - \theta\right)$$
$$\tan\theta = \cot\left(\frac{\pi}{2} - \theta\right) \qquad \cot\theta = \tan\left(\frac{\pi}{2} - \theta\right)$$
$$\sec\theta = \csc\left(\frac{\pi}{2} - \theta\right) \qquad \csc\theta = \sec\left(\frac{\pi}{2} - \theta\right)$$

Periodic identities:

$$\sin(\theta + 2\pi) = \sin\theta \qquad \cos(\theta + 2\pi) = \cos\theta$$
$$\csc(\theta + 2\pi) = \csc\theta \qquad \sec(\theta + 2\pi) = \sec\theta$$
$$\tan(\theta + \pi) = \tan\theta \qquad \cot(\theta + \pi) = \cot\theta$$

A linear combination of $\sin x$ and $\cos x$ can be written as a sine function involving a phase shift. For the real numbers A, B, and x,

$A\sin x + B\cos x = k\sin(x + \alpha)$, where $k = \sqrt{A^2 + B^2}$ and α satisfies

$$\cos\alpha = \frac{A}{\sqrt{A^2 + B^2}} \text{ and } \sin\alpha = \frac{B}{\sqrt{A^2 + B^2}}.$$

EXAMPLES

Example 1:
Use a sum or difference formula to evaluate the sine, cosine, and tangent of 285°.

Decompose 285° into a sum or difference of angles that are multiples of 30°. One possibility is 285° = 225° + 60°.

$$\begin{aligned}\sin(225° + 60°) &= \sin 225°\cos 60° + \cos 225°\sin 60° \\ &= -\frac{\sqrt{2}}{2}\cdot\frac{1}{2} + \left(-\frac{\sqrt{2}}{2}\right)\cdot\frac{\sqrt{3}}{2} = -\frac{\sqrt{2}+\sqrt{6}}{4}\end{aligned}$$

$$\begin{aligned}\cos(225° + 60°) &= \cos 225°\cos 60° - \sin 225°\sin 60° \\ &= -\frac{\sqrt{2}}{2}\cdot\frac{1}{2} - \left(-\frac{\sqrt{2}}{2}\right)\cdot\frac{\sqrt{3}}{2} = \frac{\sqrt{6}-\sqrt{2}}{4}\end{aligned}$$

$$\begin{aligned}\tan(225° + 60°) &= \frac{\tan 225° + \tan 60°}{1 - \tan 225°\tan 60°} = \frac{1+\sqrt{3}}{1 - 1\cdot\sqrt{3}} \\ &= \frac{(1+\sqrt{3})}{(1-\sqrt{3})}\cdot\frac{(1+\sqrt{3})}{(1+\sqrt{3})} = \frac{1 + 2\sqrt{3} + 3}{1-3} \\ &= \frac{4 + 2\sqrt{3}}{-2} = -2 - \sqrt{3}\end{aligned}$$

Example 2:
Use a difference formula to verify the identity.

$$\cos\theta = \sin\left(\frac{\pi}{2} - \theta\right)$$

$$\begin{aligned}\sin\left(\frac{\pi}{2} - \theta\right) &= \sin\frac{\pi}{2}\cos\theta - \cos\frac{\pi}{2}\sin\theta \\ &= 1\cdot\cos\theta - 0\cdot\sin\theta \\ &= \cos\theta\end{aligned}$$

Example 3:
Simplify. $\sin(-x + 4\pi) + 4\sin x$

$$\begin{aligned}&\sin(-x + 4\pi) + 4\sin x \\ &\quad = \sin(-x) + 4\sin x \\ &\quad = -\sin x + 4\sin x \\ &\quad = 3\sin x\end{aligned}$$

Example 4:
Write the expression in the form $k\sin(x + \alpha)$.

$4\sin x - 3\cos x$

$k = \sqrt{4^2 + (-3)^2} = 5$

$\cos\alpha = \frac{4}{5}$ and $\sin\alpha = \frac{-3}{5}$

Since $\cos\alpha > 0$ and $\sin\alpha < 0$, α is in Quadrant IV.

$\alpha = 2\pi - \cos^{-1}\frac{4}{5} \approx 5.6397$ or $\approx 323.1°$

Therefore, $4\sin x - 3\cos x \approx 5\sin(x + 5.6397)$.

ISTUDY

SECTION 6.3 Double-Angle, Power-Reducing, and Half-Angle Formulas

KEY CONCEPTS

The sine, cosine, or tangent of a double angle follows directly from the sum and difference formulas.

Double-angle formulas:

$$\sin 2\theta = 2\sin\theta\cos\theta$$

$$\begin{aligned}\cos 2\theta &= \cos^2\theta - \sin^2\theta \\ &= 1 - 2\sin^2\theta \\ &= 2\cos^2\theta - 1\end{aligned}$$

$$\tan 2\theta = \frac{2\tan\theta}{1 - \tan^2\theta}$$

The double-angle cosine formulas are used to derive the power-reducing formulas. These convert the square of a sine or cosine term to a first power of a cosine term.

Power-reducing formulas:

$$\sin^2\theta = \frac{1 - \cos 2\theta}{2}$$

$$\cos^2\theta = \frac{1 + \cos 2\theta}{2}$$

$$\tan^2\theta = \frac{1 - \cos 2\theta}{1 + \cos 2\theta}$$

Substituting $\frac{\alpha}{2}$ for θ in the power-reducing formulas results in the half-angle formulas.

Half-angle formulas:

$$\sin\frac{\alpha}{2} = \pm\sqrt{\frac{1 - \cos\alpha}{2}}$$

$$\cos\frac{\alpha}{2} = \pm\sqrt{\frac{1 + \cos\alpha}{2}}$$

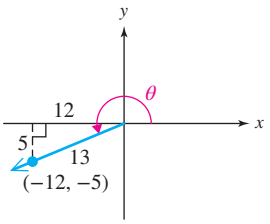
$$\tan\frac{\alpha}{2} = \pm\sqrt{\frac{1 - \cos\alpha}{1 + \cos\alpha}} = \frac{1 - \cos\alpha}{\sin\alpha} = \frac{\sin\alpha}{1 + \cos\alpha}$$

The + or − sign is determined by the quadrant of angle $\frac{\alpha}{2}$.

EXAMPLES

Example 1:

Given $\sin\theta = -\frac{5}{13}$ for θ in Quadrant III, find $\sin 2\theta$, $\sin 2\theta$, and $\tan 2\theta$.



$$\sin\theta = -\frac{5}{13}$$

$$\cos\theta = -\frac{12}{13}$$

$$\tan\theta = \frac{5}{12}$$

$$\sin 2\theta = 2\sin\theta\cos\theta$$

$$= 2\left(-\frac{5}{13}\right)\left(-\frac{12}{13}\right) = \frac{120}{169}$$

$$\cos 2\theta = \cos^2\theta - \sin^2\theta$$

$$= \left(-\frac{12}{13}\right)^2 - \left(-\frac{5}{13}\right)^2 = \frac{144}{169} - \frac{25}{169} = \frac{119}{169}$$

$$\tan 2\theta = \frac{2\tan\theta}{1 - \tan^2\theta} = \frac{2\left(\frac{5}{12}\right)}{1 - \left(\frac{5}{12}\right)^2} = \frac{120}{119}$$

Example 2:

Write $\sin^4 x$ in terms of first powers of cosine only.

$$\sin^4 x = (\sin^2 x)^2 = \left(\frac{1 - \cos 2x}{2}\right)^2$$

$$= \frac{1}{4}(1 - 2\cos 2x + \cos^2 2x)$$

$$= \frac{1}{4} - \frac{1}{2}\cos 2x + \frac{1}{4}\cos^2 2x$$

$$= \frac{1}{4} - \frac{1}{2}\cos 2x + \frac{1}{4}\left(\frac{1 + \cos 4x}{2}\right)$$

$$= \frac{1}{4} - \frac{1}{2}\cos 2x + \frac{1}{8} + \frac{1}{8}\cos 4x$$

$$= \frac{3}{8} - \frac{1}{2}\cos 2x + \frac{1}{8}\cos 4x$$

Example 3:

Evaluate $\sin 157.5°$.

$$\sin 157.5° = \sin\frac{315°}{2} = \sqrt{\frac{1 - \cos 315°}{2}}$$

$$= \sqrt{\frac{1 - \frac{\sqrt{2}}{2}}{2}} = \sqrt{\frac{2 \cdot \left(1 - \frac{\sqrt{2}}{2}\right)}{2 \cdot (2)}}$$

$$= \sqrt{\frac{2 - \sqrt{2}}{4}} = \frac{\sqrt{2 - \sqrt{2}}}{2}$$

SECTION 6.4 Product-to-Sum and Sum-to-Product Formulas

KEY CONCEPTS

Product-to-sum formulas:

$$\sin u \sin v = \frac{1}{2}[\cos(u - v) - \cos(u + v)]$$

$$\cos u \cos v = \frac{1}{2}[\cos(u - v) + \cos(u + v)]$$

$$\sin u \cos v = \frac{1}{2}[\sin(u + v) + \sin(u - v)]$$

$$\cos u \sin v = \frac{1}{2}[\sin(u + v) - \sin(u - v)]$$

Sum-to-product formulas:

$$\cos x - \cos y = -2\sin\frac{x + y}{2}\sin\frac{x - y}{2}$$

$$\cos x + \cos y = 2\cos\frac{x + y}{2}\cos\frac{x - y}{2}$$

$$\sin x + \sin y = 2\sin\frac{x + y}{2}\cos\frac{x - y}{2}$$

$$\sin x - \sin y = 2\cos\frac{x + y}{2}\sin\frac{x - y}{2}$$

EXAMPLES

Example 1:

Write the product as a sum. $\cos 5x \cos 7x$

$$\cos 5x \cos 7x$$

$$= \frac{1}{2}[\cos(5x - 7x) + \cos(5x + 7x)]$$

$$= \frac{1}{2}[\cos(-2x) + \cos 12x]$$

$$= \frac{1}{2}\cos 2x + \frac{1}{2}\cos 12x$$

Example 2:

Write the difference as a product. $\sin 3x - \sin 6x$

$$\sin 3x - \sin 6x = 2\cos\frac{3x + 6x}{2}\sin\frac{3x - 6x}{2}$$

$$= 2\cos\frac{9x}{2}\sin\left(-\frac{3x}{2}\right)$$

$$= 2\cos\frac{9x}{2}\left(-\sin\frac{3x}{2}\right)$$

$$= -2\cos\frac{9x}{2}\sin\frac{3x}{2}$$

SECTION 6.5 Trigonometric Equations

KEY CONCEPTS

To solve a conditional trigonometric equation, manipulate both sides of the equation into a simpler form to find the values of the variable that make the equation true.

Quadratic equations with the variable $\sin x$, $\cos x$, etc. can be solved by the same techniques learned to solve quadratic equations in the variable x.

EXAMPLES

Example 1:

Solve. $2\sin x + 1 = 0$

$\sin x = -\frac{1}{2}$ is an equivalent equation.

The solution set on the interval $[0, 2\pi)$ is $\left\{\frac{7\pi}{6}, \frac{11\pi}{6}\right\}$.

The general solution is

$$\left\{x \,\middle|\, x = \frac{7\pi}{6} + 2n\pi, x = \frac{11\pi}{6} + 2n\pi \text{ for integers } n\right\}.$$

Example 2:

Solve. $2\cos^2 x + 5\cos x - 3 = 0$

$$(2\cos x - 1)(\cos x + 3) = 0$$

$$\cos x = \frac{1}{2} \text{ or } \cos x = -3$$

The solutions to $\cos x = \frac{1}{2}$ are $\frac{\pi}{3}$ and $\frac{5\pi}{3}$. There is no solution to the equation $\cos x = -3$ because -3 is outside the range of the cosine function.

The solution set over the interval $[0, 2\pi)$ is $\left\{\frac{\pi}{3}, \frac{5\pi}{3}\right\}$.

ISTUDY

An equation involving a multiple angle may have numerous solutions on the interval $[0, 2\pi)$.

Example 3:

Solve. $\tan 3x = 1$

We require $3x = \frac{\pi}{4} + n\pi$ for integers n.

The solution set over $[0, 2\pi)$ is $\left\{\frac{\pi}{12}, \frac{5\pi}{12}, \frac{3\pi}{4}, \frac{13\pi}{12}, \frac{17\pi}{12}, \frac{7\pi}{4}\right\}$.

Trigonometric identities are also used to manipulate an equation into a more manageable form.

Example 4:

Solve. $\sin^2 x = 2\cos x + 2$

To begin, use the identity $\sin^2 x = 1 - \cos^2 x$.

$$1 - \cos^2 x = 2\cos x + 2$$
$$\cos^2 x + 2\cos x + 1 = 0$$
$$(\cos x + 1)^2 = 0$$
$$\cos x + 1 = 0$$
$$\cos x = -1$$

The solution set over $[0, 2\pi)$ is $\{\pi\}$.

Other algebraic techniques such as factoring, squaring both sides of the equation (being sure to check the potential solutions), applying the square root property, and applying the quadratic formula may also be used.

Example 5:

Solve.
$$1 - \tan x = \sec x$$
$$(1 - \tan x)^2 = (\sec x)^2$$
$$1 - 2\tan x + \tan^2 x = \sec^2 x$$
$$1 - 2\tan x + \tan^2 x = 1 + \tan^2 x$$
$$-2\tan x = 0$$
$$\tan x = 0$$

The potential solutions are 0 and π. However, since we squared both sides of the equation, we must check each potential solution.

Check: $x = 0$

$1 - \tan x = \sec x$

$1 - \tan 0 \stackrel{?}{=} \sec 0$

$1 - 0 = 1$ ✓

Check: $x = \pi$

$1 - \tan x = \sec x$

$1 - \tan \pi \stackrel{?}{=} \sec \pi$

$1 - 0 \stackrel{?}{=} -1$ False

The solution set over $[0, 2\pi)$ is $\{0\}$.

Often the solutions to a trigonometric equation are not multiples of the special angles 0, $\frac{\pi}{6}$, $\frac{\pi}{4}$, $\frac{\pi}{3}$, or $\frac{\pi}{2}$. In such a case, use the inverse trigonometric functions to find the exact values of the solutions to the equation.

Example 6:

Solve. $\tan x = 5$

The solution set over $[0, 2\pi)$ is $\{\tan^{-1} 5, \pi + \tan^{-1} 5\}$.

ISTUDY

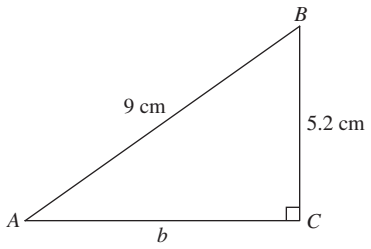
CHAPTER 7 DETAILED SUMMARY

SECTION 7.1 Applications of Right Triangles

KEY CONCEPTS

Finding the measures of the angles and sides of a right triangle when two sides or a side and an acute angle are known is called **solving a right triangle.** This can be used to solve applications involving right triangles.

Example 1:
Solve the triangle.



From the figure, $a = 5.2$, $c = 9$.

Using the Pythagorean theorem,

$b = \sqrt{9^2 - 5.2^2} \approx 7.3$ cm.

$C = 90°$

$A \approx \sin^{-1}\frac{5.2}{9} \approx 35.3°$

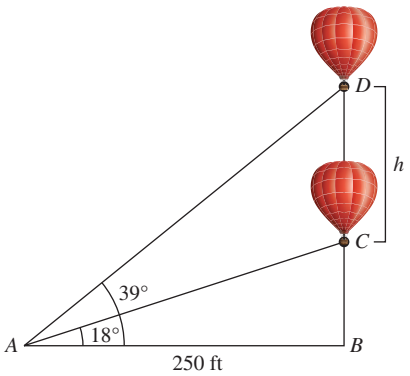
$B \approx 90° - 35.3° = 54.7°$

The **bearing** from point A to point B is the degree measure of the acute angle formed by ray $\overrightarrow{AB}$ and the north-south line.

EXAMPLES

Example 2:
A hot air balloon rises straight upward at a constant rate. An observer at ground level 250 ft from the point of launch sights the bottom of the balloon at an angle of elevation of 18°. Five minutes later the observer sights the balloon at an angle of elevation of 39°. How fast is the balloon rising? Round to the nearest ft/min.

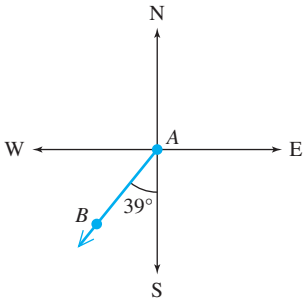
Let h represent the distance the balloon travels in 5 min.



From ΔABC, $CB = 250\tan 18° \approx 81$ ft.
From ΔABD, $BD = 250\tan 39° = 202$ ft.
Thus, $h \approx 202\text{ ft} - 81\text{ ft} \approx 121$ ft.

The balloon's speed is $\frac{121\text{ ft}}{5\text{ min}}$ or 24 ft/min.

Example 3:
In the figure, the bearing from A to B is S39°W and the bearing from B to A is N39°E.



SECTION 7.2 The Law of Sines

KEY CONCEPTS

A triangle that does not contain a right angle is called an **oblique triangle.** To solve an oblique triangle,

- Use the law of sines if two angles and a side are known (ASA or SAA) or if two sides and angle opposite one of them are known (SSA).
- Use the law of cosines if three sides are known (SSS) or if two sides and the angle between them are known (SAS).

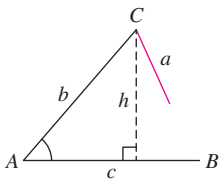
Law of sines:

If ΔABC is a triangle with sides of lengths a, b, and c opposite angles A, B, and C, respectively, then

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \text{ or } \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$

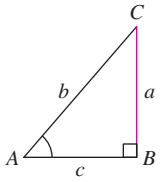
When the lengths of two sides and the measure of an angle opposite one of the known sides are given, then four cases are possible regarding the number of triangles that can be constructed.

No triangle



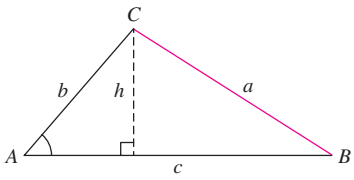
(a) $a < h$
side a is too short to meet side c.

One right triangle



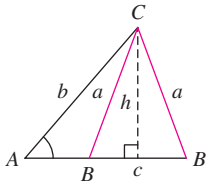
(b) $a = h$
side a exactly equals the altitude.

One oblique triangle



(c) $a > b$
One triangle is possible.

Two triangles: One acute and one obtuse triangle



(d) $h < a < b$
Side a intersects side c at an obtuse angle or acute angle.

EXAMPLES

Example 1:

Solve ΔABC subject to the given conditions.

$A = 111°, C = 24°, a = 20$

$B = 180° - (111° + 24°) = 45°$

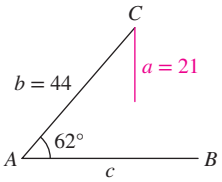
$$\frac{20}{\sin 111°} = \frac{c}{\sin 24°} \Rightarrow c = \frac{20 \sin 24°}{\sin 111°} \approx 8.7$$

$$\frac{20}{\sin 111°} = \frac{b}{\sin 45°} \Rightarrow c = \frac{20 \sin 45°}{\sin 111°} \approx 15.1$$

Example 2:

Solve ΔABC subject to the given conditions.

$A = 62°, b = 44°, a = 21$



$$\frac{\sin 62°}{21} = \frac{\sin B}{44} \Rightarrow \sin B = \frac{44 \sin 62°}{21}$$

$\sin B \approx 1.85$ This is impossible because $\sin B$ must be between -1 and 1, inclusive.

There is no triangle meeting these conditions.

Example 3:
Solve ΔABC subject to the given conditions.

$C = 42°, b = 30, c = 26$

$$\frac{\sin 42°}{26} = \frac{\sin B}{30} \Rightarrow \sin B = \frac{30 \sin 42°}{26}$$

$\sin B \approx 0.7721$

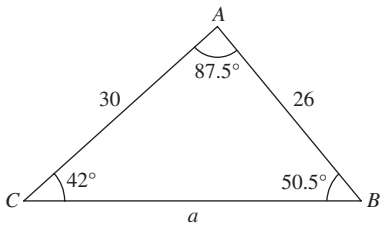
$\sin^{-1} 0.7721 = 0.8821$ radians or $50.5°$

Thus, $B \approx 50.5°$or

$$B \approx 180° - 50.5° \approx 129.5°$$

There are two possible triangles.

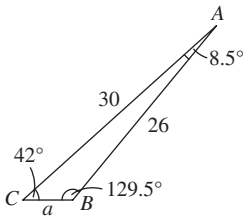
Triangle 1 (B acute):



$$A \approx 180° - (42° + 50.5°) \approx 87.5°$$

$$\frac{26}{\sin 42°} = \frac{a}{\sin 87.5°} \Rightarrow a = \frac{26 \sin 87.5°}{\sin 42°} \approx 38.8$$

Triangle 2 (B obtuse):



$$A \approx 180° - (42° + 129.5°) \approx 8.5°$$

$$\frac{26}{\sin 42°} = \frac{a}{\sin 8.5°} \Rightarrow a = \frac{26 \sin 8.5°}{\sin 42°} \approx 5.7$$

Given two sides of ΔABC and the angle between them, the area of the triangle is given by:

$$\text{Area} = \frac{1}{2} bc \sin A$$

$$\text{Area} = \frac{1}{2} ab \sin C$$

$$\text{Area} = \frac{1}{2} ac \sin B$$

Example 4:
Find the area of a triangular sail with sides of length 9 ft and 11 ft and angle between the sides of 72°.

$$A = \frac{1}{2}(9\,\text{ft})(11\,\text{ft}) \sin 72° \approx 47\,\text{ft}^2$$

ISTUDY

SECTION 7.3 The Law of Cosines

KEY CONCEPTS

Use the law of cosines to solve an oblique triangle when

- Two sides and the angle between them are known (SAS).
- Three sides are known (SSS).

Law of cosines:

Let ΔABC have sides a, b, c opposite vertices A, B, and C, respectively. Then,

Law of Cosines	Alternative Form
$a^2 = b^2 + c^2 - 2bc\cos A$	$\cos A = \dfrac{b^2 + c^2 - a^2}{2bc}$
$b^2 = a^2 + c^2 - 2ac\cos B$	$\cos B = \dfrac{a^2 + c^2 - b^2}{2ac}$
$c^2 = a^2 + b^2 - 2ab\cos C$	$\cos C = \dfrac{a^2 + b^2 - c^2}{2ab}$

For a triangle with sides of lengths a, b, and c, the area is given by

$$\text{Area} = \sqrt{s(s-a)(s-b)(s-c)}$$

where s is the semi-perimeter of the triangle:

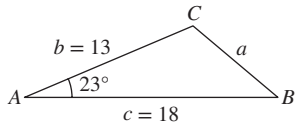
$s = \frac{1}{2}(a + b + c)$.

EXAMPLES

Example 1:

Solve ΔABC subject to the given conditions.

$A = 23°$, $b = 13$, $c = 18$



$a^2 = b^2 + c^2 - 2bc\cos A$

$a^2 = 13^2 + 18^2 - 2(13)(18)\cos 23°$

$a = \sqrt{13^2 + 18^2 - 2(13)(18)\cos 23°} \approx 7.8869$

$\cos C = \dfrac{a^2 + b^2 - c^2}{2ab}$

$\cos C = \dfrac{7.8869^2 + 13^2 - 18^2}{2(7.8869)(13)}$

$C \approx \cos^{-1}\left(\dfrac{7.8869^2 + 13^2 - 18^2}{2(7.8869)(13)}\right) \approx 116.9°$

$B \approx 180° - (23° + 116.9°) \approx 40.1°$

Example 2:

A triangular plot of land has sides of length 150 ft, 80 ft, and 90 ft. Find the area.

$s = \frac{1}{2}(150 + 80 + 90) = 160$ ft

$A = \sqrt{160(160 - 150)(160 - 80)(160 - 90)}$

$= \sqrt{160(10)(80)(70)}$

≈ 2993 ft^2

SECTION 7.4 Harmonic Motion

KEY CONCEPTS

An object moving indefinitely in a sinusoidal manner with constant amplitude is said to be moving in **simple harmonic motion.** The **period** is the time required to complete one cycle, and the **frequency** is the number of cycles per unit time.

The displacement d of an object undergoing simple harmonic motion is given by

$$d = a\sin\omega t \quad \text{or} \quad d = a\cos\omega t \quad \text{or}$$
$$d = a\sin 2\pi ft \quad \text{or} \quad d = a\cos 2\pi ft$$

where

- t is the time after motion begins.
- The amplitude of motion is $|a|$.
- The period is given by $P = \dfrac{2\pi}{\omega}$.
- The frequency f is the reciprocal of the period, $f = \dfrac{1}{P}$.

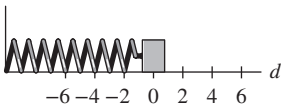
An object undergoes **damped harmonic motion** if damping forces cause the amplitude of oscillation to decrease with time. Displacement of an object under certain conditions of damped harmonic motion can be modeled by

$$d = ae^{-ct}\cos\omega t \quad \text{or} \quad d = ae^{-ct}\sin\omega t \quad \text{for } c > 0.$$

- t is the time after motion begins.
- a is the displacement of the object at $t = 0$.
- c is a constant called the **damping factor** and is related to the damping force opposing motion.
- The value of ω is related to the period P and frequency f by $P = 2\pi/\omega$ and $\omega = 2\pi f$.

EXAMPLES

Example 1:
A block at the end of a horizontal spring is compressed 6 in. from its equilibrium position and then released. The displacement d of the block can be approximated by simple harmonic motion for a short period of time. If one back-and-forth cycle occurs in 0.5 sec, write an equation of the form $d = a\cos\omega t$ to model the displacement. Assume that the initial position is $d = -6$ in.



The amplitude of motion is equal to the maximum displacement of 6 in. Since the initial position of the block is -6, then $a = -6$.

To find ω, note that $P = \dfrac{2\pi}{\omega}$. Thus,

$$\omega = \frac{2\pi}{P} = \frac{2\pi}{0.5\,\text{sec}} = 4\pi.$$

Using the model $d = a\cos\omega t$, we have $d = -6\cos 4\pi t$.

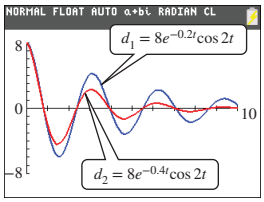
Example 2:
The two functions d_1 and d_2 model damped harmonic motion of an object.

$$d_1 = 8e^{-0.2t}\cos 2t$$
$$d_2 = 8e^{-0.4t}\cos 2t$$

The damping factor for d_1 is 0.2.

The damping factor for d_2 is 0.4.

The graphs of the functions show that the "amplitude" of each back-and-forth cycle decreases with time. Function d_2 loses amplitude more quickly because its damping factor is greater, indicating that there is a greater damping force impeding motion.

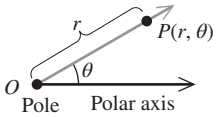


CHAPTER 8 DETAILED SUMMARY

SECTION 8.1 Polar Coordinates

KEY CONCEPTS

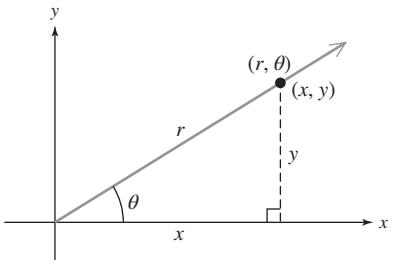
A **polar coordinate system** consists of a fixed point O called the **pole** (or origin), and a ray called the **polar axis,** with endpoint at the pole. Each point P in the plane is defined by an ordered pair of the form (r, θ), where r is the directed distance from the pole to P, and θ is a directed angle from the polar axis to line $\overleftrightarrow{OP}$.



A point in a plane can be described by an ordered pair in rectangular coordinates or by an ordered pair in polar coordinates.

$$x = r\cos\theta \qquad r^2 = x^2 + y^2$$

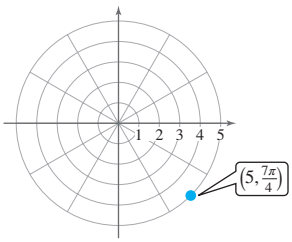
$$y = r\sin\theta \qquad \tan\theta = \frac{y}{x} \text{ for } x \neq 0$$



EXAMPLES

Example 1:

The ordered pairs $\left(5, \frac{7\pi}{4}\right)$, $\left(5, -\frac{\pi}{4}\right)$, $\left(-5, \frac{3\pi}{4}\right)$, and $\left(-5, -\frac{5\pi}{4}\right)$ in polar coordinates all represent the same point.



Example 2:

Given $\left(2, \frac{2\pi}{3}\right)$ in polar coordinates,

$$x = 2\cos\frac{2\pi}{3} = 2\left(-\frac{1}{2}\right) = -1$$

$$y = 2\sin\frac{2\pi}{3} = 2 \cdot \frac{\sqrt{3}}{2} = \sqrt{3}$$

The corresponding ordered pair in rectangular coordinates is $(-1, \sqrt{3})$.

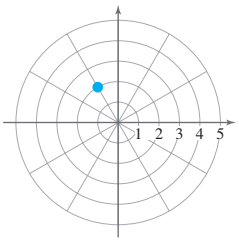
Likewise, $r = \sqrt{(-1)^2 + (\sqrt{3})^2} = \sqrt{4} = 2$

$$\tan\theta = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\theta = \pi + \tan^{-1}(-\sqrt{3})$$

$$= \pi + \left(-\frac{\pi}{3}\right)$$

$$= \frac{2\pi}{3}$$



A **polar equation** is an equation described in a polar coordinate system with variables r and θ rather than x and y.

Convert between rectangular coordinates and polar coordinates by using the relationships $x = r\cos\theta$, $y = r\sin\theta$, $r^2 = x^2 + y^2$, and $\tan\theta = \frac{y}{x}$ for $x \neq 0$.

Example 3:

Describe the graph of $r = \frac{-3}{\cos\theta}$.

$r = \frac{-3}{\cos\theta} \Rightarrow r\cos\theta = -3.$

Substitute $x = r\cos\theta$ to get $x = -3$. The graph of the polar equation is the vertical line $x = -3$.

Example 4:

Convert the equation to a polar equation.
$x^2 + y^2 = 4y$

Use $r^2 = x^2 + y^2$ and $y = r\sin\theta$ to obtain

$r^2 = 4(r\sin\theta)$

$r^2 - 4r\sin\theta = 0$

$r(r - 4\sin\theta) = 0$

The equation $r = 0$ represents the pole. The equation $r - 4\sin\theta = 0$ also passes through the pole when $\theta = 0, \pi, 2\pi, \ldots$. So the equation $r - 4\sin\theta = 0$ is sufficient to describe the graph of $x^2 + y^2 = 4y$.

Thus, $r - 4\sin\theta = 0$ and $r = 4\sin\theta$ are polar equations representing the circle $x^2 + y^2 = 4y$.

SECTION 8.2 Graphs of Polar Equations

KEY CONCEPTS

A **solution** to a polar equation is an ordered pair (r, θ) that satisfies the equation. The graph of a polar equation is the graph of all solutions to the equation.

The graphs of polar equations may be symmetric with respect to the polar axis, the line $\theta = \frac{\pi}{2}$, or the pole. For an equation in polar coordinates, if the given substitution produces an equivalent equation, then the graph has the indicated type of symmetry.

(1) Symmetry with respect to the polar axis:
Replace (r, θ) by $(r, -\theta)$.

(2) Symmetry with respect to the line $\theta = \frac{\pi}{2}$:
Replace (r, θ) by $(r, \pi - \theta)$.

(3) Symmetry with respect to the pole:
Replace (r, θ) by $(-r, \theta)$.

EXAMPLES

Example 1:

Test equation A for symmetry.

A $r = 4 + 3\cos\theta$

(1) Replace (r, θ) by $(r, -\theta)$.
$r = 4 + 3\cos(-\theta)$
$= 4 + 3\cos\theta$ (The cosine function is even.)

The resulting equation is the same as A. The graph is symmetric with respect to the polar axis.

(2) Replace (r, θ) by $(r, \pi - \theta)$.
$r = 4 + 3\cos(\pi - \theta)$
$= 4 + 3(-\cos\theta)$
$= 4 - 3\cos\theta$

The resulting equation is different than A. The test for symmetry with respect to the line $\theta = \frac{\pi}{2}$ is inconclusive.

(3) Replace (r, θ) by $(-r, \theta)$.
$-r = 4 + 3\cos\theta$
$r = -4 - 3\cos\theta$

The resulting equation is different than A. The test for symmetry with respect to the pole is inconclusive.

ISTUDY

Polar equations and their graphs may be members of specific categories of polar equations representing lines, circles, spirals, limaçons, roses, or lemniscates.

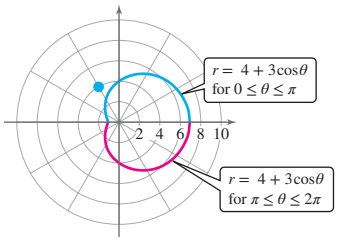
Example 2:

Use the symmetry found in Example 1 and graph the equation $r = 4 + 3\cos\theta$.

We can make a table of points for $0 \le \theta \le \pi$ and then use the symmetry with respect to the polar axis to graph the points corresponding to $\pi \le \theta \le 2\pi$.

θ	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
r	7	$4 + \frac{3\sqrt{3}}{2} \approx 6.6$	$4 + \frac{3\sqrt{2}}{2} \approx 6.1$	$\frac{11}{2}$	4

θ	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	$\frac{5\pi}{6}$	π
r	$\frac{5}{2}$	$4 - \frac{3\sqrt{2}}{2} \approx 1.9$	$4 - \frac{3\sqrt{3}}{2} \approx 1.4$	1



SECTION 8.3 Complex Numbers in Polar Form

KEY CONCEPTS

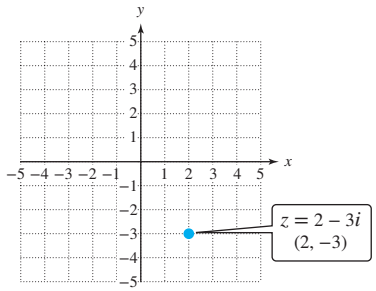
In the **complex plane,** the horizontal axis (called the **real axis**) represents the real part of a complex number, and the vertical axis (called the **imaginary axis**) represents the imaginary part. The complex number $z = a + bi$ is written as an ordered pair (a, b) and can then be graphed as such in the complex plane.

The absolute value or **modulus** of a complex number is its distance from the origin in the complex plane. If $z = a + bi$ is a complex number, then, $|z| = \sqrt{a^2 + b^2}$. The modulus of a complex number is often denoted by r.

EXAMPLES

Example 1:

The complex number $z = 2 - 3i$ is written as the ordered pair $(2, -3)$ and is graphed in the complex plane in the fourth quadrant.



Example 2:

The modulus of the complex number $z = 2 - 3i$ is given by $|z| = \sqrt{2^2 + (-3)^2} = \sqrt{13}$.

This means that the point $(2, -3)$ in the complex plane is $\sqrt{13} \approx 3.6$ units from the origin.

ISTUDY

The **polar form** (or **trigonometric form**) of a complex number $z = a + bi$ is $z = r(\cos\theta + i\sin\theta)$, where $a = r\cos\theta$, $b = r\sin\theta$, $r = \sqrt{a^2 + b^2}$, and $\tan\theta = \frac{b}{a}(a \neq 0)$. There are infinitely many choices for θ, but normally θ is taken on the interval $0 \leq \theta < 2\pi$.

Example 3:
The complex number $z = -2 - 2\sqrt{3}i$ has modulus
$r = \sqrt{(-2)^2 + (-2\sqrt{3})^2} = \sqrt{4 + 12} = 4$
$\tan\theta = \frac{-2\sqrt{3}}{-2} = \sqrt{3}$.
Since $(-2, -2\sqrt{3})$ is in Quadrant III, we have
$\theta = \pi + \tan^{-1}\sqrt{3}$
$= \pi + \frac{\pi}{3} = \frac{4\pi}{3}$
So $z = -2 - 2\sqrt{3}i = 4\left(\cos\frac{4\pi}{3} + i\sin\frac{4\pi}{3}\right)$.

The product and quotient of complex numbers can be found using their polar forms.
If $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$ and
$z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$, then
$z_1z_2 = r_1r_2[\cos(\theta_1 + \theta_2) + i\sin(\theta_1 + \theta_2)]$ and
$\frac{z_1}{z_2} = \frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i\sin(\theta_1 - \theta_2)]$ for $(z_2 \neq 0)$.

Example 4:
Given $z_1 = 2(\cos 75° + i\sin 75°)$ and
$z_2 = 4(\cos 135° + i\sin 135°)$, then
$z_1z_2 = 2 \cdot 4[\cos(75° + 135°) + i\sin(75° + 135°)]$
$= 8(\cos 210° + i\sin 210°)$
$\frac{z_1}{z_2} = \frac{2}{4}[\cos(75° - 135°) + i\sin(75° - 135°)]$
$= \frac{1}{2}[\cos(-60°) + i\sin(-60°)]$
$= \frac{1}{2}[\cos 60° - i\sin 60°]$

De Moivre's theorem enables us to raise a complex number to an integer power and to find its nth roots. Let $z = r(\cos\theta + i\sin\theta)$. If n is a positive integer, then $z^n = [r(\cos\theta + i\sin\theta)]^n = r^n(\cos n\theta + i\sin n\theta)$.

Example 5:
Given $z = 3(\cos 110° + i\sin 110°)$, then
$z^4 = 3^4[\cos(4 \cdot 110°) + i\sin(4 \cdot 110°)]$
$= 81(\cos 440° + i\sin 440°)$
$= 81(\cos 80° + i\sin 80°)$

For an integer $n \geq 2$, z has n distinct nth roots of the form
$w_k = \sqrt[n]{r}\left[\cos\left(\frac{\theta + 2\pi k}{n}\right) + i\sin\left(\frac{\theta + 2\pi k}{n}\right)\right]$
for $k = 0, 1, 2, \ldots, n - 1$.

Example 6:
Given $z = 8\left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)$, the cube roots are
$w_0 = \sqrt[3]{8}\left(\cos\frac{\frac{2\pi}{3} + 2\pi(0)}{3} + i\sin\frac{\frac{2\pi}{3} + 2\pi(0)}{3}\right)$,
$w_1 = \sqrt[3]{8}\left(\cos\frac{\frac{2\pi}{3} + 2\pi(1)}{3} + i\sin\frac{\frac{2\pi}{3} + 2\pi(1)}{3}\right)$, and
$w_2 = \sqrt[3]{8}\left(\cos\frac{\frac{2\pi}{3} + 2\pi(2)}{3} + i\sin\frac{\frac{2\pi}{3} + 2\pi(2)}{3}\right)$.
These simplify to
$w_0 = 2\left(\cos\frac{2\pi}{9} + i\sin\frac{2\pi}{9}\right)$,
$w_1 = 2\left(\cos\frac{8\pi}{9} + i\sin\frac{8\pi}{9}\right)$, and
$w_2 = 2\left(\cos\frac{14\pi}{9} + i\sin\frac{14\pi}{9}\right)$.

ISTUDY

SECTION 8.4 Vectors

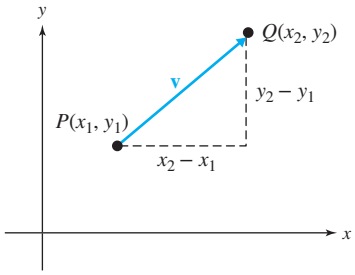
KEY CONCEPTS

A **scalar** is a quantity that has magnitude only (such as speed). A **vector quantity** (such as velocity) has both magnitude *and* direction. A **vector** in the plane is a line segment with a specified direction.

We denote a vector from point P to point Q as $\overrightarrow{PQ}$. Point P is called the **initial point** of the vector and Q is called the **terminal point** of the vector. The **magnitude** of $\overrightarrow{PQ}$, denoted $\|\overrightarrow{PQ}\|$, is the length of the line segment. Two vectors are equal if they have the same magnitude and direction. A vector drawn in **standard position** has its initial point at the origin.

Let $P(x_1, y_1)$ and $Q(x_2, y_2)$ be points in the plane, and let $\mathbf{v} = \overrightarrow{PQ}$. The component form of $\mathbf{v}$ is given by

$$\mathbf{v} = \langle x_2 - x_1, y_2 - y_1 \rangle.$$



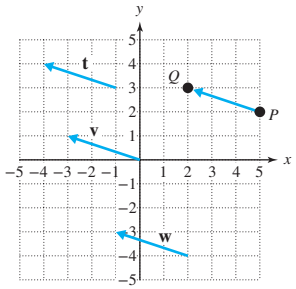
Two vectors may be added or subtracted geometrically, or by adding or subtracting the corresponding components. Multiplying a vector $\mathbf{v}$ by a scalar c results in a parallel vector $c\mathbf{v}$ and the length of $c\mathbf{v}$ is the length of $\mathbf{v}$ scaled by a factor of $|c|$.

Several properties of vectors follow directly from the definition of vector addition, vector subtraction, and multiplication of a vector by a scalar.

EXAMPLES

Example 1:
Given vector $\overrightarrow{PQ}$, P is the initial point, and Q is the terminal point. Vectors **t**, **v**, and **w** are all equal to $\overrightarrow{PQ}$.

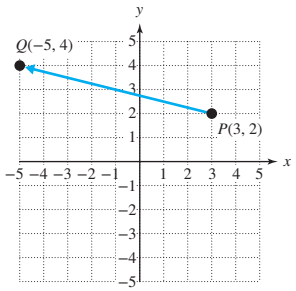
Vector **v** is in standard position.



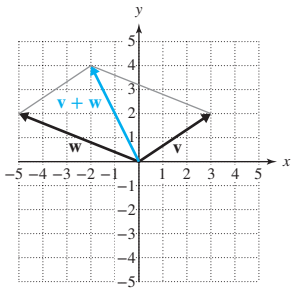
Example 2:
Given $P(3, 2)$ and $Q(-5, 4)$,

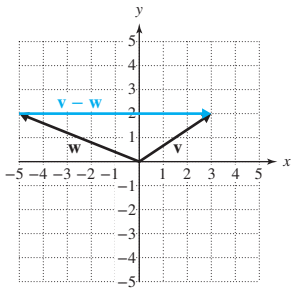
$$\overrightarrow{PQ} = \langle -5 - 3, 4 - 2 \rangle = \langle -8, 2 \rangle.$$

$$\|\overrightarrow{PQ}\| = \sqrt{(-8)^2 + 2^2} = \sqrt{68} = 2\sqrt{17}$$



Example 3:





Example 4:
Given $\mathbf{v} = \langle 2, 1 \rangle$ and $\mathbf{w} = \langle -7, 4 \rangle$,

a. $\mathbf{v} + \mathbf{w} = \langle 2 + (-7), 1 + 4 \rangle = \langle -5, 5 \rangle$

b. $3\mathbf{v} - \mathbf{w} = 3\langle 2, 1 \rangle - \langle -7, 4 \rangle$
$= \langle 6, 3 \rangle - \langle -7, 4 \rangle = \langle 13, -1 \rangle$

ISTUDY

A unit vector has a length of 1 unit. If $\mathbf{v} = \langle a, b \rangle$, then a unit vector $\mathbf{u}_v$ in the direction of $\mathbf{v}$ is given by

$$\mathbf{u}_v = \frac{\mathbf{1}}{\|\mathbf{v}\|}\mathbf{v} = \frac{1}{\|\mathbf{v}\|}\langle a, b \rangle = \left\langle \frac{a}{\|\mathbf{v}\|}, \frac{b}{\|\mathbf{v}\|} \right\rangle.$$

Two important unit vectors are $\mathbf{i} = \langle 1, 0 \rangle$ and $\mathbf{j} = \langle 0, 1 \rangle$ because they are unit vectors in the direction of the positive x- and y-axes, respectively. The representation of $\mathbf{v} = \langle a, b \rangle$ in terms of $\mathbf{i}$ and $\mathbf{j}$ is $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$.

It is often important to find the component form of a vector $\mathbf{v}$ given its magnitude $\|\mathbf{v}\|$ and direction θ. $\mathbf{v} = \langle \|\mathbf{v}\|\cos\theta, \|\mathbf{v}\|\sin\theta \rangle$.

Likewise, given the component form $\mathbf{v} = \langle a, b \rangle$, the magnitude and direction of a vector are given by $\|\mathbf{v}\| = \sqrt{a^2 + b^2}$ and $\tan\theta = \frac{b}{a} (a \neq 0)$.

Vectors have many useful applications in physics, navigation, and engineering, such as finding the true direction and speed of a boat or ship under the influence of a current or wind.

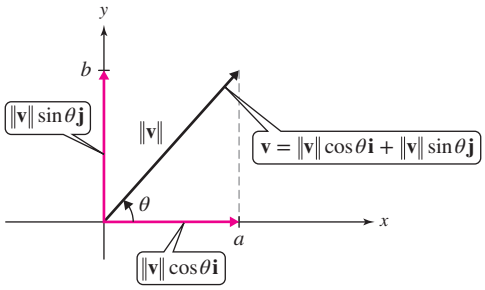
Example 5:
Given $\mathbf{v} = \langle -8, 15 \rangle$, find $\mathbf{u}_v$.

$$\|\mathbf{v}\| = \sqrt{(-8)^2 + 15^2} = \sqrt{289} = 17$$

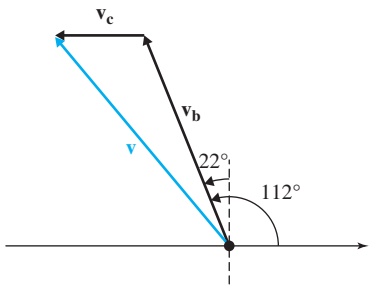
$$\mathbf{u}_v = \frac{1}{17}\langle -8, 15 \rangle = \left\langle -\frac{8}{17}, \frac{15}{17} \right\rangle$$

Example 6:
The vector $\mathbf{v} = \langle 4, -6 \rangle$ can be decomposed as a linear combination of the vectors $\mathbf{i}$ and $\mathbf{j}$ as $\mathbf{v} = 4\mathbf{i} - 6\mathbf{j}$.

Example 7:



Example 8:
A boat travels 8 knots at a bearing of N22°W in still water. It encounters a current moving due west at 2 knots. Find the true speed and direction of the boat.



The velocity of the boat in still water is given by $\mathbf{v}_b = 8\cos 112°\mathbf{i} + 8\sin 112°\mathbf{j}$.

The velocity of the current is $\mathbf{v}_c = -2\mathbf{i}$.

The net velocity of the boat is the sum of the boat's velocity in still water and the velocity of the current.

$$\mathbf{v} = \mathbf{v}_b + \mathbf{v}_c$$

$$\mathbf{v} = (8\cos 112°\mathbf{i} + 8\sin 112°\mathbf{j}) + (-2\mathbf{i})$$
$$= (8\cos 112° - 2)\mathbf{i} + 8\sin 112\mathbf{j}$$
$$\approx -5.0\mathbf{i} + 7.4\mathbf{j}$$

$$\|\mathbf{v}\| \approx \sqrt{(-5.0)^2 + (7.4)^2} \approx 8.9$$

The true speed is approximately 8.9 knots.

$$\theta \approx \tan^{-1}\left(\frac{7.4}{-5.0}\right) + 180° \approx 124°$$

The boat is on a course of N34°W.

ISTUDY

Suppose that forces $\mathbf{F}_1, \mathbf{F}_2, \mathbf{F}_3, \ldots, \mathbf{F}_n$ act on an object. The sum of these forces is called the **resultant force R.** The object is said to be in **static equilibrium** if the resultant force $\mathbf{R}$ is the zero vector, that is, if

$\mathbf{R} = \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 + \cdots + \mathbf{F}_n = \mathbf{0}.$

Example 9:
Given $\mathbf{F}_1 = 144\mathbf{i} + 160\mathbf{j}$ and $\mathbf{F}_2 = -37\mathbf{i} + 72\mathbf{j}$, the resultant force is

$$\begin{aligned}\mathbf{R} &= \mathbf{F}_1 + \mathbf{F}_2 \\ &= (144 - 37)\mathbf{i} + (160 + 72)\mathbf{j} \\ &= 107\mathbf{i} + 232\mathbf{j}\end{aligned}$$

SECTION 8.5 Dot Product

KEY CONCEPTS

If $\mathbf{v} = \langle a_1, b_1 \rangle$ and $\mathbf{w} = \langle a_2, b_2 \rangle$, the **dot product** $\mathbf{v} \cdot \mathbf{w}$ is defined as the scalar quantity $\mathbf{v} \cdot \mathbf{w} = a_1a_2 + b_1b_2$.

The following are important properties of the dot product.

If $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are vectors, and c is a scalar, then

1. $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$
2. $(c\mathbf{v}) \cdot \mathbf{w} = c(\mathbf{v} \cdot \mathbf{w})$
3. $\mathbf{v} \cdot (\mathbf{w} + \mathbf{u}) = \mathbf{v} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{u}$
4. $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$
5. $0 \cdot \mathbf{v} = 0$
6. $c(\mathbf{v} \cdot \mathbf{w}) = (c\mathbf{v}) \cdot \mathbf{w} = \mathbf{v} \cdot (c\mathbf{w})$

If θ is the angle between two nonzero vectors $\mathbf{v}$ and $\mathbf{w}$, then $\cos\theta = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \, \|\mathbf{w}\|}$ and $\theta = \cos^{-1}\left(\dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \, \|\mathbf{w}\|}\right)$.

Two vectors $\mathbf{v}$ and $\mathbf{w}$ are orthogonal if and only if $\mathbf{v} \cdot \mathbf{w} = 0$.

EXAMPLES

Example 1:
Given $\mathbf{v} = \langle -19, 3 \rangle$ and $\mathbf{w} = \langle -10, -5 \rangle$,
$\mathbf{v} \cdot \mathbf{w} = -19(-10) + 3(-5) = 175$

Example 2:
Given $\mathbf{v} = \langle 7, -3 \rangle$,

a. $\mathbf{v} \cdot \mathbf{v} = 7(7) + (-3)(-3) = 58$

b. $\|\mathbf{v}\|^2 = \left(\sqrt{7^2 + (-3)^2}\right)^2$
$= (\sqrt{49 + 9})^2 = 58$

Example 3:
Given $\mathbf{v} = \langle 1, 5 \rangle$ and $\mathbf{w} = \langle 7, 3 \rangle$,
$\mathbf{v} \cdot \mathbf{w} = 1(7) + 5(3) = 22$
$\|\mathbf{v}\| = \sqrt{1^2 + 5^2} = \sqrt{26}$
$\|\mathbf{w}\| = \sqrt{7^2 + 3^2} = \sqrt{58}$
$\theta = \cos^{-1}\left(\dfrac{22}{\sqrt{26}\sqrt{58}}\right) \approx 55.5°$

Example 4:
Given $\mathbf{v} = \langle 4, 9 \rangle$ and $\mathbf{w} = \langle 18, -8 \rangle$,
$\mathbf{v} \cdot \mathbf{w} = 4(18) + 9(-8) = 72 - 72 = 0$. Thus, $\mathbf{v}$ and $\mathbf{w}$ are orthogonal.

ISTUDY

In many applications it is important to decompose a vector into orthogonal vectors. If $\mathbf{v}$ and $\mathbf{w}$ are two nonzero vectors, then

1. The vector projection of $\mathbf{v}$ onto $\mathbf{w}$ is given by $\text{proj}_{\mathbf{w}}\mathbf{v} = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w}$.
2. To decompose $\mathbf{v}$ into vectors $\mathbf{v}_1$ and $\mathbf{v}_2$ parallel to $\mathbf{w}$ and orthogonal to $\mathbf{w}$, respectively, we have $\mathbf{v}_1 = \text{proj}_{\mathbf{w}}\mathbf{v} = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w}$ and $\mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1$.

In physics, the work W done by a constant force $\mathbf{F}$ in moving an object from point A to point B along the line of motion is given by

$$W = \begin{pmatrix}\text{Magnitude of force in}\\ \text{the direction of motion}\end{pmatrix}\begin{pmatrix}\text{Distance the}\\ \text{object is moved}\end{pmatrix}$$

1. $W = \mathbf{F} \cdot \mathbf{D}$
2. $W = \|\text{proj}_{\mathbf{D}}\mathbf{F}\|\|\mathbf{D}\|$ or $W = \|\mathbf{F}\|\|\mathbf{D}\|\cos\theta$, where θ is the angle between $\mathbf{F}$ and $\mathbf{D}$.

Example 5:
Given $\mathbf{v} = \langle 3, 4\rangle$ and $\mathbf{w} = \langle 12, 2\rangle$, find the projection of $\mathbf{v}$ onto $\mathbf{w}$.

$\mathbf{v} \cdot \mathbf{w} = 3(12) + 4(2) = 36 + 8 = 44$

$\|\mathbf{w}\|^2 = \left(\sqrt{12^2 + 2^2}\right)^2 = (\sqrt{148})^2 = 148$

$\text{proj}_{\mathbf{w}}\mathbf{v} = \dfrac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\mathbf{w} = \dfrac{44}{148}\langle 12, 2\rangle$

$= \dfrac{11}{37}\langle 12, 2\rangle = \left\langle \dfrac{132}{37}, \dfrac{22}{37}\right\rangle$

Example 6:
The work done in moving a 20 lb object straight upward 3 ft is

$$W = (20 \text{ lb})(3 \text{ ft}) = 60 \text{ ft} \cdot \text{lb}$$

Example 7:
A force of 60 N is applied to move an object 10 m horizontally. If the force is directed 34° upward from the horizontal, find the work done in moving the object.

$W = \|\mathbf{F}\|\|\mathbf{D}\|\cos\theta$

$W = (60 \text{ N})(10 \text{ m})\cos 34° \approx 497 \text{ N} \cdot \text{m}$

Approximately 497 N·m of work is done.

ISTUDY

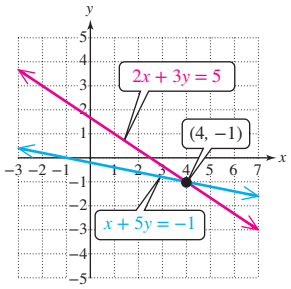
CHAPTER 9 DETAILED SUMMARY

SECTION 9.1 Systems of Linear Equations in Two Variables and Applications

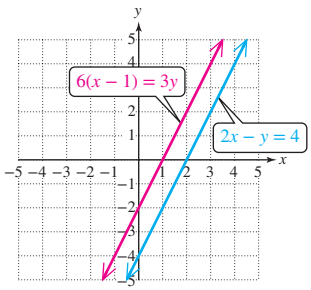
KEY CONCEPTS

Two or more linear equations taken together form a **system of linear equations.** A **solution** to a system of equations in two variables is an ordered pair that is a solution to each individual equation. Graphically, this is a point of intersection of the graphs of the equations.

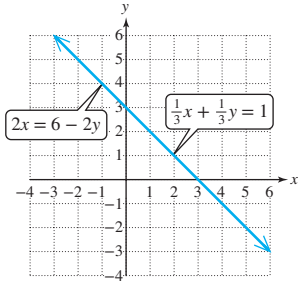
The substitution method and the addition method are often used to solve a system of linear equations in two variables.



A system of linear equations in two variables will have no solution if the equations in the system represent parallel lines. In such a case, we say that the system is **inconsistent.**



A system of linear equations in two variables will have infinitely many solutions if the equations represent the same line. In such a case, we say that the equations are **dependent.** The solution set to the system is the set of points on the line.



EXAMPLES

Example 1:
Solve by using the substitution method.

$$x + 5y = -1 \xrightarrow{\text{Solve for } x.} x = -1 - 5y$$
$$2x + 3y = 5$$

$2(-1 - 5y) + 3y = 5$ Substitute $-1 - 5y$ for x.
$-2 - 10y + 3y = 5$
$-7y = 7$
$y = -1$

Back substitution: $x = -1 - 5y$
$= -1 - 5(-1)$
$= 4$

The solution set is $\{(4, -1)\}$.

Example 2:
Solve by using the addition method.

$$\begin{array}{ll} 2x - y = 4 & 2x - y = 4 \\ 6(x - 1) = 3y \xrightarrow{\text{Standard form.}} & 6x - 3y = 6 \end{array}$$

$$\begin{array}{ll} 2x - y = 4 \xrightarrow{\text{Multiply by } -3.} & -6x + 3y = -12 \\ 6x - 3y = 6 \longrightarrow & \underline{6x - 3y = 6} \\ & 0 = -6 \end{array}$$

This results in a contradiction. There is no solution to the system, and the system is inconsistent. The solution set is $\{\ \}$.

Example 3:

$$\begin{array}{ll} \frac{1}{3}x + \frac{1}{3}y = 1 \xrightarrow{\text{Multiply by 3.}} & x + y = 3 \\ 2x = 6 - 2y \xrightarrow[\text{Standard form}]{} & 2x + 2y = 6 \end{array}$$

$$\begin{array}{ll} x + y = 3 \xrightarrow{\text{Multiply by } -2.} & -2x - 2y = -6 \\ 2x + 2y = 6 \longrightarrow & \underline{2x + 2y = 6} \\ & 0 = 0 \end{array}$$

The system results in an identity. The equations represent the same line $x + y = 3$. Solving for y in terms of x yields $y = 3 - x$. Thus, the solutions to the system are ordered pairs of the form $(x, 3 - x)$. The solution set can be written as

$$\{(x, 3 - x) | \ x \text{ is any real number}\}$$

Likewise, by solving for x in terms of y, the solution set can be written as

$$\{(3 - y, y) | \ y \text{ is any real number}\}$$

SECTION 9.2 Systems of Linear Equations in Three Variables and Applications

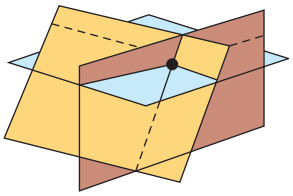
KEY CONCEPTS

A **linear equation in three variables** is an equation that can be written in the form

$$Ax + By + Cz = D$$

where A, B, and C are not all zero.

A solution to a system of linear equations in three variables is an **ordered triple** (x, y, z) that satisfies each equation in the system. Geometrically, a solution is a point of intersection of the planes represented by the equations in the system.



When solving a system of linear equations, if a contradiction arises such as $0 = 4$, the system is **inconsistent** and has no solution.

If an identity arises such as $0 = 0$, the equations are **dependent** and the system has infinitely many solutions.

EXAMPLES

Example 1:

$$\begin{array}{ll} \boxed{A} & 2x + 4y + 3z = 7 \\ \boxed{B} & 3x \quad - \quad z = 4 \\ \boxed{C} & \quad y + 5z = -3 \end{array}$$

Eliminate one variable from the system to create a system of two equations and two variables.

$$\begin{array}{rll} & \boxed{A} & 2x + 4y + 3z = 7 \\ -4 \cdot & \boxed{C} & \quad -4y - 20z = 12 \\ \hline & & 2x \quad -17z = 19 \quad \boxed{D} \end{array}$$

We will eliminate variable y first.

$$\begin{array}{ll} \boxed{B} & 3x - z = 4 \xrightarrow{\text{Multiply by } -2.} -6x + 2z = -8 \\ \boxed{D} & 2x - 17z = 19 \xrightarrow{\text{Multiply by } 3.} \quad 6x - 51z = 57 \\ \hline & \qquad\qquad\qquad\qquad -49z = 49 \\ & \qquad\qquad\qquad\qquad\quad z = -1 \end{array}$$

From equation $\boxed{B}$ we have $3x - (-1) = 4$

$$x = 1$$

From equation $\boxed{C}$ we have $y + 5(-1) = -3$

$$y = 2$$

The ordered triple $(1, 2, -1)$ checks in all three original equations.

The solution set is $\{(1, 2, -1)\}$.

Example 2:

$$\begin{array}{ll} \boxed{A} & 3x + y = 6 \\ \boxed{B} & 8x + 3y - z = 2 \qquad 8x + 3y - z = 2 \\ \boxed{C} & -5x - 2y + z = 4 \qquad -5x - 2y + z = 4 \\ & \qquad\qquad\qquad\qquad\quad 3x + y = 6 \quad \boxed{D} \end{array}$$

$$\begin{array}{rll} & \boxed{A} & 3x + y = 6 \\ -1 \cdot & \boxed{D} & -3x - y = -6 \\ \hline & & 0 = 0 \quad \text{(Identity)} \end{array}$$

The equations are dependent. To find the general solution, express the dependency among the variables as an ordered triple. From equation $\boxed{A}$, we can solve for y in terms of x.

$$\boxed{A} \quad y = 6 - 3x$$

From equation $\boxed{B}$ or $\boxed{C}$ we can substitute $y = 6 - 3x$ and then solve for z in terms of x.

$$\begin{array}{ll} \boxed{C} & -5x - 2(6 - 3x) + z = 4 \\ & \quad x - 12 + z = 4 \\ & \qquad z = 16 - x \end{array}$$

The solution set can be written as

$\{(x, 6 - 3x, 16 - x) \mid x \text{ is any real number}\}$.

Alternatively, the solution set can be written as

$\left\{\left(\frac{6 - y}{3}, y, \frac{y + 42}{3}\right) \middle| \, y \text{ is any real number}\right\}$ or

$\{(16 - z, 3z - 42, z) \mid z \text{ is any real number}\}$.

ISTUDY

SECTION 9.3 Partial Fraction Decomposition

KEY CONCEPTS

Partial fraction decomposition is used to write a rational expression as a sum of simpler fractions.

There are two basic parts to find the partial fraction decomposition of a rational expression.

I. Factor the denominator of the expression into linear factors and quadratic factors that are not further factorable over the integers. Then set up the "form" or "structure" for the partial fraction decomposition into simpler fractions.

II. Next, multiply both sides of the equation by the LCD. Then set up a system of linear equations to find the coefficients of the terms in the numerator of each fraction.

Note: The numerator of the original rational expression must be of lesser degree than the denominator. If this is not the case, first use long division.

EXAMPLES

Example 1:

$$\frac{4x^3+4x^2+8x+12}{x^4+4x^2}=\frac{4x^3+4x^2+8x+12}{x^2(x^2+4)}$$

Set up the format for the decomposition.

$$\frac{4x^3+4x^2+8x+12}{x^2(x^2+4)}=\frac{A}{x}+\frac{B}{x^2}+\frac{Cx+D}{x^2+4}$$

Multiply by the LCD to clear fractions.

$$x^2(x^2+4)\left[\frac{4x^3+4x^2+8x+12}{x^2(x^2+4)}\right]=$$
$$x^2(x^2+4)\left[\frac{A}{x}+\frac{B}{x^2}+\frac{Cx+D}{x^2+4}\right]$$

Apply the distributive property and combine like terms.

$$\begin{aligned}&4x^3+4x^2+8x+12\\&\quad=Ax(x^2+4)+B(x^2+4)+(Cx+D)x^2\\&\quad=Ax^3+4Ax+Bx^2+4B+Cx^3+Dx^2\end{aligned}$$

Therefore,

$$\begin{aligned}&4x^3+4x^2+8x+12\\&\quad=(A+C)x^3+(B+D)x^2+4Ax+4B\end{aligned}$$

Equate the coefficients on like terms and solve the resulting system for A, B, C, and D.

$$\left.\begin{aligned}4&=A+C\\4&=B+D\\8&=4A\\12&=4B\end{aligned}\right\}\ A=2,\ B=3,\ C=2,\ D=1$$

The partial fraction decomposition is:

$$\frac{4x^3+4x^2+8x+12}{x^4+4x^2}=\frac{2}{x}+\frac{3}{x^2}+\frac{2x+1}{x^2+4}$$

SECTION 9.4 Systems of Nonlinear Equations in Two Variables

KEY CONCEPTS

A **nonlinear system of equations** is a system in which one or more equations is nonlinear.

The substitution method is often used to solve a nonlinear system of equations.

In some cases, the addition method can be used provided that the terms containing the corresponding variables are like terms.

Example 2:

Use the addition method to solve the system.

$$\begin{array}{ll} \boxed{A} & x^2 + 2y^2 = 11 \xrightarrow{\text{Multiply by } -1.} -x^2 - 2y^2 = -11 \\ \boxed{B} & x^2 + 3y^2 = 12 \longrightarrow \quad x^2 + 3y^2 = 12 \end{array}$$

$$y^2 = 1$$

$$y = \pm 1$$

From equation A, we have

If $y = 1$, $x^2 + 2(1)^2 = 11$ $\quad x^2 = 9$, $x = \pm 3$

If $y = -1$, $x^2 + 2(-1)^2 = 11$ $\quad x^2 = 9$, $x = \pm 3$

The solution set is

$\{(3, 1), (3, -1), (-3, 1), (-3, -1)\}$.

EXAMPLES

Example 1:

Use the substitution method to solve the system.

$$\begin{array}{ll} \boxed{A} & y = -x - 1 \\ \boxed{B} & y = x^2 + 6x + 9 \end{array} \qquad \begin{array}{ll} \boxed{A} & y = -x - 1 \\ \boxed{B} & y = x^2 + 6x + 9 \end{array}$$

$$\begin{aligned} \boxed{B} \quad -x - 1 &= x^2 + 6x + 9 \\ 0 &= x^2 + 7x + 10 \\ 0 &= (x + 5)(x + 2) \\ x &= -5 \quad \text{or} \quad x = -2 \end{aligned}$$

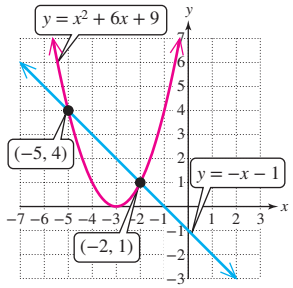
From equation A, we have

If $x = -5$, $y = -(-5) - 1$ $\quad y = 4$ $\quad (-5, 4)$

If $x = -2$, $y = -(-2) - 1$ $\quad y = 1$ $\quad (-2, 1)$

The solution set is $\{(-5, 4), (-2, 1)\}$.

The solutions are the points of intersection of the graphs of the two equations.



SECTION 9.5 Inequalities and Systems of Inequalities in Two Variables

KEY CONCEPTS

Linear inequalities in two variables:

An inequality of the form $Ax + By < C$, where A and B are not both zero, is called a **linear inequality in two variables.** (The symbols $>$, $\leq$, and $\geq$ can be used in place of $<$ in the definition.)

Solving a linear inequality in two variables:

The basic steps to solve a linear inequality in two variables are as follows.

1. Graph the related equation. The resulting line is drawn as a dashed line if the inequality is strict, and is otherwise drawn as a solid line.
2. Select a test point from either side of the line. If the ordered pair makes the original inequality true, then shade the half-plane from which the point was taken. Otherwise, shade the other half-plane.

A nonlinear inequality in two variables is solved using the same basic procedure.

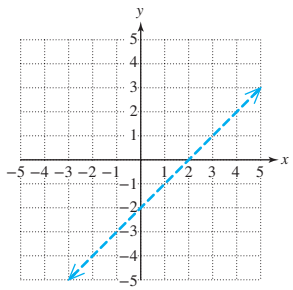
Two or more inequalities in two variables make up a system of inequalities in two variables. The solution set to the system is the region of overlap (intersection) of the solution sets of the individual inequalities.

EXAMPLES

Example 1:

$x - y > 2$

Graph $x - y = 2$.



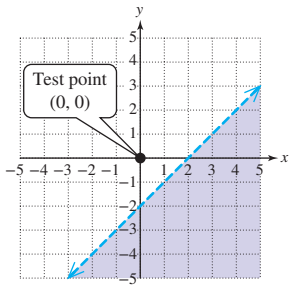
Test a point above or below the line.

Test (0, 0)

$x - y > 2$

$(0) - (0) \overset{?}{>} 2$ false

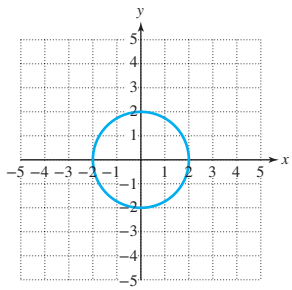
Shade below the line.



Example 2:

$x^2 + y^2 \leq 4$

Graph $x^2 + y^2 = 4$.



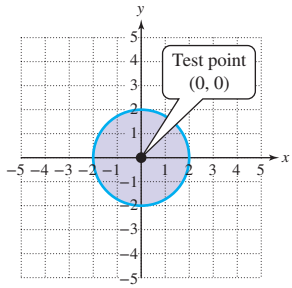
Test a point inside or outside the circle.

Test (0, 0)

$x^2 + y^2 \leq 4$

$(0)^2 + (0)^2 \overset{?}{\leq} 4$ true

Shade inside the circle.



Example 3:

$3x + 2y < 6$

$y \geq 2x + 3$

Graph the related equations and test an ordered pair from a point above or below each line.

$3x + 2y = 6$

Test (−2, 1)

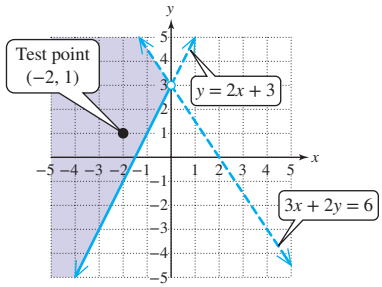
$3(-2) + 2(1) \overset{?}{<} 6$ Yes

$y = 2x + 3$

Test (−2, 1)

$1 \overset{?}{\geq} 2(-2) + 3$ Yes

Shade below the line $3x + 2y = 6$ and above the line $y = 2x + 3$.



SECTION 9.6 Linear Programming

KEY CONCEPTS

A process called **linear programming** enables us to maximize or minimize a function under specified constraints. The function to be maximized or minimized is called the **objective function.**

The steps to solve a linear programming application are outlined here.

Step 1 Write an objective function, $z = f(x, y)$.

Step 2 Write a system of inequalities defining the constraints on x and y.

Step 3 Graph the feasible region and identify the vertices.

Step 4 Evaluate the objective function at each vertex of the feasible region. Use the results to identify the values of x and y that optimize the objective function, and identify the optimal value of z.

EXAMPLES

Example 1:

An artist makes necklaces and earrings. The cost of materials for a necklace is \$12 and the cost for a pair of earrings is \$6. The artist has time to create at most 40 necklaces per week and at most 60 pairs of earrings per week. Furthermore, the artist does not want to exceed \$540 per week in cost of materials. If the profit on a necklace is \$20 and the profit on a pair of earrings is \$15, how many of each item should the artist make to maximize weekly profit? Assume that all necklaces and earrings made also sell.

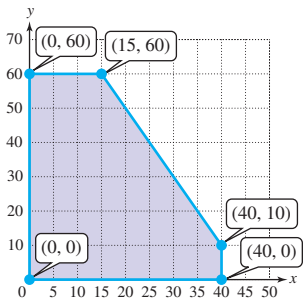
Let x represent the number of necklaces.
Let y represent the number of pairs of earrings.

Step 1 Maximize profit: $z = 20x + 15y$

Step 2 $x \geq 0$, $y \geq 0$, $x \leq 40$, $y \leq 60$

$12x + 6y \leq 540$

Step 3



Step 4 Test $z = 20x + 15y$ at each vertex:

at (0, 0): $z = 20(0) + 15(0) = \$0$
at (0, 60): $z = 20(0) + 15(60) = \$900$
at (15, 60): $z = 20(15) + 15(60) = \boxed{\$1200}$
at (40, 10): $z = 20(40) + 15(10) = \$950$
at (40, 0): $z = 20(40) + 15(0) = \$800$

The maximum weekly profit of \$1200 will be obtained if the artist makes 15 necklaces and 60 pairs of earrings.

CHAPTER 10 DETAILED SUMMARY

SECTION 10.1 Solving Systems of Linear Equations Using Matrices

KEY CONCEPTS

A system of linear equations can be represented by an **augmented matrix.**

Elementary row operations performed on an augmented matrix result in a **row-equivalent** matrix that represents an equivalent system of equations.

Elementary row operations:

1. Interchange two rows.
2. Multiply a row by a nonzero constant.
3. Add a nonzero multiple of one row to another row.

Elementary row operations can be used to write a matrix in row-echelon form or reduced row-echelon form.

To solve a system of linear equations:

- The method of Gaussian elimination (Example 2) uses elementary row operations to write an augmented matrix in row-echelon form so that the system can be solved by back substitution.

- With the method of Gauss-Jordan elimination (Example 3), the augmented matrix is written in *reduced* row-echelon form. Then the solution to the system can be found by inspection.

EXAMPLES

Example 1:

$$\begin{aligned} x - y + 5z &= 6 \\ y - 2z &= 10 \\ 2x - 5y + 18z &= -8 \end{aligned} \xrightarrow[\text{matrix}]{\text{augmented}} \left[\begin{array}{ccc|c} 1 & -1 & 5 & 6 \\ 0 & 1 & -2 & 10 \\ 2 & -5 & 18 & -8 \end{array}\right]$$

Example 2:

Solve the system from Example 1 by Gaussian elimination.

$$\left[\begin{array}{ccc|c} 1 & -1 & 5 & 6 \\ 0 & 1 & -2 & 10 \\ 2 & -5 & 18 & -8 \end{array}\right] \xrightarrow{-2R_1 + R_3 \to R_3} \left[\begin{array}{ccc|c} 1 & -1 & 5 & 6 \\ 0 & 1 & -2 & 10 \\ 0 & -3 & 8 & -20 \end{array}\right]$$

$$\xrightarrow{3R_2 + R_3 \to R_3} \left[\begin{array}{ccc|c} 1 & -1 & 5 & 6 \\ 0 & 1 & -2 & 10 \\ 0 & 0 & 2 & 10 \end{array}\right] \xrightarrow{\frac{1}{2}R_3 \to R_3} \left[\begin{array}{ccc|c} 1 & -1 & 5 & 6 \\ 0 & 1 & -2 & 10 \\ 0 & 0 & 1 & 5 \end{array}\right]$$

row-echelon form

$$\begin{aligned} x - y + 5z &= 6 \\ y - 2z &= 10 \\ z &= 5 \end{aligned}$$

Using back substitution, the solution set is $\{(1, 20, 5)\}$.

Example 3:

Use Gauss-Jordan elimination to solve the system from Examples 1 and 2.

$$\left[\begin{array}{ccc|c} 1 & -1 & 5 & 6 \\ 0 & 1 & -2 & 10 \\ 0 & 0 & 1 & 5 \end{array}\right] \xrightarrow{R_2 + R_1 \to R_1} \left[\begin{array}{ccc|c} 1 & 0 & 3 & 16 \\ 0 & 1 & -2 & 10 \\ 0 & 0 & 1 & 5 \end{array}\right]$$

$$\xrightarrow[2R_3 + R_2 \to R_2]{-3R_3 + R_1 \to R_1} \left[\begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 20 \\ 0 & 0 & 1 & 5 \end{array}\right] \begin{array}{l} x = 1 \\ y = 20 \\ z = 5 \end{array}$$

reduced row-echelon form

The solution set is $\{(1, 20, 5)\}$.

ISTUDY

SECTION 10.2 Inconsistent Systems and Dependent Equations

KEY CONCEPTS

A system of equations that has no solution is called an **inconsistent system.** An inconsistent system is detected algebraically if a contradiction is reached when solving the system.

A system of linear equations may have infinitely many solutions. In such a case, the equations are said to be **dependent.** Dependent equations are detected algebraically if an identity is reached when solving the system.

EXAMPLES

Example 1:

$$\begin{aligned} 2x + y &= 4 \\ -6x - 3y &= 6 \end{aligned} \longrightarrow \left[\begin{array}{cc|c} 2 & 1 & 4 \\ -6 & -3 & 6 \end{array}\right]$$

$\frac{1}{2}R_1 \to R_1$ $\qquad$ $6R_1 + R_2 \to R_2$

$$\longrightarrow \left[\begin{array}{cc|c} 1 & \frac{1}{2} & 2 \\ -6 & -3 & 6 \end{array}\right] \longrightarrow \left[\begin{array}{cc|c} 1 & \frac{1}{2} & 2 \\ 0 & 0 & 18 \end{array}\right]$$

The last row of the augmented matrix represents the contradiction $0 = 18$. The system is inconsistent, and the solution set is $\{\ \}$.

Example 2:

$$\begin{aligned} x + 3y + 3z &= 7 \\ -2x - 5y - 4z &= -13 \\ x + y - z &= 5 \end{aligned} \longrightarrow \left[\begin{array}{ccc|c} 1 & 3 & 3 & 7 \\ -2 & -5 & -4 & -13 \\ 1 & 1 & -1 & 5 \end{array}\right]$$

$2R_1 + R_2 \to R_2$ $\qquad$ $-3R_2 + R_1 \to R_1$

$-1R_1 + R_3 \to R_3$ $\qquad$ $2R_2 + R_3 \to R_3$

$$\longrightarrow \left[\begin{array}{ccc|c} 1 & 3 & 3 & 7 \\ 0 & 1 & 2 & 1 \\ 0 & -2 & -4 & -2 \end{array}\right] \longrightarrow \left[\begin{array}{ccc|c} 1 & 0 & -3 & 4 \\ 0 & 1 & 2 & 1 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

The corresponding system of equations is

$$\begin{aligned} x - 3z &= 4 \\ y + 2z &= 1 \\ 0 &= 0 \quad \text{(identity)} \end{aligned}$$

The first two equations can both be represented in terms of z. The solution set is

$\{(3z + 4, -2z + 1, z) \mid z \text{ is any real number}\}$.

SECTION 10.3 Operations on Matrices

KEY CONCEPTS

An $m \times n$ matrix has m rows and n columns.

The notation a_{ij} represents the element of a matrix in the ith row and jth column.

A matrix with only one row is called a **row matrix.** A matrix with only one column is called a **column matrix.** A matrix with the same number of rows and columns is called a **square matrix.**

Adding and subtracting matrices:

If A and B represent two matrices of the same order, then $A + B$ and $A - B$ are found by adding or subtracting the corresponding elements.

EXAMPLES

Example 1:

$A = \begin{bmatrix} -3 & 6.1 & \pi & 0 \\ \sqrt{3} & 4.1 & e & 7 \end{bmatrix}$ is a 2×4 matrix.

The notation a_{21} represents the element in the second row and first column. That is, $a_{21} = \sqrt{3}$.

Example 2:

$[3 \quad -5 \quad 1]$ is a row matrix.

$\begin{bmatrix} 4 \\ -5 \end{bmatrix}$ is a column matrix.

$\begin{bmatrix} 0.4 & 1.2 \\ 9.3 & 6.1 \end{bmatrix}$ is a square matrix.

Example 3:

$$\begin{bmatrix} 3 & 5 \\ -2 & 1.4 \\ \sqrt{5} & -4 \end{bmatrix} + \begin{bmatrix} -1 & 0 \\ 8 & 3.2 \\ 6\sqrt{5} & 3 \end{bmatrix} = \begin{bmatrix} 2 & 5 \\ 6 & 4.6 \\ 7\sqrt{5} & -1 \end{bmatrix}$$

ISTUDY

Scalar multiplication:
Let $A = [a_{ij}]$ be an $m \times n$ matrix and let k be a real number. Then, $kA = [ka_{ij}]$.

Example 4:

Given $A = \begin{bmatrix} 3 & 9 & -4 \\ 0 & -1 & 2 \end{bmatrix}$,

$$4A = 4\begin{bmatrix} 3 & 9 & -4 \\ 0 & -1 & 2 \end{bmatrix} = \begin{bmatrix} 12 & 36 & -16 \\ 0 & -4 & 8 \end{bmatrix}.$$

Solving a matrix equation:
The same principles apply to solve a matrix equation as with a linear equation.

Example 5:

Given $A = \begin{bmatrix} 9 & 1 \\ 5 & -2 \end{bmatrix}$ and $B = \begin{bmatrix} 6 & -5 \\ 2 & 1 \end{bmatrix}$, solve for X.

$$3X + A = B$$
$$3X = B - A$$
$$X = \frac{1}{3}(B - A)$$
$$X = \frac{1}{3}\left(\begin{bmatrix} 6 & -5 \\ 2 & 1 \end{bmatrix} - \begin{bmatrix} 9 & 1 \\ 5 & -2 \end{bmatrix}\right)$$
$$X = \frac{1}{3}\begin{bmatrix} -3 & -6 \\ -3 & 3 \end{bmatrix}$$
$$X = \begin{bmatrix} -1 & -2 \\ -1 & 1 \end{bmatrix}$$

Matrix multiplication:
Let A be an $m \times p$ matrix and let B be a $p \times n$ matrix; then the product AB is an $m \times n$ matrix. For the matrix AB, the element in the ith row and jth column is the sum of the products of the corresponding elements in the ith row of A and the jth column of B (the inner product of the ith row and jth column).

Note: If the number of columns in A does not equal the number of rows in B, then it is not possible to compute the product AB.

Example 6:

Let $A = \begin{bmatrix} 1 & 0 & -3 \\ 4 & -2 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} 6 & 8 \\ -3 & 1 \\ -1 & 4 \end{bmatrix}$

Then $AB = \begin{bmatrix} 1 & 0 & -3 \\ 4 & -2 & 4 \end{bmatrix} \cdot \begin{bmatrix} 6 & 8 \\ -3 & 1 \\ -1 & 4 \end{bmatrix}$

2×3 $\quad$ 3×2

equal

The product is a 2×2 matrix.

$$= \begin{bmatrix} (1)(6) + (0)(-3) + (-3)(-1) & (1)(8) + (0)(1) + (-3)(4) \\ (4)(6) + (-2)(-3) + (4)(-1) & (4)(8) + (-2)(1) + (4)(4) \end{bmatrix}$$
$$= \begin{bmatrix} 9 & -4 \\ 26 & 46 \end{bmatrix}$$

ISTUDY

SECTION 10.4 Inverse Matrices and Matrix Equations

KEY CONCEPTS

The **identity matrix** I_n for the multiplication of matrices is the $n \times n$ square matrix with 1's along the main diagonal and 0's for all other elements.

Inverse of a square matrix:

Let A be an $n \times n$ matrix. If there exists an $n \times n$ matrix A^{-1} such that

$$AA^{-1} = I_n \quad \text{and} \quad A^{-1}A = I_n$$

then A^{-1} is the **multiplicative inverse** of A.

A matrix that does not have an inverse is called a **singular matrix.** A matrix that does have an inverse is said to be **invertible** or **nonsingular.**

Finding the inverse of a nonsingular matrix:

Let A be an $n \times n$ matrix for which A^{-1} exists. To find A^{-1}:

Step 1 Write a matrix of the form $[A \mid I_n]$.

Step 2 Perform row operations to write the matrix in the form $[I_n \mid B]$.

Step 3 The matrix B is A^{-1}.

The inverse of a nonsingular 2×2 matrix A can also be found as follows.

If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then $A^{-1} = \dfrac{1}{ad - bc} \cdot \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$,

or equivalently $A^{-1} = \dfrac{1}{|A|}\begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$.

Solving a system using inverse matrices:

Suppose that $AX = B$ represents a system of n linear equations in n variables with a unique solution. Then,

$$X = A^{-1}B$$

where A is the coefficient matrix, B is the matrix of constants, and X is the matrix of variables.

EXAMPLES

Example 1:

$I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

Example 2:

$A = \begin{bmatrix} 5 & 3 \\ 3 & 2 \end{bmatrix}$ and $B = \begin{bmatrix} 2 & -3 \\ -3 & 5 \end{bmatrix}$ are inverses because $AB = I_2$ and $BA = I_2$.

Example 3:

To find the inverse of $A = \begin{bmatrix} 4 & 8 \\ 2 & 5 \end{bmatrix}$, we have

$$\begin{bmatrix} 4 & 8 & 1 & 0 \\ 2 & 5 & 0 & 1 \end{bmatrix} \xrightarrow{\frac{1}{4}R_1 \to R_1} \begin{bmatrix} 1 & 2 & \frac{1}{4} & 0 \\ 2 & 5 & 0 & 1 \end{bmatrix}$$

$$\xrightarrow{-2R_1 + R_2 \to R_2} \begin{bmatrix} 1 & 2 & \frac{1}{4} & 0 \\ 0 & 1 & -\frac{1}{2} & 1 \end{bmatrix} \xrightarrow{-2R_2 + R_1 \to R_1} \begin{bmatrix} 1 & 0 & \frac{5}{4} & -2 \\ 0 & 1 & -\frac{1}{2} & 1 \end{bmatrix}$$

$$A^{-1} = \begin{bmatrix} \frac{5}{4} & -2 \\ -\frac{1}{2} & 1 \end{bmatrix}$$

Example 4:

$$A \cdot X = B$$

$$\begin{aligned} 4x + 8y &= 28 \\ 2x + 5y &= 16 \end{aligned} \qquad \begin{bmatrix} 4 & 8 \\ 2 & 5 \end{bmatrix}\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 28 \\ 16 \end{bmatrix}$$

$$X = A^{-1}B = \begin{bmatrix} \frac{5}{4} & -2 \\ -\frac{1}{2} & 1 \end{bmatrix}\begin{bmatrix} 28 \\ 16 \end{bmatrix}$$

$$X = \begin{bmatrix} (\frac{5}{4})(28) + (-2)(16) \\ (-\frac{1}{2})(28) + (1)(16) \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix}$$

The solution set is $\{(3, 2)\}$.

ISTUDY

SECTION 10.5 Determinants and Cramer's Rule

KEY CONCEPTS

Associated with every square matrix is a real number called the determinant of the matrix.

Determinant of a 2 × 2 matrix:

Given $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, the determinant of A is denoted by $|A|$ or $\begin{vmatrix} a & b \\ c & d \end{vmatrix}$ and the value is $ad - bc$.

The minor and cofactor of an element of a matrix:

Given an $n \times n$ matrix $A = [a_{ij}]$, the minor M_{ij} of an element a_{ij} is the determinant of the resulting matrix obtained by deleting the ith row and jth column.

The **cofactor** of a_{ij} is $(-1)^{i+j}M_{ij}$ where M_{ij} is the minor of a_{ij}.

Determinant of a 3 × 3 matrix:

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix}$$

Find the determinant of an $n \times n$ matrix:

Step 1 Choose any row or column.

Step 2 Multiply each element in the selected row or column by its cofactor.

Step 3 The value of the determinant is the sum of the products from step 2.

Using a determinant to determine if a matrix is invertible:

An $n \times n$ matrix A is invertible if and only if $|A| \neq 0$.

Cramer's rule is a method of solving a system of linear equations with a unique solution by finding ratios of determinants derived from the coefficients of the equations within the system.

Cramer's rule for a system of two equations and two variables:

Given $\begin{aligned} a_1x + b_1y &= c_1 \\ a_2x + b_2y &= c_2 \end{aligned}$

if $D \neq 0$, then $x = \dfrac{D_x}{D}$ and $y = \dfrac{D_y}{D}$, where

$$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix},\ D_x = \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix},\ \text{and } D_y = \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}.$$

The patterns associated with Cramer's rule can be generalized to solve a system of n linear equations in n variables.

When applying Cramer's rule, if $D = 0$, then the system has either no solution or infinitely many solutions.

EXAMPLES

Example 1:

The determinant of $A = \begin{bmatrix} 3 & -4 \\ 2 & 10 \end{bmatrix}$ is

$$|A| = \begin{vmatrix} 3 & -4 \\ 2 & 10 \end{vmatrix} = (3)(10) - (-4)(2) = 38$$

Example 2:

Given $A = \begin{bmatrix} 3 & 4 & -2 \\ 9 & -8 & 5 \\ -6 & 1 & 0 \end{bmatrix}$,

a. The minor of a_{21} is $\begin{vmatrix} 4 & -2 \\ 1 & 0 \end{vmatrix} = 2$.

b. The cofactor of a_{21} is $(-1)^{2+1}\begin{vmatrix} 4 & -2 \\ 1 & 0 \end{vmatrix} = -2$.

Example 3:

$$\begin{vmatrix} 3 & 1 & -4 \\ 6 & 0 & -1 \\ 0 & 5 & 8 \end{vmatrix} = 3\begin{vmatrix} 0 & -1 \\ 5 & 8 \end{vmatrix} - 6\begin{vmatrix} 1 & -4 \\ 5 & 8 \end{vmatrix} + 0\begin{vmatrix} 1 & -4 \\ 0 & -1 \end{vmatrix}$$
$$= 3(5) - 6(28) + 0(-1)$$
$$= -153$$

Example 4:

The matrix $A = \begin{bmatrix} 3 & 1 & -4 \\ 6 & 0 & -1 \\ 0 & 5 & 8 \end{bmatrix}$ is invertible because $|A| = -153 \neq 0$ (See Example 3).

Example 5:

Solve the system by using Cramer's rule.

$3x + 7y = 12$

$4x - 5y = -7$

$$D = \begin{vmatrix} 3 & 7 \\ 4 & -5 \end{vmatrix} = -43$$

$$D_x = \begin{vmatrix} 12 & 7 \\ -7 & -5 \end{vmatrix} = -11; \quad D_y = \begin{vmatrix} 3 & 12 \\ 4 & -7 \end{vmatrix} = -69$$

$$x = \frac{D_x}{D} = \frac{-11}{-43} \text{ and } y = \frac{D_y}{D} = \frac{-69}{-43}$$

$$x = \frac{11}{43} \quad \text{and } y = \frac{69}{43}$$

The solution set is $\left\{\left(\frac{11}{43}, \frac{69}{43}\right)\right\}$.

ISTUDY

CHAPTER 11 DETAILED SUMMARY

SECTION 11.1 The Ellipse

KEY CONCEPTS

Standard form of an equation of a circle:
The standard form of an equation of a circle centered at (h, k) with radius r is $(x - h)^2 + (y - k)^2 = r^2$ for $r > 0$.

An **ellipse** is the set of all points (x, y) in a plane such that the sum of the distances between (x, y) and two fixed points is a constant. The fixed points are called the **foci** of the ellipse.

Standard forms of an equation of an ellipse:

- Major axis horizontal:

  Equation: $\dfrac{(x-h)^2}{a^2} + \dfrac{(y-k)^2}{b^2} = 1$

  $a > b > 0$; $c^2 = a^2 - b^2$ $(c > 0)$

  Center: (h, k)

  Vertices: $(h + a, k)$, $(h - a, k)$

  Foci: $(h + c, k)$, $(h - c, k)$

  Minor axis endpoints: $(h, k + b)$, $(h, k - b)$

- Major axis vertical:

  Equation: $\dfrac{(x-h)^2}{b^2} + \dfrac{(y-k)^2}{a^2} = 1$

  $a > b > 0$; $c^2 = a^2 - b^2$ $(c > 0)$

  Center: (h, k)

  Vertices: $(h, k + a)$, $(h, k - a)$

  Foci: $(h, k + c)$, $(h, k - c)$

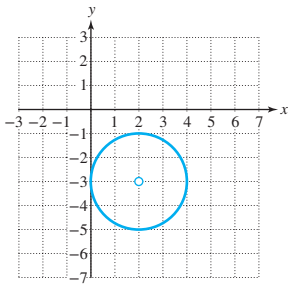
  Minor axis endpoints: $(h + b, k)$, $(h - b, k)$

$2a$ is the length of the major axis.
$2b$ is the length of the minor axis.
The **eccentricity** $e = \frac{c}{a}$ of an ellipse measures the degree of elongation. Note that for an ellipse, $0 < e < 1$.

EXAMPLES

Example 1:
$(x - 2)^2 + (y + 3)^2 = 4$
$(x - 2)^2 + [y - (-3)]^2 = 2^2$

Center: $(2, -3)$
Radius: 2



Example 2:

$$\frac{(x-2)^2}{25} + \frac{y^2}{16} = 1$$

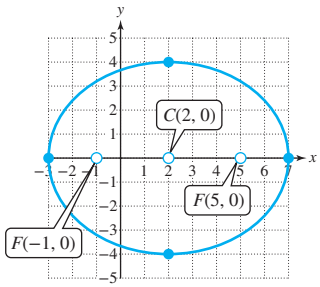
Based on the standard form, the major axis is horizontal:
$a^2 = 25$, and because $a > 0$, $a = 5$.
$b^2 = 16$, and because $b > 0$, $b = 4$.
$c^2 = a^2 - b^2 = (5)^2 - (4)^2 = 9$, and because $c > 0$, $c = 3$.

Center: $(2, 0)$

Vertices: $(2 + 5, 0), (2 - 5, 0) \rightarrow (7, 0), (-3, 0)$

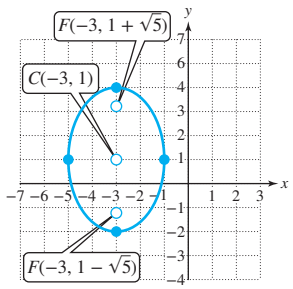
Foci: $(2 + 3, 0), (2 - 3, 0) \rightarrow (5, 0), (-1, 0)$

Minor axis endpoints: $(2, 0 + 4), (2, 0 - 4) \rightarrow (2, 4), (2, -4)$



Eccentricity: $e = \dfrac{c}{a} = \dfrac{3}{5}$

An equation of an ellipse written in expanded form can be written in standard form by completing the square.



Example 3:

$9x^2 + 4y^2 + 54x - 8y + 49 = 0$

$9x^2 + 54x + 4y^2 - 8y = -49$

$9(x^2 + 6x + 9) + 4(y^2 - 2y + 1) = -49 + 81 + 4$

$9(x + 3)^2 + 4(y - 1)^2 = 36$ Divide by 36.

$\frac{(x + 3)^2}{4} + \frac{(y - 1)^2}{9} = 1$ Standard form

$a^2 = 9$. Thus, $a = 3$.

$b^2 = 4$. Thus, $b = 2$.

$c^2 = a^2 - b^2 = 9 - 4 = 5$. Thus, $c = \sqrt{5}$.

Center: $(-3, 1)$

Vertices: $(-3, 4)$ and $(-3, -2)$

Foci: $(-3, 1 + \sqrt{5})$ and $(-3, 1 - \sqrt{5})$

Minor axis endpoints: $(-5, 1)$ and $(-1, 1)$

SECTION 11.2 The Hyperbola

KEY CONCEPTS

A **hyperbola** is the set of all points (x, y) in a plane such that the difference in distances between (x, y) and two fixed points (foci) is a positive constant.

Standard forms of an equation of a hyperbola:

- Transverse axis horizontal:

  Equation: $\frac{(x - h)^2}{a^2} - \frac{(y - k)^2}{b^2} = 1$

  $a > 0, b > 0; c^2 = a^2 + b^2 \ (c > 0)$

  Center: (h, k)

  Vertices: $(h + a, k), (h - a, k)$

  Foci: $(h + c, k), (h - c, k)$

  Asymptotes: $y - k = \pm\frac{b}{a}(x - h)$

- Transverse axis vertical:

  Equation: $\frac{(y - k)^2}{a^2} - \frac{(x - h)^2}{b^2} = 1$

  $a > 0, b > 0; c^2 = a^2 + b^2 \ (c > 0)$

  Center: (h, k)

  Vertices: $(h, k + a), (h, k - a)$

  Foci: $(h, k + c), (h, k - c)$

  Asymptotes: $y - k = \pm\frac{a}{b}(x - h)$

$2a$ is the length of the transverse axis.

$2b$ is the length of the conjugate axis.

The **eccentricity** of a hyperbola is given by $e = \frac{c}{a}$. Note that for a hyperbola, $e > 1$.

EXAMPLES

Example 1:

$\frac{(y + 1)^2}{9} - \frac{(x - 3)^2}{16} = 1$

Based on the standard form, the transverse axis is vertical:

$a^2 = 9$, and because $a > 0$, $a = 3$.

$b^2 = 16$, and because $b > 0$, $b = 4$.

$c^2 = a^2 + b^2 = (3)^2 + (4)^2 = 25$, and because $c > 0$, $c = 5$.

Center: $(3, -1)$

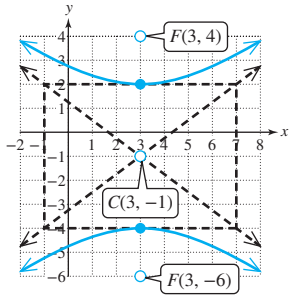
Vertices: $(3, -1 + 3), (3, -1 - 3) \rightarrow (3, 2), (3, -4)$

Foci: $(3, -1 + 5), (3, -1 - 5) \rightarrow (3, 4), (3, -6)$

Asymptotes: $y - (-1) = \pm\frac{3}{4}(x - 3)$

$\rightarrow y = \frac{3}{4}x - \frac{13}{4}$ and $y = -\frac{3}{4}x + \frac{5}{4}$

Eccentricity: $e = \frac{c}{a} = \frac{5}{3}$



SECTION 11.3 The Parabola

KEY CONCEPTS

A **parabola** is the set of all points in a plane that are equidistant from a fixed line (called the **directrix**) and a fixed point (called the **focus**).

Standard forms of an equation of a parabola:

- Vertical axis of symmetry:
  Equation: $(x - h)^2 = 4p(y - k)$
  If $p > 0$, the parabola opens upward.
  If $p < 0$, the parabola opens downward.
  Vertex: (h, k)
  Focus: $(h, k + p)$
  Directrix: $y = k - p$
  Axis of symmetry: $x = h$
- Horizontal axis of symmetry:
  Equation: $(y - k)^2 = 4p(x - h)$
  If $p > 0$, the parabola opens to the right.
  If $p < 0$, the parabola opens to the left.
  Vertex: (h, k)
  Focus: $(h + p, k)$
  Directrix: $x = h - p$
  Axis of symmetry: $y = k$

The value of $|p|$ is the focal length (distance between the vertex and focus).

The **latus rectum** is the line segment perpendicular to the axis of symmetry, through the focus, with endpoints on the parabola.

The value $4|p|$ is the focal diameter (length of the latus rectum).

EXAMPLES

Example 1:
$(y - 4)^2 = -8(x + 3)$

Based on the standard form, the axis of symmetry is horizontal:

$4p = -8$, which implies that $p = -2$.
The parabola will open to the left.

Vertex: $(-3, 4)$

Focus: $[-3 + (-2), 4)]$ S $(-5, 4)$

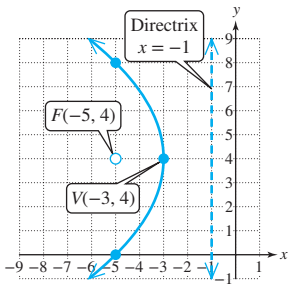
Directrix: $x = -3 - (-2) \rightarrow x = -1$

Axis of symmetry: $y = 4$

Focal length: $|-2| = 2$

Focal diameter: $4|(-2)| = 8$

Endpoints of latus rectum: $(-5, 8), (-5, 0)$



SECTION 11.4 Rotation of Axes

KEY CONCEPTS

If A and C are not both zero, then the graph of a nondegenerate conic given by the equation

$Ax^2 + Cy^2 + Dx + Ey + F = 0$

1. Is a circle if $A = C$.
2. Is an ellipse if $AC > 0$ (A and C have the same sign).
3. Is a hyperbola if $AC < 0$ (A and C have opposite signs).
4. Is a parabola if $AC = 0$ (A or C equals zero).

EXAMPLES

Example 1:
Given $3x^2 + 6y^2 - 4x + 5y - 40 = 0$, we have $A = 3$, $C = 6$. The graph is an ellipse because $AC = 18 > 0$.

Given $2x^2 - 5y^2 + 9x - 3y - 10 = 0$ we have $A = 2$, $C = -5$. The graph is a hyperbola because $AC = -10 < 0$.

Given $-4y^2 + 6x - 7y - 8 = 0$ we have $A = 0$, $C = -4$. The graph is a parabola because $AC = 0$.

ISTUDY

Rotation of axes:
Suppose that the x- and y-axes in a rectangular coordinate system are rotated about the origin through an angle θ to form the x'- and y'-axes.

- x' and y' in terms of x and y
  $x' = x\cos\theta + y\sin\theta$
  $y' = -x\sin\theta + y\cos\theta$
- x and y in terms of x' and y'
  $x = x'\cos\theta - y'\sin\theta$
  $y = x'\sin\theta + y'\cos\theta$

Determine the angle of rotation:
To write the general second-degree polynomial equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

with no xy term, rotate the axes through an acute angle θ given by

$$\cot 2\theta = \frac{A - C}{B}.$$

Graphing a rotated conic:
1. Determine the angle of rotation.
2. Substitute $x = x'\cos\theta - y'\sin\theta$ and $y = x'\sin\theta + y'\cos\theta$ into the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$. The resulting equation will have no xy term.
3. Write the equation from Step 2 in standard form and graph the conic relative to the x'- and y'-axes.

Identify conics by the discriminant of the equation $B^2 - 4AC$:
Excluding degenerate cases, the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ represents

- An ellipse (or a circle) if $B^2 - 4AC < 0$.
- A hyperbola if $B^2 - 4AC > 0$.
- A parabola if $B^2 - 4AC = 0$.

Example 2:
Suppose that the x'- and y'-axes are formed by rotating the x- and y-axes through an angle of 45°. Given a point $P(-1, 6)$ in the xy-plane, find the coordinates of P in the $x'y'$-plane.

$$x' = x\cos\theta + y\sin\theta$$
$$= -1\cos 45° + 6\sin 45°$$
$$= -1 \cdot \frac{\sqrt{2}}{2} + 6 \cdot \frac{\sqrt{2}}{2} = \frac{5\sqrt{2}}{2}$$

$$y' = -x\sin\theta + y\cos\theta$$
$$= -(-1)\sin 45° + 6\cos 45°$$
$$= 1 \cdot \frac{\sqrt{2}}{2} + 6 \cdot \frac{\sqrt{2}}{2} = \frac{7\sqrt{2}}{2}$$

Example 3:
Determine an acute angle of rotation to eliminate the xy-term.

$3x^2 - 2xy + 3y^2 - 16 = 0$
$A = 3, B = -2, C = 3$

$$\cot 2\theta = \frac{A - C}{B} = \frac{3 - 3}{-2} = 0$$

$2\theta = 90° \Rightarrow \theta = 45°$

Sketch the graph of $3x^2 - 2xy + 3y^2 - 16 = 0$.

We will eliminate the xy term by rotating the x- and y-axes 45° to form the x'- and y'-axes. The new equation in the variables x' and y' will have no rotation term.

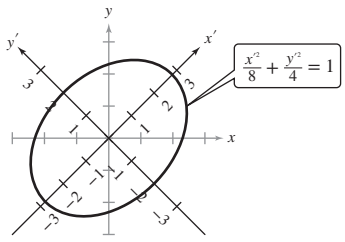
Make the following substitutions for x and y in the original equation with $\theta = 45°$.

$x = x'\cos\theta - y'\sin\theta$
$y = x'\sin\theta + y'\cos\theta$

This produces the new equation $2x'^2 + 4y'^2 - 16 = 0$, or equivalently,

$$\frac{x'^2}{8} + \frac{y'^2}{4} = 1.$$

This is an equation of an ellipse in the $x'y'$-plane.



Example 4:
Given $3x^2 - 12xy + 6y^2 - 4x + 5y - 40 = 0$, we have $A = 3$, $B = -12$, and $C = 6$. The discriminant is

$$B^2 - 4AC = (-12)^2 - 4(3)(6) = 72.$$

Since $B^2 - 4AC > 0$, the graph of the equation is a hyperbola.

ISTUDY

SECTION 11.5 Polar Equations of Conics

KEY CONCEPTS

Alternative definition of conics:

Let l be a fixed line (**directrix**) in a plane and let F be a fixed point (**focus**) in the plane, not on the line. A **conic** is the set of points P in the plane such that the ratio of the distance between P and F to the distance from P to l is a constant positive real number e (the **eccentricity**). That is, $\dfrac{d(P, F)}{d(P, l)} = e$.

Furthermore,

1. If $e = 1$, the conic is a parabola.
2. If $e < 1$, the conic is an ellipse.
3. If $e > 1$, the conic is a hyperbola.

Polar equations of conics:

A polar equation of the form $r = \dfrac{ed}{1 \pm e\cos\theta}$ or $r = \dfrac{ed}{1 \pm e\sin\theta}$ is a conic with focus at the pole and eccentricity $e > 0$. The value $|d|$ is the distance between the focus at the pole and the directrix. The conic is

1. A parabola if $e = 1$ (axis of symmetry perpendicular to the directrix).
2. An ellipse if $0 < e < 1$ (major axis perpendicular to the directrix).
3. A hyperbola if $e > 1$ (transverse axis perpendicular to the directrix).

Guidelines to graph a conic in polar form:

1. Write the polar equation in the form $r = \dfrac{ed}{1 \pm e\cos\theta}$ or $r = \dfrac{ed}{1 \pm e\sin\theta}$.
2. Determine the value of the eccentricity e and identify the type of conic.
3. Determine the orientation of the conic.
4. Plot points at $\theta = 0, \dfrac{\pi}{2}, \pi$, and $\dfrac{3\pi}{2}$.
5. Identify key characteristics of the conic as desired (center, vertices, length of major/minor/transverse/conjugate axes, directrix).

EXAMPLES

Example 1:

a. $r = \dfrac{7}{2 - 5\cos\theta} = \dfrac{\frac{1}{2} \cdot (7)}{\frac{1}{2} \cdot (2 - 5\cos\theta)}$

$= \dfrac{\frac{7}{2}}{1 - \frac{5}{2}\cos\theta}$

Therefore, $e = \frac{5}{2}$ and the equation represents a hyperbola.

b. $r = \dfrac{8}{3 + 2\sin\theta} = \dfrac{\frac{8}{3}}{1 + \frac{2}{3}\sin\theta}$

Therefore, $e = \frac{2}{3}$ and the equation represents an ellipse.

c. $r = \dfrac{10}{5 + 5\cos\theta} = \dfrac{2}{1 + \cos\theta}$

Therefore, $e = 1$ and the equation represents a parabola.

Example 2:

Graph the equation $r = \dfrac{10}{4 - 2\cos\theta}$.

$r = \dfrac{10}{4 - 2\cos\theta} = \dfrac{\frac{5}{2}}{1 - \frac{1}{2}\cos\theta}$

- Since $e = \frac{1}{2}$, the equation represents an ellipse.
- In the numerator, $\frac{5}{2} = ed \Rightarrow \frac{5}{2} = \frac{1}{2} \cdot d \Rightarrow d = 5$.
- The cosine term in the denominator tells us that the directrix is vertical.
- The subtraction sign between the terms tells us that the directrix is to the left of the pole.

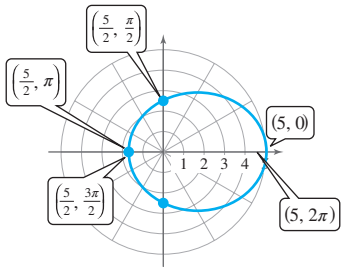
Thus, in rectangular coordinates, the directrix is $x = -5$.

ISTUDY

Plot points corresponding to $\theta = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}$, and 2π.

The ordered pairs in polar coordinates are

$(5, 0), \left(\frac{5}{2}, \frac{\pi}{2}\right), \left(\frac{5}{3}, \pi\right), \left(\frac{5}{2}, \frac{3\pi}{2}\right)$, and $(5, 2\pi)$.



Rotation of conics in polar form:

The rotation of a conic about the origin is much more convenient when the conic is expressed in polar versus rectangular form. Consider the graph of $r = f(\theta)$. Replacing θ by $(\theta - \alpha)$ results in

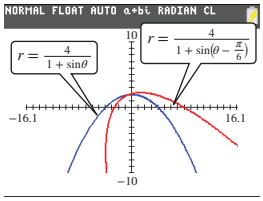
- A counterclockwise rotation (rotation through a positive angle) if $\alpha > 0$.
- A clockwise rotation (rotation through a negative angle) if $\alpha < 0$.

Example 3:

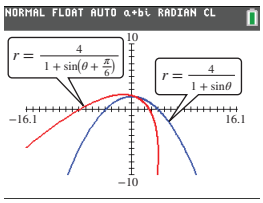
Consider the graph of the parabola defined by

$$r = \frac{4}{1 + \sin\theta}.$$

The graph can be rotated 30° counterclockwise by replacing θ by $\left(\theta - \frac{\pi}{6}\right)$.



The graph can be rotated 30° clockwise by replacing θ by $\left(\theta - \left(-\frac{\pi}{6}\right)\right)$ or equivalently $\left(\theta + \frac{\pi}{6}\right)$.



ISTUDY

SECTION 11.6 Plane Curves and Parametric Equations

KEY CONCEPTS

Plane curves:

Let f and g be functions of t over an interval I. Then the set of points defined by $(x, y) = (f(t), g(t))$ is called a **plane curve.** The equations $x = f(t)$ and $y = g(t)$ are called **parametric equations** of the curve, and t is called the **parameter.**

Graphing a plane curve:

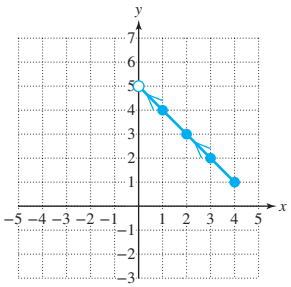
- One method to graph a plane curve defined by parametric equations is to create a table of points.
- Another method to graph a plane curve is to eliminate the parameter t by solving for t or an expression involving t in one equation. Then substitute the result in the other equation. Note any restrictions on the domain of the rectangular equation so that the resulting graph is consistent with the restrictions on x and y in the parametric equations.
- The orientation of a curve defined by parametric equations is taken in the direction of increasing values of the parameter.

EXAMPLES

Example 1:

Graph the curve defined by $x = -t + 3$ and $y = t + 2$ for $-1 \le t < 3$.

t	-1	0	1	2	3
x	4	3	2	1	0
y	1	2	3	4	5

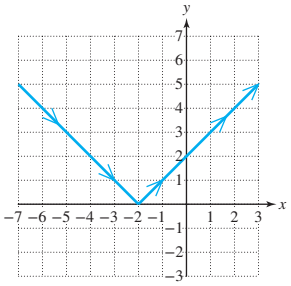


Example 2:

For the given parametric equations, eliminate the parameter and sketch the resulting equation in rectangular coordinates.

$x = t - 2$ and $y = |t|$

$t = x + 2 \Rightarrow y = |x + 2|$



Parametric equations are particularly well-suited for describing objects in motion. Let $t \geq 0$ represent the time under which an object is in motion along a plane curve, and let (x_0, y_0) represent the initial position of the object at $t = 0$.

Uniform linear motion:

$x = x_0 + at$

$y = y_0 + bt$

The values of a and b are the horizontal and vertical components of velocity, respectively.

Projectile motion:*

$x = (v_0 \cos\theta)t + x_0$

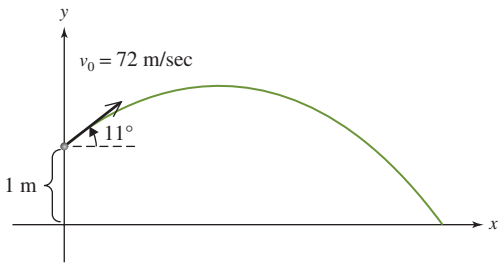
$y = -\frac{1}{2}gt^2 + (v_0 \sin\theta)t + y_0$

θ is the angle of launch relative to the horizontal, and v_0 is the initial speed (magnitude of the initial velocity). The value of g is the acceleration due to gravity, where $g = 32$ ft/sec^2 or $g = 9.8$ m/sec^2 on the surface of the Earth.

*Assuming negligible air resistance.

Example 3:

A mortar shell is launched at an angle of elevation of 11° at a speed of 72 m/sec from a point 1 m above ground level.



a. Write parametric equations to model the path of the shell. Use a coordinate system with origin at ground level directly below the launch position.

$x = (72\cos 11°)t$

$y = -\frac{1}{2}(9.8)t^2 + (72\sin 11°)t + 1$

Simplifying we have

$x = (72\cos 11°)t$

$y = -4.9t^2 + (72\sin 11°)t + 1$

b. Find the position of the shell after 2 sec.

$x = (72\cos 11°)(2) \approx 141.4$

$y = -4.9(2)^2 + (72\sin 11°)(2) + 1 \approx 8.8$

c. Find the range of the shell.

The range of the shell is the horizontal distance from the launch position to the point where the shell hits the ground. First set $y = 0$ to solve for the positive value of t at which the shell hits the ground.

$0 = -4.9t^2 + (72\sin 11°)t + 1$

$$t = \frac{-72\sin 11° \pm \sqrt{(72\sin 11°)^2 - 4(-4.9)(1)}}{2(-4.9)}$$

$t \approx 2.87$

$x = (72\cos 11°)(2.87) \approx 203$

The range is approximately 203 m.

d. Find the point where the shell is at its maximum height.

Use the vertex formula and the equation for y to solve for the time at which the shell reaches its maximum height.

$y = -4.9t^2 + (72\sin 11°)t + 1$

$$t = -\frac{b}{2a} = -\frac{72\sin 11°}{2(-4.9)} \approx 1.4 \text{ sec}$$

Evaluate x and y for $t = 1.4$.

$x = (72\cos 11°)(1.4) \approx 98.9$

$y = -4.9(1.4)^2 + (72\sin 11°)(1.4) + 1$

$= 10.6$

The shell is at its maximum height approximately 1.4 sec after launch at a position of (98.9, 10.6).

ISTUDY

CHAPTER 12 DETAILED SUMMARY

SECTION 12.1 Sequences and Series

KEY CONCEPTS

An **infinite sequence** is a function whose domain is the set of positive integers. A **finite sequence** is a function whose domain is the set of the first n positive integers.

A sequence in which consecutive terms alternate in sign is an **alternating sequence.**

A **recursive formula** defines the nth term of a sequence as a function of one or more terms preceding it.

For a positive integer n, the quantity $\boldsymbol{n!}$ ("n factorial") is defined as

$n! = (n)(n-1)(n-2)\cdots(2)(1)$
By definition, $0! = 1$.

The ***n*th partial sum** of a sequence $\{a_n\}$ is a finite series and is given by

$$S_n = \sum_{i=1}^{n} a_i = a_1 + a_2 + a_3 + \cdots + a_n$$

The sum of *all* terms in an infinite sequence is an **infinite series:**

$$\sum_{i=1}^{\infty} a_i = a_1 + a_2 + a_3 + \cdots$$

Properties of summation:
If $\{a_n\}$ and $\{b_n\}$ are sequences, and c is a real number, then

1. $\sum_{i=1}^{n} c = cn$
2. $\sum_{i=1}^{n} ca_i = c\sum_{i=1}^{n} a_i$
3. $\sum_{i=1}^{n} (a_i \pm b_i) = \sum_{i=1}^{n} a_i \pm \sum_{i=1}^{n} b_i$

EXAMPLES

Example 1:
$\{a_n\} = 5, 8, 11, 14$ is a finite sequence.
$\{b_n\} = 5, 8, 11, 14, \ldots$ is an infinite sequence.

Example 2:
The sequence defined by

$c_n = (-1)^n(2n)$ is an alternating sequence.
$\{c_n\} = -2, 4, -6, 8, \ldots$

Example 3:
The following sequence is defined recursively.

$d_1 = 2$ and $d_n = 5d_{n-1} + 1$
$\{d_n\} = 2, 11, 56, 281, \ldots$

Example 4:
$6! = 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 720$

Example 5:

$$\sum_{i=1}^{4} 2i = 2(1) + 2(2) + 2(3) + 2(4)$$
$$= 2 + 4 + 6 + 8$$
$$= 20$$

Example 6:

$$\sum_{i=1}^{10} 6 = 6(10) = 60$$

ISTUDY

SECTION 12.2 Arithmetic Sequences and Series

KEY CONCEPTS

An **arithmetic sequence** $\{a_n\}$ is a sequence in which each term after the first results from adding a fixed constant to its predecessor.

$$a_1,\ a_1 + d,\ a_1 + 2d,\ a_1 + 3d,\ a_1 + 4d,\ \ldots$$

- The value a_1 is the first term, and d is called the **common difference** of the sequence.
- The value of d is the difference of any term after the first and its predecessor.

$$d = a_{n+1} - a_n$$

- The nth term of the sequence is given by $a_n = a_1 + (n - 1)d$.
- The sequence can be defined recursively as $a_1,\ a_n = a_{n-1} + d$ for $n \geq 2$.

Sum of the first n terms of an arithmetic sequence:

$$S_n = \frac{n}{2}(a_1 + a_n)$$

where a_1 is the first term of the sequence and a_n is the nth term of the sequence.

EXAMPLES

Example 1:
6, 8, 10, 12, … is an arithmetic sequence with common difference 2.

Example 2:
Write the nth term of an arithmetic sequence with $a_1 = 5$ and $a_8 = -23$.

$a_n = a_1 + (n - 1)d$ To find d, substitute $a_1 = 5$, $a_8 = -23$, and $n = 8$.

$-23 = 5 + (8 - 1)d$

$-23 = 5 + (7)d$

$-28 = 7d$

$d = -4$

$a_n = 5 + (n - 1)(-4)$, or equivalently,

$a_n = -4n + 9$

Example 3:

Find the sum. $\sum_{i=1}^{25}(2i + 4) = 6 + 8 + 10 + \cdots + 54$

The terms of the series are in an arithmetic progression with $a_1 = 6$ and $a_{25} = 54$.

The sum is: $S_{25} = \frac{25}{2}(6 + 54) = 750$

SECTION 12.3 Geometric Sequences and Series

KEY CONCEPTS

A **geometric sequence** $\{a_n\}$ is a sequence in which each term after the first results from multiplying its predecessor by a fixed constant, r.

$$a_1,\ a_1r,\ a_1r^2,\ a_1r^3,\ a_1r_4,\ \ldots$$

- The value a_1 is the first term, and r is called the **common ratio** of the sequence.
- The value of r is the quotient of any term after the first and its predecessor.

$$r = \frac{a_{n+1}}{a_n}$$

- The nth term of the sequence is given by $a_n = a_1r^{n-1}$.
- The sequence can be defined recursively as $a_1,\ a_n = a_{n-1}r$ for $n \geq 2$.

EXAMPLES

Example 1:
The sequence 7, 14, 28, 56, … is a geometric sequence with $a_1 = 7$ and $r = 2$.

The nth term can be represented by

$$a_n = 7(2)^{n-1}$$

Example 2:
Given a geometric sequence with $a_1 = 18$ and $a_4 = \frac{2}{3}$, find the nth term.

$a_n = a_1r^{n-1}$

$\frac{2}{3} = (18)r^{4-1}$ Substitute $a_4 = \frac{2}{3}$, $a_1 = 18$, and $n = 4$.

$\frac{2}{54} = r^3$

$\frac{1}{27} = r^3$

$r = \sqrt[3]{\frac{1}{27}} = \frac{1}{3}$

The nth term is $a_n = 18\left(\frac{1}{3}\right)^{n-1}$.

ISTUDY

nth partial sum of a geometric sequence:
The sum S_n of the first n terms of a geometric sequence is given by

$$S_n = \frac{a_1(1 - r^n)}{1 - r}$$

where a_1 is the first term of the sequence and r is the common ratio, $r \neq 1$.

Sum of an infinite geometric series:
Given an infinite geometric series $a_1 + a_1r + a_1r^2 + a_1r^3 + \cdots$ with $|r| < 1$, the sum S of all terms in the series is given by

$$S = \frac{a_1}{1 - r}$$

Note: If $|r| \geq 1$, then the sum does not exist.

Future value of an ordinary annuity:
Suppose that P dollars is invested at the end of each compounding period n times per year at interest rate r. Then the value A (in \$) of the annuity after t years is given by

$$A = \frac{P\left[\left(1 + \frac{r}{n}\right)^{nt} - 1\right]}{\frac{r}{n}}$$

Example 3:

Find the sum. $\sum_{n=1}^{6} 5\left(\frac{4}{3}\right)^{n-1}$

$a_1 = 5$ and $r = \frac{4}{3}$.

$$S_6 = \frac{5\left[1 - \left(\frac{4}{3}\right)^6\right]}{1 - \frac{4}{3}} = \frac{16{,}835}{243}$$

Example 4:

Find the sum, if possible. $\sum_{n=1}^{\infty} 4\left(-\frac{1}{2}\right)^n$

The series is an infinite geometric series with $a_1 = 4$ and $r = -\frac{1}{2}$. Since $|r| = \left|-\frac{1}{2}\right| = \frac{1}{2} < 1$, the sum is given by

$$S = \frac{4}{1 - \left(-\frac{1}{2}\right)} = \frac{8}{3}$$

Example 5:
At age 26, Preston begins putting aside \$250 at the end of each month in an annuity. The annuity pays 5.4% interest compounded monthly. What will the annuity be worth when Preston retires at age 65?

$P = \$250$, $r = 0.054$, $n = 12$, and $t = 39$ yr

$$A = \frac{250\left[\left(1 + \frac{0.054}{12}\right)^{(12)(39)} - 1\right]}{\frac{0.054}{12}} = 398{,}699.66$$

The annuity will be worth \$398,699.66.

SECTION 12.4 Mathematical Induction

KEY CONCEPTS

Mathematical induction is a technique of mathematical proof that is often used to prove that a statement is true for all positive integers.

The principle of mathematical induction:
Let P_n be a statement involving the positive integer n, and let k be an arbitrary positive integer. Then P_n is true for all positive integers n if

1. P_1 is true, and
2. The truth of P_k implies the truth of P_{k+1}.

Inductive hypothesis

From the inductive hypothesis, the sum of the first k terms can be replaced by $k(5k - 1)$.

Extended principle of induction:
Mathematical induction can be extended to prove statements that might hold true only for integers greater than or equal to some positive integer j. In such a case,

- First prove the statement for $n = j$.
- Then show that the truth of the statement for an integer greater than or equal to j implies the truth of the statement for the integer that follows.

EXAMPLES

Example 1:
For all positive integers n, prove that

$$4 + 14 + 24 + \cdots + (10n - 6) = n(5n - 1)$$

Proof:
Let P_n denote the statement
$4 + 14 + 24 + \cdots + (10n - 6) = n(5n - 1)$.

1. P_1 is true because for $n = 1$, the sum is 4, which equals $1[5(1) - 1]$.
2. Assume that $4 + 14 + \cdots + (10k - 6) = k(5k - 1)$.
   Show that
   $4 + 14 + \cdots + (10k - 6) + [10(k + 1) - 6]$
   $= (k + 1)[5(k + 1) - 1]$
   $= (k + 1)(5k + 4)$

   By the inductive hypothesis,
   $\underbrace{[4 + 14 + \cdots + (10k - 6)]}_{\text{sum of first } k \text{ terms}} + \underbrace{[10(k + 1) - 6]}_{(k+1)\text{th term}}$
   $= k(5k - 1) + 10k + 4$
   $= 5k^2 + 9k + 4 = (k + 1)(5k + 4)$ as desired.

We have shown that P_1 is true, and that if P_k is true, then P_{k+1} is true. By mathematical induction, we conclude that the statement is true for all positive integers.

ISTUDY

SECTION 12.5 The Binomial Theorem

KEY CONCEPTS

Binomial theorem:
Let n be a positive integer. The expansion of $(a + b)^n$ is given by

$$(a + b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \cdots + \binom{n}{n-1}ab^{n-1} + \binom{n}{n}b^n = \sum_{r=0}^{n}\binom{n}{r}a^{n-r}b^r$$

The values $\binom{n}{0}, \binom{n}{1}, \binom{n}{2}, \ldots, \binom{n}{n}$ are called the **binomial coefficients** of the expansion of $(a + b)^n$. The binomial coefficients can also be found by using **Pascal's triangle.**

$$\begin{array}{ccccccccc} & & & & 1 & & & & \\ & & & 1 & & 1 & & & \\ & & 1 & & 2 & & 1 & & \\ & 1 & & 3 & & 3 & & 1 & \\ 1 & & 4 & & 6 & & 4 & & 1 \\ 1 & \cdots & & & & & & & \end{array}$$

Finding the *k*th term of a binomial expansion:
Let n and k be positive integers with $k \le n + 1$. The kth term of $(a + b)^n$ is

$$\binom{n}{k-1}a^{n-(k-1)}b^{k-1}$$

EXAMPLES

Example 1:
Expand $(2y - 3z^2)^4$

$$(2y - 3z^2)^4 = [(2y) + (-3z^2)]^4$$

Apply the binomial theorem with $n = 4$, $a = 2y$, and $b = -3z^2$.

$$[(2y) + (-3z^2)]^4 =$$

$$\binom{4}{0}(2y)^4 + \binom{4}{1}(2y)^3(-3z^2) + \binom{4}{2}(2y)^2(-3z^2)^2 + \binom{4}{3}(2y)(-3z^2)^3 + \binom{4}{4}(-3z^2)^4$$

$$= (1)(16y^4) + (4)(8y^3)(-3z^2) + (6)(4y^2)(9z^4) + (4)(2y)(-27z^6) + (1)(81z^8)$$

$$= 16y^4 - 96y^3z^2 + 216y^2z^4 - 216yz^6 + 81z^8$$

Example 2:
Find the seventh term of $(5x + 2)^9$.

$n = 9$, $k = 7$, $a = 5x$, and $b = 2$

$$\text{seventh term: } \binom{9}{7-1}(5x)^{9-(7-1)}(2)^{(7-1)}$$

$$= \binom{9}{6}(5x)^3(2)^6$$

$$= (84)(125x^3)(64)$$

$$= 672{,}000x^3$$

SECTION 12.6 Principles of Counting

KEY CONCEPTS

Fundamental principle of counting:
If one event can occur in m different ways and a second event can occur in n different ways, then the number of ways that the two events can occur in sequence is $m \cdot n$.

EXAMPLES

Example 1:
An early-bird special for dinner at a restaurant has 4 choices for soup or salad, 6 choices of entrée, and 3 choices of dessert. How many different dinners can be made if a customer selects one item from each category?

$4 \cdot 6 \cdot 3 = 72$ different dinners

ISTUDY

Permutation rules:

A **permutation** is an ordered arrangement of distinct items.

- The number of permutations of n distinct elements is $n!$.
- Consider a set of n elements with r_1 duplicates of one kind, r_2 duplicates of a second kind, … , r_k duplicates of a kth kind. Then the number of distinguishable permutations of the n elements of the set is:

$$\frac{n!}{r_1! \cdot r_2! \cdot \cdots \cdot r_k!}$$

- The number of permutations of n elements taken r at a time is given by

$${}_nP_r = \frac{n!}{(n-r)!} \quad \text{or equivalently,}$$

$${}_nP_r = n(n-1)(n-2) \cdots (n-r+1)$$

Combinations:

A **combination** is a collection of distinct items taken without regard to order.

The number of combinations of n elements taken r at a time is given by

$${}_nC_r = \frac{n!}{r! \cdot (n-r)!}$$

Example 2:

The number of ways that the letters in the word FORK can be arranged is $4! = 24$ because the four letters are all different.

Example 3:

The number of ways that the letters in the word MIRROR can be arranged is

$$\frac{6!}{3!} = \frac{6 \cdot 5 \cdot 4 \cdot \cancel{3!}}{\cancel{3!}} = 120$$

The denominator of 3! eliminates the repeated arrangements due to the 3 indistinguishable letters "R."

Example 4:

In how many ways can 3 people be selected from a group of 10 people to fill the offices of president, vice president, and secretary for a committee?

The order in which the people are selected is important because the three people will hold different offices. We have $n = 10$ and $r = 3$.

$${}_{10}P_3 = \frac{10!}{(10-3)!} = \frac{10!}{7!} = \frac{10 \cdot 9 \cdot 8 \cdot \cancel{7!}}{\cancel{7!}} = 720$$

Example 5:

In how many ways can 3 people be selected from a group of 10 people to serve on a committee?

The order in which the people are selected is *not* important because the people are serving indistinguishable roles on the committee. We have $n = 10$ and $r = 3$.

$${}_{10}C_3 = \frac{10!}{3! \cdot (10-3)!} = \frac{10!}{3! \cdot 7!} = \frac{10 \cdot 9 \cdot 8 \cdot \cancel{7!}}{3 \cdot 2 \cdot 1 \cdot \cancel{7!}} = 120$$

SECTION 12.7 Introduction to Probability

KEY CONCEPTS

Theoretical probability of an event:

Let S represent a sample space with equally likely outcomes, and let E be a subset of S. Then the probability of event E, denoted by $P(E)$, is given by

$$P(E) = \frac{n(E)}{n(S)}$$

Let E be an event relative to sample space S. The **complement of E,** denoted by $\overline{E}$, is the set of outcomes in the sample space but not in event E. It follows that

$$P(E) + P(\overline{E}) = 1$$

Empirical probability is computed based on observed outcomes of the relative frequency of an event compared to the number of times an experiment is performed.

EXAMPLES

Example 1:

A box contains five \$1 bills, three \$5 bills, two \$10 bills, and one \$20. If one bill is drawn at random, what is the probability that the bill is a \$10 bill?

Let E be the event that a \$10 bill is drawn.

$$P(E) = \frac{2}{11}$$

Example 2:

If one bill is drawn from the box in Example 1, find the probability that a \$10 bill is *not* drawn.

$\overline{E}$ is the complement of event E from Example 1.

$$P(\overline{E}) = 1 - P(E) = 1 - \frac{2}{11} = \frac{9}{11}$$

Example 3:

A basketball player makes 229 free throws out of 300 attempts. Therefore, the probability that the player will make a free throw on a given attempt is approximately

$$\frac{229}{300} \approx 0.763$$

ISTUDY

Two events are **mutually exclusive** if they share no common elements.

The probability of *A* or *B*:
Given events A and B in a same sample space, $P(A \text{ or } B)$ is given by

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

If A and B are mutually exclusive, then

$$P(A \cup B) = P(A) + P(B)$$

Probability of a sequence of independent events:
Two events are **independent** if the probability of one event does not affect the probability of the second event.

If events A and B are independent events, then the probability that both A and B will occur is

$$P(A \text{ and } B) = P(A) \cdot P(B)$$

Example 4:
A sample of students at a small college is taken, and the gender and political affiliation for each student is summarized in the table.

	Male (*M*)	Female (*F*)	Total
Democrat (*D*)	31	42	73
Republican (*R*)	39	28	67
Independent (*I*)	7	4	11
Total	77	74	151

a. Find the probability that an individual taken at random from the sample is a female or a Democrat.

$$\begin{aligned} P(F \cup D) &= P(F) + F(D) - P(F \cap D) \\ &= \frac{74}{151} + \frac{73}{151} - \frac{42}{151} \\ &= \frac{105}{151} \end{aligned}$$

b. Find the probability that an individual is a Democrat or a Republican.

$$\begin{aligned} P(D \cup R) &= P(D) + F(R) \\ &= \frac{73}{151} + \frac{67}{151} \\ &= \frac{140}{151} \end{aligned}$$

Example 5:
The probability that an NFL quarterback will score at least one touchdown in a football game is 0.67. What is the probability that he will score at least one touchdown in each of the next four games?

Let T represent the event that an NFL quarterback scores at least one touchdown in a given game. Furthermore, his performance for each game is independent of the game before. Then,

$P(T) = 0.67$ and
$P(T \text{ occurs in the next four games}) =$
$(0.67)(0.67)(0.67)(0.67) = (0.67)^4 \approx 0.2015$

ISTUDY

GROUP ACTIVITY CHAPTER R

Understanding Algebraic Expressions

Estimated time: 15 minutes

Group Size: 2–3

To begin, have each person in the group try this puzzle: Take your seven-digit phone number and enter the first three digits on your calculator. Multiply this number by 80. Add 1 to the product. Multiply this sum by 250. Add the last four digits of your phone number to this result. Add the last four digits of your phone number again. Divide this value by 2. Subtract 125 from this number. The result should be your seven-digit phone number. Are you surprised?

In this activity we investigate the mathematics behind the puzzle. We begin by letting each digit of your phone number be represented by a different variable:

Phone number: abc-defg

1. Write down the variable expression representing the first three digits. _____

2. Write down an expression representing this number multiplied by 80. _____

3. Add 1 to the expression from step 2 and write the result. _____

4. Now take the expression from step 3 and multiply the entire sum by 250. Make sure you include parentheses where necessary. _____

5. Write the variable expression representing the last four digits of your phone number. _____

6. Add the last four digits of the phone number to the expression from step 4. _____

7. Add the last four digits again. _____

8. At this point, take time to simplify your expression. You may need to use the distributive property and collect like terms. _____

9. Now take the simplified algebraic expression from step 8 and divide the entire mathematical statement by 2. _____

10. Subtract 125 from your answer in step 9. _____

11. The result should be your seven-digit phone number. Discuss in your group how the algebraic expression in step 10 properly places the digits in their respective positions to form a phone number.

ISTUDY

GROUP ACTIVITY CHAPTER 1

Applying a Quadratic Model

Estimated time: 20 minutes

Group Size: 3

In Chapter 1, we presented a model for the vertical position s of an object that is launched straight upward with an initial velocity v_0 and initial position s_0:

$$s = -\frac{1}{2}gt^2 + v_0t + s_0$$

Recall that t is the time after launch and g is the acceleration due to gravity.

1. A circus juggler tosses a ball straight upward from an initial height of 2.8 m with an initial velocity of 14.7 m/sec. If the acceleration due to gravity is 9.8 m/sec^2, write an equation representing the height of the ball t seconds after release. _____

2. Complete the table to determine the height of the ball for the given values of t. Round to 1 decimal place.

***t* (seconds)**	0	0.5	1.0	1.5	2.0	2.5	3.0
***h* (meters)**							

3. Use the equation from question 1 to determine how long it will take the ball to return to the juggler's hand. _____

4. Suppose that the juggler misses the ball and it falls straight to the ground instead of being caught. Determine the amount of time that the ball was in the air. Round to the nearest tenth of a second. _____

5. There are two solutions to the quadratic equation in question 4. Discuss why the negative value was discarded. Also discuss restrictions that should be placed on t so that model breakdown does not occur.

6. Suppose that the time required for the ball to reach its maximum height is given by $t_{\max} = \frac{v_0}{g}$. Find the time for the ball to reach its maximum height. Compare the answer to the result from question 3.

7. Find the maximum height of the ball.

GROUP ACTIVITY CHAPTER 2

Understanding Piecewise-Defined Functions

Estimated time: 20 minutes

Group Size: 3

Mannie works for a company that pays him \$15.60/hr for the first 40 hr worked in a given week. If he works more than 40 hr but less than or equal to 50 hr he earns time-and-a-half. Occasionally he works more than 50 hr in one week, and his company pays him double time for these hours.

1. How much would Mannie earn if he worked:

a. 35 hr? _____ **b.** 43 hr? _____ **c.** 51 hr? _____

To represent his pay for the week, Mannie uses the following piecewise-defined function:

$$P(h) = \begin{cases} 15.60h & \text{for } 0 < h \leq 40 \\ 15.60(40) + 23.40(h - 40) & \text{for } 40 < h \leq 50 \\ 15.60(40) + 23.40(10) + 31.20(h - 50) & \text{for } h > 50 \end{cases}$$

2. If Mannie works 40 hr, how much does he earn? _____

3. For question 2, you should have substituted a value of 40 for h in the top equation. What would be the result if you accidentally substituted 40 for h in the second equation? _____

4. Rewrite the function defined by $P(h)$ in a simplified form. _____

Now suppose that Olivia works for a company that pays her \$18/hr for the first 20 hr worked in a given week. If she works more than 20 hr but less than or equal to 35 hr, she earns time-and-a-quarter. If she must work more than 35 hr in one week, she is paid double time.

5. Use the given information to write a piecewise-defined function that represents Olivia's pay each week $P(h)$ based on the number of hours worked, h. Write the function in its simplest form.

6. Using your answer from question 5, determine

a. How much Olivia earns if she works 25 hr. _____

b. How much Olivia earns if she works 40 hr. _____

GROUP ACTIVITY CHAPTER 3

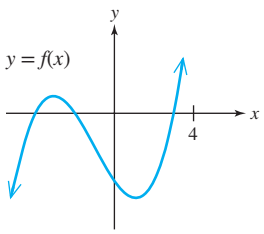
Investigating the Bisection Method for Finding Zeros

Estimated time: 30 minutes

Group Size: 3

1. Consider a polynomial function defined by $y = f(x)$ and an interval $[a, b]$. If $f(a)$ and $f(b)$ have different signs, what does the intermediate value theorem imply about the zeros of f?

2. Now consider $f(x) = x^3 + 3x^2 - 10x - 24$ and the interval $[0, 4]$.



- **a.** Find $f(0)$.
- **b.** Find $f(4)$.
- **c.** What do you notice about the signs of $f(0)$ and $f(4)$?
- **d.** What conclusion can you draw about the function based on the intermediate value theorem?

From question 2, we know that at least one zero of the polynomial exists on the interval $[0, 4]$. To approximate a zero on this interval, we will use the bisection method. The bisection method works by repeatedly bisecting an interval and using the intermediate value theorem to determine which of the subintervals contains the zero.

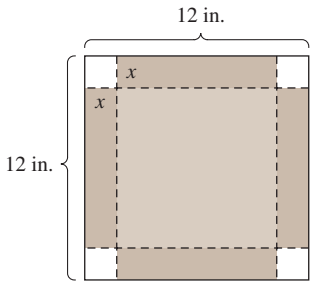
3.
- **a.** What is the midpoint of the interval $[0, 4]$?
- **b.** Find $f(2)$.
- **c.** Is 2 a zero of $f(x)$?
- **d.** Based on the signs of $f(0)$, $f(2)$, and $f(4)$, which subinterval $[0, 2]$ or $[2, 4]$ contains a zero of $f(x)$?

4. Now continue using the format from question 3 to search for a zero of $f(x)$.

- **a.** What is the midpoint of the new interval?
- **b.** Is the midpoint of the new interval a zero of $f(x)$?
- **c.** If the midpoint is a zero of $f(x)$, you can stop. If not, continue using the bisection method.

Often the real zeros of polynomials are not rational numbers. In such a case, we can apply the bisection method to approximate the value of a zero of a function or a root of an equation to a desired degree of accuracy. This technique will be employed to solve the application in questions 5–7.

5. An open box is to be constructed from a 12-in. square piece of cardboard by cutting out squares of equal size from each corner and turning up the sides.



- **a.** Write a relationship representing the volume of the box $V(x)$ as a function of x.
- **b.** The box is to be designed to have a volume of 120 in.^{3}. Show that the equation $x^3 - 12x^2 + 36x - 30 = 0$ represents the value(s) of x that will produce a volume of 120 in.^{3}.
- **c.** Show that the equation has no rational solutions. (*Hint*: List the possible rational zeros. Use Descartes' rule of signs and the upper and lower bound theorem to restrict the list. Then have each group member test different possible rational zeros.)

Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

Suppose that the manufacturer wants to keep the height of the box less than or equal to 2 in. Questions 6–7 will lead you through the bisection method to approximate the real solution(s) to the equation $x^3 - 12x^2 + 36x - 30 = 0$ on the interval [0, 2] with a 0.02 degree of accuracy.

6. Fill in the table. For each row, the value of the midpoint in the fifth column is the new approximation of the root of the equation. Continue filling in rows of the table until two consecutive values of the midpoint differ by less than 0.02.

a	b	$f(a)$	$f(b)$	**Midpoint**	f**(midpoint)**	**New Interval**
0	2					

7. **a.** At approximately what length should the corner squares be cut so that the volume is 120 in.^{3}?

b. Determine the dimensions of the box.

c. Verify that the volume is approximately 120 in.^{3}.

GROUP ACTIVITY CHAPTER 4

Investigating a Human Memory Model

Estimated time: 20 minutes

Group Size: 3

The moment that a human being learns a new idea, the brain takes on the job of storing and recalling that information. A memory model representing $p(t)\%$ that a person can recall is based on the elapsed time since learning the information. For example, one such model is

$$p(t) = a + b \ln(t + 1) \text{ where } 0 \leq t \leq 24$$

and t represents the number of months after learning the given information.

1. Suppose that immediately after information is presented ($t = 0$), an individual retains 75% of what was presented. Find the parameter a in the model. [*Hint:* $p(t) = 75$.]

$a =$ _____

2. If 65.3% of the information was retained 1 month after the material was presented, find the parameter b in the model.

$b =$ _____

3. Rewrite the equation representing $p(t)$ substituting the known values of a and b.

$p(t) =$ _____

4. Use the model from question 3 to approximate the percentage of material retained after 2 months. Round to 1 decimal place. _____

5. Use the model to evaluate $p(3)$, $p(6)$, $p(9)$, and $p(12)$.

$p(3) =$ _____ $p(6) =$ _____ $p(9) =$ _____ $p(12) =$ _____

6. Determine the average rate of change of $p(t)$ for the given intervals.

a. [0, 3] = _____ **b.** [3, 6] = _____

c. [6, 9] = _____ **d.** [9, 12] = _____

7. Based on the results from questions 5 and 6, what do you notice about the percentage of material retained as time increases?

8. After how many months will the individual recall 50% or less of the material? Round to the nearest month.

_____

9. Write several ordered pairs for this function and sketch the function.

GROUP ACTIVITY CHAPTER 5

Introduction to Right Triangle Trigonometry

Estimated time: 20 min

Group size: 3

1. In Figure 1, ΔABC is a right triangle constructed with hypotenuse on line l and acute angles A and B. Find the length of $\overline{AB}$.

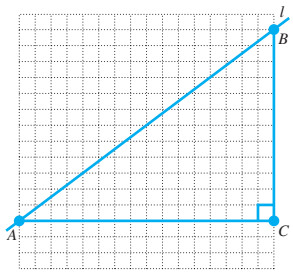

Figure 1

2. Side $\overline{AB}$ is the hypotenuse (hyp), and relative to $\angle A$, leg $\overline{AC}$ is the adjacent leg (adj), and $\overline{BC}$ is the opposite leg (opp). Find and simplify the following ratios relative to $\angle A$.

$\frac{\text{opp}}{\text{hyp}} =$

$\frac{\text{adj}}{\text{hyp}} =$

$\frac{\text{opp}}{\text{adj}} =$

3. Draw two other triangles similar to ΔABC and below line l using point A as one of the vertices. For each new triangle, compute the three ratios relative to angle A and simplify the result.

Triangle 1: $\frac{\text{opp}}{\text{hyp}} =$ $\frac{\text{adj}}{\text{hyp}} =$ $\frac{\text{opp}}{\text{adj}} =$

Triangle 2: $\frac{\text{opp}}{\text{hyp}} =$ $\frac{\text{adj}}{\text{hyp}} =$ $\frac{\text{opp}}{\text{adj}} =$

Compare the values of the ratios from Question 2.

4. Using the symbols opp, adj, and hyp, write the definitions of the following functions of angle A.

$\sin A =$ $\cos A =$ $\tan A =$

$\csc A =$ $\sec A =$ $\cot A =$

5. In Figure 1, the measure of $\angle A$ is approximately 36.87°. Use a calculator in degree mode to approximate $\sin A$, $\cos A$, and $\tan A$. Round to 4 decimal places.

$\sin A =$ $\cos A =$ $\tan A =$

6. Referring to Figure 1, which trigonometric function of the acute angle A gives the slope of line l?

7. We will now use the trigonometric functions of right angles in an application in three dimensions. Morgan is a biologist who studies bald eagles. An eagle's nest is situated at the top of a tall pine tree at the Lake Woodruff Wildlife Refuge. The tree is on a grassy knoll surrounded by swamp area, and Morgan cannot get close to the base of the tree (Figure 2).

The height of the tree is the length of side BC. From an eye level of 6 ft, Morgan uses a clinometer and estimates the measure of $\angle CAB$ to be 19°. Given just the angle of 19°, does Morgan have enough information to determine the height of the tree?

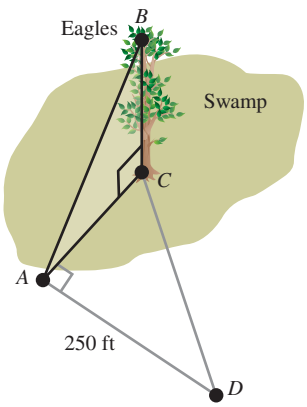

Figure 2

8. To estimate AC, Morgan walks 250 ft in a straight line perpendicular to $\overline{AC}$ and marks a point D on the ground. He then measures $\angle ADC$ as 58°. Determine AC. Round to the nearest foot.

9. Use the length of $\overline{AC}$ found in Question 8 to determine the height of the tree. Use the fact that Morgan measured $\angle CAB$ as 19° from an eye level of 6 ft.

GROUP ACTIVITY CHAPTER 6

Deriving Key Identities

Estimated time: 40 min

Group size: 3

Part I: Prove the Sum Formula for Cosine

$$\cos(\alpha + \beta) = \cos\alpha\cos\beta - \sin\alpha\sin\beta \qquad (1)$$

1. Refer to Figure 1. Using ΔABC, write an expression for $\cos(\alpha + \beta)$.

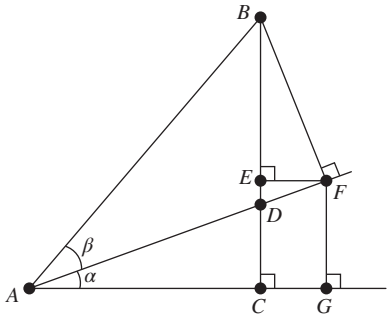

Figure 1

2. Line segments $\overline{AG}$ and $\overline{EF}$ are parallel. Show that

$$\cos(\alpha + \beta) = \frac{AG}{AB} - \frac{EF}{AB}$$

3. Using the fact that $\overline{AG}$ and $\overline{EF}$ are parallel, is the measure of $\angle EFD$ equal to α or β? Is the measure of $\angle EBF$ equal to α or β?

4. The two terms on the right side of the identity $\cos(\alpha + \beta) = \cos\alpha\cos\beta - \sin\alpha\sin\beta$ involve a product of cosines and a product of sines, respectively.

Thus, it would be advantageous for us to write the ratio $\frac{AG}{AB}$ as $\frac{AG}{AF} \cdot \frac{AF}{AB}$. Why?

Likewise, it would be helpful to write $\frac{EF}{AB}$ as $\frac{EF}{BF} \cdot \frac{BF}{AB}$. Why?

5. Use the expressions from Question 4 to complete the proof of the identity.

Part II: Prove the Remaining Sum and Difference Identities for Sine and Cosine

$$\cos(\alpha + \beta) = \cos\alpha\cos\beta - \sin\alpha\sin\beta \qquad (1)$$

$$\cos(\alpha - \beta) = \cos\alpha\cos\beta + \sin\alpha\sin\beta \qquad (2)$$

$$\sin(\alpha + \beta) = \sin\alpha\cos\beta + \cos\alpha\sin\beta \qquad (3)$$

$$\sin(\alpha - \beta) = \sin\alpha\cos\beta - \cos\alpha\sin\beta \qquad (4)$$

6. Write $\cos(\alpha - \beta)$ as $\cos[\alpha + (-\beta)]$ along with the even and odd identities for sine and cosine to prove (2): $\cos(\alpha - \beta) = \cos\alpha\cos\beta + \sin\alpha\sin\beta$

7. Prove (3): $\sin(\alpha + \beta) = \sin\alpha\cos\beta + \cos\alpha\sin\beta$. *Hint*: Use the cofunction identities for sine and cosine to write $\sin(\alpha + \beta)$ as $\cos\left[\frac{\pi}{2} - (\alpha + \beta)\right]$ and consequently as $\cos\left[\left(\frac{\pi}{2} - \alpha\right) - \beta\right]$.

8. Prove (4): $\sin(\alpha - \beta) = \sin\alpha\cos\beta - \cos\alpha\sin\beta$ by writing $\sin(\alpha - \beta)$ as $\sin[\alpha + (-\beta)]$ and using the even and odd identities for sine and cosine.

Part III: Prove the Double-Angle Formulas for Sine and Cosine

$$\sin 2\theta = 2\sin\theta\cos\theta \qquad (5)$$

$$\cos 2\theta = \cos^2\theta - \sin^2\theta \qquad (6)$$

$$\cos 2\theta = 1 - 2\sin^2\theta \qquad (7)$$

$$\cos 2\theta = 2\cos^2\theta - 1 \qquad (8)$$

Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

9. Prove (5): $\sin 2\theta = 2\sin\theta\cos\theta$. *Hint:* Apply formula (3) with $\alpha = \theta$ and $\beta = \theta$.

10. Prove (6): $\cos 2\theta = \cos^2\theta - \sin^2\theta$. *Hint:* Apply formula (1) with $\alpha = \theta$ and $\beta = \theta$.

11. Prove (7): $\cos 2\theta = 1 - 2\sin^2\theta$ by using formula (6) and the Pythagorean identity $\sin^2\theta + \cos^2\theta = 1$.

12. Prove (8): $\cos 2\theta = 2\cos^2\theta - 1$ by using formula (6) and the Pythagorean identity $\sin^2\theta + \cos^2\theta = 1$.

Part IV: Prove the Power-Reducing Formulas for Sine and Cosine

$$\sin^2\theta = \frac{1 - \cos 2\theta}{2} \qquad (9)$$

$$\cos^2\theta = \frac{1 + \cos 2\theta}{2} \qquad (10)$$

13. Prove (9): $\sin^2\theta = \dfrac{1 - \cos 2\theta}{2}$ by using the double-angle cosine formula (7).

14. Prove (9): $\cos^2\theta = \dfrac{1 + \cos 2\theta}{2}$ by using the double-angle cosine formula (8).

Part V: Prove the Half-Angle Identities for Sine and Cosine

$$\sin\frac{u}{2} = \pm\sqrt{\frac{1 - \cos u}{2}} \qquad (11)$$

$$\cos\frac{u}{2} = \pm\sqrt{\frac{1 + \cos u}{2}} \qquad (12)$$

15. Prove (11): $\sin\dfrac{u}{2} = \pm\sqrt{\dfrac{1 - \cos u}{2}}$ by using the power-reducing formula (9) and by letting $\theta = \dfrac{u}{2}$.

16. Prove (12): $\cos\dfrac{u}{2} = \pm\sqrt{\dfrac{1 + \cos u}{2}}$ by using the power-reducing formula (10) and by letting $\theta = \dfrac{u}{2}$.

GROUP ACTIVITY CHAPTER 7

Investigating a Predator-Prey Model

Estimated time: 20 min

Group size: 3

Conservation attempts to protect endangered species often lead biologists to study the relationships between endangered species and their predators. Such relationships, called predator-prey models, often follow sinusoidal patterns (Figure 1). When the population of prey is large, the number of predators tends to increase due to an abundance of food. However, with increased predation, this in turn makes the prey population decrease. Eventually when the prey population approaches its low point, the predators begin to die off due to a low food supply. This subsequently enables the prey population to recover and increase again. Thus, the cycle is periodic.

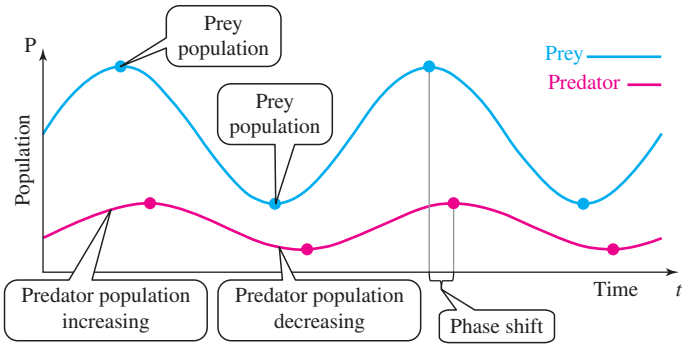

Figure 1

In the absence of external variables, the cycle representing the predator population will lag behind the prey population by a fixed phase shift. For example, as Figure 1 shows, the maximum predator population comes slightly after the maximum prey population. Then, as the predator population reaches its maximum value, the prey population has already begun its decline.

Barn owls feed almost exclusively on mice. In fact, during the course of a year, an adult barn owl will consume approximately 1000 mice. In the Tosohatchee Wildlife Management Area in central Florida, scientists estimate that the barn owl population varies in a sinusoidal manner from 150 owls to 180 owls and back to 150 owls over a 6-month period. Likewise, the scientists estimate that the population of field mice varies sinusoidally between 12,000 and 20,000 and back again to 12,000 over a 6-month period. Furthermore, the mouse population reaches its peak approximately 1 month before the owl population reaches its peak.

Momo64/iStock/Getty Images

1. Let t represent the time in months after the scientists begin their study. Further suppose that the mouse population is at its maximum value at $t = 0$. Write a model of the form $M(t) = A\cos(Bt - C) + D$ to represent the mouse population $M(t)$ as a function of the time t after the study begins.

2. Write a model of the form $P(t) = A\cos(Bt - C) + D$ to represent the owl population $P(t)$ as a function of the time t after the study begins.

3. When the mouse population is at its peak, what is the owl population?

4. When the mouse population is at its minimum, what is the owl population?

5. When is the first time after the study that the owl population will reach its minimum value?

Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

6. When is the first time after the study that the owl population will reach its maximum value?

7. The average number of owls is 150. When is the first time that the owl population will reach its average value?

8. When the mouse population is at its maximum, is the owl population increasing or decreasing?

9. When the mouse population is at its minimum, is the owl population increasing or decreasing?

10. When the mouse population reaches a population of 18,000 for the first time, what is the owl population?

11. When the mouse population reaches a population of 18,000 for the second time, what is the owl population?

ISTUDY

GROUP ACTIVITY CHAPTER 8

Introduction to Rectangular Coordinate Systems and Vectors in Space

Estimated time: 45 min

Group size: 4

Part I: Locating Points in Space

The graphs of curves in a plane have been studied extensively thus far by using functions and equations in two variables. Each of these topics can also be extended to three-dimensional coordinate systems. For example, a Cartesian coordinate system in two variables is made up of two perpendicular lines (the x- and y-axes) in a plane intersecting at the origin. In turn, the location of a point is defined by an ordered pair indicating the position to the left, right, above, or below the origin.

Now suppose that we extend this to three dimensions by passing a third line (the z-axis) through the origin and perpendicular to the plane formed by the x- and y-axes (Figure 1). The coordinate system is described as a *right-hand* coordinate system if your thumb points upward when you curl the fingers of your right hand around the z-axis from the positive x-axis toward the positive y-axis (Figure 2).

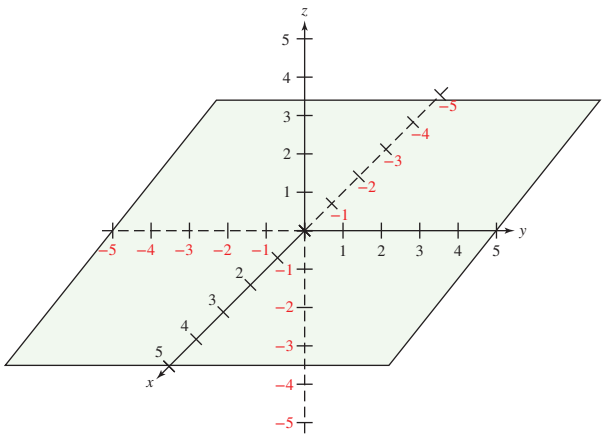

Figure 1

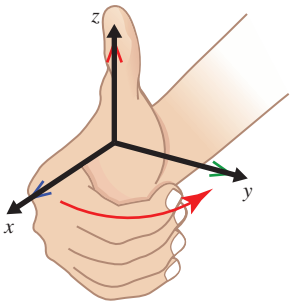

Figure 2

- The plane formed by the x- and y-axes is called the xy-plane. The z-axis is perpendicular to the xy-plane.
- The plane formed by the x- and z-axes is called the xz-plane. The y-axis is perpendicular to the xz-plane.
- The plane formed by the y- and z-axes is called the yz-plane. The x-axis is perpendicular to the yz-plane.

A point P in space can be uniquely determined by an ordered triple (x, y, z) where x is the directed distance from the yz-plane, y is the directed distance from the xz-plane, and z is the directed distance from the xy-plane (Figure 3).

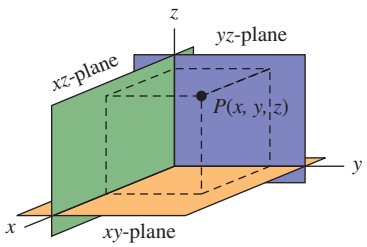

Figure 3

Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

1. Suppose that a rectangular coordinate system is set up so that the xy-plane coincides with the plane of a table top. The positive z-axis extends above the table and the negative z-axis extends below the table (Figure 4). Describe how you would locate each point $P(x, y, z)$.

a. $A(4, 5, -3)$ **b.** $B(-8, 2, 5)$

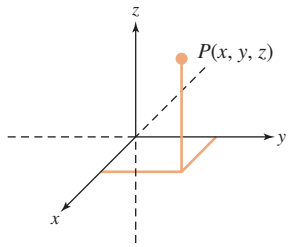

Figure 4

Part II: Finding the Midpoint Between Points in Space

2. In a two-dimensional coordinate system, the midpoint between two points (x_1, y_1) and (x_2, y_2) is found by taking the average of the x- and y-coordinates, respectively. That is, the midpoint M is given by $M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$. Use an analogy to write the ordered triple representing the midpoint of the line segment in space with endpoints (x_1, y_1, z_1) and (x_2, y_2, z_2).

3. Find the midpoint between the points $(-8, 2, -5)$ and $(4, -20, 11)$.

Part III: Finding the Distance Between Two Points in Space

In a two-dimensional coordinate system, the distance d between two points $P(x_1, y_1)$ and $Q(x_2, y_2)$ is found by applying the Pythagorean theorem to the right triangle with legs of length $|x_2 - x_1|$ and $|y_2 - y_1|$ (Figure 5).

We have $d^2 = |x_2 - x_1|^2 + |y_2 - y_1|^2$.

Then taking the positive square root yields $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$.

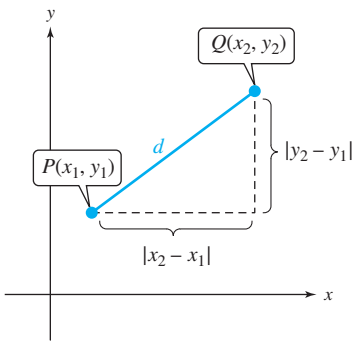

Figure 5

4. Now suppose that we want to find the distance between the points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$. Consider the points $A(x_2, y_2, z_1)$ and $B(x_2, y_1, z_1)$. See Figure 6. Write an expression representing the length of line segment $\overline{PA}$.

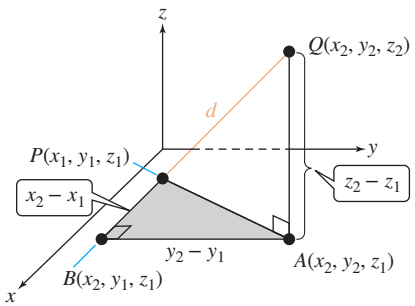

Figure 6

Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

5. Using the length of line segment $\overline{PA}$ from Question 4 and the fact that $AQ = |z_2 - z_1|$, write an expression for the distance d between P and Q.

6. Find the exact distance between the points $(-8, 2, -5)$ and $(4, -20, 11)$.

Part IV: Graphing Surfaces in Space

Given an equation in the variables x and y, we can graph a curve in a two-dimensional coordinate system. For example, the equation $x^2 + y^2 = 25$ is a circle centered at the origin with radius 5 units. The three-dimensional analogy to a circle is a sphere. Thus, the equation $x^2 + y^2 + z^2 = 25$ represents a sphere with center at the origin and radius 5 units (Figure 7). Notice that an equation in three variables represents a surface in space rather than a curve in a plane.

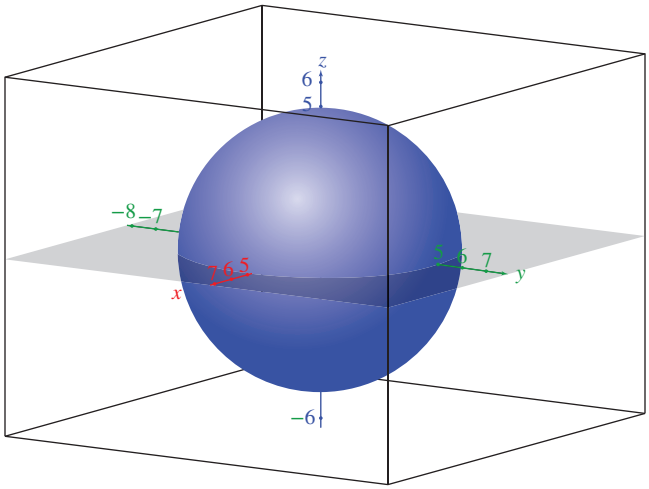

Figure 7

7. Describe the surface represented by the equation $(x - 1)^2 + (y - 5)^2 + (z + 4)^2 = 16$.

Part V: Graphing a Function of Two Variables

Given a function defined by $y = f(x)$, the domain is a set of x values that can be visualized on the x-axis. Then for each domain element x, the range element is a corresponding y value, and together they form an ordered pair (x, y). The graph of all such ordered pairs in a two-dimensional Cartesian coordinate system is the graph of the function.

In three variables, we can define a function as $z = f(x, y)$. The domain is a set of ordered pairs (x, y) that can be visualized as a region in the xy-plane (Figure 8). Then for each ordered pair (x, y) in the domain, the range element is a corresponding z value. This results in an ordered triple (x, y, z). The graph of all such points in a three-dimensional coordinate system is the graph of the function and represents a surface in space (shown in blue in Figure 8).

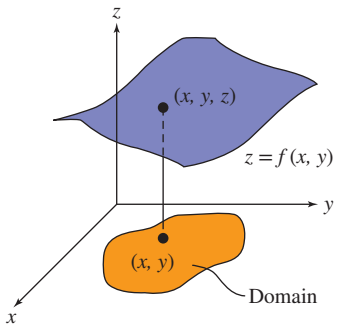

Figure 8

Another way to visualize this is to think of the domain as a set of points (x, y) on a table top. The function then maps each point on the table to a directed height either above or below the table.

Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

8. In a two-dimensional coordinate system, the equation $x^2 + y^2 = 25$ represents a circle centered at the origin with radius 5. In turn, the equation $y = \sqrt{25 - x^2}$ represents the upper semicircle and the equation $y = -\sqrt{25 - x^2}$ represents the lower semicircle. The equation $x^2 + y^2 + z^2 = 25$ represents a sphere centered at the origin with radius 5.

a. Write a function of the form $z = f(x, y)$ representing the upper hemisphere.

b. Write a function of the form $z = f(x, y)$ representing the lower hemisphere.

c. (Optional) Use a three-dimensional graphing utility to graph the equations from parts (a) and (b).

9. (Optional) Use a three-dimensional graphing utility to graph the equations.

a. $z = \sqrt{x^2 + y^2}$ **b.** $z = \cos x + \sin y$

Part VI: Vectors in Space

We have already seen that a vector in a plane can be used to denote position, velocity, acceleration, and force in a plane. Likewise, vectors can be used to denote these variables in space. To do so, a vector in three-dimensional space must have three components. For example, $\mathbf{v} = \langle a_1, b_1, c_1 \rangle$ drawn in standard position is a vector with initial point at the origin and terminal point at (a_1, b_1, c_1). See Figure 9.

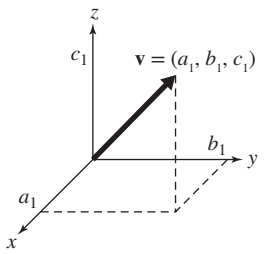

Figure 9

10. We find the component form of a vector between two points in space by using the same approach as a vector in a plane. Find the component form of a vector from point $A(3, -7, 9)$ to $B(2, 0, -8)$.

11. The operations of vector addition, vector subtraction, and multiplication of a vector by a scalar are the same for vectors in space as for vectors in a plane. Given $\mathbf{v} = \langle 2, -5, -3 \rangle$ and $\mathbf{w} = \langle -10, 3, 1 \rangle$ find

a. $\mathbf{v} + \mathbf{w}$ **b.** $-\mathbf{w}$ **c.** $2\mathbf{w} - 5\mathbf{v}$

12. The vectors **i** and **j** represent the unit vectors in the direction of the positive x-axis and positive y-axis, respectively. The vector **k** represents the unit vector in the direction of the positive z-axis (Figure 10). Use the vectors **i, j,** and **k** to represent $\mathbf{v} = \langle 6, -10, 7 \rangle$.

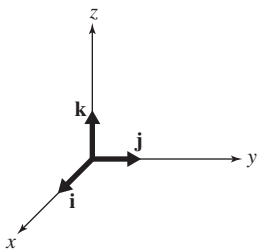

Figure 10

13. We find the magnitude of a vector in space by using the same approach as finding the magnitude of a vector in a plane. Find the magnitude of $\mathbf{v} = \langle 2, -5, -3 \rangle$.

14. We find a unit vector in the direction of a given vector **v** in space by using the same approach as finding a unit vector in a plane. Find a unit vector in the same direction as $\mathbf{v} = \langle 2, -5, -3 \rangle$.

Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

Point of Interest

Vectors are also useful to define a path of motion of objects traveling in two and three dimensions. One such way to define a path of motion is to use a **vector-valued function.** For example, consider the vectors $\mathbf{r}_1$ and $\mathbf{r}_2$ shown in Figures 11 and 12 and defined by

$$\mathbf{r}_1 = \langle t\cos t,\ t\sin t\rangle \quad \text{and} \quad \mathbf{r}_2 = \langle 4\cos t,\ 4\sin t,\ t\rangle$$

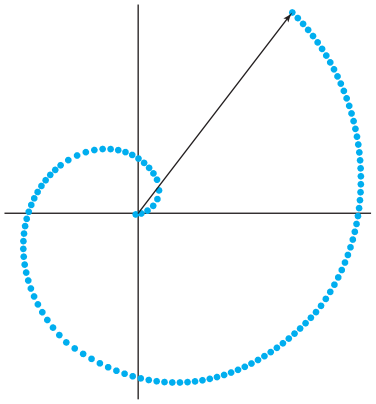

Figure 11

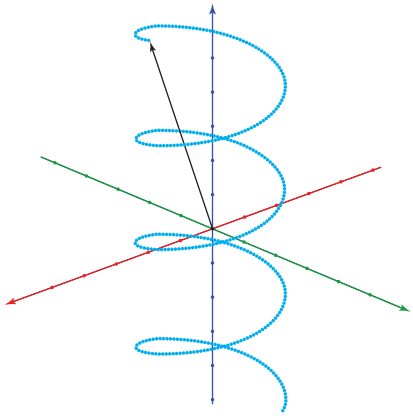

Figure 12

The components of each vector depend on an independent variable t, called a **parameter.** In this case, suppose that t represents time. For a vector drawn in standard position, as the parameter changes, so do the coordinates of the terminal point of the vector. As a result, the tip of the vectors sweeps out a curve representing the path of motion over time. To see an amination of this concept, go to https://youtu.be/GTB-g9f3WEI.

The path defined by vector $\mathbf{r}_2$ shown in Figure 12 is called a helix. This shape can help scientists model the shape of DNA molecules.

GROUP ACTIVITY CHAPTER 9

Using a System of Equations to Approximate the Acceleration Due to Gravity

Estimated time: 20 minutes

Group Size: 3

Recall from Chapter 1 that if an object is launched straight upward with an initial velocity v_0 from an initial height s_0, then the height s of the object can be modeled by

$$s = -\frac{1}{2}gt^2 + v_0t + s_0$$

Suppose that the initial height s_0, the initial velocity v_0, and the acceleration due to gravity g are unknown. The values of these parameters can be determined from observed data. For example, the following data give the height of a ball, t seconds after it is thrown straight upward.

Time t (sec)	1	2	3
Height s (ft)	38	40	10

1. Each table entry represents an ordered pair of the form (t, s). Substitute the t and s values from each ordered pair into the formula for s to build three equations.

_____

_____

_____

2. Simplify the equations from question 1.

_____

_____

_____

3. Solve the system of equations from question 2 to find the value of g, v_0, and s_0. Be sure to include the units of measurement for each.

$g =$ _____, $v_0 =$ _____, $s_0 =$ _____

4. Interpret the meaning of g, v_0, and s_0 in the context of this problem.

5. Substitute the known values of g, v_0, and s_0 in the model $s = -\frac{1}{2}gt^2 + v_0t + s_0$.

_____

6. Use the equation from question 5 to determine the time required for the ball to reach its maximum height. _____

7. What is the maximum height of the ball? _____

8. How long will it take the ball to hit the ground? Round to the nearest tenth of a second. _____

GROUP ACTIVITY CHAPTER 10

Coding and Decoding Messages Using Matrices

Estimated time: 15 minutes

Group Size: 3

Cryptography is the study of coding and decoding messages. One type of coding process assigns a number to each letter of the alphabet. For example A = 1, B = 2, … , Z = 26, and the space symbol = 0. The numerical code for ALGEBRA is

$$\frac{1}{\text{A}}\ \frac{12}{\text{L}}\ \frac{7}{\text{G}}\ \frac{5}{\text{E}}\ \frac{2}{\text{B}}\ \frac{18}{\text{R}}\ \frac{1}{\text{A}}$$

We can write the numerical representation for a word in a square matrix. Notice that zeros are placed for unused entries of the matrix.

$$\text{Matrix for the word ALGEBRA: } A = \begin{bmatrix} 1 & 12 & 7 \\ 5 & 2 & 18 \\ 1 & 0 & 0 \end{bmatrix}$$

We can encode this word by multiplying matrix A by any square matrix of the same order. We have arbitrarily chosen matrix C as the coding matrix.

$$C = \begin{bmatrix} 18 & 16 & -13 \\ 7 & 6 & -5 \\ 1 & 1 & -1 \end{bmatrix}$$

1. Encode the word ALGEBRA by finding the product CA. _____

2. The inverse of matrix C will be the decoding matrix. Find C^{-1}. _____

3. The product $C^{-1}(CA)$ returns the original matrix A (decoded). Perform this multiplication to show that the result is A.

4. A word has been encoded, and the resulting matrix is $DM = \begin{bmatrix} 122 & -38 & 78 \\ 41 & 48 & 23 \\ 83 & -19 & 52 \end{bmatrix}$. Find D^{-1}, given that $D = \begin{bmatrix} 3 & 6 & -5 \\ 1 & 1 & 2 \\ 2 & 4 & -3 \end{bmatrix}$. _____

5. Multiply $D^{-1}(DM)$. _____

6. What word is represented by matrix M? _____

7. Using matrix D once again as the coding matrix, what word is represented by the matrix G given that $DG = \begin{bmatrix} 57 & 90 & 8 \\ 13 & 48 & 58 \\ 38 & 63 & 12 \end{bmatrix}$? _____

GROUP ACTIVITY CHAPTER 11

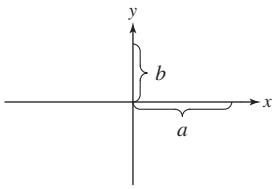
Using the Trammel Method to Draw an Ellipse

Estimated time: 15 minutes

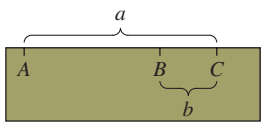
Group Size: 2

In Section 11.1 we discussed how to construct an ellipse using thumbtacks at the foci. This idea was then used to develop the standard form for an equation of an ellipse. Another method to draw an ellipse is called the *trammel method*. A trammel is a device that restricts motion.

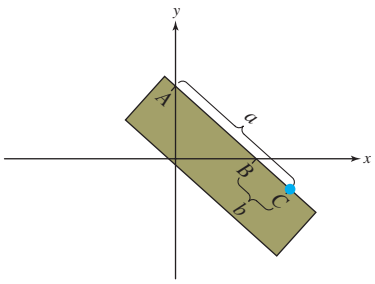
1. Using a straightedge, draw horizontal and vertical lines that form a right angle. Choose one of the perpendicular lines to contain the major axis and the other line to contain the minor axis. Mark the distance a along the major axis, and mark the distance b along the minor axis. Recall that a represents half the length of the major axis and that b represents half the length of the minor axis.

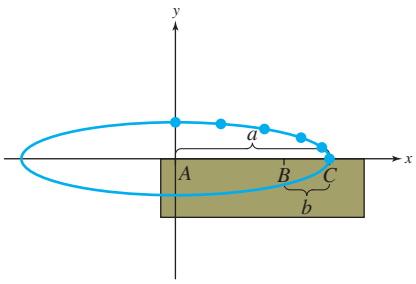


2. Use a firm strip of cardboard as the trammel and mark off points A, B, and C such that the length of line segment $\overline{AC} = a$, and $\overline{BC} = b$.



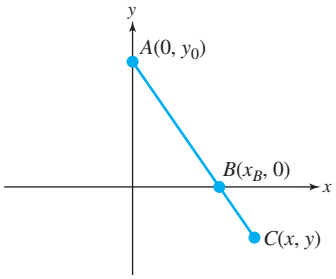
3. Place the trammel so that point A is on the minor axis of the ellipse and point B is on the major axis of the ellipse. Point C will be the location of a point on the ellipse. Move the strip with A and B staying on their respective axes and mark several points C so that an accurate graph can be rendered. Note that when A reaches the origin (still on the minor axis), the point C gives one endpoint of the major axis (a vertex of the ellipse). The other vertex can be found in a similar fashion.



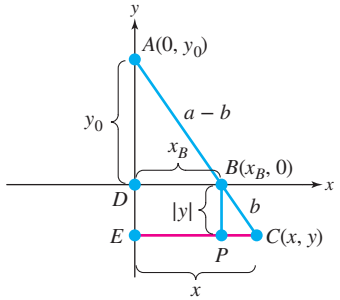


How do you know that the graph constructed in step 3 actually forms an ellipse? Steps 4–11 will lead you through the process to show that the trammel method yields the standard form of an equation of an ellipse centered at the origin.

4. Construct a line segment to represent the trammel. Label the points A, B, and C with the ordered pairs as shown.



5. Draw right triangles ADB, AEC, and BPC. Label the distances as shown in the figure. Why are triangles AEC and ADB similar?



Copyright © McGraw Hill Education. All rights reserved. No reproduction or distribution without the prior written consent of McGraw Hill Education.

6. Recall that the trammel $\overline{AC}$ has length a. Using the similar triangles AEC and ADB, fill in the blank:

$$\frac{x_B}{\square} = \frac{a-b}{a}$$

7. Now use the similar triangles BPC and ADB to fill in the blank:

$$\frac{y_0}{\square} = \frac{a-b}{b}$$

8. From the relationships in steps 6 and 7, show that

$$x_B = x\left(\frac{a-b}{a}\right) \quad \text{and} \quad y_0 = |y|\left(\frac{a-b}{b}\right).$$

9. Triangle ADB is a right triangle. Use the Pythagorean theorem to fill in the blank.

$$(x_B)^2 + (y_0)^2 = (\quad)^2$$

10. Substitute the expressions for x_B and y_0 from step 8 into the equation from step 9. Show that the result is

$$\frac{x^2}{a^2}(a-b)^2 + \frac{y^2}{b^2}(a-b)^2 = (a-b)^2.$$

11. How do you know that $a - b \neq 0$? _____
Divide both sides of the equation from step 10 by $(a-b)^2$ and verify that the result is the standard form of an equation of an ellipse with center at the origin.

ISTUDY

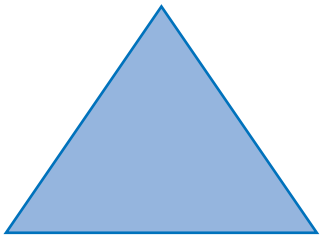
GROUP ACTIVITY CHAPTER 12

Investigating Fractals with Sequences and Series

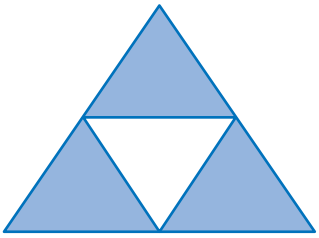
Estimated time: 30 minutes

Group Size: 4

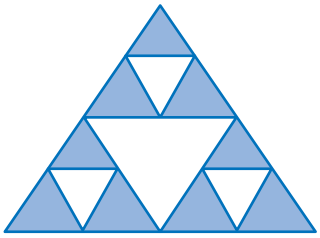
A **fractal** is a geometric shape that can be split into parts that are reduced-scale patterns of the original. This pattern is repeated an infinite number of times. If you zoom in on any part of it, you will see that the pattern looks the same. One such fractal is the Sierpinski Triangle. This fractal is created by connecting the midpoints of the three sides of an equilateral triangle. This creates a new equilateral triangle which is then "removed" from the original. The remaining three triangles are smaller versions of the original. This process can then be repeated to create another iteration of the figure. The first three stages are shown here.



Stage 1



Stage 2



Stage 3

1. Write the first three terms of the sequence, representing the number of blue triangles at each stage.

2. Write an expression N_n for the nth term of the sequence, representing the number of blue triangles at each stage, n.

3. Assume that the original triangle has a side length of 1 unit. Write an expression s_n for the nth term of the sequence, representing the length of the sides of a blue triangle at stage n.

4. Use the Pythagorean theorem to show that for an equilateral triangle with sides s_n, the height is given by $h_n = \frac{\sqrt{3}}{2}s_n$. Then show that the height of one of the blue triangles at stage n is given by $h_n = \frac{\sqrt{3}}{2}\left(\frac{1}{2}\right)^{n-1}$.

5. Consider the stage 1 triangle.

a. Determine the height of the triangle.

b. Determine the area of the triangle.

6. Consider the stage 2 triangle.

a. Determine the height of one of the blue triangles in stage 2.

b. Determine the area of one of the blue triangles in stage 2.

7. Write an expression A_n for the area of one of the blue triangles at stage n.

8. Use the results from questions 2 and 7 to write an expression T_n for the total area for all the blue triangles at stage n.

Group Activity Answer Appendix

Chapter R Group Activity

1. abc **2.** 80abc **3.** 80abc + 1 **4.** 250(80abc + 1)
5. defg **6.** 250(80abc + 1) + defg
7. 250(80abc + 1) + defg + defg **8.** 20,000abc + 250 + 2defg
9. 10,000abc + 125 + defg **10.** 10,000abc + defg
11. "abc" represents a three-digit number that occupies the ones, tens, and hundreds places. By multiplying by 10,000, the digits are moved to the millions, hundred-thousands, and ten-thousands places. The expression "defg" will occupy the thousands, hundreds, tens, and ones places. To see this visually, we have:

$$\begin{array}{rr} 10{,}000*\text{abc} = & \text{abc0000} \\ & \text{abc0000} \\ + & \text{defg} \\ \hline & \text{abcdefg} \end{array}$$

Chapter 1 Group Activity

1. $s = -4.9t^2 + 14.7t + 2.8$

2.

t (seconds)	0	0.5	1.0	1.5	2.0	2.5	3.0
h (meters)	2.8	8.9	12.6	13.8	12.6	8.9	2.8

3. 3 sec **4.** 3.2 sec
5. The value $t = -0.2$ is not reasonable because this represents a time before the ball was released. The value of t should be restricted to $0 \le t \le 3.2$. This is the range of times (to the nearest 0.1 sec) from release of the ball to impact with the ground.
6. 1.5 sec; The ball will reach its maximum height at a time halfway between the time of release and the time at which the juggler catches the ball. **7.** The maximum height of the ball is 13.825 m.

Chapter 2 Group Activity

1. a. \$546 **b.** \$694.20 **c.** \$889.20
2. \$624 **3.** The results are the same.
4. $P(h) = \begin{cases} 15.60h & \text{if } 0 < h \le 40 \\ 23.40h - 312 & \text{if } 40 < h \le 50 \\ 31.20h - 702 & \text{if } h > 50 \end{cases}$
5. $P(h) = \begin{cases} 18h & \text{if } 0 < h \le 20 \\ 22.50h - 90 & \text{if } 20 < h \le 35 \\ 36h - 562.50 & \text{if } h > 35 \end{cases}$
6. a. \$472.50 **b.** \$877.50

Chapter 3 Group Activity

1. f has at least one zero on $[a, b]$. **2. a.** $f(0) = -24$
b. $f(4) = 48$ **c.** The signs are different.
d. The function has at least one zero on [0, 4].
3. a. 2 **b.** $f(2) = -24$ **c.** No **d.** [2, 4] **4. a.** 3 **b.** Yes
5. a. $V(x) = (12 - 2x)^2 \cdot x$ **b.** $V(x) = 120$ implies that $(12 - 2x)^2 \cdot x = 120$, or equivalently, $4x^3 - 48x^2 + 144x - 120 = 0$. Dividing both sides by 4 gives $x^3 - 12x^2 + 36x - 30 = 0$.
c. By the rational zeros theorem, the only possible rational zeros of $x^3 - 12x^2 + 36x - 30$ are $\pm 1, \pm 2, \pm 3, \pm 5, \pm 6, \pm 10, \pm 15, \pm 30$. Testing each possibility verifies that none is a solution to the equation.

6.

a	b	$f(a)$	$f(b)$	Midpoint	f(midpoint)	New Interval
0	2	−30	2	1	−5	[1, 2]
1	2	−5	2	1.5	0.375	[1, 1.5]
1	1.5	−5	0.375	1.25	−1.7969	[1.25, 1.5]

Chapter 6 Group Activity

1. $\cos(\alpha+\beta)=\dfrac{AC}{AB}$ **2.** $\cos(\alpha+\beta)=\dfrac{AG-EF}{AB}=\dfrac{AG}{AB}-\dfrac{EF}{AB}$

3. α, α **4.** The product $\dfrac{AG}{AF}\cdot\dfrac{AF}{AB}$ represents the product $\cos\alpha\cdot\cos\beta$ This comes from using ΔAGF and ΔAFB, respectively. The product $\dfrac{EF}{BF}\cdot\dfrac{BF}{AB}$ represents the product $\sin\alpha\cdot\sin\beta$. This comes from using ΔBEF and ΔABF, respectively.

5. $\cos(\alpha+\beta)=\dfrac{AG}{AB}-\dfrac{EF}{AB}$

$=\dfrac{AG}{AF}\cdot\dfrac{AF}{AB}-\dfrac{EF}{BF}\cdot\dfrac{BF}{AB}$

$=\cos\alpha\cos\beta-\sin\alpha\sin\beta$

6. $\cos(\alpha-\beta)=\cos[\alpha+(-\beta)]$

$=\cos\alpha\cos(-\beta)-\sin\alpha\sin(-\beta)$

$=\cos\alpha\cos\beta-\sin\alpha(-\sin\beta)$

$=\cos\alpha\cos\beta+\sin\alpha\sin\beta$

7. $\sin(\alpha+\beta)=\cos\left[\dfrac{\pi}{2}-(\alpha+\beta)\right]$

$=\cos\left[\left(\dfrac{\pi}{2}-\alpha\right)-\beta\right]$

$=\cos\left(\dfrac{\pi}{2}-\alpha\right)\cos\beta+\sin\left(\dfrac{\pi}{2}-\alpha\right)\sin\beta$

$=\sin\alpha\cos\beta+\cos\alpha\sin\beta$

8. $\sin(\alpha-\beta)=\sin[\alpha+(-\beta)]$

$=\sin\alpha\cos(-\beta)+\cos\alpha\sin(-\beta)$

$=\sin\alpha\cos\beta+\cos\alpha(-\sin\beta)$

$=\sin\alpha\cos\beta-\cos\alpha\sin\beta$

9. $\sin 2\theta=\sin(\theta+\theta)$

$=\sin\theta\cos\theta+\cos\theta\sin\theta$

$=2\sin\theta\cos\theta$

10. $\cos 2\theta=\cos\theta\cos\theta-\sin\theta\sin\theta$

$=\cos^2\theta-\sin^2\theta$

11. $\cos 2\theta=\cos^2\theta-\sin^2\theta$

$=(1-\sin^2\theta)-\sin^2\theta$

$=1-2\sin^2\theta$

12. $\cos 2\theta=\cos^2\theta-\sin^2\theta$

$=\cos^2\theta-(1-\cos^2\theta)$

$=\cos^2\theta-1+\cos^2\theta$

$=2\cos^2\theta-1$

13. $\cos 2\theta=1-2\sin^2\theta$

$2\sin^2\theta=1-\cos 2\theta$

$\sin^2\theta=\dfrac{1-\cos 2\theta}{2}$

14. $\cos 2\theta=2\cos^2\theta-1$

$2\cos^2\theta=1+\cos 2\theta$

$\cos^2\theta=\dfrac{1+\cos 2\theta}{2}$

15. Let $\theta=\dfrac{u}{2}$. Then $\sin^2\theta=\dfrac{1-\cos 2\theta}{2}$ becomes $\sin^2\dfrac{u}{2}=\dfrac{1-\cos u}{2}$ or $\sin\dfrac{u}{2}=\pm\sqrt{\dfrac{1-\cos u}{2}}$.

16. Let $\theta=\dfrac{u}{2}$. Then $\cos^2\theta=\dfrac{1+\cos 2\theta}{2}$ becomes $\cos^2\dfrac{u}{2}=\dfrac{1+\cos u}{2}$ or $\cos\dfrac{u}{2}=\pm\sqrt{\dfrac{1+\cos u}{2}}$.

Chapter 7 Group Activity

1. $M(t)=4000\cos\left(\dfrac{\pi}{3}t\right)+16{,}000$

2. $P(t)=30\cos\left(\dfrac{\pi}{3}t-\dfrac{\pi}{3}\right)+150$

3. 165 **4.** 135 **5.** 4 months **6.** 1 month **7.** 2.5 months
8. Increasing **9.** Decreasing **10.** 180 **11.** 135

Chapter 8 Group Activity

1. a. Locate the position (4, 5) in the *xy*-plane. Then move directly downward 3 units in the *z* direction. This is the position of point *A*.

b. Locate the position (−8, 2) in the *xy*-plane. Then move directly upward 5 units in the *z* direction. This is the position of point *B*.

2. $M=\left(\dfrac{x_1+x_2}{2},\dfrac{y_1+y_2}{2},\dfrac{z_1+z_2}{2}\right)$ **3.** (−2, −9, 3)

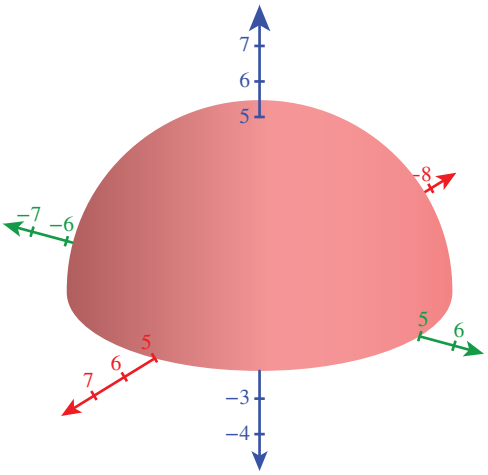
4. $PA=\sqrt{(x_2-x_1)^2+(y_2-y_1)^2}$

5. $d=\sqrt{(x_2-x_1)^2+(y_2-y_1)^2+(z_2-z_1)^2}$ **6.** $2\sqrt{221}$

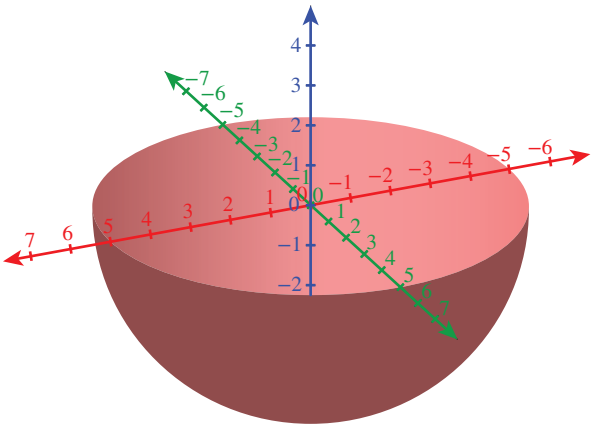
7. The surface is a sphere centered at the point (1, 5, −4) with radius 4.

8. a. $z=\sqrt{25-x^2-y^2}$ **b.** $z=-\sqrt{25-x^2-y^2}$

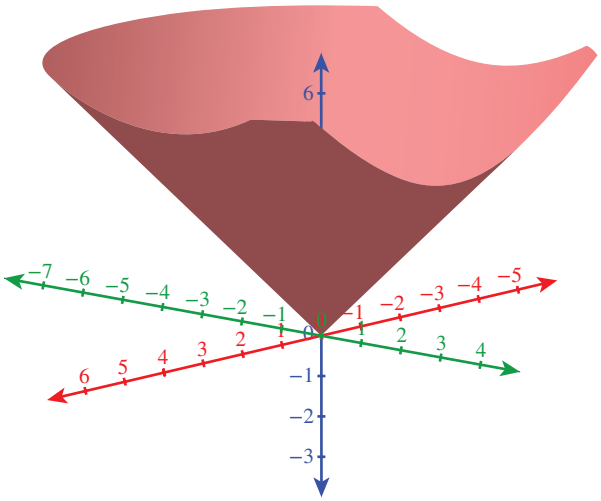
c. $z=\sqrt{25-x^2-y^2}$



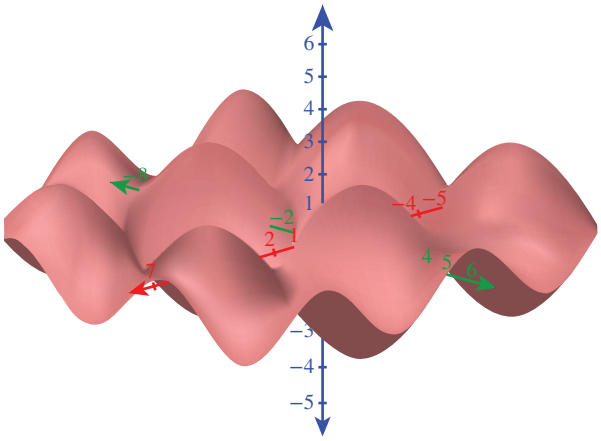
$z=-\sqrt{25-x^2-y^2}$



9. a. $z = \sqrt{x^2 + y^2}$



b. $z = \cos x + \sin y$



10. $\overrightarrow{AB} = \langle -1, 7, -17 \rangle$ **11. a.** $\mathbf{v} + \mathbf{w} = \langle -8, -2, -2 \rangle$

b. $-\mathbf{w} = \langle 10, -3, -1 \rangle$ **c.** $2\mathbf{w} - 5\mathbf{v} = \langle -30, 31, 17 \rangle$

12. $\mathbf{v} = 6\mathbf{i} - 10\mathbf{j} + 7\mathbf{k}$ **13.** $\|\mathbf{v}\| = \sqrt{38}$

14. $\mathbf{u}_\mathbf{v} = \left\langle \frac{2}{\sqrt{38}}, \frac{-5}{\sqrt{38}}, \frac{-3}{\sqrt{38}} \right\rangle$.

Chapter 9 Group Activity

1. $38 = -\frac{1}{2}g(1)^2 + v_0(1) + s_0$; $40 = -\frac{1}{2}g(2)^2 + v_0(2) + s_0$; $10 = -\frac{1}{2}g(3)^2 + v_0(3) + s_0$ **2.** $-\frac{1}{2}g + v_0 + s_0 = 38$; $-2g + 2v_0 + s_0 = 40$; $-\frac{9}{2}g + 3v_0 + s_0 = 10$ **3.** 32 ft/sec^2; 50 ft/sec; 4 ft **4.** The force of gravity working on the ball is 32 ft/sec^2. The speed at which the ball was initially thrown is 50 ft/sec. The ball was thrown from an initial height of 4 ft.

5. $s = -16t^2 + 50t + 4$ **6.** 1.5625 sec **7.** 43.0625 ft

8. Approximately 3.2 sec

Chapter 10 Group Activity

1. $CA = \begin{bmatrix} 85 & 248 & 414 \\ 32 & 96 & 157 \\ 5 & 14 & 25 \end{bmatrix}$ **2.** $C^{-1} = \begin{bmatrix} -1 & 3 & -2 \\ 2 & -5 & -1 \\ 1 & -2 & -4 \end{bmatrix}$

3. $C^{-1}(CA) = A$ **4.** $D^{-1} = \begin{bmatrix} 11 & 2 & -17 \\ -7 & -1 & 11 \\ -2 & 0 & 3 \end{bmatrix}$

5. $D^{-1}(DM) = M = \begin{bmatrix} 13 & 1 & 20 \\ 18 & 9 & 3 \\ 5 & 19 & 0 \end{bmatrix}$ **6.** MATRICES

7. GO FOR IT

Chapter 11 Group Activity

5. The corresponding angles within both triangles have the same measure. This means that the corresponding sides will be proportional.

6. x **7.** $|y|$

8. Multiplying both sides of $\frac{x_B}{x} = \frac{a-b}{a}$ by x yields $x_B = x\left(\frac{a-b}{a}\right)$.

Multiplying both sides of $\frac{y_0}{|y|} = \frac{a-b}{b}$ by $|y|$ yields $y_0 = |y|\left(\frac{a-b}{b}\right)$.

9. $a - b$

10. $(x_B)^2 + (y_0)^2 = (a-b)^2$

$\left[x\left(\frac{a-b}{a}\right)\right]^2 + \left[|y|\left(\frac{a-b}{b}\right)\right]^2 = (a-b)^2$

$\frac{x^2}{a^2}(a-b)^2 + \frac{y^2}{b^2}(a-b)^2 = (a-b)^2$

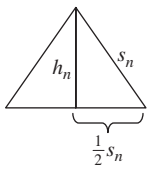
11. $a - b$ represents part of the length of the trammel. $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

Chapter 12 Group Activity

1. 1, 3, 9 **2.** $N_n = 3^{n-1}$ **3.** $s_n = \left(\frac{1}{2}\right)^{n-1}$

4. $\left(\frac{1}{2}s_n\right)^2 + h_n^2 = s_n^2$ implies that $h_n = \frac{\sqrt{3}}{2}s_n$.

Substituting $\left(\frac{1}{2}\right)^{n-1}$ for s_n produces $h_n = \frac{\sqrt{3}}{2}\left(\frac{1}{2}\right)^{n-1}$.



5. a. $\frac{\sqrt{3}}{2}$ units **b.** $\frac{\sqrt{3}}{4}$ square units

6. a. $\frac{\sqrt{3}}{4}$ units **b.** $\frac{\sqrt{3}}{16}$ square units

7. $A_n = \frac{\sqrt{3}}{4}\left(\frac{1}{4}\right)^{n-1}$ **8.** $T_n = \frac{\sqrt{3}}{4}\left(\frac{3}{4}\right)^{n-1}$
